OGIP Calibration Memo CAL/GEN/92-027

THE OGIP FORMAT FOR 2-D (IMAGE) POINT SPREAD FUNCTION DATASETS

Ian M George & Rehana Yusaf

Mail Code 668,
NASA/GSFC,
Greenbelt,
MD 20771.

Version: 1995 Jan 19

SUMMARY

Ths document describes the standard formats adopted by the OGIP for the storage of the 2-diemnsional Point Spread Function (2DPSF) datasets.
Intended audience: primarily OGIP programmers & hardware teams.

Log of Significant Changes

Release Date	Sections Changed	Brief Notes
1992 Jul 24	First Draft	(within memo CAL/GEN/92-003)
1993 Oct 03	All	Separation from CAL/GEN/92-003
1994 Jan 12	All	Revised & added HDUCLASn info
1995 Jan 25	All	Made compatible with `LaTeX2HTML` software
2004 Apr 01	All	Made compatible with tth

1 Introduction

Within the OGIP caldb the term *"Point Spread Function"* (*PSF*) is used to refer to the spatial/angular spreading of incident photons from a point source caused by the instrument (detector and/or mirror). In the most common and simple case, imperfections in the surface smoothness and shape of the mirrors result in incident photons from cosmic sources not being perfectly focussed on the focal plane. Thus the number of events detected as a function of position in the focal plane is not the idealized δ-function at the expected position, but has a characteristic shape (depending upon the optics and detectors in use) with a finite "width". More generally, the *PSF* also can include spreading of events due to "geometrical" effects (*eg* obscuring structures, the detector surface not laying exactly on the focal plane, including coma), and effects within the detector (*eg* lateral charge-cloud drift in gas experiments), *etc.*

Thus, generally a point-source at infinity gives rise to a 2-dimensional image of finite size. Within the the OGIP caldb such a dataset is refered to as a *2DPSF*, and it is the FITS file format for such calibration datasets which are described here. The corresponding file formats for the analogous 1-dimensional calibration datasets (based upon azimuthally averaged values of a *2DPSF*, centred on the theoretical point of focus based on an idealized optical path) are described in CAL/GEN/92-020 (George & Yusaf).

2 2DPSF Data File Formats

The OGIP FITS Working Group (OFWG) Header-Data Unit (HDU) keywords and values for this type of dataset are:

- `HDUCLASS = 'OGIP'`
  - the name of the organization that defined this file format.
- `HDUDOC = 'CAL/GEN/92-027'`
  - the name of the document describing the format (*ie* this document)
- `HDUCLAS`n
  - giving the HDUCLAS hierarchy for this format.
    - `HDUCLAS1 = 'IMAGE'`
    - `HDUCLAS2 = 'PSF'`
    - `HDUCLAS3 =` (*see below*)
    - `HDUCLAS4 =` (*see below*)

These are valid for all datasets described in this section, and should be present in the **header of the extension** containing the *2DPSF* dataset.

2.1 Summary of 2DPSF file formats versions

The following versions of file formats for a *2DPSF* dataset have been defined:

- `HDUVERS = '1.0.0'` (Section 2.2)
  This format is currently still **VALID**, and can be used for calibration datasets.

2.2 The PSF Extension (HDUVERS = '1.0.0')

Description:
A 2-dimensional array either in the Primary FITS array or in an IMAGE extension.

Extension Header
Beyond the standard FITS keywords required, and the HDU keywords/values given in Section 2, the following keywords/values are mandatory:

- `CTYPE1` & `CTYPE2` - the names of the coordinates represented by the first and second axes
- `CRPIX1` & `CRPIX2` - the locations of a reference point along the first and second axes in units of the axis index. These value is based upon counters which run from 1 to `NAXIS1`/`NAXIS2` with an increment of 1 per pixel. The reference point values need not be that for the center of a pixel nor lie within the actual data array.

- `CRVAL1` & `CRVAL2` - the values of the coordinate system specified by the corresponding `CTYPE` keyword at the reference point given by the `CRPIX` keywords in units specified by the `CUNIT` keywords.
- `CDELT1` & `CDELT2` - the length of one side of the pixel at the reference point given by the `CRPIX` keywords in units specified by the `CUNIT` keywords.
- `CUNIT1` & `CUNIT2` - the units of the physical quantities specified by the `CTYPE` keywords. Allowed values are given in CAL/GEN/93-001.
- `TELESCOP` - the name of the satellite/mission.
  Allowed values are given in CAL/GEN/92-011.
- `INSTRUME` - the name of the telescope mirror/detector assembly.
  Allowed values are given in CAL/GEN/92-011.
- `HDUVERS = '1.0.0'` - giving the version of the format.
- `HDUCLAS3` - further describing the scientific content of the dataset, specifically regarding the origin of the dataset. The allowed values are:
  - `HDUCLAS3 = 'OBSERVED'` - indicating the *PSF* dataset has been generated from an observational dataset.
  - `HDUCLAS3 = 'PREDICTED'` - indicating the *PSF* has been generated using a theoretical model.
- `HDUCLAS4` - further describing the scientific content of the dataset, specifically regarding the contents of the dataset. The allowed values are:
  - `HDUCLAS4 = 'TOTAL'` - indicating the *PSF* dataset includes counts from the 'source' as well as any counts from the 'background'
  - `HDUCLAS4 = 'NET'` - indicating the *PSF* dataset has been background-subtracted
- `BACKGRND` - the background count rate in units of counts per pixel (where the pixel size is definded by `PIXSIZ`). If no underlying instrument or cosmic background is expected, then a value of zero should be entered.
- `ENERG_LO` - the minimum energy (in keV) for which the the *PSF* dataset was constructed or is valid. The value `-99.0` indicates that the value is unknown.
- `ENERG_HI` - the maximum energy (in keV) for which the the *PSF* dataset was constructed or is valid. The value `-99.0` indicates that the value is unknown.
- `CHANMIN` - the minimum detector channel number for which the the *PSF* dataset was constructed or is valid. The value `-99.0` indicates that the value is unknown.
- `CHANMAX` - the maximum detector channel number for which the the *PSF* dataset was constructed or is valid. The value `-99.0` indicates that the value is unknown.
- `CHANTYPE` - the type of detector channels `CHANMIN` & `CHANMAX` are expressed in, with the allowed values:

  - `CHANTYPE = 'PHA'` - for 'raw' detector channels
  - `CHANTYPE = 'PI'` - for (corrected) 'Pulse Invariant' detector channels

- `SUMRCTS` - the sum of the raw counts 'under' the *PSF* dataset. Essentially the value of this keyword can provide the 'normalization' of an observed dataset. It is **strongly** urged that the *PSF* supplied to the OGIP caldb be normalized to 1 count (*ie* `SUMRCTS = 1.0`).

and the following keywords/values are mandatory for CIF purposes **ONLY** if the dataset is ever to be included as a calibration file within the OGIP caldb (see CAL/GEN/92-011; George, Zellar & Pence 1992):,

- `CCLS0001` - the OGIP class of this calibration file, with allowed values:
  - `CCLS0001 = 'BCF'` - for Basic Calibration datasets
  - `CCLS0001 = 'CPF'` - for Calibration Product datasets
- `CDTP0001` - the OGIP class of the data type, with allowed values:
  - `CDTP0001 = 'DATA'` - for 'true' datasets
  - `CDTP0001 = 'TASK'` - for 'virtual' calibration datasets
- `CCNM0001 = '2D_PSF'` - the OGIP codename for the contents
- `CBD`n`0001` - the parameter-space limitations of the dataset (see below)
- `CVSD0001` - calibration validity start date
- `CVST0001` - calibration validity start time
- `CDES0001` - a descriptive string of the calibration dataset

Data Format:
A 2-dimensional array either in the Primary FITS array or in an IMAGE extension.

Points to Note & Conventions

- The parameter-space limitations on the dataset involving the following *pname* strings are recommended to be specified via the CBDn0001 keywords (see CAL/GEN/92-003):
  - *pname* = `THETA` - giving the off-axis angle for which the dataset is valid;
  - *pname* = `PHI` - giving the azimuthal angle for which the dataset is valid;
  - *pname* = `ENERGY` - given the energy range for which the dataset is valid
  - *pname* = `CHAN` - given the range of PHA detector channels for which the dataset is valid
  - *pname* = `PICH` - given the range of PI detector channels for which the dataset is valid

  (or corresponding alternate values of *pname* if a different coordinate notation is employed) along with any other limitations the authors of the dataset consider necessary.

3 Example FITS headers

Here we give an example of keywords used for a number of *PSF* images already in the calibration database.

3.1 *ASCA*

Example 1

A *2DPSF* dataset given in detector coordinates, constructed from observations, background subtracted, valid over a restricted energy range (1.0–2.0 keV) and at specified position in the focal plane (off-axis angle $\theta = 6.0$ arcmin, azimuthal angle $\phi = 9.0°$), stored in the Primary array.
