CH₃SH MW: 48.11 CAS: 74-93-1 RTECS: PB4375000 CH₃CH₂SH KI9625000 62.13 75-08-1 CH₃CH₂CH₂CH₂SH EK6300000 90.19 109-79-5

METHOD: 2542, Issue 1 **EVALUATION: PARTIAL** Issue 1: 15 August 1994

PROPERTIES: Table 1 OSHA: Table 1

NIOSH: Table 1 ACGIH: Table 1

SYNONYMS: Methyl mercaptan: methanethiol; mercaptomethane; methyl sulfhydrate

Ethyl mercaptan: ethanethiol; mercaptoethane; ethyl sulfhydrate n-Butyl mercaptan: butanethiol; 1-mercaptobutane; 1-butanethiol

SAMPLING MEASUREMENT SAMPLER: FII TFR TECHNIQUE: GAS CHROMATOGRAPHY. FPD (glass fiber, 37-mm, impregnated with **SULFUR** MODE mercuric acetate) ANALYTE: methyl, ethyl and n-butyl mercaptans FLOW RATE: 0.1 to 0.2 L/min VOL-MIN: 10 L @ 0.5 ppm **EXTRACTION:** 20 mL HCI (25% v/v) plus 5 mL 1,2-dichloroethane, 2 min -MAX: 150 L **SHIPMENT:** protect samples from light [1,2] **INJECTION** VOLUME: 1 µL **SAMPLE** STABILITY: at least 3 weeks @ 25 °C **TEMPERATURE-INJECTOR:** 250 °C 250 °C -DETECTOR: **BLANKS:** -COLUMN: 30 °C 2 min, 2 to 10 field blanks per set 15 °C/min, 200 °C COLUMN: narrow-bore, fused-silica capillary, **ACCURACY** 30 cm x 0.25-mm ID, 1 μ m DB-1 **RANGE STUDIED:** Table 2 **CARRIER GAS:** He, 1.0 mL/min; makeup gas: N₂,

20 mL/min BIAS: not determined

CALIBRATION: standard solutions of mixed mercaptans

OVERALL PRECISION (\$,T): Table 2 in 1,2-dichloroethane

ACCURACY: not determined RANGE: Table 2

ESTIMATED LOD: Table 2

PRECISION (S,): Table 2

APPLICABILITY: The working ranges are 0.2 to 10 ppm for a 20-L air sample for all three mercaptans [1-4].

INTERFERENCES: Dimethyl disulfide, diethyl disulfide and dibutyl disulfide may interfere [2-4].

OTHER METHODS: This is a modification of OSHA Method 26 for methyl mercaptan with the addition of ethyl- and n-butyl mercaptan [2].

REAGENTS:

- Methyl mercaptan* gas, lecture bottle, 99.5+%.
- 2. Ethyl mercaptan,* 99+%.
- 3. n-Butyl mercaptan,* 99+%.
- 4. Mercuric acetate, ACS reagent grade.
- 5. Hydrochloric acid, ACS reagent grade.
- 6. 1,2-Dichloroethane, ACS reagent grade.
- Methyl mercaptan calibration stock solution, 0.394 mg/mL. Pipet 5.0 mL methylene chloride into a vial and attach PTFE-lined cap. Add 1.0 mL pure methyl mercaptan gas (measured at 25 °C, 1 atm) to the liquid using gas-tight syringe.
- Ethyl mercaptan calibration stock solution, 2.52 mg/mL. Dissovle 30 μL ethyl mercaptan in methylene chloride in a 10-mL volumetric flask and dilute to the mark.
- n-Butyl mercaptan calibration stock solution,
 3.34 mg/mL. Dissolve 40 µL n-butyl mercaptan in methylene chloride in a 10-mL volumetric flask and dilute to the mark.
- 10. Helium, purified.
- 11. Hydrogen, prepurified.
- 12. Air, filtered, compressed.
 - * See SPECIAL PRECAUTIONS.

EQUIPMENT:

- Sampler: glass fiber filters impregnated with mercuric acetate. The filters are prepared by immersing 37-mm Gelman Metrigard (or equivalent) glass fiber filters with acrylic binder in 5% (w/v) aqueous solution of mercuric acetate, dried in the air, and then assembled in two-piece filter cassettes without backup pads. The filters exhibit yellowish color, but it does not affect their collection efficiency.
- 2. Personal sampling pump, 0.10 to 0.20 mL/min, with flexible polyethylene or PTFE tubing.
- 3. Gas chromatograph with a flame photometric detector, capillary column, integrator.
- 4. Vials, glass, 2-mL and 5-mL, PTFE-lined crimp caps.
- 5. Syringes, 10-, 50, and 250-µL.
- 6. Volumetric flasks, 10-mL.
- 7. Pipets, 5- and 20-mL glass, delivery, with pipet bulb.

SPECIAL PRECAUTIONS: Store methyl-, ethyl-, and n-butyl-mercaptans from flammable and

oxidizing materials [5,6]. The analytes are highly flammable and irritating to the eyes. Work in a

8. Separatory funnel, 30-mL.

SAMPLING:

- 1. Calibrate each personal sampling pump with a representative sampler in line.
- Remove the plugs from the filter cassette
 immediately before sampling. Connect the cassette to the sampling pump with flexible tubing.
 Air being sampled should not pass through any hose or tubing before entering filter cassette.

hood.

- 3. Sample at an accurately known flow rate between 0.1 and to 0.2 L/min for a total sample size of 10 to 150 L.
- 4. Replace the plugs in the filter cassette immediately after sampling. Store protected from light.

SAMPLE PREPARATION:

- 5. Add 20 mL of 25% (v/v) hydrochloric acid and 5 mL of 1,2-dichloroethane to a 30-mL separatory funnel. Fold sample filter and insert into the neck of a separatory funnel, without allowing the filter to become wet. While seating the stopper, push filter into funnel.
- 6. Shake funnel for 2 min without venting.
- 7. Let stand at least 5 min, until the phases completely separate. Then drain the 1,2-dichloroethane into a vial and seal with a PTFE-lined cap.

CALIBRATION AND QUALITY CONTROL:

8. Calibrate daily with at least six working standards covering the range of the samples:

- Add known amounts of calibration stock solution to 1,2-dichloroethane in 10-mL volumetric flasks and dilute to the mark.
- b. Analyze together with samples and blanks (steps 10 and 11).
- c. prepare calibration graphs: either quadratic curves, i.e., peak area vs. concentration of mercaptans, or linear curves, i.e., In (peak area) vs. In (concentration) ² can be used for calibration.
- Determine recovery (R) for each lot of glass fiber filters impregnated with mercuric acetate in the concentration range of interest. Prepare four filters at each of three concentrations plus three media blanks.
 - a. Apparatus for preparing and sampling gas spikes is shown in Figure 1. The apparatus is composed of glass and Teflon.
 - b. Sample at a rate of 0.2 L/min for 100 min.NOTE: Protect the samples from light.
 - c. Extract the samples (steps 5 through 7) and analyze (steps 10 and 11).
 - d. Prepare separate recovery graphs for each mercaptan (R vs. µg analyte).

MEASUREMENT:

- 10. Set gas chromatograph to conditions given on page 2542-1. Set air and hydrogen flow rates on the flame photometric detector to manufacturer's specification. Inject 1-µL sample aliquot via the split injection mode. Retention times: methyl mercaptan, 2.4 min; ethyl mercaptan, 3.2 min; n-butyl mercaptan 6.9 min.
- 11. Measure peak area.

CALCULATIONS:

- 12. Determine the mass, μg, of methyl-, ethyl-, and n-butyl-mercaptans found in the samples (W) and in the average media blanks (B).
- 13. Calculate concentration, C, of the mercaptans in the air volume sampled, V (L):

$$C = \frac{W - B}{V}$$
, mg/m³.

EVALUATION OF METHOD:

This method modifies OSHA Method 26, Methyl Mercaptan [2], and further develops and evaluates the procedure for ethyl- and n-butyl mercaptans, as well as methyl mercaptan [1]. The method was evaluated for recovery and extraction efficiency with gas spikes, 18 samples (6 at each level, 0.5, 1, and 2 x PEL)(Figure 1). Recoveries were 82.7% for methyl mercaptan, 89.3% for ethyl mercaptan, and 93.0% for n-butyl mercaptan. Test atmospheres of methyl- and ethyl mercaptans were generated with permeation tubes as the analyte source. Six samples at one level (1 x PEL) were collected and analyzed. Recoveries for generated samples, corrected for extraction efficiency, were 98.6 \pm 8.9% for methyl mercaptan and 102 \pm 7.8% for ethyl mercaptan. Samples of n-butyl mercaptan were not generated. Samples prepared by spiking impregnated filters with a solution of mixed mercaptans were found to be stable for at least three weeks at ambient temperatures when protected from light. The evaluation data are summarized in Table 2.
