Teacher: Mrs. Scarce

Proposal:

It is triangle shaped feature, near Double Curtain Glacier.

X:381101.77  
Y:-1290074.45

It is scientifically important because it looks man made and it is a perfect triangle. I would like to know what formed this weird thing. It also looks like it could be a crevasse that opened up. I think that maybe the crevasse opened up because of global warming.

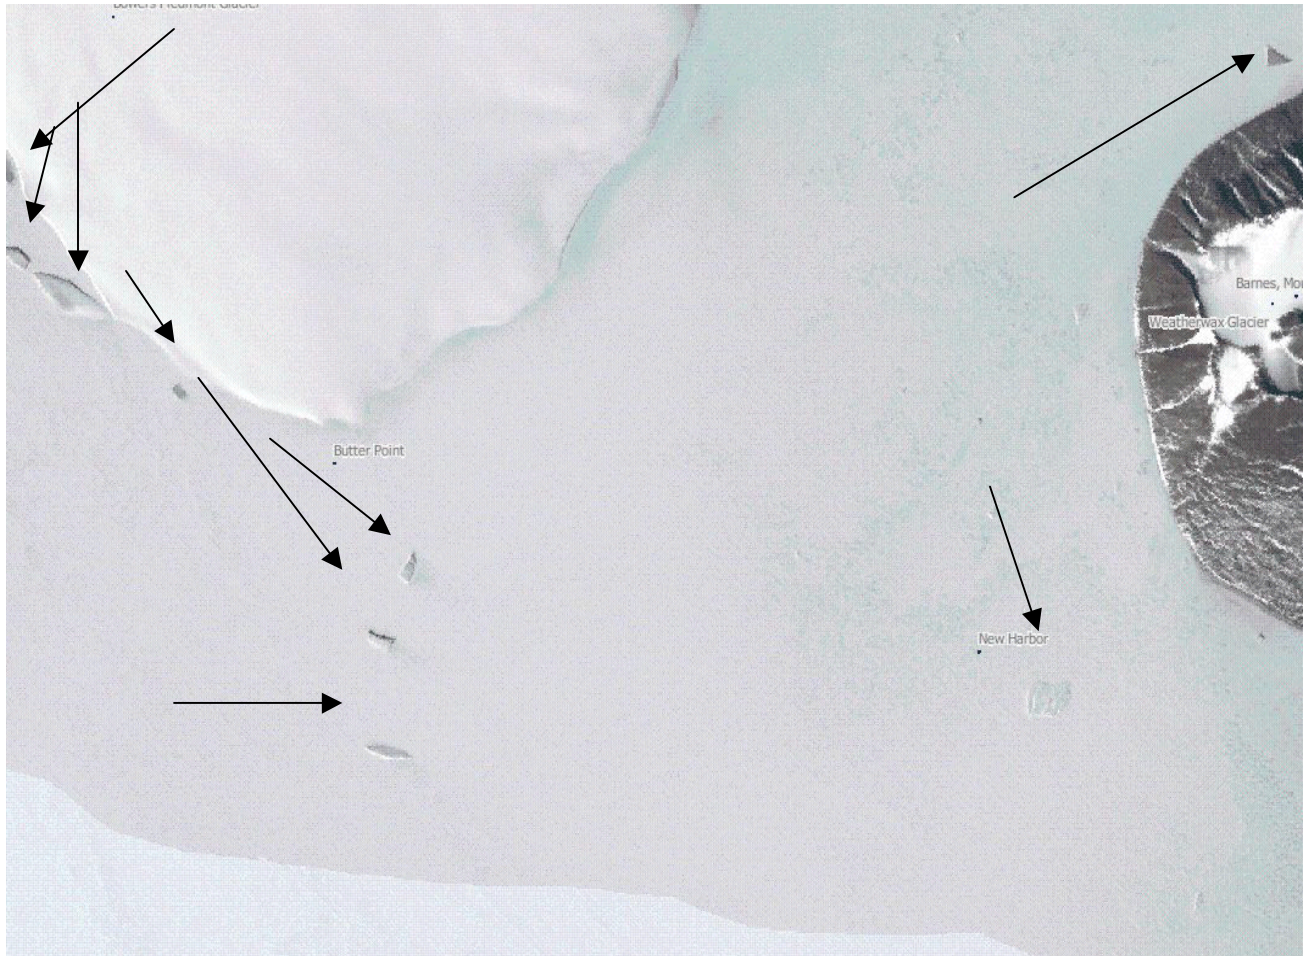

I think that maybe some geological features caused it. Like maybe a volcano is in that spot. Or an earthquake opened up the area. Or maybe it even is indeed man made!

I think that scientists should explore the area because maybe it is something that has been undiscovered and is important.

In the image below, my Triangular object is in the top right with the others ☺ on the left side of the picture near Butter Point.

They seem to occur in that same area.

On the web chat, I learned that there are even *rock glaciers* and *rock avalanches* in places on Antarctica. My feature is about .4 kilometers wide on each side. There are about 9 of them☺. I think that maybe an avalanche occurred and made an interesting hole in the ground, or maybe ice melted because of global warming and it just happened to make a perfect triangle. My proposal should be funded to explore this feature further.

**Thank you for considering my feature!**
