ATTENDEES

COMMITTEE MEMBERS:

WILMA BERGFELD, M.D., Acting Chair
Head of Clinical Research
Department of Dermatology
Cleveland Clinic Foundation
9500 Euclid Avenue
Cleveland, Ohio 44195-5001

KIMBERLY TOPPER, Executive Secretary
Advisors & Consultants Staff, HFD-21
Food and Drug Administration
5600 Fishers Lane
Rockville, Maryland 20857

GLORIA ANDERSON, PH.D., Consumer Representative
Morris Brown College
Atlanta, Georgia 30314-4140

O. FRED MILLER, M.D.
Director, Department of Dermatology
Geisinger Medical Clinic, M.C. 1406
Danville, Pennsylvania 17822

VOTING CONSULTANTS:

ELIZABETH A. ABEL, M.D.
Dermatology
2660 Grant Road, Suite D
Mountain View, California 94040

JENNIFER ANDERSON, PH.D.
CHQOER
Bedford Veterans Administration
Medical Center (152)
200 Spring Road
Bedford, Massachusetts 01730

ROBERT A. BRANCH, M.D., F.R.C.P.
Director, Center for Clinical Pharmacology
University of Pittsburgh Medical Center
100 Lothrop Street, 623 Scaife Hall
Pittsburgh, Pennsylvania 15213-2582

ATTENDEES (Continued)

VOTING CONSULTANTS: (Continued)

JANET CRAGAN, M.D.
Division of Birth Defects & Pediatric Genetics
National Center for Environmental Health
CDC MS F45 4770
Buford Highway NE
Building 101, Room 2158
Atlanta, Georgia 30341-3724

ROSELYN EPPS, M.D.
8630 Fenton Street, Suite 300
Silver Spring, Maryland 20910

MICHAEL GREENE, M.D.
Department of Obstetrics and Gynecology
Massachusetts General Hospital
Founders Room 430
Boston, Massachusetts 02114

ERIC HOLMBOE, M.D.
FACP Yale University School of Medicine
1074 LMP
333 Cedar Street
New Haven, Connecticut 06510

LLOYD E. KING, JR., M.D., PH.D.
Professor of Medicine
Dermatology Division
Vanderbilt University
1301 22nd Avenue North
3900 The Vanderbilt Clinic
Nashville, Tennessee 37232-5227

ARTHUR LEVIN, M.P.H.
Center for Medical Consumers
130 Macougal Street
New York, New York 10012-5030

RICHARD MALONE, M.D.
MCP Hahnemann University, School of Medicine
Philadelphia, Pennsylvania 19129

WILLIAM ROSENBERG, M.D.
956 Court Avenue, Room E-332
Memphis, Tennessee 38163

ATTENDEES (Continued)

VOTING CONSULTANTS: (Continued)

MING T. TAN, PH.D.
Associate Member of Biostatistics
Department of Biostatistics
St. Jude Children's Research Hospital
332 North Lauderdale Street
Memphis, Tennessee 38105

ANDREW WINOKUR, M.D., PH.D.
University of Connecticut Health Center
10 Talcott Notch Road
Farmington, Connecticut 06032

GUESTS:

JANE ADAMS, PH.D.
Department of Psychology
100 Morris Boulevard
University of Massachusetts
Boston, Massachusetts 02125

ALAN BYRNE, M.D.
18 Thorn Brook
Maas County
Kildare, Ireland

LAURENCE GREENHILL, M.D.
New York State Psychiatric Institute
1051 Riverside Drive
New York, New York 10032

KENNETH LYONS JONES, M.D.
UCSD Medical Center
200 West Arbor Drive, H8446
San Diego, California 92103-8446

ERIC KODISH, M.D.
RBC 340
11100 Euclid Avenue
Cleveland, Ohio 44106

ED LAMMER, M.D.
747 52nd Street
Oakland, California 94609-1809

ATTENDEES (Continued)

GUESTS: (Continued)

JAMES MILLS, M.D., M.S.
NICND, NIH

(8:35 a.m.)

1
2
3 DR. BERGFELD: Good morning. I'm Dr. Wilma
4 Bergfeld, the acting chairperson for this Accutane advisory
5 committee meeting, the two-day meeting. We'll meet today,
6 September 18th, and the 19th. We have a two-day meeting
7 that will comprise first today the Accutane pregnancy
8 prevention program, which will involve the FDA presentation
9 and Roche presentation. This afternoon we will have an
10 open public hearing. We already have many scheduled
11 presenters. If there is someone in the audience who has to
12 present, will you please see Ms. Kimberly Topper.

13 (Audio failure.)

14 DR. BERGFELD: Again, welcome to the FDA's
15 Accutane advisory committee.

16 As I was saying, this morning we will deal with
17 Accutane's pregnancy prevention program, and I wanted to
18 again mention the open public hearing time, which is
19 scheduled for 1:45 p.m., and you need to be scheduled to
20 present there. Tomorrow we will take up Accutane-
21 associated psychiatric events and Accutane new
22 formulations.

23 This is to be a very busy meeting. There will
24 be many statements stated and lots of comment, and so I
25 will control the meeting and limit the conversations if

1 it's appropriate.

2 At this time, however, I think we need to meet
3 the diverse committee members. Some are voting and some
4 are non-voting. I would like to begin here with you in the
5 blue, if you don't mind introducing yourself, and we'll go
6 around the table, including the table in front of me.

7 DR. MURPHY: Dr. Dianne Murphy, Associate
8 Director for Pediatrics at CDER.

9 DR. WILKIN: Jonathan Wilkin, Director,
10 Division of Dermatologic and Dental Drug Products, CDER.

11 DR. BULL: Dr. Jonca Bull, Deputy Director for
12 the Office of Drug Evaluation V.

13 DR. WOODCOCK: I'm Janet Woodcock. I'm
14 Director of the Center for Drug Evaluation and Research at
15 the FDA, and I'll point out the FDA members are not panel
16 members here.

17 DR. VEGA: I'm Amarilys Vega, medical officer
18 from the Office of Postmarketing Drug Risk Assessment.

19 DR. WINOKUR: Andy Winokur from the Department
20 of Psychiatry, University of Connecticut Health Center.

21 DR. ROSENBERG: Bill Rosenberg from the
22 Division of Dermatology, University of Tennessee College of
23 Medicine in Memphis.

24 DR. CRAGAN: Jan Cragan, Birth Defects and
25 Pediatric Genetics Branch, CDC.

1 DR. GREENE: I'm Mike Greene. I'm Director of
2 the Maternal/Fetal Medicine at Massachusetts General
3 Hospital and Associate Professor at Harvard Medical School.

4 DR. BERGFELD: I'm Wilma Bergfeld and I'm a
5 dermatologist and dermatopathologist at the Cleveland
6 Clinic.

7 DR. MILLER: Fred Miller, Director of
8 Dermatology, Geisinger Medical Center in Pennsylvania.

9 DR. KING: Lloyd King, Director of Dermatology
10 at Vanderbilt University and the Nashville VA hospital,
11 Nashville, Tennessee.

12 DR. EPPS: Roselyn Epps, head of pediatric
13 dermatology, Children's National Medical Center in
14 Washington, D.C.

15 DR. MALONE: Richard Malone, child psychiatry,
16 MCP Hanneman University in Philadelphia.

17 DR. BRANCH: Bob Branch, from the University of
18 Pittsburgh, Director of the Center for Clinical
19 Pharmacology.

20 DR. HOLMBOE: My name is Eric Holmboe. I'm a
21 general internist and I'm from Yale University.

22 MR. LEVIN: Arthur Levin, Director of the
23 Center for Medical Consumers, a consumer advocacy
24 organization in New York City.

25 DR. GLORIA ANDERSON: Gloria Anderson, Callaway

1 Professor of Chemistry at Morris Brown College in Atlanta.

2 DR. ABEL: Elizabeth Abel, clinical professor
3 of dermatology at Stanford and practicing dermatologist in
4 Mountain View, California.

5 DR. JENNIFER ANDERSON: Jennifer Anderson,
6 biostatistician, professor of biostatistics at Boston
7 University, and also working at the Bedford VA in
8 Massachusetts.

9 DR. TAN: Ming Tan from St. Jude Children's
10 Research Hospital, and associate member of the Department
11 of Biostatistics there.

12 DR. JONES: I'm afraid this doesn't go on, but
13 I'm Ken Jones from the Department of Pediatrics at the
14 University of California, San Diego.

15 DR. MILLS: I'm Jim Mills. I'm at the National
16 Institute of Child Health and Human Development.

17 DR. KODISH: I'm Eric Kodish, pediatric ethics,
18 from Rainbow Babies' and Children's Hospital in Cleveland.

19 DR. MOORE: Cynthia Moore, Centers for Disease
20 and Control Prevention, Birth Defects and Pediatric
21 Genetics Branch.

22 DR. ADAMS: Jane Adams, Associate Professor of
23 Psychology, University of Massachusetts, Boston.

24 DR. RACZKOWSKI: Victor Raczkowski. I'm the
25 Deputy Director in the Office of Drug Evaluation III at the

1 FDA.

2 DR. HONIG: Peter Honig from the Office of
3 Postmarketing Drug Risk Assessment, Center for Drugs.

4 DR. BERGFELD: Well, thank you very much. You
5 see that we have gathered together many, many experts from
6 many diverse fields, including the FDA's expertise.

7 We're going to now proceed to the meeting
8 statement, being presented by Kimberly Topper, the
9 Executive Secretary for the meeting.

10 MS. TOPPER: The following announcement
11 addresses the issue of conflict of interest with regard to
12 this meeting and is made a part of the record to preclude
13 even the appearance of such at this meeting.

14 Based on the submitted agenda and information
15 provided by the participants, the agency has determined
16 that all reported interests in firms regulated by the
17 Center for Drug Evaluation and Research present no
18 potential for a conflict of interest at this meeting when
19 evaluated against the agenda.

20 With respect to FDA's invited guests, Drs. Jane
21 Adams, Alan Byrne, James Mills, and Edward Lammer have
22 reported interests which we believe should be made public
23 to allow the participants to objectively evaluate their
24 comments.

25 Dr. Adams would like to disclose that in the

1 past she has participated in two research grants to study
2 Accutane. One was funded by Roche and the other was funded
3 by NIH/NICHD.

4 Dr. Byrne would like to disclose that he has
5 published articles on the subject of Roaccutane.

6 Dr. Mills would like to disclose that he is
7 currently collaborating with Roche on an unrelated research
8 project. He has also written an article and attended a
9 seminar which were unrelated to the particular matters at
10 issue, but sponsored by Roche.

11 Dr. Lammer would like to disclose that in the
12 past he has served as principal investigator on phase I and
13 phase II longitudinal studies of infants exposed to
14 isotretinoin in utero. The studies, sponsored by Hoffmann-
15 LaRoche, were designed to document the developmental
16 toxicities of isotretinoin following inadvertent human use
17 during pregnancies in North America.

18 In the event that the discussions involve any
19 other products or firms not already on the agenda for which
20 an FDA participant has a financial interest, the
21 participants are aware of the need to exclude themselves
22 from such involvement, and their exclusion will be noted
23 for the record.

24 With respect to all other participants, we ask
25 in the interest of fairness that they address any current

1 or previous financial involvement with any firm whose
2 products they may wish to comment upon.

3 Thank you.

4 DR. BERGFELD: Thank you very much.

5 We are now going to proceed with the opening
6 comments by Jonca Bull.

7 DR. BULL: Good morning. I first want to
8 extend thanks to everyone here who has taken time from
9 their busy schedules to attend this meeting. I
10 particularly want to thank the advisory committee members
11 for their commitment of time, intellect, and willingness to
12 share these talents on behalf of the American public in
13 addressing these important public health issues.

14 My task this morning is to delineate for the
15 committee, our discussants, and the public the purpose of
16 this meeting on Accutane.

17 The context of this advisory committee is
18 unique in several respects. Accutane is a drug that has
19 been marketed for over 18 years. Few drugs have engendered
20 the level of involvement by the agency and a sponsor in
21 ensuring safe use in both past advisory committees and
22 internal meetings. Few drugs are as explicitly labeled as
23 Accutane, and I would bring your attention to the size of
24 those black box warnings that are currently part of the
25 label for Accutane.

1 You might ask, why now? What is new? You
2 would suppose that after 18 years we would have it all
3 figured out, but the truth of the matter is that we don't,
4 particularly in concerns as to the sufficiency of risk
5 management.

6 Accutane is a highly effective drug in the
7 treatment of cystic nodular acne. Accutane has a well-
8 characterized risk profile as a teratogen, but also an
9 evolving risk profile of uncertain risk for psychiatric
10 adverse events.

11 For known risk of pregnancy and teratogenicity,
12 are current programs adequate to reduce these risks to
13 their minimum? What should be the goals to assess the
14 sufficiency of management of these known risks?

15 Historically, regulatory efforts have
16 repeatedly over the years been directed to improve the
17 professional labeling and packaging of the product in order
18 to fully inform patients and physicians of the risk
19 associated with its use, particularly the teratogenic risk
20 during pregnancy. Additionally, through a contract with
21 Hoffmann-LaRoche, the Slone Epidemiology Unit at Boston
22 University has tracked Accutane users who elect to
23 participate in this program.

24 As will be shown today in data from several
25 surveillance sources, the FDA, Hoffmann-LaRoche, and Slone,

1 | there is a persistent and disturbing body of data of
2 | pregnancy exposures. We also know that these databases
3 | reflect a significant level of under-reporting of these
4 | events.

5 | The fundamental question is, from a risk
6 | management standpoint, can we in our mission to ensure the
7 | safe and effective use of drug products, given societal and
8 | regulatory realities, develop a framework that further
9 | reduces the known risk of teratogenicity attendant to the
10 | use of this drug product?

11 | Indeed, some of these issues may not be
12 | answerable. There may well be areas, for example, limiting
13 | distribution or mandatory registries, that you, the
14 | committee, may deem not appropriate for government to be
15 | involved in.

16 | From a risk management standpoint, looking
17 | toward our day two, for the uncertain risk of psychiatric
18 | adverse events, specifically depression and suicide, is
19 | more needed to educate providers and patients and their
20 | families? Is more study needed to better characterize and
21 | to minimize risk and ensure safe use? For the new
22 | formulation, is there sufficient information on its dosing
23 | profile for safe and effective use, as well as delineating
24 | its relationship to the currently marketed formulation?

25 | As ordinary citizens in our daily lives, we

1 must regularly assess risk in making decisions. We know
2 that risks are ubiquitous in our modern society. We know
3 that all drugs have benefits and risk. We have a
4 responsibility as a public health protection agency, along
5 with you, our expert panel, the advocates with us today,
6 the manufacturer, and health care providers to the very
7 best of our collective abilities to ensure a risk
8 management framework for therapeutic decisions that
9 maximizes the beneficial and safe use of Accutane.

10 We are here today because opportunities exist
11 for improvement. Clearly it is in everyone's best interest
12 to get all these issues out on the table, to try to assess
13 risk and examine a variety of options for risk management.
14 We welcome this opportunity for discussion as we learn from
15 your experience, knowledge, and perspectives on the issues.
16 We have asked for and need your help and advice.

17 Now for an overview of our day one. In
18 presentations this morning, our first two FDA discussants
19 will address the agency's evolving risk management
20 framework. Dr. Victor Raczowski will present to you on
21 risk management options for marketed drugs, followed by Dr.
22 Peter Honig, who will provide a post-marketing perspective.
23 These talks will be followed by the FDA presentation on the
24 pregnancy prevention program and on Accutane and its
25 clinical background and regulatory history. This will be

1 followed by a guest presentation by Dr. Edward Lammer on
2 pregnancy exposures and teratogenicity. Following the
3 presentations by Roche in the open public hearing, Dr. Vega
4 will discuss potential design elements for risk management
5 and pregnancy prevention.

6 In closing, I must acknowledge the hard work
7 and the commitment of all of our FDA scientists who have
8 applied themselves with dedication to the complex and
9 difficult task involved in preparing for this meeting.

10 Thank you.

11 DR. BERGFELD: Thank you very much, Dr. Bull.
12 I must say that the materials presented to the committee
13 members were outstanding and we appreciate them.

14 We're going to move on, then, to the risk
15 management options for marketed drugs presentation by
16 Victor Raczkowski.

17 DR. RACZKOWSKI: Good morning.

18 Once the safety issue has been identified, the
19 issue arises as to what should be done subsequently, what
20 sort of risk management interventions should be taken. In
21 my talk today I will briefly summarize some of the options
22 that are available to FDA and to sponsors in terms of risk
23 management.

24 The first three options, labeling,
25 communications and educational programs, and advertising,

1 can basically be grouped into risk communication, and
2 altering risk communication in order to decrease adverse
3 events.

4 The next two items, packaging and restricted
5 distribution, are more formalized methods by which the
6 distribution of the drug is limited, either to physicians
7 or other health care practitioners, those who are
8 dispensing the drug, or to patients.

9 I will also touch upon the importance of
10 monitoring the effects of the risk management program, and
11 we'll talk about informed consent.

12 Then ultimately once a drug is on the market
13 and has been shown to have an unacceptable risk-benefit
14 profile then the product can be withdrawn.

15 Labeling is one of the main risk management
16 tools and risk communication tools that FDA has used over
17 the years, and labeling refers not only to the labels which
18 are the labels that are placed on the immediate container
19 and package, but also refers to the package insert, which
20 contains both professional labeling, and in some instances
21 patient package inserts and other information for patients.
22 I will also talk about a new regulatory mechanism that we
23 have now which are called medication guides.

24 Patient package inserts are essentially
25 extensions of the professional labeling. They can be

1 distributed to patients when the drug is dispensed, and
2 they provide important language about a drug in lay terms
3 so that the patient and other consumers are able to
4 understand the information and perhaps take steps to
5 prevent serious harm.

6 In contrast, there is a new mechanism that FDA
7 now has which are called medication guides, which became
8 effective by regulations that were published in the end of
9 1998 and which became effective in June of 1999. In
10 contrast to patient package inserts, what medication guides
11 are, they are also leaflets for patients, but they are
12 required to be distributed to patients whenever a
13 prescription is filled or refilled. Moreover, medication
14 guides may be used with unit-of-use packaging to enforce
15 their distribution.

16 So again, just to summarize some of the main
17 differences between patient package inserts and medication
18 guides is that they must be distributed whenever a
19 prescription is filled or refilled, and they also have a
20 standard content and format which is approved by the FDA.

21 In terms of the professional labeling, there
22 are many areas of professional labeling which identify
23 serious risks, but the two most important are the
24 contraindications section, which refers to risks that are
25 so serious that they clearly outweigh any potential benefit

1 of using the drug. Another category are boxed warnings.
2 Boxed warnings refer to serious risks, and particularly
3 those reactions that are serious in proportion to the
4 potential benefit that might be achieved from the drug.
5 Boxed warnings are oftentimes imposed when a benefit risk
6 should be considered before a drug is prescribed.

7 Boxed warnings also refer to serious adverse
8 reactions that can be prevented or decreased in frequency
9 and/or severity. For example, Accutane currently has a
10 boxed warning for its use in pregnancy. Boxed warnings
11 describe contraindicated situations, and they also provide
12 important risk benefit information about a drug.

13 In addition to the labeling, both professional
14 labeling, patient package inserts, and medication guides,
15 there are other sorts of risk communication mechanisms that
16 can be used. These fall under categories of communications
17 to healthcare practitioners and consumers. Dear Healthcare
18 Practitioner letters are letters that are provided by and
19 written by the sponsor, and that are mailed to different
20 healthcare practitioners, describing significant risks
21 associated with the drug. In addition, companies and the
22 FDA can release press releases to describe things. And FDA
23 also has another mechanism to provide talk papers, which
24 are posted on an FDA web site whenever risks have been
25 identified.

1 In addition, there are health advisories that
2 can communicate serious health risks, and there are
3 educational programs that are sponsored by the drug
4 manufacturer which are directed to health care
5 practitioners to ensure the drug's optimal use and
6 implementation of necessary precautions.

7 In addition to those educational programs,
8 educational programs can be directed to the public and to
9 the patients through toll-free numbers, Internet sites,
10 newsletters, and collaborative efforts with patient
11 advocacy groups.

12 Finally, sales force outreach is another risk
13 communication mechanism that sponsors can use in order to
14 alert health care practitioners of significant adverse
15 events associated with the drug.

16 Advertising is the third main category of risk
17 communication, and there are several ways that advertising
18 can be used or restricted in order to serve a risk
19 management function. One is to voluntarily restrict
20 advertising to a specific general type. The second is to
21 voluntarily restrict direct-to-consumer advertising.

22 In general, advertising must present a brief
23 and accurate and balanced representation of adverse
24 reactions, contraindications, and effectiveness. Reminder
25 ads, which are simply advertisements that draw attention

1 only to the name of the drug, are not permitted for drugs
2 with a boxed warning.

3 The third major category is packaging and
4 restricted distribution. Packaging can be manufactured
5 such that whenever the product is distributed it is
6 automatically distributed either with a patient package
7 insert or a medication guide, and that is called unit-of-
8 dose packaging.

9 In addition, under certain circumstances
10 restricted distribution can be employed. What restricted
11 distribution is is a mechanism to ensure safer use and
12 availability of a specific drug over existing treatments to
13 treat serious or life-threatening conditions.

14 Restriction may be either voluntary, or it may
15 be required. There are a number of drugs that are on the
16 market that do have restricted distribution either to
17 physicians or to dispensers.

18 Finally, informed consent is a mechanism that
19 provides the opportunity for the patient to consider
20 whether or not to take the drug. Accutane has a consent
21 form at the end of its package insert. However, this
22 informed consent form is a voluntary one, which primarily
23 deals with the risk of teratogenicity of the drug.

24 Information in informed consent should be in
25 language understandable to the patient, and it cannot

1 contain language to waive the patient's legal rights, and
2 cannot contain language to release others from liability or
3 negligence.

4 Once risk management interventions have been
5 undertaken, it's important also to evaluate whether they
6 are having the desired impact because implementation of a
7 risk management intervention or risk management plan may
8 not lead to the desired outcome. In other words, increased
9 knowledge may not translate into desired changes in
10 behavior. So, the success of risk management plans should
11 be assessed. Once they are assessed, the results can then
12 be used to tailor the risk management strategy.

13 As I've mentioned, withdrawal is the ultimate
14 risk management tool, which can be either voluntary
15 withdrawal by the sponsor or withdrawal of approval of an
16 imminent hazard.

17 Finally, risk assessment is important because
18 there may be need for additional studies to evaluate risk.
19 For example, the etiology of a risk or other risk factors
20 or incidence of a risk. However, a risk management plan
21 can often be implemented concurrently with such studies
22 that are intended to assess risk. In other words, it is
23 not necessary oftentimes, if a risk has been identified, to
24 formally assess the risk first and etiology prior to
25 instituting a risk management plan.

1 So, in conclusion, there are many options that
2 are available to help manage risk for Accutane, and I've
3 tried to provide the whole broad spectrum, all the way from
4 labeling changes and other risk communication techniques,
5 through restricted distribution and withdrawal.

6 Interventions will be considered.

7 So, several points for consideration that we
8 would like the panel to consider are to consider which risk
9 management pools should be used for Accutane. Consider
10 next steps if the goals of a risk management program for
11 Accutane are not being realized. And then consider when
12 additional risk management tools should be implemented. In
13 other words, what defines success and failure of a risk
14 management plan, and when would you consider going to the
15 next step, or using an additional risk intervention tool.

16 Thank you.

17 DR. BERGFELD: Thank you very much. You have
18 set the stage for some of the discussion later on this
19 morning. We'll now proceed to the next presenter, a
20 postmarketing perspective, Dr. Peter Honig.

21 DR. HONIG: Good morning. My name is Peter
22 Honig. I'm from the Office of Postmarketing Drug Risk
23 Assessment.

24 As you've heard from Dr. Raczkowski, there are
25 a variety of risk management and risk communication options

1 available to FDA and the pharmaceutical manufacturer.
2 Traditionally we have relied on product labeling and/or re-
3 labeling and relatively passive strategies such as Dear
4 Doctor letters and educational efforts to attempt to
5 optimize the benefit-risk of marketed drugs.

6 I was asked in 15 minutes to give a brief
7 postmarketing perspective on the relative effectiveness of
8 these strategies. I thought this might best be done in the
9 context of some recent FDA experiences and examples.

10 Before you is a partial list of drugs that have
11 been removed from the market in the last three years or so.
12 They share the property of having known safety problems,
13 either identified at the time of approval or in the post-
14 marketing phase, that were largely preventable if the drugs
15 had been used appropriately. I will briefly discuss each
16 of them and attempt to frame the risk management lessons
17 each has provided to the agency.

18 Seldane, terfenadine, the first non-sedating
19 antihistamine approved in the United States in 1985. Its
20 secondary pharmacologic effect on cardiac repolarization
21 was not appreciated at the time of approval. However,
22 reports of QT interval prolongation and torsade de pointes
23 were received by the agency shortly after approval.
24 Eventually its mechanism of the cardiac repolarization
25 abnormalities were appreciated largely through the

1 | perturbation of its metabolism, in the case of use with
2 | contraindicated drugs which impaired its metabolism or in
3 | the presence of hepatic failure.

4 | Nevertheless, serial labeling changes, Dear
5 | Doctor letters, and educational campaigns were attempted to
6 | manage the risk. This was one of the first examples in
7 | which the FDA attempted to quantify the effect of its risk
8 | management and risk communication efforts, and in looking
9 | at a managed care database, it was apparent that there was
10 | residual, recalcitrant co-prescribing going on, despite the
11 | re-labeling changes in the Dear Doctor letters.
12 | Eventually, as we know, this drug was voluntarily withdrawn
13 | from the market.

14 | I think the lesson we've taken away from that
15 | is that postmarketing labeling changes in a widely
16 | prescribed product were relatively ineffective.

17 | Mibefradil, trade name Posicor. This drug did
18 | benefit from the legacy of terfenadine in that its
19 | potential for drug-drug interactions was clearly identified
20 | prior to approval and the drug was painstakingly labeled
21 | for its potential to interact with other drugs. It was a
22 | calcium channel blocker approved for hypertension in 1997.

23 | Shortly after approval, reports of serious
24 | injury due to drug-drug interactions were received by the
25 | agency, and again, serial labeling changes, Dear Doctor

1 letters, an FDA warning, as well as educational efforts
2 were attempted to manage the risk. Reports continued to
3 be received by FDA, and eventually this drug was
4 voluntarily withdrawn, approximately one year after its
5 approval.

6 Again, the lesson we learned from this was that
7 detailed labeling, even at the time of launch, with
8 subsequent labeling changes were ineffective at completely
9 managing the risk of this product.

10 Duract, bromphenac. This was a non-steroidal
11 anti-inflammatory drug approved in July '97 for the short-
12 term management of acute pain, labeled to be used for 10
13 days or less. And this was largely labeled because of the
14 higher incidence of increased liver enzymes that were seen
15 in clinical trials that appeared to be related to
16 cumulative exposure.

17 Shortly after approval, reports of severe
18 hepatitis, as well as acute liver failure were received by
19 the agency. Labeling changes and Dear Doctor letters were
20 attempted in early 1998. However, there was evidence that
21 the drug was being used in a chronic manner for more than
22 10 days, as well as additional reports of hepatic injury
23 being received by the agency, which led to its voluntary
24 withdrawal from the market in June 1998.

25 Again, the lesson that we have here is that

1 initial as well as postmarketing risk management, risk
2 communication efforts were relatively ineffective at
3 managing the risk from this relatively effective drug.

4 Then finally I offer Propulsid as an example, a
5 drug whose secondary pharmacologic properties and its
6 effect on cardiac repolarization was not appreciated at the
7 time of approval in 1993 for nocturnal heartburn.

8 Shortly after approval, reports of QT
9 prolongation, torsade de pointes, and death were reported
10 and received by the agency. Eventually the mechanism of
11 injury and the risk factors were, indeed, well described
12 and situated in the product label.

13 Serial labeling changes over the life cycle of
14 this drug, Dear Doctor letters, as well as intensive
15 educational campaigns were relatively ineffective at
16 managing the risk. Reports continued to be received, and
17 most recently a study was done in two managed care
18 databases and a Medicaid database showing us that even
19 after the most recent labeling change and Dear Doctor
20 letters, 22 to 53 percent of cisapride use was in contra-
21 indicated conditions, which was relatively unchanged from
22 after the risk management strategy.

23 The lesson here was, again, that serial
24 postmarketing labeling changes, as well as passive
25 information dissemination strategies, had little effect on

1 the risk of this drug.

2 So, what are the lessons learned we have from
3 these examples? I think it's clear that labeling changes
4 and Dear Doctor letters are relatively ineffective ways of
5 communicating risk if your intention is changing behavior.

6 We also, I think, with the cisapride example,
7 with seven years of serial labeling changes and Dear Doctor
8 letters, introduced the concept of labeling fatigue and the
9 law of diminishing returns coming into play here, that if
10 the inappropriate or the unsafe prescribing behavior is not
11 modified after the first or second labeling change, one
12 really can't expect to have dramatic improvements with the
13 fifth or sixth labeling change.

14 As Dr. Raczowski said, labeling and labeling
15 changes do not necessarily equate into knowledge, either on
16 the part of the consumer or the prescriber, and even if
17 that knowledge is disseminated to the prescriber it does
18 not necessarily translate into behavior.

19 So, clearly if we're going to address the issue
20 of knowledge not necessarily translating into behavior, is
21 there a fundamental question here, that knowledge overload
22 is the problem? I think I would submit to the committee
23 that health care providers are probably not lacking for the
24 information or access into the information. It's putting
25 it into practice that's the problem.

1 And maybe we can look to some of the other
2 experiences, perhaps from the Agency for Healthcare
3 Research and Quality which are TRIP and PORT initiatives.
4 TRIP is the Translating Research Into Practice initiative,
5 and PORT is the Pharmaceutical Outcomes Research Team
6 initiative.

7 I would just cite two examples there, in the
8 use of beta-blockers post-MI, post myocardial infarction.
9 BHAD is now a quarter of a century old, and still eligible
10 patients after myocardial infarction are not being beta-
11 blocked in a dramatic manner. Still only 40 percent of
12 those eligible patients are getting beta-blocked, which is
13 clearly known lifesaving therapy. Most recently it's been
14 elucidated that beta-blockers, when used appropriately in
15 congestive heart failure, are also lifesaving therapies.
16 It's quite evident that this knowledge is not being
17 translated into prescribing practice by and large.

18 In closing, I'd like just to cite an article
19 that appeared in JAMA last year, entitled "Why Don't
20 Physicians Follow Clinical Practice Guidelines?" It
21 addresses some of the impediments to translating knowledge
22 into behavior, and it clearly has application to the risk
23 management and risk communication questions that are being
24 addressed here.

25 What they looked at were several thousand

1 studies and their objective was to identify the barriers to
2 adherence to clinical practice guidelines. Six major
3 barriers were identified. As I discuss each of them, think
4 about how these barriers would apply to each of the drugs
5 I've cited as examples, as well as to the safe and
6 effective use of Accutane.

7 The first barrier that these authors identified
8 was the lack of awareness of the guideline, and as an
9 example, they cite that 84 percent of practicing internists
10 and family practitioners are not aware of the United States
11 Preventative Services Task Force. These are the
12 recommendations that put in place screening and other
13 strategies for the health maintenance of patients.

14 They also, as a contrast, cite the National
15 Heart, Lung and Blood Institute guidelines for the
16 management of asthma, of which 99 percent of the practicing
17 physicians are aware of these guidelines. So, there is
18 probably some lesson to be learned here as to how one gets
19 out at a 99 percent penetration rate, yet another one,
20 which was well touted, only has relatively little awareness
21 on the part of practicing physicians.

22 The second major barrier they cite is lack of
23 familiarity. They are aware of the guidelines. They just
24 don't know what it says. They cite that 89 percent of
25 practicing physicians are unaware of the American College

1 of Physicians exercise stress testing guidelines.

2 The third major barrier is lack of agreement.
3 For this they cite that over 90 percent of practicing
4 pediatricians disagree with the American Academy of
5 Pediatrics ribavirin recommendations. So, they are aware
6 of the recommendations, they're familiar with the
7 recommendations, they don't agree with the recommendations.
8 A significant barrier to implementation, I would say.

9 The fourth major barrier is lack of outcome
10 expectancies. So, they're aware of it, they know what it
11 says, they believe what it says, but they don't think it
12 really is going to make a difference. For this they cite
13 that 90 percent of the physicians think that the alcohol
14 abuse prevention guidelines, even if they're followed,
15 won't really make a difference.

16 The fifth one was the inertia of previous
17 practice, and this was a very interesting one. About two-
18 thirds of practicing neonatologists, pediatricians don't
19 abide by the infant sleeping position guidelines to prevent
20 the occurrence of sudden infant death syndrome. This is
21 probably due to the fact that the recommendations seem to
22 change relatively frequently. I think we can all remember
23 that the lay press has picked up on this recommendation,
24 saying that a child should be positioned on its stomach, at
25 a 45 degree angle, on its back. Conflicting

1 | recommendations I think leads to inertia and lack of
2 | adherence to the most recent one.

3 | Finally, external barriers, such as
4 | inconvenience, confusing, time-consuming, or fundamentally
5 | that the physician doesn't think they can follow the
6 | guideline is an important consideration, especially with
7 | regard to the risk management strategies.

8 | So, I'll close by saying, with knowledge of
9 | these barriers, do they apply to Accutane? I thank you for
10 | taking up this important issue. As you hear the data on
11 | Accutane, consider some of these barriers and how they may
12 | apply to the risk management options that we'll be
13 | presenting to you.

14 | DR. BERGFELD: Thank you very much.

15 | We're now going to move and segue into the next
16 | part of the morning's program, and that is the subject of
17 | the Accutane pregnancy prevention program. Our first
18 | presenter is Dr. Jonathan Wilkin, who will present on
19 | Accutane clinical background, regulatory history.

20 | DR. WILKIN: During the next two days we will
21 | be discussing Accutane, which is isotretinoin. We should
22 | keep in mind during these two days that Accutane is
23 | uniquely effective for severe cystic acne, a mutilating,
24 | scarring condition that can severely compromise the quality
25 | of life. Accutane is also a potent teratogen, which has

1 attracted significant public interest and has been the
2 focus of multiple advisory committee meetings, especially
3 to consider the issue of pregnancy prevention. There is
4 also an uncertain relationship with associated psychiatric
5 events. Thus, it is timely that the committee considers
6 the Accutane issues, since the sponsor proposes to
7 introduce a new formulation.

8 Accutane was approved in May of 1982 with a
9 pregnancy category X. The labeling described the risk of
10 teratogenicity and contraindications, warnings, and
11 precautions. A patient information brochure also contained
12 warnings about avoiding pregnancy.

13 In 1983 came the first report of infant
14 malformation. The sponsor distributed red stickers to
15 pharmacies with further warnings. There were labeling
16 changes. The first Dear Doctor letter was sent, and in the
17 same year a second Dear Doctor letter was sent with
18 additional information about the reported cases.

19 In 1984 came more labeling changes, a third
20 Dear Doctor letter, and an advisory committee meeting that
21 addressed monitoring for pregnancy. From 1984 to 1988
22 Roche issued seven Dear Doctor letters. In 1988, at an
23 advisory committee meeting, Roche introduced the concept of
24 the Accutane pregnancy prevention program.

25 There are some characteristic malformations

1 | which occur when the infant is exposed in utero to
2 | Accutane. Microtia, anotia, micrognathia, conotruncal
3 | heart defects, aortic arch abnormalities, thymic
4 | ectopia/aplasia, cerebellar vermis agenesis, neuronal
5 | migration abnormalities, bones of the central face can be
6 | abnormal. There is no debate about the teratogenicity of
7 | Accutane. It occurs in approximately one in four exposed
8 | pregnancies. The issue really is how to prevent exposed
9 | pregnancies.

10 | One of the cornerstones of pregnancy prevention
11 | for many patients is hormonal contraception. There have
12 | been disturbing reports of pregnancies occurring during use
13 | of both hormonal contraception and isotretinoin. There
14 | have been spontaneous marketing reports of hormonal
15 | contraception failure, not just oral contraceptives but
16 | implantable and injectable hormonal contraceptives as well.
17 | Pastuszak and Koren reported several additional cases of
18 | oral contraceptive failure, and then there is the Dai
19 | article in the Journal of the American Academy of
20 | Dermatology that provides additional information.

21 | In Dai's article, isotretinoin-exposed
22 | pregnancy reports in the United States voluntarily
23 | submitted to Hoffmann-LaRoche from September 1982 to July
24 | 1989 were reviewed. The method of contraception was known
25 | for only 264 of the 433 patients who conceived. Over 16

1 percent of these women who became pregnant, ages 14 to 29
2 years, identified oral contraceptive as the method.

3 The only pre-2000 published study to
4 investigate a potential isotretinoin interaction with oral
5 contraceptives was by Orme, and it's actually reported in
6 two locations. There is a briefer presentation that only
7 mentions 9 patients and has very little detail, and it's
8 found in 1984 in the Lancet. There's a 1983 version in
9 Retinoid Therapy, edited by Cunliffe and Miller, which
10 mentions 10 patients and has much more detail.

11 There were 10 women ages 19 to 29 years. They
12 were taking six different oral contraceptives, long-term,
13 and after a control cycle, isotretinoin 0.5 milligram per
14 kilogram per day was introduced. I would point out that
15 this is the lowest recommended dose and the upper end, the
16 highest recommended dose is four times this amount.

17 In 2 of the patients the plasma levels of the
18 oral contraceptive hormones decreased on isotretinoin, and
19 in 1 patient there was a spike of the plasma progesterone
20 to 2,300 picograms per ml. This was captured on day 12
21 through 15, which may not have actually captured the peak
22 progesterone. If that signal is discounted then the 0 out
23 out of 10 would rule out at the upper 95 percent confidence
24 limit an interaction in more than 26 percent of the
25 population. If interpreted as a signal, then the upper 95

1 percent confidence limit would be 44.5 percent.

2 So, this led to a labeling addition, July 13,
3 1994, which emphasized the need to use two reliable forms
4 of contraception simultaneously. So, if hormonal is
5 chosen, add a barrier method.

6 Because the FDA continues to receive reports of
7 pregnancies coded as compliant with hormonal
8 contraceptives, the labeling was further strengthened in
9 May to include the following statements: "Any birth
10 control method can fail. It is critically important that
11 women of childbearing potential use two effective forms of
12 contraception simultaneously, even when one of the forms is
13 a hormonal contraceptive method."

14 There have been reports of pregnancy from women
15 who have used oral contraceptives as well as injectable and
16 implantable contraceptive products. It is not known if
17 hormonal contraceptives differ in their effectiveness when
18 used with Accutane.

19 Now, because today we have low estrogen oral
20 contraceptives, progestin-only contraceptives, and a wide
21 variety of progestational agents, the sponsor has ongoing
22 studies to more thoroughly investigate a potential
23 isotretinoin-hormonal contraceptive interaction, and we'll
24 be discussing this tomorrow afternoon in the context of the
25 new formulation.

1 Now, later this morning and this afternoon the
2 committee will be considering the pregnancy prevention
3 program, and I would emphasize that it is a voluntary
4 program and there are several voluntary components to it.
5 It's voluntary in its use by physicians, and whether
6 patients choose to participate in the survey, which is
7 conducted by the Slone Epidemiology Unit of Boston
8 University School of Medicine, commissioned by Roche, and
9 directed by Dr. Allen Mitchell, is also voluntary.

10 Dr. Mitchell's December 1997 report on the
11 Slone survey indicates that 23 percent of the women did not
12 report signing a consent form, which is a component of the
13 voluntary pregnancy prevention program. 25 percent did not
14 report having a pregnancy test before starting Accutane,
15 also a component of the voluntary pregnancy prevention
16 program. 33 percent did not report postponing the start of
17 Accutane until the pregnancy test result was known, also a
18 component of the voluntary program. And 43 percent did not
19 report postponing the start of Accutane until their next
20 menstrual period, also a component of the voluntary
21 pregnancy prevention program.

22 In Dr. Mitchell's 1995 New England Journal of
23 Medicine article, he points out that the women who did not
24 enroll were more likely to be noncompliant. I think the
25 article is in the sponsor's briefing document, if the

1 committee would like to review it further.

2 Tomorrow we'll be discussing the details of the
3 association of psychiatric disorders with Accutane. The
4 FDA has received postmarketing reports of associated
5 psychiatric events, including depression and suicide. We
6 also know of dose-dependent psychiatric events occurring
7 with vitamin A, and there are reports in the literature of
8 the association between psychiatric events and
9 isotretinoin, such as this article from the NIH
10 investigators.

11 Now, this article comes from the NIH group.
12 Actually the title of the article is "Acute Depression from
13 Isotretinoin." 7 of 700 patients in trials at the NIH who
14 have diagnoses of acne, psoriasis, and basal cell carcinoma
15 had an onset of depression on Accutane. The patients were
16 older than the adolescent years, at ages 22 to 47 years,
17 and a mean of 32 years. Importantly, the depression
18 resolved within 7 days after discontinuing isotretinoin,
19 which is consistent with the pharmacokinetics of
20 isotretinoin.

21 Based on these reports, the following was added
22 to labeling on February 24, 1998. "Accutane may cause
23 depression, psychosis and, rarely, suicidal ideation,
24 suicide attempts and suicide. Discontinuation of Accutane
25 therapy may be insufficient. Further evaluation may be

1 necessary. No mechanism of action has been established for
2 these events."

3 This is from something we probably all remember
4 from college, Strunk and White, Elements of Style. What
5 Strunk and White say is, save the auxiliaries, which
6 includes the word "may" for situations involving real
7 uncertainty. Although there is real uncertainty about
8 isotretinoin causing psychiatric events, it is prudent that
9 physicians act as if it does until we have more
10 information.

11 Now, about the same time as this labeling
12 change for psychiatric events, the sponsor was running this
13 advertisement, and on the next slide the marked paragraph
14 will be magnified so that you can read it.

15 The Roche advertisement for Accutane states
16 that "effective treatment of severe recalcitrant nodular
17 acne minimizes progressive physical scarring, as well as
18 negative psychosocial effects such as depression and poor
19 self image."

20 A warning letter was sent to Roche on March 5,
21 1998, which stated in part that statements and suggestions
22 in Roche's promotional materials that Accutane therapy will
23 minimize or improve the patient's psychological status,
24 including depression, are false or misleading and promote
25 an unapproved use.

1 Now, before closing this introduction, it is
2 important to emphasize the uniquely effective nature of
3 Accutane. You can see from the before and after slides
4 here that Accutane can eliminate cystic acne, a mutilating,
5 scarring condition, as no other treatment can.

6 This is a recent advertisement for Accutane,
7 and the caption says, "Nine months after one course of
8 Accutane," and of course, what it's speaking to is the
9 remission can be permanent, even in the severe cystic acne.
10 Of course, it can also be permanent in some of the lesser
11 grades of acne, and this is one of the reasons for off-
12 label use.

13 Not only can Accutane induce remission, unlike
14 any other therapy, it is also more effective in control
15 than any other therapy. Regardless what other therapy this
16 young man is on, Accutane would almost certainly be more
17 effective. I don't know if anyone can read this in the
18 back, but it says, "Can your son's acne products do this?"
19 Such campaigns as this directed to parents may serve to
20 increase demand, even though Accutane is not specifically
21 mentioned in this advertisement.

22 In summary, we should keep in mind that
23 Accutane is uniquely effective for severe cystic acne.
24 Accutane is a potent teratogen used in otherwise healthy
25 teenagers and young adults. There is minimal evidence to

1 | exclude a hormonal contraceptive-isotretinoin interaction.
2 | There is substantial evidence of incomplete use of the
3 | voluntary pregnancy prevention program. Infants continue
4 | to be born with isotretinoin-induced malformations. These
5 | aspects will be considered today.

6 | Tomorrow we'll consider the relationship with
7 | the psychiatric disorders, which we believe remains
8 | uncertain. Finally, the sponsor is proposing a new
9 | isotretinoin formulation, which we'll discuss tomorrow
10 | afternoon.

11 | DR. BERGFELD: Thank you, Jon.

12 | The next presenter, then, is Dr. Amarilys Vega,
13 | who is going to present on pregnancy prevention program,
14 | postmarketing drug risk assessment.

15 | DR. VEGA: The regulatory history of Accutane,
16 | as previously described by Dr. Wilkin, clearly demonstrates
17 | that a lot of effort has been put out into communicating to
18 | health care professionals and the general public the risks
19 | of teratogenicity associated with in utero exposure to
20 | Accutane. Accutane was initially labeled as a pregnancy
21 | category X and, as he already showed, has been intensely
22 | labeled for its teratogenicity. Patient and physician
23 | educational materials also contain lots of information
24 | about avoiding pregnancy.

25 | In 1983 further labeling changes were made, and

1 as we continued to receive further information, Dear Doctor
2 letters first, second, went out. The sponsor also
3 distributed red stickers to pharmacies with further
4 warnings.

5 More labeling changes were done in 1984
6 followed by the third Dear Doctor letter. And between 1984
7 and 1988, seven Dear Doctor letters were issued, all of
8 these a reflection of the intense efforts that the company
9 and the agency have been putting on to communicate the risk
10 of teratogenicity to the public and health care
11 professionals. This series of events culminated in the
12 1988 advisory committee, in which Roche introduced the
13 novel approach of the pregnancy prevention program.

14 The main objective of this program is to
15 prevent pregnancy exposure among women exposed to Accutane.
16 The Accutane pregnancy prevention program consists of
17 warning labels on the product package, informed consent
18 form for female patients, warnings on the product package,
19 and a PPP kit for prescribers. Numerous patient and
20 physician educational efforts have been undertaken. The
21 Accutane tracking study and the patient enrollment survey
22 also form part of this pregnancy prevention program.

23 The label contains a boxed warning which
24 describes a series of characteristics females of
25 childbearing potential should have in order to qualify for

1 treatment with Accutane. It also emphasizes the importance
2 of pregnancy testing before starting treatment and during
3 therapy, as well as the need to use two reliable methods of
4 contraception, starting one month before therapy, during
5 therapy, and one month after treatment. It also contains
6 instructions to begin treatment on the second and third day
7 of the next menstrual period.

8 The boxed warning also contains specific
9 information about when to start taking the medication,
10 which should be within the specified period of time. It
11 mentions that a negative pregnancy test should be obtained
12 within a week from starting therapy. The prescription
13 should not exceed a one-month supply of Accutane, and that
14 female patients of childbearing potential must have monthly
15 pregnancy testing and monthly contraceptive counseling.

16 An informed consent for female patients
17 supplied by Roche reiterates the teratogenic risk of in
18 utero exposure to the drug and emphasizes pregnancy
19 prevention practices required for the safe use of Accutane.
20 Roche has also introduced a blister package with a "Do Not
21 Get Pregnant" sign on it.

22 A very important part of Accutane PPP is the
23 pregnancy prevention program kit for prescribers, which
24 contains pregnancy counseling materials, patient
25 information brochures, information on the patient referral

1 program, and a toll-free number for patients and health
2 care providers. The sponsor has also embarked on many
3 other educational efforts, such as CME courses and training
4 videos for residency programs. All of these represent a
5 tremendous effort by the sponsor to educate patients and
6 health care providers about the teratogenic risks of
7 Accutane.

8 The Accutane tracking study and patient
9 enrollment surveys are integral parts of the Accutane
10 pregnancy prevention program. The Accutane tracking study
11 evaluates physicians' usage of the pregnancy prevention
12 program kit and other core components of the PPP.

13 The patient enrollment survey, the Slone
14 survey, is an independent follow-up survey conducted by the
15 Slone Epidemiology Unit of the Boston University School of
16 Public Health.

17 The Accutane tracking study is a telephone
18 survey which includes dermatologists and primary care
19 physicians. The purpose of this survey is to determine
20 physicians' usage of the pregnancy prevention program
21 components. The major limitation of the study is that it
22 tracks physicians' perceptions of their use of the program
23 materials rather than the actual use of them.

24 The Slone is a voluntary survey of women
25 treated with Accutane and it seeks to measure patients'

1 | knowledge about Accutane's teratogenicity, compliance with
2 | PPP components, pregnancy exposure rates among survey
3 | enrollees, and to characterize Accutane female users'
4 | profile, including some of the risk factors for pregnancy
5 | exposure.

6 | It has been estimated that the Slone survey
7 | captures 30 to 40 percent of all women treated with
8 | Accutane. This represents a real problem. What goes on
9 | with the remaining 60 to 70 percent of these women no one
10 | knows for sure.

11 | To measure the impact of the Accutane pregnancy
12 | prevention program of the occurrence of pregnancy
13 | exposures, we have available the following tools. The
14 | Slone survey, which, as I mentioned, is voluntary and has
15 | incomplete capture of Accutane female users. The Accutane
16 | tracking study, which captures physicians' perceptions of
17 | PPP kit usage, and spontaneous case reports with their
18 | numerous limitations. These, as you may see, are less than
19 | ideal tools to monitor the impact of a program of
20 | tremendous public health importance.

21 | Accutane pregnancy prevention program has by no
22 | means been a static program. It has been fine-tuned by
23 | Roche through its lifetime. Nevertheless, both Roche and
24 | FDA have evaluated this program's performance and concluded
25 | that there are specific areas of the program which need to

1 | be strengthened.

2 | These areas of concern may be summarized under
3 | the following headings: the patterns of drug use, the
4 | performance characteristics of the pregnancy prevention
5 | programs as described by the Slone survey, and the Accutane
6 | tracking study, and case reports data.

7 | This slide shows the estimated number of
8 | patients treated with Accutane by year from 1982 to 1999
9 | using two different sources of drug use data and different
10 | methodologies to estimate the number of patients exposed to
11 | the drug. The line on top, the one that has the arrow and
12 | says NDC, is however, a more accurate representation of the
13 | total number of patients treated with Accutane. The
14 | conclusion, however, is the same regardless of the method
15 | used to estimate these numbers.

16 | Since the early 1990s, the number of patients
17 | treated with Accutane has really increased. The change
18 | from 1992 to 1999 represents a little above a 200 percent
19 | increase. About 50 percent of Accutane users are females.
20 | 85 to 90 percent of those females are women in their
21 | childbearing years. This is between 15 and 44 years.
22 | Among women 15 to 44, 75 to 80 percent are below age 30,
23 | the age of peak fertility.

24 | If we take the estimated number of females 15
25 | to 44 treated with Accutane in 1999 and divide it by the

1 | estimated number of females of childbearing potential in
2 | the U.S. for the same year, the result is approximately 2.5
3 | per 1,000 reproductive aged women in the U.S. were exposed
4 | to Accutane last year. This is a high exposure to a known
5 | human teratogen.

6 | This is again to show the number of Accutane
7 | users by gender, and as I mentioned earlier, the male to
8 | female ratio is about 1 to 1, and it has remained fairly
9 | stable through time.

10 | In summary, the use of Accutane in women
11 | approximates the use in men. Accutane use in women has
12 | increased over 200 percent between 1992 and 1999. 85 to 90
13 | percent of women using Accutane are age 15 to 44. Among
14 | women 15 to 44, 80 percent of use is below age 30. All
15 | these figures indicate high levels of exposure to a known
16 | human teratogen during the peak years of fertility.

17 | You'll be hearing a lot more in-depth
18 | description of the Slone data later on today by the
19 | experts, but we would like to highlight some important
20 | points.

21 | As I mentioned early on, the Slone captures
22 | approximately 30 to 40 percent of all Auctane female users.
23 | We must keep in mind, however, that we don't know what goes
24 | on with the other 60 to 70 percent of these women. The
25 | following data describes characteristics of the subset of

1 women captured by the survey. Approximately 500,000 women
2 have been enrolled in the Slone since its inception on
3 January 1, 1989, and over 322,000 have completed follow-up
4 information.

5 This slide describes the distribution of women
6 enrolled in the Slone survey by pregnancy risk category.
7 40 percent of the enrollees reported to be sexually active.
8 The majority used some kind of contraception. About 1
9 percent sexually active women were not using contraception.
10 57 percent report that they were not sexually active, and
11 this represents a low level of sexual activity for age and
12 raises additional questions about the other 60 to 70
13 percent of women not captured by the survey. About 4
14 percent reported they had hysterectomies, were post-
15 menopausal, or their pregnancy risk category was unknown.

16 A group of concern is the group not reporting
17 to be sexually active and not using birth control. We know
18 the sexual activity status from being not sexually active
19 to becoming sexually active may change overnight.

20 How are the women enrolled in the Slone survey
21 and their physicians complying with core pregnancy
22 prevention program elements? First, I should mention that
23 these categories are not mutually exclusive.

24 23 Twenty-three percent did not report signing
25 a consent form. 25 did not have a pregnancy test before

1 starting therapy. This is that no one checked if these
2 women were pregnant before starting therapy with a known
3 human teratogen. Unfortunately, it keeps getting worse.
4 33 percent started Auctane and did not wait for the results
5 of the pregnancy test to document that they were not
6 pregnant, and they proceeded to start taking Accutane.

7 Only 43 percent waited until the second or
8 third day of their next menstrual period to start Accutane.
9 40 percent had no pregnancy test at all during treatment
10 with Accutane.

11 These are unacceptable high percentages of
12 physicians and patients not complying with core components
13 of the pregnancy prevention program, all of them clearly
14 described by Roche in all their materials for patients and
15 physicians.

16 How are the remaining 60 to 70 percent of women
17 and their physicians complying with the program? No one
18 knows for sure, but we certainly know that this group is
19 not doing well.

20 Data from the sponsor's most recent quarterly
21 report to the agency shows that so far 958 pregnancies have
22 been identified in the Slone survey. Of these, 644, or 67
23 percent, were elective terminations. 110 resulted in live
24 births, and in 14 cases the outcome was unknown.

25 111 infants resulted from these pregnancies.

1 Of these, 60 infants were examined and had available
2 medical records. Among these 60 infants, 8 had major
3 congenital anomalies, for a 13 percent rate of congenital
4 malformations. This is way below the 25 percent reported
5 in the literature.

6 This table shows pregnancy rates among Slone
7 survey enrollees from 1991 to 1998. These rates are based
8 on voluntary self-reporting by survey participants, and
9 they show a decline. We want to emphasize, however, that
10 these are pregnancy reporting rates and do not necessarily
11 represent the actual number of pregnancies occurring among
12 Slone survey enrollees. If we apply those rates to the
13 number of person-years contributed by women treated with
14 Accutane in the U.S. for each of these years, the column on
15 your right shows the number of pregnancies that would be
16 estimated.

17 Based on these yearly estimates of pregnancy
18 exposures, pregnancy reporting rates are decreasing, but
19 the absolute number of pregnancies increases as a function
20 of the expanding use of the drug, as I already showed you.
21 We will come back to the issue of number of pregnancy
22 exposures in a few moments.

23 In summary, pregnancies are still occurring.
24 Substantial noncompliance with critical elements of the
25 Accutane pregnancy prevention program is well documented.

1 Representativeness of the survey is unlikely.

2 As I mentioned before, the major limitation of
3 the Accutane tracking study is that it tracks physicians'
4 perceptions of their use of the program components rather
5 than their actual use of them. This study showed that
6 physicians do not use all the elements included in the kit
7 because they feel it's adequate and sufficient, and they
8 feel the pregnancy prevention program kit is inconvenient
9 to them. The survey also suggests a high use of product
10 brochure and a slight increase over time in the report of
11 pregnancy testing and the use of the consent form.

12 Before embarking on a discussion of spontaneous
13 case reports data, I would like to highlight two of the
14 multiple limitations of case reports which are particularly
15 important in this situation. Only a small percentage of
16 adverse drug events are recognized and reported to the FDA.
17 Under-reporting of adverse drug reactions is significant,
18 and reporting of adverse drug events typically declines
19 over the marketing history of a drug product.

20 This graph shows U.S. pregnancy reports
21 received by the sponsor by outcome and year of therapy for
22 1982 to 1999. The four lines in this chart show number of
23 pregnancy exposures total and by various pregnancy
24 outcomes. The top one is the total number of pregnancy
25 exposures reported. The second one in descending order is

1 the number of elective terminations. The third one are
2 spontaneous abortions. And the last one is the line
3 corresponding to the data on congenital anomalies.

4 We have plotted data until 1997 because of a
5 lag time of approximately 3 to 4 years between year of
6 therapy and the year when the report is filed. So, we have
7 complete and fairly stable numbers until 1997 only.

8 Based on this graph, we may say that
9 spontaneous case reports of pregnancy exposures to Accutane
10 are still received by the sponsor and the agency. The
11 number of case reports of congenital anomalies has remained
12 constant over time in spite of the existence of a pregnancy
13 prevention program. The majority of all these pregnancy
14 exposures result in elective terminations. The absolute
15 number of case reports of pregnancy exposures to Accutane
16 is definitely not declining.

17 Data from the sponsor's most recent quarterly
18 report to the agency shows that so far Roche has received
19 1,995 cases of pregnancy exposures to Accutane since
20 approval. 70 percent of these occurred after the
21 initiation of the Accutane pregnancy prevention program.
22 60 percent of these exposures resulted in elective
23 terminations, 383 in live birth, and in 166 cases the
24 outcome was unknown.

25 162 of these infants have congenital anomalies.

1 This is a rate of 42 percent of all live births. We know,
2 however, that spontaneous case reports series are enriched
3 by cases reporting the most serious outcomes. Thus, we
4 know this reported rate is inflated by this bias in
5 reporting.

6 The rates of congenital anomalies identified by
7 the two different sources of data I have just presented ---
8 this is the Slone survey and spontaneous case reports --
9 are distanced from the generally accepted rate of 25
10 percent described in the literature. The 42 percent is
11 high because of the reporting bias, and the 13 percent is
12 low because of under-ascertainment of pregnancy exposure in
13 cases of congenital anomalies.

14 In summary, pregnancy exposures reported to
15 Roche and FDA are not declining. 70 percent of all exposed
16 pregnancies have been documented by Roche since the
17 beginning of the Accutane pregnancy prevention program.
18 Congenital anomalies continue to be reported to the sponsor
19 and the agency. With the data at hand, it is not possible
20 to reliably quantify the changes in the occurrence of
21 pregnancy exposure to Accutane in the most recent years.

22 To get a ballpark number estimate of the
23 potential pregnancy exposures to Accutane in a given year,
24 we have developed the following model based on very
25 conservative assumptions. Let me talk you through the

1 different steps.

2 Step number 1. We estimated the number of
3 females 15 to 44 years treated with Accutane in 1999. For
4 now, let's forget about the lower portion of this slide and
5 let's concentrate on the top portion where we see the Slone
6 and the perfect typical use. Let's talk about that part
7 first.

8 In the second step, if we take the total number
9 of females 15 to 44 years treated with Accutane in 1999,
10 and assume that all the women exposed to Accutane follow
11 the distribution of contraceptive use described by Slone,
12 we will get an estimate of the total number of women using
13 each method of contraception, and this includes those not
14 using contraception.

15 In the following step, step number 3, we know
16 that all contraceptive methods have failures. These
17 failure rates vary according to how the specific methods
18 are being used. Some people use the methods perfectly,
19 follow all the instructions on the label, don't forget to
20 take their contraceptives, and they have lower pregnancy
21 rates than those who are not so cautious.

22 Then we apply these failure rates for perfect
23 use and for typical use to the numbers that we obtain on
24 step number 2. These will give us the estimated number of
25 pregnancy exposures if all the women taking Accutane would

1 follow the distribution of oral contraceptives described by
2 Slone, and if they had perfect or typical use, depending on
3 their contraceptive methods.

4 The National Survey of Family Growth, which is
5 the NSFG that you see on the lower circle -- now we can
6 look at the lower part of the diagram -- is a nationally
7 representative survey. Its main function is to collect
8 data on factors affecting pregnancy and women's health. We
9 obtained the distribution of contraceptive use followed by
10 women in the general population from this survey, and we
11 follow exactly the same steps that we follow as we did with
12 the Slone distribution.

13 Based on contraceptive failure rates alone, we
14 get numbers which are two to four times larger than those
15 numbers obtained when we use pregnancy reporting rates from
16 the Slone. I'm referring to these numbers up here. So,
17 these are based on contraceptive failure rates only. These
18 strongly suggest that pregnancies are being under-
19 ascertained by the Slone survey. This bring us back to the
20 self-reporting nature of the Slone survey. The true number
21 is probably between these two models here. We need better
22 means to enumerate pregnancy exposures.

23 How many pregnancy exposures to Accutane
24 occurred in 1999? No one knows for sure. We know Accutane
25 is a human teratogen, and that's why we have a pregnancy

1 prevention program in place. We do not have a reliable way
2 to track pregnancy exposures to Accutane, and consequently
3 we do not have a good way to monitor the public health
4 impact of this program.

5 In conclusion, drug use of Accutane among women
6 of childbearing potential is escalating. We have a real
7 problem with compliance with core program components, and
8 in spite of all the sponsor's and FDA efforts to
9 communicate Accutane's teratogenic potential, there is
10 still limited compliance with pregnancy testing before
11 exposure, pregnancy testing during exposure, and the use of
12 appropriate contraception.

13 Measures of pregnancy exposures and outcomes
14 based on the Slone survey and spontaneous case reports are
15 not representative of all female Accutane users. Because
16 the enumeration of cases of exposure through this means is
17 so poor, we are forced to rely on estimates. It would be
18 much better if we had better means to accurately and
19 completely enumerate cases. And finally, increasing
20 numbers of women exposed to Accutane increases the absolute
21 number of pregnancy exposures.

22 Thank you.

23 DR. BERGFELD: Thank you very much. Our next
24 presenter then is Dr. Edward Lammer, medical geneticist,
25 FDA consultant from Oakland, California, who will be

1 presenting on pregnancy exposures and teratogenicity.

2 DR. LAMMER: Thank you. I'm the Director of
3 the Medical Genetics Program, the Craniofacial Center at
4 Oakland Children's Hospital.

5 I've been present for the 1988, 1989, and 1990
6 meetings of this advisory committee, and it was interesting
7 going back over this weekend and re-reading the transcripts
8 from those three meetings. It's an interesting historical
9 note.

10 I've been involved with tracking pregnancies
11 exposed to Accutane since really 1984 when I worked for the
12 Center for Disease Control and started these projects. Our
13 projects are not terribly active currently, in part because
14 I think we've pretty much defined this particular syndrome
15 and what the risks are to women who use this drug during
16 pregnancy and what happens to the babies afterward. My
17 collaborator Jane Adams is also here, and she has expertise
18 in the area of the central nervous system problems that
19 these children have that may not be evident at birth.

20 I think one of the things to really emphasize
21 here is that surveillance with major structural
22 malformations really just hits the tip of the iceberg of
23 the adverse effects that result from the use of this drug
24 during pregnancy. I think I'll just start by running
25 through very briefly the magnitude of risks that we've

1 identified from exposure to this drug and exactly briefly
2 really what this phenotype looks like.

3 This is actually an old slide, but the results
4 are pretty much the same now. That is, we've tracked now
5 close to 200 pregnancies that we identified prospectively.
6 That is, the mother using the Accutane drug and was
7 reported and identified to us before any prenatal
8 ultrasonography or other tests had been done that would
9 indicate the status of the fetus, and the results are
10 pretty much like this.

11 We lose to follow-up a small handful of these
12 mothers. Some of them go on to have spontaneous abortions,
13 and then from this population, when we were doing our
14 active study, 77 of them were live born. The top three
15 numbers are really what we call embryonic exposures; that
16 is, women who used the drug in the first 60 days after
17 conception. In fact, almost all the women used the drug
18 between conception and day 45, so you can really think of
19 it in that sense.

20 In addition, we've tracked probably 12 or 15
21 children I think now, where the exposure occurred in what
22 we call the fetal period. That is, the mother did not
23 start using the drug until more than 60 days after
24 conception. There are problems among those children as
25 well, but they are largely limited to problems affecting

1 | the brain, and I'm not going to talk about them today.

2 | So, if you can identify the pregnancies early
3 | enough -- and these are the first 65 that we identified
4 | before 13 weeks after the last menstrual period. That
5 | would be women who are still at risk at the time we
6 | ascertain them to have a spontaneous abortion. What we
7 | find is that of the first 65 pregnancies that we identified
8 | early enough to be able to measure risk for spontaneous
9 | abortion, 40 percent of those women had that adverse
10 | outcome. That's about 2.5 times the typical number that's
11 | used, which is about 15 percent for risk of spontaneous
12 | abortion among clinically recognized pregnancies, which
13 | these clearly all would be.

14 | We tried at various times to do pathology
15 | evaluations on these aborted embryos but were really
16 | unsuccessful for that. The assumption, of course, is that
17 | many of these embryos are severely malformed, but we really
18 | don't know that that's the case.

19 | Again, the absolute risk in our data for
20 | spontaneous abortions is 40 percent.

21 | And then of the babies who are live born, we
22 | have evaluated them a number of times since birth. Usually
23 | I saw them in the first 2 years of life and then, with Dr.
24 | Adams, did a large developmental battery of tests at age 5,
25 | and then Dr. Adams has seen all these children again at age

1 10. So, we have a good picture longitudinally of what
2 happens to these children, and the full range of adverse
3 effects that can result from exposure to the drug, even
4 from a relatively unbiased population.

5 One of the things we have noticed is that these
6 babies have about a 300-gram difference in birth weight
7 from our control group, and that difference is really not
8 explained by intrauterine growth retardation. It's
9 explained by prematurity. So, despite the fact that these
10 exposures all occur only in the early part of the first
11 trimester, about 16 percent of these pregnancies result in
12 a delivery before 37 weeks of gestational age. That's
13 clearly an excess. Most of these babies are born to
14 Caucasian women for whom the risk of premature delivery is
15 substantially below 16 percent.

16 These babies are not growth retarded, which is
17 unusual for most known human teratogens. They do develop
18 frequently postnatal growth retardation, but at least
19 intrauterine growth retardation would be an extremely
20 uncommon feature of this syndrome.

21 Now, you've heard Dr. Vega present a summary of
22 what the absolute risk is for an infant to be born with a
23 major malformation, and you can see in the pie chart here
24 on the left that if you look at all of the pregnancies that
25 we've tracked, that would be 77 where the exposures

1 occurred sometime between conception and day 60. 23
2 percent of those have at least one major malformation, and
3 this is an extraordinarily high absolute risk, really
4 comparable, in terms of environmental exposures, only to
5 thalidomide or certain congenital infections. There is no
6 other medication that poses an absolute risk anything
7 remotely close to this, even medications used to treat
8 cancer during pregnancy.

9 Now, if you take that group and subdivide them,
10 all the risk appears in the women who continue to take the
11 drug more than 15 days after conception. So, if the woman
12 stops the drug before 15 days, the risk that she'd have a
13 baby with a major malformation is really indistinguishable
14 from background risk. So, all of the risk is really among
15 women who continue to take this drug beyond 15 days, and
16 that fits with the observed malformation pattern, which is
17 one that suggests that this drug primarily affects cranial
18 neural crest cells, which begin their migration and
19 activity around 18 days after conception, and effects on
20 the brain, which are undoubtedly due to a different
21 mechanism other than an effect on cranial neural crest
22 cells because the brain appears to be susceptible to the
23 effects of this drug throughout the entire pregnancy, from
24 our experience.

25 The phenotype is pretty straightforward. Brain

1 abnormalities, tragically, are by far and away the most
2 common problem, even among babies who appear to be
3 perfectly normal at birth. Effects on facial development
4 are primarily on bones and cartilage of the face, the
5 external ears, occasionally the palate, the mandible. But
6 the ear structures are most commonly affected. The third
7 most common abnormality would be heart defects, congenital
8 heart defects, many of which are fatal. Thymic deficiency
9 and hypoparathyroidism. That's basically the phenotype
10 that we see. It's unusual to see problems in other parts
11 of the body except among the most severely affected
12 children.

13 Just to give you an idea how some of these,
14 this is a baby is almost a complete absence of ear
15 development. All there is is a little slit with a small
16 piece of cartilage. This child has severe hydrocephalus,
17 spent his entire life in a nursing home in Pennsylvania and
18 died after several years.

19 This shows the typical hind brain abnormality.
20 This is the brain stem, the two cerebellar hemispheres.
21 This is a cyst filling the space between the cerebellar
22 hemispheres, a malformation commonly known as the Dandy
23 Walker anomaly. There are more children with Accutane
24 embryopathy who have this malformation than any other cause
25 that's ever been reported in the literature as a cause of a

1 Dandy Walker malformation.

2 This is just to emphasize the point that this
3 drug causes much more than just major malformations of the
4 brain. This is a section through the medulla, the hind
5 brain. We see this structure right here that looks oval.
6 That's an inferior olive, part of the tract related to
7 controlling movement. That normally should have an
8 undulated C-shaped appearance, and what we see here is just
9 a globular bunch of nerve cells that completely lack the
10 normal structure of this part of the hind brain. So, there
11 are diffuse abnormalities throughout the brain.

12 Here's another good example. This big thing
13 right here is a heterotopia, which is a collection of cells
14 in the part of the brain where they should not be. This is
15 the edge of a cut through a section of the cerebellum.
16 This is a completely disorganized mass of cells that's
17 composed of all the different cell types in this part of
18 the brain, and they are completely disorganized and will
19 have absolutely no functional benefit and certainly will
20 contribute to adverse effects in this child.

21 The point I'm really trying to make here is
22 that the major malformations in the brain are really only a
23 signal that there are more subtle problems that cannot be
24 detected except really at autopsy, or through the studies
25 that Dr. Adams has done that demonstrate that many of these

1 children who appear normal at birth -- in other words, they
2 don't have obvious major malformations -- have deficits in
3 full scale IQ scores and a number of specific learning
4 problems that, if you want to hear from Dr. Adams, she
5 could explain in much more detail than I can.

6 Here's an example of some of the craniofacial
7 anomalies. This drug can completely inhibit formation of
8 the ear so that there's no trace of any ear development
9 whatsoever.

10 This is another characteristic ear malformation
11 which, for reasons we don't understand well, is identical
12 to the type of ear malformations induced by thalidomide.
13 That is, you get formation of part of the ear derived from
14 the first branchial arch, but complete inhibition of
15 development of the parts of the ear that derive from the
16 second branchial arch tissue.

17 That's really all I wanted to show this
18 morning. The point really is that surveillance for major
19 structural malformations really only hits the tip of the
20 iceberg of the adverse effects of this drug when it's used
21 during pregnancy. I think you saw the data from Dr.
22 Mitchell's survey during this morning. During the era of
23 the survey, they've identified 8 children with at least one
24 major malformation from that survey. I personally am
25 contacted by six to eight cases of children with major

1 malformations every year during the 1990s.

2 So, this problem is not one that's going away.
3 I think if you go back and read the transcripts from the
4 hearings from '88, '89 and '90, you'll see that in that era
5 consultants to Hoffmann-LaRoche were falling all over
6 themselves trying to justify that 70,000 women deserved to
7 get prescriptions of this drug per year. You saw the data
8 that since that time there are now over 200,000 new
9 prescriptions per year in reproductive aged women. I don't
10 see how this can really be justified. If you go back and
11 read the transcripts, you'll see that Dr. Strauss, an
12 eminent dermatologist from the university where I went to
13 medical school, estimated only 10 years ago that he thought
14 70,000 new prescriptions per year in reproductive aged
15 women seemed like it was right on the mark. Now we're
16 being told that that number has hugely increased, at least
17 a 200-fold increase, and that this number in the minds of
18 some people seems like it's okay as well.

19 I think there's clearly a problem with over-
20 prescribing, and I hope members of this committee will go
21 back and read the transcripts from 10, 11 and 12 years ago,
22 to see what was said at that time in terms of estimates of
23 the number of reproductive aged women who ought to have
24 severe enough acne to warrant being put on this drug. I
25 think I'll stop there.

1 DR. BERGFELD: Thank you very much. Dr. Adams,
2 would you like to add to the remarks of Dr. Lammer?

3 DR. ADAMS: I'm sorry. I'm certainly not
4 prepared to show you any slides or anything, but I think my
5 main comment would be that everyone has to keep in mind
6 that there is a continuum of abnormal development caused by
7 Accutane, and often the focus is strictly on congenital
8 malformations which, as Dr. Lammer pointed out, is just one
9 endpoint.

10 You have to remember the 40 percent who are
11 naturally miscarried when the woman is on this drug during
12 pregnancy.

13 You have to remember that when we talk about a
14 25 to 35 percent malformation rate, we are talking about 25
15 to 35 percent of the only 60 percent that make it to term.

16 And then you have to remember that the 25
17 percent malformation rate does not capture the functionally
18 impaired children because there are many children with
19 severe learning disabilities who do not have major
20 malformations that were detectable at birth.

21 Thank you.

22 DR. BERGFELD: Thank you very much. It's now
23 time for questions by the committee, and I would state that
24 these would be clarification questions regarding the
25 presenters' materials. If you're asking a question, if

1 you'd please present your name first so that they can
2 record this with your question. Any questions from the
3 committee members?

4 DR. ABEL: Elizabeth Abel. I just have one for
5 Roche regarding the types of contraceptive recommendations.
6 Does one have to be hormonal, or could two of the methods
7 be non-hormonal?

8 MS. LEACH: My name is Eileen Leach.

9 The May 2000 label calls for two separate
10 effective contraception to be used, one primary and one
11 secondary.

12 DR. ABEL: So, it is not defined?

13 MS. LEACH: Yes. In fact, the primary
14 contraception is listed in the patient brochures as well as
15 in the informed consent.

16 DR. BERGFELD: Thank you.

17 Any other questions? Dr. King.

18 DR. KING: Dr. Lloyd King, Vanderbilt,
19 Nashville.

20 I have a question for Dr. Lammer and Dr. Adams.
21 It's unclear to me in your conversation whether there are
22 an effects of hypervitaminosis A due to increased taking of
23 multivitamin during pregnancy and/or a lack of folic acid
24 or other factors. Can you identify specifically the risks
25 due to Accutane or what are these other factors that affect

1 | the central nervous system? How are they enumerated? Is
2 | that a clear question?

3 | DR. LAMMER: I'm a little unclear about your
4 | question. Folic acid has been shown to be beneficial in
5 | preventing neural tube defects, and to the best of my
6 | knowledge, there has only been one instance with a neural
7 | tube defect associated with exposure to retinoic acid. So,
8 | neural tube defects are not a characteristic central
9 | nervous system problem among infants whose mothers used
10 | this drug during pregnancy.

11 | DR. KING: Then what about hypervitaminosis A?

12 | DR. LAMMER: We interview all these mothers and
13 | ask them about their intake of vitamin A in terms of a
14 | supplement during pregnancy, and none of these mothers were
15 | taking a supplement of vitamin A along with their Accutane
16 | prescription, if that's your question.

17 | DR. KING: That's the question.

18 | Then a follow-up is the inference is that there
19 | was a pregnancy test prior to entering and then monthly.
20 | That would detect the population at risk. Is that your
21 | implication?

22 | You were saying that the major risk was in the
23 | first 15-20 days, that if you knew prior to taking the drug
24 | and then with the follow-up test in 1 month, 4 weeks, that
25 | you would identify the population at risk. Is that

1 correct?

2 DR. LAMMER: No. My comment, Terry, really was
3 only to delineate that there are differential periods of
4 risk from exposure during the pregnancy. That was really
5 all that I meant with that presentation.

6 DR. BERGFELD: Yes, Dr. Adams.

7 DR. ADAMS: Just to get to this issue of time
8 of vulnerability, Dr. Lammer was intending to show that
9 vulnerability begins at about day 14, 2 weeks post-
10 conception. We know from the sample that there are people
11 who had one pill who had abnormal babies because the
12 exposure occurred during this period, and no, a monthly
13 pregnancy test would not capture them. You would have a
14 full day 14 to day 30 potential period of exposure in there
15 that could occur for these women, and that would be a very
16 high period of risk. So, the idea that monthly follow-ups
17 for pregnancy for women on this drug would considerably
18 reduce risk is just not the reality.

19 DR. BERGFELD: Thank you.

20 Yes.

21 DR. MILLS: I'm James Mills from the National
22 Institutes of Health.

23 Dr. Vega, you presented data on pregnancy rates
24 based on estimates of perfect and typical failure rates of
25 contraceptives. I was a little confused about that in the

1 sense that are these based on a single method of
2 contraception, or two methods, and based on what
3 combination of failure rates?

4 DR. VEGA: That's a very good question. I
5 should mention that for the Slone survey estimates we
6 adjusted those pregnancy failure rates for the use of two
7 or more methods of contraception because there's like about
8 200 possible combinations. It was impossible to factor all
9 those in. So, we assumed that those using two methods or
10 more were not at risk of pregnancy. That's why I said that
11 we used very conservative assumptions. So, we basically
12 eliminated those patients' risk to get pregnant.

13 DR. BERGFELD: Yes.

14 DR. JONES: I'm Ken Jones.

15 I'd like to address a question to Dr.
16 Raczkowski, and it relates to educational programs to the
17 public that you enumerated. One of those programs that you
18 talked about was advertising. I would appreciate it if you
19 could enlighten us about restrictions that are imposed on
20 advertising regarding a drug that the FDA places upon a
21 sponsor.

22 DR. RACZKOWSKI: The main thing with
23 advertising is that the advertising materials have to
24 represent a fair balance of both the benefits and the risks
25 of the drug. So, in a nutshell, that's the primary

1 restriction that the FDA places, that the advertising
2 materials have to represent a fair balance.

3 DR. JONES: And to further that, can you
4 comment about the advertising for Accutane at the present
5 time? For example, it does not seem to me that many of the
6 advertisements that I have heard on such programs as
7 Nickelodeon, which clearly are being directed towards
8 children, I don't think you see the teratogenic effect of
9 Accutane when you hear the advertisement on TV. Can you
10 comment about that?

11 DR. RACZKOWSKI: I'm not familiar with the
12 advertisements, and so I'd prefer not to comment.

13 DR. JONES: You haven't seen the
14 advertisements?

15 DR. RACZKOWSKI: I'd prefer not to comment.

16 DR. JONES: Is there somebody that could
17 comment about that for us, please?

18 DR. BERGFELD: Perhaps the Roche people would
19 comment in the afternoon when they present.

20 Dr. Wilkin?

21 DR. WILKIN: That was going to be my
22 suggestion. I personally don't watch Nickelodeon, so I
23 don't know --

24 DR. JONES: I'm a pediatrician. I do.

25 (Laughter.)

1 DR. WILKIN: You do. Well, perhaps you could
2 or later the folks from Roche could describe what that is.
3 Does it actually mention the name Accutane? Because if it
4 doesn't really mention the name Accutane, then it may not
5 really be an advertisement that our drug advertisement
6 folks would review.

7 DR. JONES: No, it does not specifically use
8 the word Accutane, and I think that's an obfuscation, if
9 you will, as far as this is concerned. And I think that it
10 certainly should come under the jurisdiction of the FDA,
11 whether the word Accutane is used or not because certainly
12 the implication is there.

13 DR. BERGFELD: Thank you.

14 Yes?

15 DR. KODISH: Eric Kodish from Rainbow,
16 Cleveland.

17 To take this discussion perhaps from the mass
18 marketing level to the clinical bedside level, we think
19 about informed consent as both a document and a process,
20 and I heard some discussion about the document, but the
21 document should not dominate the process, most people in
22 ethics say. I'm wondering whether anyone has any data,
23 information about the informed consent process itself.

24 DR. BERGFELD: Dr. Wilkin or Roche?

25 DR. WILKIN: Actually Dr. Mitchell might have

1 some information perhaps gleaned through the Slone survey
2 on that point.

3 DR. MITCHELL: No, we don't have any specific
4 process information currently collected in the survey.

5 DR. BERGFELD: Thank you. Dr. Moore?

6 DR. MOORE: I just had one more question about
7 the advertising. Did I understand the presentation
8 correctly, that any drugs that have a boxed warning are not
9 allowed to have advertising which actually names the
10 product? Was that correct? I think that was in Dr.
11 Raczkowski's.

12 DR. RACZKOWSKI: The only restriction that a
13 boxed warning places on advertising is that you cannot have
14 so-called reminder ads, and those are the sort of ads where
15 you might say the name of a product on a pen, without any
16 other additional information, just the name of the product.
17 That's called a reminder ad.

18 DR. BERGFELD: There was another question over
19 here. Dr. Abel?

20 DR. ABEL: Yes. Could someone from Roche
21 please describe further the Accutane tracking study, and
22 how that is carried out to capture physicians' perceptions.

23 DR. BERGFELD: A representative from Roche,
24 please?

25 DR. LEACH: Actually the Accutane tracking

1 survey is conducted by Roche. Twice a year we survey 100
2 dermatologists and 300 family practitioners. They are
3 asked about their use of the pregnancy prevention program
4 and we break it down by actual pieces of the pregnancy
5 prevention program. They are also asked about their
6 patients' perception of the pregnancy prevention program.

7 DR. BERGFELD: Dr. Anderson?

8 DR. JENNIFER ANDERSON: Dr. Jennifer Anderson
9 from Boston.

10 I have a question actually for Dr. Lammer about
11 the possibility of birth defects with other drugs that are
12 used to treat acne, like antibiotics. Dr. Lammer, you said
13 that the birth defect rate with Accutane was much higher
14 than with any other drug, but I was wondering what the
15 rates might be with, say, antibiotics, which are commonly
16 used.

17 DR. LAMMER: Commonly used antibiotics are not
18 teratogenic at all. The only example I can really come up
19 with off the top --

20 DR. ANDERSON: I mean commonly used to treat
21 acne.

22 DR. BERGFELD: Tetracycline, erythromycin.

23 DR. LAMMER: Right. Tetracycline, when it's
24 used beyond the fifth month of pregnancy, can cause
25 yellowing and mottling and other abnormalities of the

1 | teeth. It's absolutely not teratogenic used in the first
2 | trimester.

3 | What other antibiotics are of concern?

4 | DR. ANDERSON: I'm sorry. I don't know the
5 | names of them but I just --

6 | DR. BERGFELD: Erythromycin.

7 | DR. LAMMER: Erythromycin is not teratogenic
8 | either. As a general principle, there would be very few
9 | antibiotics that have been demonstrated to be teratogenic,
10 | and this late-in-pregnancy effect from tetracycline is the
11 | only thing that really comes to mind.

12 | DR. BERGFELD: Dr. Greene?

13 | DR. GREENE: I had question for Dr. Honig,
14 | please. During your presentation you mentioned the issue
15 | of clinical practice guidelines promulgated by professional
16 | societies and whether they do or do not have a significant
17 | impact on the practitioners. Are you familiar with what
18 | practice guidelines the dermatology professional
19 | associations may have promulgated and what effect they have
20 | had on their physicians?

21 | DR. HONIG: I can't speak to that. Perhaps Dr.
22 | Wilkin could address that as a dermatologist.

23 | DR. WILKIN: The American Academy of
24 | Dermatology has a task force that from time to time
25 | publishes in the Journal of the American Academy of

1 Dermatology practice care guidelines. Typically these are
2 fairly open kinds of guidelines that really are
3 nondirective. They don't say use treatment A, B, or C.
4 They simply list treatments that are available. They
5 typically go down the list of safety monitoring, these
6 sorts of things. I don't really recall the specifics for
7 the acne guideline.

8 Dr. Bergfeld?

9 DR. BERGFELD: I'll remove myself as chair and
10 respond as the past president of the American Academy of
11 Dermatology. As Dr. Wilkin did say, these guidelines are
12 rather global. However, in the mention of Accutane, there
13 is mention of dosage and selected patient populations of
14 recalcitrant acne. I don't think that we in any way survey
15 our population of physicians to see their use, nor their
16 adverse events. We have been totally dependent on Roche
17 and all of your patient and physician education to assist
18 us in that.

19 DR. GREENE: Just a follow-up then. I can
20 understand that they may not specifically advocate for the
21 use of one treatment or another, but do they say anything
22 with respect to if you're going to use Accutane beyond what
23 the indications are for it, then here's what you need to do
24 to make sure that no one gets injured.

25 DR. BERGFELD: Yes, they do have some specifics

1 on what needs to be done for the adverse event problem of
2 the fetal teratogenicity. Yes, they do have that. And
3 they do specifically state for recalcitrant cystic acne.

4 Now, the question might also evolve too, do
5 they use it for other things? And the answer would be,
6 obviously yes.

7 Any other questions? Yes, doctor.

8 MR. LEVIN: Arthur Levin.

9 Dr. Lammer, you made a comparison to
10 thalidomide for ear malformation. I just wonder, overall
11 how would you sort of rank the risks of this drug compared
12 to other drugs with known birth defect risks?

13 DR. LAMMER: That's an excellent question and
14 one that has been discussed at previous meetings of this
15 advisory committee, so I think it is well worth going over.
16 The magnitude of risk that this drug poses is essentially
17 unique. The only other medications that I'm aware of that
18 have a magnitude of risk in this range, when they are used
19 during pregnancy, is really thalidomide. Congenital
20 rubella infection might have an attack rate as high as
21 well, but that's an infectious agent.

22 In terms of medications, in terms of the
23 magnitude of risk and the severity of the malformations,
24 this drug is really unique. Brain abnormalities are
25 actually not that common in thalidomide embryopathy, but

1 that may in part have been problems with identification and
2 how those studies were done in that era.

3 In terms of the phenotypic features of the two
4 syndromes, they're really also quite strikingly similar.
5 Other than there were many more children with limb
6 abnormalities identified in association with thalidomide
7 exposure. But otherwise heart defects, ear abnormalities
8 were both frequent in both of the conditions and really
9 resemble each other in many ways.

10 DR. BERGFELD: Question, Dr. Malone?

11 DR. MALONE: Dr. Malone from MCP Hanneman.

12 If we know that this drug causes abnormalities
13 in fetuses for the brain, what does it tell us about what
14 would happen in adults? Would it cause any changes in
15 brain in adults?

16 DR. BERGFELD: Is there anyone that can respond
17 to that question? Dr. Adams again.

18 DR. ADAMS: The ability of Accutane to affect
19 the developing brain has to do with particular events that
20 are only present during early developmental stages. It is
21 often the case, nevertheless, that agents that can affect
22 the developing brain overlap very highly with agents that
23 can affect the adult brain. But in this case the
24 mechanisms through which it acts prenatally would not be
25 expected to even be present in adulthood under normal

1 | circumstances.

2 | DR. MALONE: I guess I was thinking mainly of
3 | the psychiatric symptoms you may get with Accutane. I
4 | guess there is no way to tell at what level this drug could
5 | cause changes in adults, from what you've said?

6 | DR. BERGFELD: I think we're going to hear at
7 | length tomorrow on that issue, unless there is a short
8 | answer to it.

9 | Seeing none, then any other questions? Yes,
10 | Dr. Jones again.

11 | DR. JONES: I'm not sure quite who to direct
12 | this question to, but it relates to that Accutane tracking
13 | study, as well as the PPP. I was really impressed to see
14 | that there are 200 primary care physicians that are being
15 | interviewed as far as this Accutane tracking study because
16 | it was more my impression that PPP and then the targeted
17 | PPP were focused almost exclusively on dermatologists, and
18 | that there were an awful lot of other physicians that would
19 | be prescribing Accutane who really were not being educated
20 | to the same extent that dermatologists were. Can somebody
21 | comment about that? I maybe completely wrong.

22 | DR. ELLISON: Russell Ellison from Roche.

23 | It's an excellent question. Since the launch
24 | of this product 18 years ago, Roche has confined its
25 | promotion entirely to dermatologists because of the need to

1 select patients with severe recalcitrant nodular acne. On
2 the other hand, the drug has been available for 18 years.
3 So, other practitioners will start to prescribe it,
4 particularly those with an interest in skin conditions.
5 So, we thought it was important to include people like that
6 in the survey to get a larger idea what's going on.

7 The second point is with respect to the
8 Accutane patients survey. Patients in the survey are
9 treated by any kind of physician. It's not selected for
10 the physician, if you will. I think the following slide
11 might be useful.

12 Basically 85 percent of prescriptions are from
13 dermatologists and 15 percent, as far as we can tell, are
14 from primary care practitioners. As far as their access to
15 information, we don't, as I said, call on them directly
16 because we don't want to promote to them, but they have the
17 entire labeling situation and so on, and the patient gets
18 the instructions and the informed consent.

19 DR. BERGFELD: Could I ask an additional
20 question, if I might? If you identify these primary care
21 physicians, pediatricians who are using the drug by another
22 tracking mechanism, that is, purchasing the drug, and who
23 has written the prescription, is it then appropriate that
24 you call on them to give them the physician educational
25 materials?

1 DR. ELLISON: I think it's a very good point of
2 discussion. We've taken the balance of not having contact
3 with these people, to make sure that we're not promoting
4 use in that segment of the practicing population. At the
5 same time, we recognize that there certainly would be
6 advantages in terms of educating them. We've gone further
7 to identify those general practitioners that prescribe more
8 than once or twice per year and, based on our further
9 discussions with the agency, are anticipating being able to
10 call on them as well as we roll out the new targeted
11 pregnancy prevention program.

12 DR. BERGFELD: Thank you.

13 Dr. Woodcock?

14 DR. WOODCOCK: I have a clarification question,
15 if I may. Dr. Lammer and Dr. Adams, I was a little bit
16 confused by what you were saying about the timing of
17 exposure and the rate of birth defects detected. I
18 understood you to say exposure I suppose to one or more
19 pills of Accutane during the first 15 days after
20 conception. Can you explain that a little bit?

21 DR. LAMMER: No. I think the comment that Dr.
22 Adams made concerning risks from even one or two capsules
23 of this medication would all be in women who took those
24 pills after day 15. Women who stopped using this drug
25 before conception, or within the first 15 days after

1 conception, we've not been able to identify that they have
2 an increased risk to have babies with malformations.

3 DR. WOODCOCK: And you're dating conception
4 like a teratologist would, from actual conception, not from
5 the first day of the last menstrual period?

6 DR. LAMMER: That's correct. When I speak in
7 terms of days, I'm talking about the estimated date of
8 conception is day 0.

9 DR. WOODCOCK: Thank you.

10 DR. BERGFELD: Any other questions? Yes,
11 doctor.

12 DR. GREENHILL: Dr. Greenhill from Columbia
13 University.

14 I wonder if any comments could be made by the
15 Food and Drug Administration about a program or
16 recommendations they might have given for the reapproval of
17 thalidomide, which has occurred in the last several years,
18 for the treatment of leprosy. Is there a similar or
19 parallel program in terms of letters to doctors, black box
20 inserts, or suggestions or recommendations that would guide
21 physicians and protect pregnant mothers?

22 DR. BERGFELD: Thank you.

23 Is there an FDA respondent? Yes, Dr. Vega.

24 DR. VEGA: This is Dr. Vega.

25 There is a program called the STEPS program, or

1 the System for Thalidomide Education and Prescribing
2 Safety. This program is a pregnancy prevention program in
3 essence, and it has educational materials for physicians
4 and patients, and it contains tracking of the pregnancy
5 exposures, and so forth. So, there is another program out
6 there trying to do the same thing.

7 DR. GREENHILL: Does it differ in any way from
8 the current program with Accutane?

9 DR. VEGA: Yes, it is in several ways. To
10 begin with, it's a mandatory program. Participation in
11 that program is required to get the drug. So, that's, I
12 think, the main difference from the Accutane pregnancy
13 prevention program because the educational component is
14 there and the tracking of the pregnancy exposures. But I
15 think the main difference is in the nature of the
16 requirement to participate to get in the program.

17 DR. BERGFELD: Dr. Greene?

18 DR. GREENE: But Dr. Vega, please correct me if
19 I'm wrong, but the system of distribution for thalidomide
20 is far more restrictive. Pharmacies must register to
21 dispense it. Not any pharmacy can dispense it. And
22 physicians must register to prescribe it. Not any
23 physician can prescribe it. So, it is very different and
24 much more restrictive than the distribution system for
25 Accutane, right?

1 DR. VEGA: Yes, that's correct. It's more
2 restricted and the nature, as I said, it's required. It's
3 mandatory, and it involves decisions in pharmacies and
4 patients. So, that's correct.

5 DR. MURPHY: This is Dr. Murphy.

6 I just wanted to say one thing to the
7 committee. Dr. Vega is going to go over a variety of
8 options after Roche presents, and I think it will be clear
9 that there are a number of elements that we will ask you to
10 look at.

11 DR. BERGFELD: Thank you.

12 Any other questions? Dr. Miller.

13 DR. MILLER: Dr. Vega, this is in follow-up on
14 the thalidomide. What's been the history of reporting of
15 adverse events since its approval, do you know? Do you
16 have any data?

17 DR. VEGA: Specifically on the pregnancy
18 exposures, are you referring to?

19 DR. MILLER: Pregnancy and then perhaps any
20 other significant adverse events, when you're looking at
21 the program you have to ensure that it's not used without
22 care and restriction.

23 DR. VEGA: So, your question is if there has
24 been any pregnancy exposures, any babies born with
25 congenital anomalies since the approval of thalidomide.

1 The answer is no. So, we can get into more details about
2 the nature of the population exposed to thalidomide versus
3 the Accutane. That might answer some of the questions.
4 For a short answer, it's no.

5 DR. BERGFELD: For perspective, though, that
6 program is how old?

7 DR. VEGA: June 1998, if I'm not mistaken.

8 DR. BERGFELD: Any other questions?

9 (No response.)

10 DR. BERGFELD: Seeing none, I'll declare a
11 recess until 10:55, when we'll resume with Roche's
12 presentation.

13 (Recess.)

14 DR. BERGFELD: Would everyone take their
15 seats, please. We'd like to begin. We have a very full
16 remainder of the morning, but before we proceed, Dr.
17 Woodcock is going to do something for us on the advertising
18 question that was asked earlier.

19 DR. WOODCOCK: Just to clarify the regulation
20 of advertising. As I think was already stated, the
21 reminder ads, where the name of the drug is just put up,
22 are not permitted for drugs that have a black box warning.
23 Health-seeking ads that simply mention a condition and talk
24 about the condition and don't mention the name of a drug
25 are not regulated as drug advertising. So, any promotion a

1 company would want to run about a particular disease
2 condition that doesn't specifically point to any drug would
3 not be subject to our regulation.

4 All other advertising, though, promotion that
5 mentions a drug, would be subject to FDA rules and
6 regulations, which require fair balance and disclosure of
7 warning.

8 DR. BERGFELD: Could you then respond to the
9 Nickelodeon ad or topic suggestion that was mentioned
10 earlier? Who presented that? Dr. Jones, do you want to
11 re-present that to Dr. Woodcock?

12 DR. JONES: I think you've answered my
13 question, actually. I was asking specifically related to
14 advertisements that, in fact, did not mention the drug. I
15 assumed, therefore, that the reason the drug was not
16 mentioned was to avoid having to talk about the teratogenic
17 effect of the drug, and I'm sure other complications as
18 well. And I think you've answered that and I appreciate
19 it. Thank you.

20 DR. BERGFELD: Thank you, then.

21 Dr. Lammer?

22 DR. LAMMER: This kind of advertising may fit
23 within the legal definition of what FDA allows, but I'd
24 like to just read briefly from the presentation of Dr.
25 Cunningham from Roche in 1989. I'm reading from the

1 transcript of the hearing of this committee on page 86 from
2 1989. "The advertising you've seen is rather dramatically
3 focused on contraindication and proper usage of pregnancy
4 prevention. It is not focused on usage. The two ads
5 you've seen" -- these were ads for dermatologists -- "are
6 representative of the type of advertising you will see in
7 the future."

8 I'd like to ask whether the type of advertising
9 that Dr. Jones brought up, which doesn't mention Accutane,
10 but does have Roche's name and suggests and urges people to
11 seek treatment for their acne or whatever, to me seems
12 inconsistent with the company's previous statements of the
13 type of advertising that they anticipated using in the
14 future.

15 DR. BERGFELD: Yes, if you'll respond, please,
16 Dr. Woodcock.

17 DR. WOODCOCK: Yes. I wasn't commenting on the
18 consistency of advertising with previous commitments or
19 whatever. I was simply saying the legal framework permits
20 such health-seeking ads, and you see them for a wide
21 variety of conditions. Cholesterol lowering, all sorts of
22 things. There are these types of ads that are out there.

23 DR. BERGFELD: All right, I think we can then
24 move on. The Roche presentation will be introduced by Dr.
25 Russell Ellison.

1 DR. ELLISON: Dr. Bergfeld, members of the
2 advisory committee and FDA, Hoffmann-LaRoche is pleased to
3 be able to discuss how to improve the public health profile
4 of this very important medication. I'm the Chief Medical
5 Officer and Vice President of Medical Affairs of Roche
6 Laboratories and I'd like to introduce our presentation.

7 As from the FDA briefing document, we all
8 recognize the Accutane is uniquely and highly effective in
9 the most severe form of acne which if not adequately
10 treated, causes significant and often permanent
11 disfigurement. At the same time, which I think Dr. Lammer
12 has taken us through, Accutane is a very potent teratogen.

13 It was introduced in the U.S. in 1982 for
14 severe recalcitrant nodular acne. Since that time about 5
15 million patients have been treated in the U.S. and 12
16 million worldwide. As FDA has pointed out, and we agree,
17 use has been increasing since 1991.

18 We introduced the pregnancy prevention program
19 that you've heard about in 1988. It was modified in 1989,
20 based on data received in the Slone tracking survey to
21 improve it, to prevent fetal exposure by preventing
22 pregnancy.

23 We believe that from the data in the survey and
24 other supportive data that the pregnancy rate is declining.
25 We believe that the pregnancy rate in women on Accutane is

1 about 80 to 90 percent less than normal contraceptive use.
2 We believe that given the pregnancy rate observed in our
3 survey, that for every 1,000 women treated with Accutane
4 pregnancy has not occurred in about 997.

5 The Accutane survey was introduced in 1989 as a
6 risk assessment and risk monitoring tool of this program.
7 Since that time, half a million women have been enrolled in
8 the survey. The yearly enrollment has doubled since 1989.
9 We believe that available data, from which you could
10 compare the user population and the population in the
11 Slone, supports the idea that the survey might be
12 reasonably representative of the Accutane-treated
13 population.

14 However, while these data would indicate that
15 an individual's risk of pregnancy is decreasing, the total
16 public health burden has not. That is, the absolute number
17 of exposed pregnancies has not decreased. We believe the
18 absolute goal is the prevention of pregnancy. We believe
19 the first step along this goal is that the pregnancy rate
20 must decline faster relative to use.

21 Our goal is the optimal program to further
22 prevent pregnancies, balancing the likelihood of success,
23 the risk of compromising current success for the vast
24 majority of women who do not become pregnant while taking
25 Accutane, and the risk of denying treatment to patients who

1 | would not become pregnant.

2 | We did launch this year a targeted pregnancy
3 | prevention program after discussions with FDA which
4 | specifically addresses the behaviors leading to pregnancies
5 | in women on Accutane.

6 | Our presentation, after this very brief
7 | introduction, will start with a brief presentation by Dr.
8 | Guy Webster, Vice Chairman, Department of Dermatology at
9 | Jefferson Medical College, who will put the clinical
10 | benefits into context of real patients. Subsequently Dr.
11 | John LaFlore, our Vice President of Drug Safety and Risk
12 | Management at Roche Laboratories, will have a brief
13 | discussion about epidemiology, and he's going to shorten
14 | his presentation to focus entirely on the issue of
15 | pregnancies, as much as I think we're all agreed that use
16 | has increased. With respect to risk assessment and risk
17 | monitoring, Dr. Allen Mitchell will take us through a
18 | detailed discussion of the findings from the Slone survey.
19 | Subsequently Eileen Leach, whom you've already met, will
20 | discuss the details of the new targeted pregnancy
21 | prevention program based on what we've learned to further
22 | reduce pregnancies. And I will close with a brief
23 | discussion of other risk management options.

24 | Thank you. Dr. Webster?

25 | DR. WEBSTER: Madam Chairwoman, members of the

1 committee, guests. I'm the Vice President of Dermatology
2 at Jefferson Medical College in Philadelphia, and for over
3 20 years I've been studying the pathogenesis of acne, and
4 for the past 10 I've been treating it. I'm pleased to be
5 here to present the benefits of Accutane to you.

6 This woman has been treated with maximal
7 medical therapy already, short of Accutane. She has been
8 given topical antibiotics, topical retinoids, oral
9 antibiotics, and for her this is a good day. She still has
10 nodules on her jaw. They're forming scars, and her life is
11 really dominated by her severe disease. She needs
12 Accutane. Nothing else will do it.

13 When a patient is treated for acne, they
14 typically walk up the staircase of different treatments,
15 starting with topical therapy, some over the counter, like
16 benzoyl peroxide, progress to oral antibiotics, the
17 tetracyclines, erythromycins, and then maybe the
18 combination of oral and topical drugs such as topical
19 retinoic acid and minocycline. A large number of patients
20 still aren't better, still have resistant nodular scarring
21 acne, and these are the people that should be put on
22 Accutane.

23 This fellow is in high school. He's on maximal
24 non-Accutane therapy, and he has devastating disfiguring
25 disease. Picture going to school looking like this every

1 day. Picture looking at this in the mirror every day.
2 It's pretty tough. This is his back. He hasn't yet been
3 treated with Accutane and he has huge, disfiguring scars
4 that will be with him for life.

5 The psychosocial effects of acne can't be
6 minimized. First, it's a long-lasting disease. This is
7 not the drugstore grade acne where a little of Clearasil
8 makes it go away. This starts in the early teens and can
9 last into the 30s, and it's not something that the patient
10 can just ignore and put a little cover-up on. They become
11 anxious and depressed. This is at a time when their
12 personality is being formed and they have all the troubles
13 every teenager has, plus they have acne. A lot of them
14 become withdrawn and anxious and depressed.

15 All dermatology patients have been shown to
16 have a higher prevalence of psychiatric disorders, and acne
17 is no exception. They are more angry, they are more
18 anxious, and they tend to do relatively badly in
19 interpersonal situations.

20 Isotretinoin is a unique drug for treating acne
21 because it addresses all of the pathogenic limbs that make
22 the acne lesions form. It corrects the older pattern of
23 follicular keratinization that forms the blackhead, behind
24 which sebum backs up and P. acnes grows. It turns down the
25 sebaceous gland activity so that sebum isn't produced and

1 | there is no nutrition for the organism, Proprionibacterium
2 | acnes, that lives in the follicle and is the target for the
3 | inflammatory response. And finally, it's directly anti-
4 | inflammatory, cooling off lesions that have formed before
5 | treatment and reducing the chance of scarring.

6 | This is what Accutane can do. This patient had
7 | had all the appropriate medical therapy before, short of
8 | Accutane, and finally became treated with it. He had
9 | inflamed nodules that were scarring on his chest. You can
10 | see what his chest looks like after treatment. This is his
11 | back. His back is more obviously scarred. He didn't get
12 | Accutane in time, but he clearly has had a remarkable
13 | change in the quality of his disease.

14 | I apologize for the quality of these pictures.
15 | They were sent in by patients who were pleased with how
16 | they did. You can see on August 24th, she had big scarring
17 | nodules on her face, forehead and nose, and by December 2nd
18 | she was, for all intents and purposes, clear.

19 | The same with this woman. Early in November
20 | she had nodular acne. Treatment was started. She had a
21 | little bit of irritation and flare. Her face is a little
22 | redder. By Christmas she has some irritation and fewer
23 | nodules, and by March there is nothing that you can see in
24 | the picture. This is a dramatic effect for patients who
25 | have been treated with everything else.

1 You can imagine how anxious patients are. It's
2 been measured. Studies have shown that patients who are
3 treated with isotretinoin do much better following
4 treatment in a wide variety of psychological measurements,
5 including anxiety and depression.

6 So, to sum up, isotretinoin is a unique drug.
7 It's one that we cannot do without in dermatology. It
8 gives a lasting response in disfiguring disease. It gives
9 this response in a short duration of treatment, 4 to 6
10 months, and the long-term improvement in self-esteem and
11 function is clear.

12 Thank you.

13 DR. LaFLORE: Good morning, Madam Chairwoman,
14 advisory committee. My name is John LaFlore, Vice
15 President, Drug Safety and Risk Management for Hoffmann-
16 LaRoche.

17 As Dr. Ellison pointed out earlier in his
18 introduction, the purpose of this section is to provide you
19 with a basis for overall current patterns of Accutane use,
20 as well as provide you with a context for the pregnancy
21 prevention program, which will address risk assessment, and
22 that will be addressed by Dr. Allen Mitchell, and risk
23 management would be addressed by Ms. Eileen Leach following
24 this presentation.

25 Also as Dr. Ellison mentioned, since we all

1 | agreed that basically there is an increased use in Accutane
2 | over all the past years, some portions of this particular
3 | presentation have been shortened in order to save time for
4 | the other issues.

5 | First of all, even though the use of Accutane
6 | has increased over the years, it does not imply that there
7 | has been an increased use outside the labeled indication.
8 | Though the use is increasing, pregnancy rates are basically
9 | declining, and absolute numbers of pregnancy reports have
10 | remained stable throughout the duration and life history of
11 | this drug. The overall pregnancy rate you see from the
12 | Slone survey is 2.8 per 1,000, and this is supported by
13 | additional international and other data which gives
14 | approximately the same rates.

15 | In 1991, in cooperation with the FDA, Roche
16 | developed and agreed upon a set method for calculating
17 | overall use of Accutane. Within that method, we decided
18 | there were three parameters that would be adequate to give
19 | us a pretty significant estimate of what the overall use
20 | would be. The first one had to deal with the retail
21 | prescriptions directly from pharmacies themselves. The
22 | second was the third party payment tracking, and this was
23 | obtained from pharmacy records.

24 | Now, the estimates then are adjusted to the
25 | Roche factory shipments, and this was allowed to give us a

1 definite increased look and a specific amount of estimates
2 at that time. These data, keep in mind, were patient-based
3 and not physician-based, as with IMS data.

4 This graph shows again, while the use of
5 Accutane has increased over time, that both male and female
6 use has increased at about the same rate, and toward the
7 end they are actually approximately equal.

8 Now I'd like to move directly into the
9 discussion regarding pregnancy. Again, while the use of
10 Accutane has increased, pregnancy rates, as you can see
11 according to this map, have declined. The number of
12 reported pregnancies has remained basically stable. This
13 takes into account both the spontaneous reports, as well as
14 reports from the Accutane survey conducted by the Slone
15 Epidemiology Unit at Boston University.

16 Now, with regards to receiving reports of
17 pregnancies, there are two sources that we are primarily
18 using.

19 One was the Accutane survey by the Slone
20 Epidemiology Unit. It's important to keep in mind that
21 this is solicited information and it contains a defined
22 denominator. And it's this particular data source whereby
23 we generate pregnancy rates. Of the one-half million women
24 enrolled in this survey, greater than 80 percent have
25 responded since the program began.

1 The second source of information of reports of
2 pregnancy are obtained through the spontaneous reporting
3 system, and these reports are received directly by Roche.
4 Reports are also received from the agency, and also reports
5 are received from the Centers for Disease Control, and
6 those reports are also considered spontaneous, unsolicited
7 reports.

8 Now, one might expect that pregnancy reports
9 are decreasing since reporting of adverse events generally
10 decrease over the time and the life of the product in terms
11 of most drugs. However, as this graph shows, the
12 spontaneous reports for Accutane has not decreased.
13 However, the pregnancy reports from '91 to '98, the most
14 completed data, show that they're being stable. This would
15 suggest that there is no decline in the reporting of
16 pregnancy rates.

17 One might then ask, does the Accutane survey
18 with the defined denominator represent the actual user
19 population? The proportional distribution of age in the
20 Accutane survey is similar in the Accutane users' general
21 population. If anything the survey over-represents the
22 high risk group of 20 to 29-year-olds, those patients who
23 are most likely at risk to become pregnant. Later Dr.
24 Mitchell will go into more details with regard to the
25 Accutane survey.
