

# Learn About the Health and Safety of Common Household Chemicals

Visit NLM's Household Products Database

<http://householdproducts.nlm.nih.gov>

**T**he Household Products Database is a consumer's guide to easy-to-understand information on the potential health effects of more than 2,000 ingredients contained in over 5,000 common household products.

The Household Products Database allows scientists and consumers to learn about ingredients in brand-name products, such as household cleaners, pesticides, detergents, and personal care products. It is designed to help answer questions like these:

- What chemicals are contained in brand-name products?
- What is the contact information for manufacturers of specific household products?
- What are the potential health effects of the chemical ingredients in a specific brand?
- What other information is available about the chemicals in the databases of the National Library of Medicine?

The information in this database comes from product labels and the manufacturers' Material Safety Data Sheet (MSDS).
