PAO V COMPOSITION

PAO V
DIETARY SUPPLEMENT OF THE BARK OF
PAO PEREIRA

COMPOSITION

Names of the Components	Quantity per Capsule	Quantity in Percentage	Function	Pharmacopoeia References
<u>Active Principle</u>				
Extract of Pao Pereira (24/1)	125 mg	45.1%	Active Principle	Brazilian Pharmacopoeia (1926)
<u>Excipients</u>				
Lactose	61.5 mg	22.2%	Solvent	European Pharmacopoeia 2 II - 187 (1985) US Ph 23-NF 18
Cellulose Microcrystalline	61.5 mg	22.2%	Solvent/Binder	European Pharmacopoeia 2 II - 316 (1984) US Ph 23-NF 18
Magnesium Stearate	3.75 mg	1.4%	Lubricant	European Pharmacopoeia 2 II - 229 (1983) US Ph 23-NF 18
Corn Starch	25.25 mg	9.1%	Disintegrating	European Pharmacopoeia 2 II - 344 (1984) US Ph 23-NF 18
Gelatin Capsule	Q.S.		Capsule	French Pharmacopoeia 10 (1986) US Ph 23-NF 18

CERTIFICATE OF ACCURACY

TRANSLATION:
FROM FRENCH TO ENGLISH

STATE OF NEW YORK)
COUNTY OF NEW YORK) ss:

On this day personally appeared before me Nadia Kaddour who, after being duly sworn, deposes and says:

That she is thoroughly conversant with the French and English languages and able to translate from French into English;

That she has carefully made the attached translation from the original document written in the French language; and

That the attached translation is a true and correct English version of such original, to the best of her knowledge and belief.

Nadia Kaddour

Sworn to and subscribed
before me this 29th day
of August, 1996.

JENNIFER W. KOTZEN
NOTARY PUBLIC, STATE OF NEW YORK
NO. 02K05053916
QUALIFIED IN NEW YORK COUNTY
COMMISSION EXPIRES FEB. 26, 1998

QUALITY CONTROL

Inspections were regularly carried out during the various stages of this assay, at the following dates :

STAGE OF ASSAY	DATE OF INSPECTION
PROTOCOL REVIEW	2 JUNE 1993
ASSAY PREPARATION	23 JUNE 1993
ASSAY UNDERWAY	30 JUNE 1993
	14 JULY 1993
PRELIMINARY REPORT REVIEW	16 SEPTEMBER 1993
FINAL REPORT "AUDIT"	29 SEPTEMBER 1993

This report was accepted by the quality guarantee agent as a strictly accurate presentation of results obtained.

Montrouge, 29 September 1993

(signed) Monique HEROLD, D. Sc.

We, the undersigned, declare that this assay was carried out under our supervision according to procedures described in the present report and that the latter is the faithful account of results obtained.

Montrouge, 29 September 1993

SUMMARY

SUMMARY

Tested product	Pao V.
Animal species	Male and female Sprague-Dawley rats.
Number of animals per batch	Twenty (10 males, 10 females).
Route of administration	Oral (intragastric intubation). Controls rats received solvent only (distilled water). Treatments were carried out daily, 7 days a week, between 9 and 11 AM.
Treatments per batch	0 mg.kg ⁻¹ (controls). - Male rats : - 56.5 mg.kg ⁻¹ - 226 mg.kg ⁻¹ - Female rats : - 73.2 mg.kg ⁻¹ - 292.8 mg.kg ⁻¹ .
Length of treatment	- Males : 28 days - Female : 28 days
RESULTS	Compared to controls, the following was observed :
Mortality	None.
Clinical manifestations	None.
Weight increase	Similar to that of controls.
Food intake	Similar to controls.
Water intake	- Transiently reduced between D 15 and D 18 in male rats. - Identical to that of controls, in females.
Hematology	No change indicating any pathological alteration of hematologic constants.

- Clinical biochemistry** No change indicating any pathological functional alteration.
- Urinary data**
- Similar to that of controls, in male rats.
 - Increase of urine volume passed between 7 hours and 24 hours following the last treatment, accompanied by decrease of urine osmolarity in females treated with the high dose.
- Terminal examinations**
- Macroscopic pathology: no anomaly that could be related to treatment.
 - Organ weight :
 - * non coherent variation of liver weight (decrease using the low dose in males, increase using the high dose in females).
 - * increase of kidney weight in females at the high dose.
 - Microscopic pathology : no histological difference is observed between controls and animals treated with Pao V. at high dose. The rarely observed morphological modifications remain within limits of spontaneous pathology for this animal species.

I - Description of assay**1.1. Objective of the assay**

Tested product subacute toxicity determination following repeated oral administration to the rat for 28 days.

1.2. Assay carried out by

SIR international
6 rue Blanche
92120 MONTROUGE
France

1.3. Supervisor

Marie-Gilberte BORZEIX, Master of Science, DEA in Psychophysiology (Paris VI University), expert in toxicology and pharmacology, Research Director (SIR international).

1.4. Pathologist

Jean CAHN, MD, Doctor of Science, former histology and anatomopathology assistant at the Paris Faculty of Medicine.

1.5. Veterinarian

Animal sanitary condition was checked by Doctor Ch. Boutelier, biologist veterinarian, chief of Services (retired), 15 rue du Limousin, 91220 Bretigny s/Orge.

1.6. Technicians

Jean-Pierre AKIMJAK, BTS (qualified technician) in biological analysis, hemato-coprology certificate from the Paris Faculty of Medicine.

Jean ANGIGNARD, member of the managing staff, biologist.
Dominique ANGIGNARD, biochemist.

Philippe CHARLES, psychophysiology technician.

Maguy LENFANT, histology technician.

Pierre ROUSSELON, animal care technician.

Jean VIKINNE, animal care technician.

Suzanne WEBER, biochemist.

1.7. Dates of the assay

June-July 1993.

1.8. Date of report

29 September 1993.

1.9. Filing

All individual data, the protocol, and a copy of the final report will be kept for five years in SIR international files.

1.10 Statistical analysis

Statistical data processing was carried out with SPSS software for WINDOS 5.0 on a 486 DX2-66 computer.

Statistical study was carried out with two boundaries to test the following null (H_0) hypothesis: "in male and female rats alike, the three experimental series are similar", first species risk alpha being 5 percent.

Variance analysis was carried out for all quantitative data using parametric (AOV) or non parametric (Kruskall-Wallis test) methods according to whether distribution was normal or not. In case of statistically significant inter-series difference, either the Nemann-Keuls parametric test or the Mann-Whitney "U" non parametric test was applied.

For organ weight, covariance analysis was applied to raw data to take account of eventual differences related to body weight.

2 - Tested product**2.1. Substance**

Pao V.(Batch RDJA 1059).

2.2. Supplier

MU Laboratoire
Z.A.C. du Pra de Serre
63960 VEYRE-MONTON
France

3 - Solvent**3.1. Solvent**

Twice-distilled water.

3.2. Supplier

Prepared on site in a still (SERLABO, 26 rue Saint Gilles,
75003 PARIS, France).

4- Preparation of study

4.1. Species	Rat.
4.2. Strain	Sprague-Dawley - OFA - SD (IOPS Caw).
4.3. Breeder	Iffa Credo, Domaine des Oncins, 69592 L'ARBRESLE Cedex
4.4. Total number of animals received	Thirty-two male rats and thirty-two females.
4.5. Age at start of assay	Five weeks (34/36 days).
4.6. Weight at start of assay	- Males (150g) - Females (130g).
4.7. Number of experimental animals	30 males, 30 females.
4.8. Acclimatization period and and sanitary measures	Rats are acclimatized for 5 days, during which they are regularly weighed and trained for intragastric treatment so as to eliminate any deficient animal.
4.9. Identification	Each cage is identified using a colored label. Rats, two to each cage, are identified by an ink marking of the same color on the base of the tail.

5 - Stabulation

- 5.1. Animal house** Animals are kept in a room where temperature is set at 22 + 1°C and humidity varies from 40 % to 70 %. A clock controls the 12 hour day/night cycle (7 AM/7 PM). Filtered air is renewed 8 times hourly.
- 5.2. Housing** Polypropylene cages containing a dust-free sawdust litter (UAR, EPINAY S/ORGE, France). Each 43x28x18.5 cm cage contains five rats.
- 5.3. Sanitary measures** Sawdust is renewed twice a week. Cages are washed and disinfected every week.
- 5.4. Food** Animal feed AO4-10 (UAR, EPINAY S/ ORGE, France), *ad libitum*
- 5.5. Food analysis** Quality analysis voucher supplied by UAR.
- 5.6. Water** Tap water from the local network was available *ad libitum* in feeding bottles.
- 5.7. Water analysis** Water is analyzed at regular intervals by the Departement des Hauts de Seine (local authority).

6 - Method

- 6.1. Product preparation** A 10 % stock solution was prepared every week : aqueous solution was boiled, then filtered on paper (Macherey-Nagel R, Duren, Germany), stored in a refrigerator (+2 to +4° C) and extemporaneously diluted with distilled water.
- 6.2. Doses** Male rats : 56.5 mg.kg⁻¹ (1/20 LD₅₀) and 226 mg.kg⁻¹ (1/5 LD₅₀).
Female rats : 73.2 mg.kg⁻¹ (1/20 LD₅₀) and 292.8 mg.kg⁻¹ (1/5 LD₅₀).
- 6.3. Route of administration** Oral (intragastric intubation).

- 6.4. Justification of route** Oral route recommended for clinical use.
- 6.6. Frequency and length of treatment** Daily, 7 days a week for 28 consecutive days.
- 6.7. Weight increase** To calculate weight evolution, animals were weighed twice a week (Tuesday/Friday).
- 6.8. Food and water intakes** Water and food intakes were measured twice a week (Tuesday/Friday).
- 6.9. Nutritional efficacy coefficient** It was calculated using the following formula:

$$\frac{\text{daily food intake (g/rat)} \times \text{number of days}}{\text{weight evolution (g)}}$$

7 - Clinical chemistry

7.1. Hematology

- Cells (erythrocytes, leucocytes) were counted using a Coulter counter (Coultronics, model D IND). Erythrocyte counts are expressed in tera.l^{-1} ; leucocytes counts, in giga.l^{-1} .
- Thrombocyte counts, expressed in giga.l^{-1} , were carried out with a Coulter counter (Coultronics, model ZBI).
- Hemoglobin (mmol.l^{-1}) was measured with a hemoglobin meter (Coultronics).
- Hematocrit (Ht) was obtained by blood sample centrifugation (14813 g for 5 minutes) in a Hauwsley centrifuge (Jouan).

- Mean corpuscular volume (fl) was calculated from :

$$\text{MCV} = \frac{\text{Ht} \times 1000}{\text{erythrocyte count}}$$

- Mean corpuscular concentration (mmol.l⁻¹) was calculated from :

$$\text{MCC} = \frac{\text{hemoglobin}}{\text{hematocrit}}$$

7.2. Blood biochemistry

- Calcium (mmol.l⁻¹), measured according to Sarkar and Chauhan (1967).
- Total protein (g.l⁻¹), measured using a technique adapted from the Biuret reaction, according to Weichselbaum (1946).
- Urea (mmol.l⁻¹), measured using a method adapted from that of Fawcett and Scott (1960).
- Creatinin (mmol.l⁻¹), measured according to Jaffe, using the colorimetric method of Popper et al. (1937).
- Total bilirubin (umol.l⁻¹), measured according to Jendrassik and Grof (1938).
- Alanine aminotransferase (ALAT), measured using method optimized according to recommendations of the German Society for Clinical Chemistry (1970, 1972), and expressed in IU.l⁻¹.
- Aspartate aminotransferase (ASAT), measured using method optimized according to recommendations of the German Society for Clinical Chemistry (1970, 1972), and expressed in IU.l⁻¹.
- Alkaline phosphatases (IU.l⁻¹), measured according to Bowers and Mc Comb (1975).
- Total cholesterol (mmol.l⁻¹), measured according to the CHOD-PAP enzymatic method.

7.3. Urine analysis

A diuresis test was carried out over a 24 hours period following a 30 ml.kg⁻¹ water overload (which included tested product at the 28th treatment). Animals, placed in individual cages for the study of metabolism, were deprived of water and food during this period.

Urine volume was measured 7 and 24 hours following water overload and percentage of excretion compared to this overload was calculated.

Biochemical dosages were carried out on urine collected between 7 and 24 hours.

- Creatinin (mmol.l^{-1}).
- Osmolarity (mOsm.l^{-1}), measured with a reflectometer (ERMA Optical Works Ltd., Japan).
- Reagent strips (Combur⁹-test®, Boehringer-Mannheim) were used to detect proteins, glucose, bilirubin, urobilinogen, ketone compounds, nitrites, leucocytes, blood and to estimate pH.

8 - Pathology

8.1. Euthanasia

All the rats were euthanized by decapitation.

8.2. Postmortem examination

Postmortem examination was carefully performed on all the animals, special attention being paid to macroscopic examination of the gastrointestinal tract.

The following organs were weighed as soon as possible after excision so as to avoid as much as possible tissue dehydration: kidneys (left, right), adrenals, (left, right), liver, heart, thymus, brain.

N.B. Organ weight is expressed as absolute value and as relative value compared to body weight at time of sacrifice.

8.3. Histopathology

The following organs were fixed and preserved in 10 % buffered formalin : stomach (in case of a macroscopic lesion), liver, gonads (testicles#, ovaries), ileon + Peyer plaques, pancreas, lungs, spleen, kidneys (left, right), thymus, thyroid and parathyroids, adrenals.

prior fixation for 24 hours in Stieve's fixative.

N.B. Histology of these organs was studied for the control and high dose series. Other organs were preserved after paraffin embedding.

9 - Results

PARAMETERS	SEX	
	MALE	FEMALE
Body weight	1 to 5	34 to 38
Food intake	6 to 8	39 to 41
Water intake	9 to 12	42 to 44
Water/Food ratio	13 to 16	45 to 47
Hematology	17 to 21	48 to 50
Biochemistry (blood, urine)	22 to 25	51 to 56
Urine (volume, pH)	26 to 29	57 to 60
Organ weight	30 to 33	61 to 65

Individual data are listed in appendix A 1 to A 17 for male rats and A 58 to A 84 for female rats.

9.1. Mortality

No mortality was observed in the course of the assay.

9.2. Clinical examination

No modification of neuromotor behavior was detected, either in male rats or in females.

9.3. Weight evolution

Weight increase was progressive and regular, similar for the three experimental series, showing that Pao V. does not affect weight gain of young male and female rats.

9.4. Food intake

Food intake was never affected by Pao V. intragastric administration.

9.5. Water intake

Water intake transiently increased in male rats between days 15 and 18, under the effect of 226 mg.kg^{-1} . It was never modified in females.

9.6. Water/food ratio

This ratio increased between D15 and D18 in male rats, on account of a transient water intake increase during that period.

9.7. Nutritional efficacy coefficient

This ratio progressively increases with time, more regularly in males than females ; this reflects the progressive stabilization of food intake in animals that were very young at start of assay (35 days on average).

9.8. Hematology

No pathological variation was observed.

There was only, in male rats, an increase of hemoglobin using the low dose (10.5 versus 10.2 mmol.l^{-1} in controls), leading to an increase of mean corporcular hemoglobin concentration (MCC: 21.86 versus $21.13 \text{ mmol.l}^{-1}$ in controls) ; these statistically significant modifications have no biological significance.

9.9. Clinical biochemistry

Both in males and females, ASAT increases using the high dose ; this statistically significant increase is of low amplitude: +20 % in males and +46 % in females.

In the absence of ALAT modification, ASAT increase does not signify liver alteration and, in the absence of cardiac weight increase, it does not evoke heart failure.

Bilirubinemia decrease observed with the low dose in females has no biological significance.

9.10 Urinary data

In males, no alteration of urinary data was observed, except for a slight acidification of urine collected between 7 and 24 hours in animals treated with the high dose.

In contrast, in females treated with the high Pao V. dose, urinary excretion increase (volume collected between 7 and 24 hours), accompanied by a decrease of urine osmolarity, evokes a slight renal functional disturbance, the nephron having lost part of its urine concentrating ability.

9.11. Postmortem examination

9.11.1 Macroscopic examination

Postmortem examination did not reveal any anomaly that could be related to Pao V. treatment.

The only detected anomaly concerns the gastric mucosa, where hyperemic regions accompanied by ulcerations were observed ; this must be ascribed to stress due to the 24 hours total fast prior to sacrifice. Very little difference is observed in its incidence among various experimental batches, as indicated by the following table, females being more susceptible to fasting than males.

RATS WITH ONE OR SEVERAL GASTRIC ULCERATIONS			
Series		Males n° S ...	Females n° S ...
controls		1080	-
Pao V.	Low dose	-	1056 1068 1072
	High dose	-	1052 1061

A morphological abnormality was noted in male rat n° S 1085 treated with 56.5 mg.kg^{-1} Pao V. ; this animal had a constriction of the spleen.

9.11.2 Organ weight

Liver weight was decreased in males receiving the low dose, but, on the contrary, it was increased in females receiving the high dose. In the latter, kidney weight was also increased, probably due to increased diuresis.

9.11.3. Microscopic examination of six organs (liver, spleen, kidneys, gonads (testicles and ovaries), thyroid, parathyroids).

The only observed anomalies consisted of : the presence of a few interstitial hemorrhagic suffusions in the kidney of male control rat n° S 1093 (appendix 30), of a discreet centrolobular steatosis, without lymphocyte-type infiltration, in female control rat n° S 1053 (appendix 86) and, finally, of a small sclerotic region of inflammatory origin in the renal cortex, at tubular level, in male rat n° 1077 treated with 226 mg.kg^{-1} Pao V. (appendix 47).

On the whole, histological examination of the different organs shows :

- *in the liver* :

- Absence of peri- or centrolobular steatosis. No nucleolysis. No lymphocyte-type infiltration.

- *in the gonads* :

- * *testicles* :

- All stages of spermatogenesis were present. No alteration of Sertoli basal cells. Abundant spermatocytes in lumen of tubes.

* ovaries :

Presence of ovules of the first order and of ovules with oocytes, with or without liquor folliculi. Presence of corpora lutea with or without necrotic stage. Tube epithelium was normal, with no trace of inflammation.

- in the thyroid :

Presence of signs of activity, large vesicles with cuboid epithelium. Nuclei were apical, colloid was dense, generally not retracted.

- in the parathyroids :

They were normal, without any atrophic or hemorrhagic lesions.

- in the spleen :

White pulp containing a germinative center. Red pulp with no atrophic or hemorrhagic lesions.

10 - Conclusion

Taken together, data collected in this Pao V. predictive toxicity assay carried out over a four week period shows that at the two tested doses (respectively corresponding to 1/20 and 1/5 LD₅₀, i.e., 56.5 and 226 mg.kg⁻¹ for males and 73.2 and 292.8 mg.kg⁻¹ for females), and compared to controls, Pao V.

- does not induce any lethality or any behavioral manifestation,
- does not modify food intake or weight increase of males or females,
- reduces, but only contingently (between D15 and D18), water intake of male rats,
- does not induce any modification of hematologic constants,
- does not induce any change of measured clinical chemistry parameters,
- does not affect male rat urinary data, but induces urine volume increase and osmolarity decrease some length of time after treatment (between 7 and 24 hours) in females treated with the high dose,
- does not affect organ weight in male rats, but induces kidney and liver weight increase in high dose treated female rats,
- does not induce macroscopically detectable morphological alterations,
- does not induce any microscopic alteration that could be attributed to treatment.

Classification test : Student - Newman - Keuls with significance level .050

Difference between two means is significant if

$$\text{MEAN (J)} - \text{MEAN (I)} \geq 9.1151 * \text{RANGE} * \text{SQRT}(1/N(I) + 1/N(J))$$

with the following range value :

Steep 2 3

RANGE 2.90 3.50

* indicates significant differences

FEMALE RAT

----- STUDENT - NEWMAN - KEULS -----

URINARY VOLUME FROM 7 H TO 24 H VARIABLE PER SERIES VARIABLE

Classification test : Student - Newman - Keuls with significance level .050

Difference between two means is significant if

$$\text{MEAN } (J) - \text{MEAN } (I) \geq .9865 * \text{RANGE} * \text{SQRT } (1/N(I) + 1/N(J))$$

with the following range value :

Stoop	2	3
RANGE	2.90	3.50

* indicates significant differences
