Re: IMPORTANT SUPPLY INFORMATION
Phospholine Iodide[®]
(echothiophate iodide for ophthalmic solution)

Dear Health Care Provider:

Currently, Wyeth Pharmaceuticals has a very limited supply of Phospholine Iodide, 6.25 mg (0.125%), a product indicated for the treatment of glaucoma or accommodative esotropia (strabismus). At this time, we are initiating a limited distribution plan for purchases from Wyeth and limiting such sales to current patients only (1 bottle per patient). Purchases will be authorized based upon prior order history. Stocking orders will not be accepted.

Although we are making every effort and working closely with the FDA to resolve this situation, we are sending this notification to advise that we expect to be out of product in the near future and that the outage may be prolonged. This product outage is not related to any safety or efficacy concerns, but is due to a delay in supplies of raw material used for the manufacturing of the product.

Please immediately contact patients who are using the product for glaucoma and advise them of this product supply situation. They should be instructed to immediately contact their prescribing physician to seek alternative therapies. In addition, they should be advised of the potential health risk of untreated glaucoma.

We regret any inconvenience this shortage may cause. If you have any questions or wish to place an order for a current patient, please call our Customer Service Department at 1-800-666-7248. The product prescribing information can be accessed at www.wyeth.com.

Sincerely,

Joseph Camardo, MD
Senior Vice President
Global Medical Affairs
Wyeth Pharmaceuticals
