WASHINGTON — The government's House Price Index (HPI) for the 12 months ending in March showed house prices rising fastest in the Rocky Mountain states and slowest in the Middle Atlantic and Pacific Coast regions. The HPI, containing movements of single-family house values obtained from home sales and refinancing appraisals for the 12-month period ended March 31, 1996, was released by the Office of Federal Housing Enterprise Oversight (OFHEO).

House prices increased by an average 5.4% for the United States as a whole between the first quarter of 1995 and the first quarter of 1996. The 12-month increase in the Mountain region was 8.0%. Both the Middle Atlantic and Pacific regions fell short of the national average, with increases of 4.8% and 4.2% respectively.

Among the states, the largest average 12-month increases were: Utah 10.7%, Oregon, 8.8%, South Dakota, 7.8%, Wyoming, 7.7% and Tennessee 7.4%. The District of Columbia showed an increase of 9.2%. The slowest increases were recorded by Delaware, 3.5%, and California 3.3%. House prices in Hawaii were unchanged in the 12-month period.

The House Price Index is a quarterly index that measures average changes in housing prices at the regional and state levels as well as nationwide. The HPI is based on sales or refinancings of single-family homes whose mortgages have been purchased or securitized by Fannie Mae (Federal National Mortgage Association) or Freddie Mac (Federal Home Loan Mortgage Corporation).

The HPI is a *weighted repeat sales* index, meaning that it measures average price changes in repeat sales or refinancings on the same single-family properties. The mortgages measured by the HPI are both *conforming* and *conventional*. *Conforming* refers to a mortgage that both meets the underwriting guidelines of Fannie Mae or Freddie Mac and doesn't exceed the *conforming loan limit*, now \$207,000 for single-family homes. *Conventional* means that the mortgages are neither insured nor guaranteed by the FHA or VA. In 1995, about 83% of conventional mortgages had principal amounts under the conforming limit. In 1995, Fannie Mae and Freddie Mac purchased or securitized roughly 41% of all single-family mortgage loans originated or refinanced.

The HPI is published by the **Office of Federal Housing Enterprise Oversight (OFHEO)**. **OFHEO is the government's financial safety and soundness regulator of Fannie Mae and Freddie Mac.** These two government-sponsored enterprises (GSEs) are the nation's largest housing finance institutions. The two GSEs were chartered by Congress to help generate a continuing supply of affordable mortgage credit for homebuyers. They do this through secondary market operations — buying mortgages from primary lenders (commercial banks, thrift institutions and mortgage banks) and either packaging them into mortgage-backed securities for resale to investors or holding the mortgages in their own portfolios.

-0-

NOTE: Division and state rankings reported in the various HPI tables may vary over time due to the following factors: (1) changes in housing values that are observed for holding periods that end with the most recent quarter; (2) differences in Fannie Mae and Freddie Mac purchase patterns that result in changes in the composition of the sample available for analysis; and (3) sampling variability in the estimated index. Each quarter, the beginning and ending points used to calculate the appreciation in housing values are adjusted to the most recently available information. This can result in significant changes in the rankings of states in which the indexes vary from quarter to quarter. Changes in Fannie Mae's and Freddie Mac's purchase patterns occur over longer periods of time, but can also have an impact on the underlying samples. Sampling variability in the estimated indexes is largely a function of the size of the samples that can be obtained from GSE mortgage transactions, particularly for less populous states.

HOUSE PRICE INDEX HIGHLIGHTS

CENSUS DIVISIONS: (See maps and tables, pages 6-14)

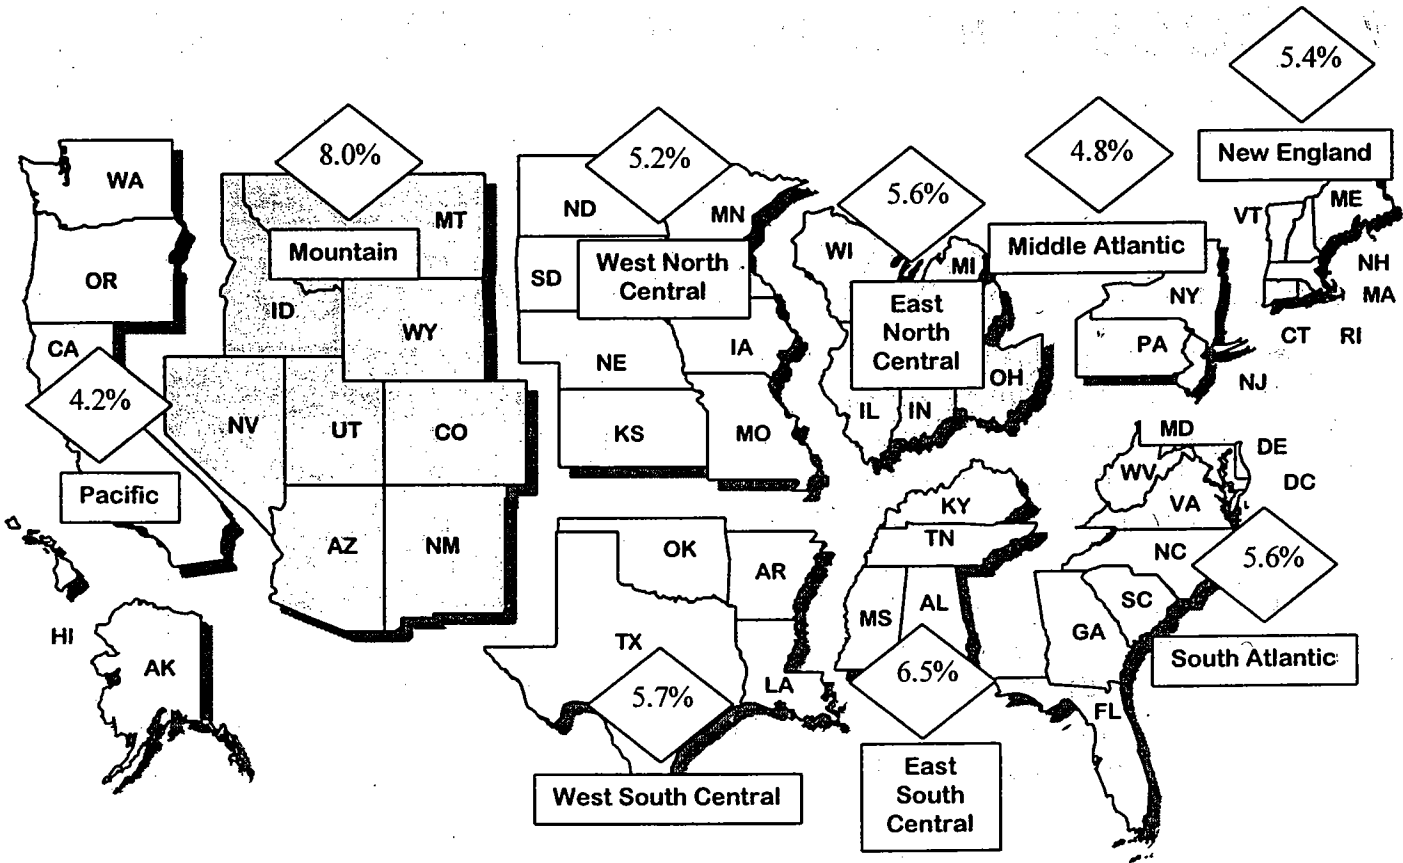

- House prices for the 12 months ended March 31, 1996 grew fastest in the eight-state Mountain division at 8.0%. The Mountain division also recorded the fastest price growth among the nine Census Divisions for the January- March 1996 quarter (1.5%), and for the five-year period ended March 31, 1996 (44.7%).
- Measured over the 16-year period since 1980, house price gains have been strongest in the New England, Middle Atlantic and Pacific divisions. But price gains tapered off markedly to the point where house price performance in these three divisions in the last five years was the weakest of all the nation's regions.

STATES: (See maps and tables, pages 6-14, plus summary table on page 15)

- Utah had the most rapid rise in house prices of any state for the 12 months ended March 31, 1996 at 10.7%, and also for the five years ending the same date, at 70.2%. The next fastest 12-month price increases among the states were Oregon, 8.8%; South Dakota, 7.8%; Wyoming, 7.7%; and Tennessee, 7.4%. House prices in the District of Columbia rose 9.2% in the 12-month period.
- California house prices continued to rally from earlier depressed levels. California prices were up an average 3.3% for the 12 months ended in March. For the five years ended March 31, 1996, single-family home prices in California have fallen an average 9%.

REGIONAL HIGHLIGHTS:

Mountain (AZ, CO, ID, MT, NM, NV, UT, WY): House prices increased 1.5% for the first quarter of 1996, and 8.0% for the last 12 months. For the past five years, house prices rose 44.7%.

East South Central (AL, KY, MS, TN): House prices rose 1.3% for the first quarter of 1996, and 6.5% for the year ended Dec. 31, 1995. The increase over five years was 26.0%.

West South Central (AR, LA, OK, TX): House prices rose 1.2% in the first quarter of 1996, and 5.7% for the preceding 12 months. The five-year increase was 20.3%.

East North Central (IL, IN, MI, OH, WI): House prices rose 0.9% for the first quarter of 1996, and 5.6% for the preceding 12 months. The five-year increase was 27.2%.

South Atlantic (DC, DE, FL, GA, MD, NC, SC, VA, WV): House prices rose 1.0% for the first quarter and 5.6% for the preceding 12 months. The five-year increase was 15.1%.

New England (CT, MA, ME, NH, RI, VT): House prices rose 0.9% in the first quarter, and 5.4% in the preceding year. House prices in New England have risen 2.1% in the five years ended Dec. 31, 1995.

West North Central (IA, KS, MN, MO, ND, NE, SD): House prices rose 0.8% for the first quarter of 1996, and 5.2% for the 12 months ended Dec. 31, 1995. The five-year increase was 24.6%.

Middle Atlantic (NJ, NY, PA): House prices rose 1.2% for the first quarter and 4.8% for the preceding 12 months. For the five years ended Dec. 31, 1995, house prices in the Middle Atlantic division rose 7.6%.

Pacific (AK, CA, HI, OR, WA): House prices rose 0.8% in the first quarter, and 4.2% for the preceding 12 months. House prices in the Pacific division have fallen - 0.2% in the preceding five years.

QUESTIONS AND ANSWERS ABOUT THE HOUSE PRICE INDEX (HPI)

What is the House Price Index?

It is a measure designed to capture changes in the value of single-family homes in the U.S. as a whole, in various regions of the country, and in the individual states and the District of Columbia. The HPI is published by the **Office of Federal Housing Enterprise Oversight (OFHEO)** using data provided by the **Federal National Mortgage Association (Fannie Mae)** and the **Federal Home Loan Mortgage Corporation (Freddie Mac)**.

How often will the HPI be published?

Every three months, approximately two months after the end of the previous quarter. The HPI reflecting home price figures for the quarter ending June 30, 1996 will be released in late August.

What is the value of the HPI?

The HPI is a broad measure of the movement of single-family house prices. Because of the breadth of the sample, it provides more information than is available in other house price indexes. The HPI serves as a timely, accurate indicator of house price trends at various geographic levels. It also provides housing economists with an improved analytical tool that is useful for estimating changes in the rates of mortgage defaults, prepayments and housing affordability in specific geographic areas.

What geographic areas are covered by the House Price Index?

The HPI includes house price figures for the nine Census Bureau divisions. In addition, the Index contains separate house price indexes for the 50 states and the District of Columbia. A weighted average index figure for the United States as a whole is also included.

How is the HPI computed?

The HPI is a *weighted repeat sales* index, meaning that it measures average price changes in repeat sales or refinancings on the same properties. This information is obtained by reviewing repeat mortgage transactions on single-family properties whose mortgages have been purchased or securitized by Fannie Mae or Freddie Mac since January 1975. There are more than 6.9 million repeat transactions in this national statistical sample. The HPI is updated each quarter as additional mortgages are purchased or securitized by Fannie Mae and Freddie Mac. The new mortgage acquisitions are used to identify repeat transactions for the most recent quarter and for each quarter since the first quarter of 1975.

What transactions are covered in the HPI?

The House Price Index is based on transactions involving conforming, conventional mortgages purchased or securitized by Fannie Mae or Freddie Mac. Only mortgage transactions on single family properties are included. "Conforming" refers to a mortgage that both meets the underwriting guidelines of Fannie Mae or Freddie Mac and that doesn't exceed the conforming loan limit, a figure linked to an index published by the Federal Housing Finance Board. The conforming limit for single-family homes is now \$207,000. "Conventional" means that the mortgages are neither insured nor guaranteed by the FHA, VA, or other federal government entity.

What transactions are not covered in the HPI?

Mortgages on properties financed by government-insured loans, such as FHA or VA mortgages, are excluded from the HPI, as are properties with mortgages whose principal amount exceeds the conforming loan limit. Mortgage transactions on attached or multi-unit properties are also excluded.

Why is the HPI based on Fannie Mae or Freddie Mac mortgages?

OFHEO has access to this information by virtue of its role as the federal regulator responsible for ensuring the financial safety and soundness of these two government-sponsored enterprises. Chartered by Congress for the purpose of creating a reliable supply of mortgage funds for homebuyers, Fannie Mae and Freddie Mac are by far the largest mortgage finance institutions in the United States. The combined mortgage records of these two GSEs are the nation's largest database of mortgage transactions.

Why is OFHEO publishing the HPI?

OFHEO is required by its enabling statute — *The Federal Housing Enterprises Financial Safety and Soundness Act of 1992 (Title XIII of P.L. 102-550)* — to develop and administer a quarterly risk-based capital stress test to measure the capital adequacy of Fannie Mae and Freddie Mac. In the stress test, the statute requires OFHEO to use a house price index to account for changes in the loan-to-value (LTV) ratios of mortgages held or guaranteed by Fannie Mae or Freddie Mac. To account for changes in LTV ratios, the statute specifies that OFHEO use the Commerce Department's annual Constant Quality Home Price Index (CQHPI) "or any index of similar quality, authority and public availability that is regularly used by the Federal Government." OFHEO has concluded that an index based on GSE mortgages offers significant advantages over the Commerce Department survey.

Why is the House Price Index an improvement on the CQHPI?

The HPI published by OFHEO covers far more transactions, and appears more frequently, than the Commerce Department survey. The CQHPI covers sales of new homes and homes for sale, based on a sample of about 12,000 transactions annually, gathered through monthly surveys. OFHEO's quarterly HPI is based on 6.9 million repeat transactions over 20 years. This gives a more accurate reflection of current property values than the Commerce index. The HPI also can be updated efficiently using data collected by Fannie Mae and Freddie Mac in the normal course of their business activity.

What role do Fannie Mae and Freddie Mac play in the House Price Index?

OFHEO uses data supplied by Fannie Mae and Freddie Mac in compiling the HPI. Each of the Enterprises had previously created a weighted repeat sales index based on property matches within its own database. In the first quarter of 1994, Fannie Mae and Freddie Mac began publishing a joint index, the Conventional Mortgage Home Price Index. The CMHPI is a 20-year quarterly index series covering 6.9 million repeat home sales or refinancings.

How is the HPI updated?

Each quarter, Fannie Mae and Freddie Mac provide information on their most recent mortgage transactions. These data are combined with the data of the previous 20 years to establish price differentials on properties where more than one mortgage transaction has occurred. The data are merged, creating an updated historical database that is then used to estimate the HPI.

What is the methodology used by OFHEO in computing the Index?

The methodology is a modified version of the Case-Shiller geometric weighted repeat sales procedure. A detailed description of the HPI methodology is available from OFHEO in an associated publication.

How can I obtain more information on the HPI?

Questions and requests for additional information should be directed to:

HOUSE PRICE INDEX (HPI) STATISTICAL REPORT

House Price Index Series 1st Quarter 1980 to 1st Quarter 1996

This report contains the index number and standard error for each quarterly regional and state HPI calculation since the first quarter of 1980. The boldface number in each column is the index number. The number in parenthesis is the standard error, which indicates the relative precision of the index number estimate. The higher the standard error, the larger the range of possible statistical error. Higher error numbers are generally associated with areas with relatively few repeat transactions and also with areas where the economy has experienced more pronounced ups and downs with resulting wide swings in house prices.

This report also contains house price volatility parameter estimates and annualized volatility estimates for each division and state index. For details on the index methodology and derivation of standard errors and volatility estimates, see the paper *OFHEO House Price Indexes: HPI Technical Description*, by Charles A. Calhoun. This paper is available on request from OFHEO.

OFHEO House Price Indexes : 1996 Q1
 U.S. Combined* and Census Division Indexes
 (1980 Q1=100)

* U.S. Combined Index is average of Census Division Indexes (weights are 1-unit detached housing units from 1990 Census). Standard error of index number in parentheses. For details on index methodology and derivation of standard errors see: OFHEO House Price Index : Technical Description, Office of Federal Housing Enterprise Oversight, Washington, D.C., 1996.

OFFICE OF FEDERAL HOUSING ENTERPRISE OVERSIGHT (OFHEO)

The **Office of Federal Housing Enterprise Oversight (OFHEO)** was established as an independent entity within the Department of Housing and Urban Development by the Federal Housing Enterprises Financial Safety and Soundness Act of 1992 (Title XIII of P.L. 102-550). The Office is headed by a Director appointed by the President for a five-year term. Aida Alvarez, OFHEO's first Director, was sworn in on June 1, 1993.

OFHEO's primary mission is ensuring the capital adequacy and financial safety and soundness of two government-sponsored enterprises (GSEs)—the **Federal National Mortgage Association (Fannie Mae)** and the **Federal Home Loan Mortgage Corporation (Freddie Mac)**.

Fannie Mae and Freddie Mac are the nation's largest housing finance institutions. They buy mortgages from commercial banks, thrift institutions, mortgage banks, and other primary lenders, and either hold these mortgages in their own portfolios or package them into mortgage-backed securities for resale to investors. These secondary mortgage market operations play a major role in creating a ready supply of mortgage funds for American homebuyers. Combined assets and off-balance sheet obligations of Fannie Mae and Freddie Mac were \$1.4 trillion at the end of 1995.

Fannie Mae and Freddie Mac are Congressionally-chartered, publicly-owned corporations whose shares are listed on the New York Stock Exchange. Under terms of their GSE charters, they are exempt from state and local taxation

and from registration requirements of the Securities and Exchange Commission. Each firm has a back-up credit line with the U.S. Treasury.

OFHEO's oversight responsibility includes:

- Conducting broad-based examinations of Fannie Mae and Freddie Mac;
- Developing risk-based capital standards using a "stress test" that simulates stressful interest rate and credit risk scenarios;
- Making quarterly findings of capital adequacy based on minimum capital standards until a risk-based standard is completed;
- Prohibiting excessive executive compensation;
- Issuing regulations concerning capital and enforcement standards;
- and
- Taking necessary enforcement actions.

OFHEO is funded through assessments of Fannie Mae and Freddie Mac. OFHEO's operations represent no direct cost to the taxpayer.

In its safety and soundness mission, OFHEO has regulatory authority similar to such other federal financial regulators as the Federal Deposit Insurance Corporation, the Office of the Comptroller of the Currency, the Office of Thrift Supervision and the Federal Reserve System.

(The legislation that established OFHEO also requires Fannie Mae and Freddie Mac to meet certain affordable housing goals set annually by the Secretary of Housing and Urban Development. These goals specify the share of mortgages that the two GSEs are required to purchase annually from low-income, moderate-income and central-city homebuyers.)
