

## FOOD AND DRUG ADMINISTRATION

+ + + + +

PILOT PROGRAM FOR STREAMLINING THE  
LICENSURE OF BLOOD AND BLOOD COMPONENTS

+ + + + +

WORKSHOP

+ + + + +

WEDNESDAY

DECEMBER 9, 1998

+ + + + +

The workshop was held at 8:30 a.m., in the Plaza II Room of the DoubleTree Hotel, 1750 Rockville Pike, Rockville, Maryland.

## SPEAKERS:

GILLIAM B. CONLEY, MA, MT(ASCP)SBB, Moderator  
ELIZABETH CALLAGHAN, MS, MT(ASCP)SBB  
MARY ANN DENHAM, MBA, MT(ASCP)SBB  
REBECCA A. DEVINE, PhD  
JAY EPSTEIN, M.D.  
CAPT. MARY L. GUSTAFSON  
LESLIE G. HOLNESS, M.D.  
JONG-HOON LEE, M.D.

## I-N-D-E-X

	Page
Introduction, Gilliam B. Conley, M.A.	4
Welcome, Rebecca A. Devine, PhD. Jay Epstein, M.D.	10
Background, Mary Gustafson	18
Basic Concepts, Jong-Hoon Lee, M.D.	37
Discussions Questions, Gilliam Conley, M.A.	70
Gamma Irradiation, Mary Ann Denham, MBA	77
RBC Immunization, Elizabeth Callaghan, MS	93
Application Process, Leslie Holness, M.D.	108
Panel Discussion, All Speakers	112
Open Discussions, Speakers and Participants	176

P-R-O-C-E-E-D-I-N-G-S

(8:30 a.m.)

MODERATOR CONLEY: Good morning. Last chance to grab one more cup of coffee. There will be a break a little bit later.

Welcome to Rockville. If you had been here earlier in the week, it was so warm we're all having trouble getting into the Christmas spirit. I have a theory that it's because Texas was so hot last summer. It's like when you put a brick in bed with you to keep warm at night; it's still warming the whole nation. But we're getting there.

I'm the one who gets to introduce himself this morning. I'm Gil Conley, and I'm a Consumer Safety Officer in the Division of Blood Applications, and I'll be the moderator today.

Introducing myself, I kind of had a choice of deciding what to call myself, and I think moderator is probably best. I started with Master of Ceremonies, but then we would need candles on the tables, and I would have to tell jokes and maybe sing a song, and you would be sneaking out the back looking for the gambling tables. So we'll stick with moderator.

My task today is to introduce our speakers and to keep us focused on the task that we're here for. We really appreciate all of you coming to join

1 us. These meetings are always preceded by the  
2 disclaimers. The speakers today are all from the FDA,  
3 and they all have a vested interest in a smooth,  
4 efficient regulatory process which both protects and  
5 improves the public health.

6 Our other presenters today, hopefully,  
7 will be you, because we're presenting some new ideas  
8 and inviting discussion, and we hope that you'll  
9 participate in that discussion, especially later  
10 today; and, of course, you all also have a vested  
11 interest in the entire regulatory approach that the  
12 FDA follows.

13 Although the term workshop has really come  
14 to mean another name for a lecture series, that's not  
15 what we're about today. It's a true workshop where we  
16 want to exchange ideas, hear your thoughts and  
17 opinions on what we are currently proposing or  
18 thinking is a proper direction for regulatory affairs.

19 Why are we here today? Well, if you've  
20 heard me speak before, you know I like cartoons. They  
21 usually sum up life pretty well, and this one does.

22 In this one, Ruthie is coming home from  
23 school, and her grandfather wants to know what she  
24 has. She explains she has schedules, changes, and  
25 announcements for her mother, and she says, "I'm only  
26 in first grade, and already I'm fed up with the  
27 paperwork."

1           Well, there are a lot of us who feel the  
2 same way about some of the regulatory paperwork we've  
3 been through, and you've already seen that a lot of  
4 the changes that have been coming from our group in  
5 recent history have been geared toward reducing the  
6 paperwork, both for you to produce and submit and for  
7 us to review.

8           Today's efforts will, hopefully, extend  
9 that whole goal of reducing paperwork and easing the  
10 process without losing the FDA's responsibility for  
11 the public health.

12           Some housekeeping issues first: There are  
13 bathrooms right outside this door and more in the  
14 hallway around the corner. If you need to use a  
15 phone, again, farther down this hall on the right or  
16 back near the bathrooms over here there are phones.

17           Come lunchtime, there are many  
18 opportunities in the area. Of course, there is a  
19 restaurant in the hotel. There is a listing in your  
20 folder of local restaurants. Some are too far away,  
21 I think, for lunchtime, but directly across Rockville  
22 Pike in front of the hospital there's a Greek and  
23 Indian restaurant.

24           There's also more restaurants as you go up  
25 Rockville Pike, and if you exit through the door  
26 that's at the back of this auditorium and across the  
27 way, there's another restaurant on the right. You

1 won't have any trouble finding places to eat.

2           We also have a message center here today.  
3 In this day of cellphones and beepers, probably most  
4 of you won't need that, but in case you do need to  
5 give somebody a phone number where you can be reached  
6 today: 301-230-6757. That comes to a phone for the  
7 people who are manning our front desk area, and there  
8 is a message board out there that you can check during  
9 breaks.

10           You all got handout packages and, just  
11 briefly to go over some of the information that you'll  
12 find in the package: In the righthand pocket you'll  
13 find today's agenda. So if I deviate from the agenda,  
14 you can call me on it.

15           There's a list of our speakers, and there  
16 will be copies, I believe, of most of the presenters'  
17 slides to make it easier for you to take notes.

18           In the lefthand pocket there's a  
19 participant list, at least those who registered for  
20 the program ahead of time. It's possible there should  
21 be some people who are registering here today or that  
22 people registered and decided not to come, but that's  
23 the list of those who registered.

24           You will also find a sheet -- I believe  
25 it's on gray paper -- that is topics and questions for  
26 participant comment. We'll go over those in a little  
27 more detail later this morning, but they are some of

1 the issues that we want you to consider, and we  
2 specifically or especially want to hear your comments  
3 on this afternoon.

4           There's a sheet that describes the  
5 transcript that will be taken here today. There will  
6 be a full transcript of this meeting available 15  
7 working days after the meeting. There will also be  
8 summary minutes that will be produced no later than 30  
9 days after this meeting.

10           The easiest access for the transcript will  
11 be on the Net, and there's a Net address given to you  
12 on that sheet of paper. There are also other  
13 mechanisms for requesting a print, if you wish.

14           There are few sheets in there for notes,  
15 very few sheets. Write small. But there are also  
16 some cards in there that we'll want you to write your  
17 questions on. You may use those or later, as I said,  
18 there will be opportunities to come to the microphone.

19           Please turn your questions in after the  
20 speakers have spoken on the relevant topic. In past  
21 sessions we've found that we got a lot of questions  
22 that had to have been written before the speakers  
23 spoke, because the information was included in what  
24 they presented to the group. So after the speaker has  
25 completed their presentation, if you have questions,  
26 jot them down on those cards.

27           I'll be reading them. I'm getting older

1 all the time. We just got a stronger script. So  
2 please write clearly for me, and I'll organize those  
3 questions for later.

4           You can give those to me at the break or  
5 you can give them to the people at the front desk in  
6 the lobby or later in the day some of those same  
7 people will be circulating around the room to pick up  
8 your questions.

9           We will ask later this afternoon when you  
10 give your opinions to not limit yourself to just  
11 reacting to our own ideas that are presented, but to  
12 expand on them with suggestions and ideas for  
13 regulatory review.

14           Today's agenda -- There are -- Look at the  
15 agenda sheet with me just briefly. We've got large  
16 gaps of time scheduled for breaks and for lunch.  
17 Please spend that time to sit down with your  
18 colleagues and, again, enhance the discussion so that  
19 you can share those ideas with us.

20           I think that's enough housekeeping. So  
21 our first speaker today is Dr. Rebecca Devine.

22           Becky is the Assistant Director for Policy  
23 for the Center for Biologics Evaluation and Research.  
24 She assumed this role in April of 1994 and has  
25 responsibility for the oversight of policy  
26 initiatives, regulation and guidance for CBER. In  
27 other words, she's an agent for change within the

1 FDA/CBER. She sponsors it, encourages it and, hence,  
2 meetings like this.

3 She's also responsible for the development  
4 and the maintenance of the managed review process at  
5 CBER. She's in charge of the system that keeps our  
6 reviews on track and on time.

7 Dr. Devine received her BS degree in  
8 microbiology in 1977 and a PhD in microbial physiology  
9 in 1986, both from the University of Maryland. She's  
10 held various positions in CBER in the areas of quality  
11 control testing, GMP review, inspections, and vaccine  
12 and biotech application review since she joined the  
13 FDA in 1979.

14 Becky is here from the Office of the  
15 Director to welcome you.

16 DR. DEVINE: Good morning, and welcome to  
17 the workshop. As Gil said, I'm here to welcome you,  
18 and I would also like to thank those of you who have  
19 taken the time out of your busy holiday schedules to  
20 come and spend some time with us.

21 I think it's important, as we go through  
22 our reform initiatives, that we get feedback from the  
23 regulated industry and the affected public. So that's  
24 why we spend time and effort to have workshops such as  
25 this, to get that kind of feedback.

26 In terms of setting the stage, in 1994 in  
27 January, as you all may recall, we issued a Federal

1 Register notice asking people to give us input on  
2 where we could change our regulations. This was part  
3 of an effort that we were taking to look at all of the  
4 biologics regulations and decide where they needed to  
5 be changed if they were outdated or were no longer  
6 useful in terms of what we wanted to accomplish to  
7 protect the public health.

8 We got many comments during that time  
9 period, and in addition to that, we specifically  
10 queried the blood industry for ways that we could  
11 change the blood regulations. We also received much  
12 input on that.

13 Over the past four to five years, we have  
14 been embarking on an effort to accomplish many of  
15 these changes. In 1995 we began our reinventing  
16 government initiatives under Vice President Gore's  
17 leadership in terms of how we could streamline the  
18 regulation of medical devices, drugs and biologics.

19 As you might recall, in April of 1995 we  
20 issued our first RIGO report which indicated some of  
21 the initiatives we were undertaking. One of the very  
22 important initiatives that affected the blood industry  
23 in that time period was the manufacturing changes  
24 streamlining that we were undertaking.

25 In that time period, April of '95, we  
26 issued our first effort in terms of trying to  
27 downgrade certain types of manufacturing changes.

1 That was just a first step. We, after the guidance,  
2 had to go forward to change our regulations at 601.12,  
3 and that effort was completed in July of 1997.

4 Now during the comment period for the  
5 manufacturing changes rule, it was interesting that we  
6 did not get a lot of public comment on the proposed  
7 rule and the attached guidance documents. However,  
8 after the comment periods had closed and we were now  
9 working on the final rule and issuing final guidances,  
10 we then began to hear some dissatisfaction with some  
11 of the initiatives.

12 So we thought we had made great efforts to  
13 try and get the input during the comment period, and  
14 that's again more of the reason why we're here this  
15 morning. It is helpful for us to know ahead of time.  
16 So please don't be shy about giving us your input on  
17 this proposal that we're talking about today.

18 Now in terms of the other initiatives that  
19 have affected us and that are moving us towards this,  
20 we have, obviously, been affected by the passage of  
21 the Food and Drug Administration Modernization Act  
22 which was signed into law in November of 1997.

23 Now that law codified our second RIGO  
24 initiative, which was the elimination of the  
25 establishment license application and the product  
26 license application, and our moving to a single  
27 biologics license application for all biological

1 products that are subject to licensure under the  
2 Public Health Service Act.

3 Now we have not yet been able to complete  
4 that initiative, but we're getting very close. We  
5 proposed a rule, and we had an open public meeting in  
6 September to discuss that. The comment period on the  
7 rule has now closed, and we received several letters  
8 of comment.

9 It's interesting that most of the comments  
10 we received were from the blood industry. So for  
11 those, I thank you, and we are now working on trying  
12 to get that rule finalized.

13 The companion document to the proposed  
14 rule was the CMC or the Chemistry Manufacturing and  
15 Controls guidance document that described what  
16 information would go into the BLA. Now it proscribed  
17 a set of things we thought were appropriate for  
18 inclusion in the BLA, and we are now currently  
19 evaluating comments on that as well.

20 Now as you know, there are many oversight  
21 bodies which are looking at how we regulate blood and  
22 other biological products. As a result of many of  
23 these oversight reviews, we have established in the  
24 Center a blood action plan to address many of these  
25 public health issues that have been brought to our  
26 attention in some of these oversight, as well as to  
27 address the reform efforts that we were undertaking

1 starting in 1994.

2 Part of the blood action plan is this  
3 effort at the pilot program which we will be talking  
4 about today. One of the things we're trying to do is  
5 look for areas where the amount of information that's  
6 submitted in an application can be streamlined or  
7 decreased as much as possible.

8 So we're now talking about proposals such  
9 as the one today where we would submit less  
10 information, and we would be able to approve,  
11 hopefully, applications on supplements more quickly  
12 and streamline the process.

13 So, hopefully, that's put the effort in  
14 perspective for you, and again the only way that we  
15 can really make this useful for the industry is to get  
16 your feedback.

17 So I really hope that we get a good  
18 dialogue going today. I notice there are many FDA  
19 people that deal with the regulation of the blood  
20 products in the audience, and they're very anxious to  
21 hear your thoughts.

22 If you are shy and you don't want to step  
23 up to the microphone today, there are other ways that  
24 you can give us your input. The guidance document,  
25 which will be discussed today, was posted on our Web  
26 site. It is available there for people under our  
27 FDA/CBER guidelines location on our Web site.

1           In several weeks there will be a Federal  
2 Register notice of availability for that document that  
3 we'll publish, and it will have a docket number, and  
4 that would be a place where you could send written  
5 comments to the document, if you feel that you really  
6 don't want to get up to the microphone today; but I  
7 would encourage you to come to the mike today. don't  
8 be shy. We really are very anxious for your input.

9           I hope that we have a productive meeting.  
10 We have a lot of time scheduled today, and the success  
11 of the effort today is going to depend on  
12 participation from the audience.

13           In terms of my recommendations and wishes  
14 for you today, I hope that we have a productive  
15 meeting and get lots of good input. My recommendation  
16 for lunch is Ambrosia, and I would order the gyro  
17 platter. So have a good meeting, and thanks for  
18 coming.

19           (APPLAUSE)

20           MODERATOR CONLEY: Any program that runs  
21 absolutely on schedule must be boring. So we have a  
22 surprise welcome not on our agenda. Dr. Jay Epstein  
23 is the Director in the Office of Blood.

24           If you understand the organization of the  
25 Center, there are a number of offices within the  
26 Center for Biologics, and Jay heads up one of those  
27 groups and wants to re-accent how welcome you all are

1 and how much we appreciate your time today.

2 DR. EPSTEIN: Thank you, Gil. The  
3 moderator said, well, if you're going to come, you're  
4 going to speak. So --

5 Let me just express my pleasure in being  
6 here and having the opportunity to greet you all  
7 personally, and to add my appreciation to those that  
8 you've heard for your willingness and interest to come  
9 today and help us in this task.

10 I'm sure you all know the Chinese proverb  
11 that a journey of a thousand miles begins with a  
12 single step, and this fairly small and fairly quiet  
13 meeting really is the start of what potentially is a  
14 major new approach to blood licensing.

15 As Dr. Devine explained, the FDA is  
16 responding to a set of forces. We are highly mindful  
17 of our responsibility to assure blood safety and  
18 availability. At the same time, we live in an era of  
19 cost accountability and downsizing, and there is a  
20 need to streamline, both for the purposes of the FDA  
21 and for the purposes of the industry.

22 I cannot overemphasize the fact that  
23 success in this endeavor depends upon you and your  
24 colleagues. We think that it is essential that we  
25 engage in a good, two-way communication, and we  
26 certainly hope that you and your counterparts will  
27 embrace this initiative constructively and make it

1 work.

2           What can you do? Well, you can help us  
3 spread the word, and you can set good examples of  
4 successful use of applications through monographs.  
5 What you need to know is that the agency is poised to  
6 move fairly quickly to expand the scope of the use of  
7 monographs, should the pilot demonstrate that this is  
8 a successful mode which results in safe and effective  
9 products.

10           So I would encourage you to interact fully  
11 at the workshop. Otherwise, let me just say that I  
12 hope that you have a fruitful day and truly enjoy this  
13 "inside the Beltway" experience.

14           (APPLAUSE)

15           MODERATOR CONLEY: So you're only a small  
16 group today, and you've already heard how important  
17 you are and what a role you may get to play in setting  
18 the tone for future changes in regulatory review.

19           Our next speaker, Captain Mary Gustafson,  
20 is the Director of the Division of Blood Applications  
21 in the Office of Blood, CBER, within the FDA. That  
22 means that the majority of the people who are coming  
23 to the podium today report to Mary, and she shepherds  
24 our efforts within the Division of Blood Applications.

25           It's a little bit like harnessing the  
26 potential energy in a rock slide to good use, but  
27 that's what she does.

1           During her career with FDA, she has been  
2 involved in policy development, product approval, and  
3 compliance enforcement in the regulation of biologics,  
4 but primarily in blood and blood related products.

5           She frequently speaks to the blood and  
6 regulatory organizations concerning FDA's regulation  
7 of blood. She's a registered medical technologist and  
8 a blood bank specialist, and prior to coming to the  
9 FDA she worked in clinical blood banking for several  
10 years at private hospitals and then at the National  
11 Institutes of Health.

12           She holds a BS from Fort Hays State  
13 University, an MS from University of Tennessee Center  
14 for Health Services. She is a commissioned officer in  
15 the U.S. Public Health Service.

16           Mary will discuss the background issues  
17 which have led to today's meeting to discuss possible  
18 new regulatory approaches. Mary.

19           CAPTAIN GUSTAFSON: Thank you, Gil. I  
20 loved the introduction. I think I would refer to my  
21 job not like a landslide. I usually think it's more  
22 like herding cats. Also, listening to my bio, I know  
23 I have a dilemma, having received my Master's degree  
24 from University of Tennessee, and I have a daughter  
25 who's a sophomore at Florida State. So the Fiesta  
26 Bowl this year is going to be a real dilemma for me.

27           The primary reason that we're here today -

1 - By the way, I have six or seven overheads. They're  
2 not in your packet, but they're not anything that's  
3 critical to the actual program. So you may wonder why  
4 in the world I'm even speaking. It truly is  
5 background on why we have gotten to this point in  
6 blood licensing.

7           The primary reason is that licenses are  
8 required for blood and blood components when they  
9 cross state lines. Up until about a year ago -- in  
10 fact, for nearly two decades in FDA -- I would quote  
11 the language of the Public Health Service Act as  
12 saying no person shall sell, barter or exchange from  
13 any state into any other state any biological product  
14 unless that product has been manufactured at an  
15 establishment holding an unsuspended and unrevoked  
16 license.

17           As Dr. Devine mentioned, there is a law  
18 that was passed in 1997 that's called the Food and  
19 Drug Administration Modernization Act. Among many  
20 other provisions that we are grappling with, it  
21 changed the language of the Public Health Service Act,  
22 so that it reads more like the language in the Federal  
23 Food, Drug and Cosmetic Act.

24           That is, "No person shall introduce or  
25 deliver for introduction into interstate commerce any  
26 biological product unless a biologics license is in  
27 effect for the biological product."

1           You may ask, what in the world does that  
2 wording change mean? Well, it eliminates the need for  
3 an establishment license altogether. It has some more  
4 subtle meanings that I will leave to the attorneys for  
5 another day, but the bottom line is that a license is  
6 still required when a biological product crosses a  
7 state line.

8           In the past few years we have been working  
9 on changes in the way we license biological products  
10 to decrease the burden on industry, which is you, but  
11 still ensure the protection of the public health. One  
12 of the changes was initiated as a report reduction  
13 project and ended up as a change in the regulation  
14 governing when and how changes to an already approved  
15 product are reported to the FDA.

16           This is a change in the regulation covered  
17 by Title 21, Code of Federal Regulations, Section  
18 601.12. The new regulation was enacted in July of  
19 1997 and implemented in October of 1997.

20           Reporting of changes was stratified by  
21 risk into three reporting categories. Changes to an  
22 application determined to have a substantial potential  
23 to have an adverse effect on the product requires the  
24 submission of a supplement that must be reviewed and  
25 approved prior to the product prepared by the changed  
26 method being shipped for use.

27           Changes to an application determined to

1 have a moderate potential to have an adverse effect on  
2 the product require the submission of a supplement,  
3 but product manufactured by the changed method can be  
4 shipped prior to the submission actually receiving  
5 approval.

6 Changes that have a minimal potential to  
7 adversely affect the product can be reported once a  
8 year in an annual report. The report is reviewed and  
9 filed in the license application, but the changes  
10 reported in this manner are not issued an approval.  
11 This change in reporting was undertaken to benefit  
12 both the industry and FDA in terms of reducing the  
13 reporting burden.

14 We have quickly learned that use of the  
15 prior approval supplement route assures the greatest  
16 public health, but is basically the status quo of how  
17 applications have been submitted, reviewed and  
18 approved over the years.

19 The 30-day changes and the changes being  
20 effected upon submission -- that is, the CBE-30 and  
21 the CBE -- may benefit the industry somewhat because  
22 of the ability to implement the change and ship the  
23 product prior to the approval being granted. However,  
24 this reporting category does nothing for us.

25 In fact, the need to review the submission  
26 upon receipt to determine if the reporting category is  
27 correct requires us to track these submissions

1 separately and increases our burden. We also know  
2 that you in the industry are not terribly comfortable  
3 with the notion of going ahead with a change without  
4 knowing for sure if it is approvable or not.

5           The annual report, although viewed by many  
6 of you as a new burdensome reporting requirement, is  
7 where we see the most regulatory relief. We have been  
8 impressed by the reports we have received in terms of  
9 the reporting being in the correct category.

10           There have been few cases in which we have  
11 disagreed that the change was not minimal but had  
12 either a moderate or a substantial potential to harm  
13 the product being changed and, therefore, should have  
14 been reported in a higher reporting category.

15           We know that we owe you additional  
16 guidance for reporting under 601.12. You have told us  
17 that you wanted the blood and components guidance  
18 removed from the general biologics guidance, because  
19 so many of the examples are not related to what you  
20 do, and the language is, well, rather druggy.

21           We have been preparing the guidance you  
22 want, but quite frankly, we want to include as much as  
23 we can in the annual reporting category, since we  
24 think this category benefits all of us. We are  
25 looking for as many changes as possible that represent  
26 a minimal potential for harm to include in the  
27 guidance document.

1           Another change that was begun several  
2 years ago for a group of biotech products and made  
3 into law by the Food and Drug Administration  
4 Modernization Act of 1997 or what we call FDAMA is the  
5 elimination of the establishment license application  
6 and establishment licensing and the replacement of the  
7 product license with a biologics license.

8           Currently, we are in a transition period.  
9 Since February of this year when FDAMA was  
10 implemented, we have issued biologics licenses, but  
11 have issued those licenses based on the review and  
12 approval of separate filings for the product and the  
13 establishment.

14           Yeah, I know it's really confusing. If  
15 it's confusing to you, you should know what it's like  
16 to work with it on a day to day basis. We have  
17 numerous internal discussions about where we are and  
18 what we are doing in relation to biologics licensing.  
19 Most of the time I feel like I'm in a very bad revival  
20 of the famous "who's on first" sketch.

21           Sometime in the near future, we will be  
22 implementing the biologics license application. The  
23 enactment of FDAMA in many ways put the cart before  
24 the horse in terms of our planned implementation of  
25 the biologics license application process.

26           During the summer, we published for  
27 comment a guidance to assist manufacturers in the

1 completion of the biologics license application for  
2 blood and blood components. The agency, as Dr. Devine  
3 mentioned, also published a proposed rule o regulation  
4 changes to accommodate the biologics license  
5 application filing.

6 Comment periods for both the guidance  
7 document and rule have ended, and although we did not  
8 receive a lot of comments, we are thoughtfully  
9 considering each one and making revisions as  
10 necessary.

11 When the guidance publishes in final, we  
12 wills be ready to accept applications filed using the  
13 Standard Form 356h, which is an application form that  
14 will be used for all drugs and biologics. Those of  
15 you who have approved product and establishment  
16 licensed applications will be automatically deemed to  
17 have an approved biologics license application, which  
18 can then be supplemented with a single application  
19 filing.

20 In addition, the group of common products  
21 that currently have separate license applications will  
22 be consolidated into a single filing for blood and  
23 blood components rather than the separate product  
24 filings.

25 We believe the change to the biologics  
26 license application filing will reduce the filing  
27 burden to industry. We do not know what economies we

1 will actually derive from the change.

2 Our work in preparation for the change,  
3 including guidance, tracking and document handling,  
4 have been very resource intensive for us. We plan for  
5 the payoff to be in less administrative paperwork once  
6 the filing change is implemented.

7 The process changes I have just mentioned  
8 were discussed in detail at our workshop almost  
9 exactly one year ago today. Staff members from the  
10 Division of Blood Applications also presented these  
11 changes during a workshop at the American Association  
12 of Blood Banks annual meeting in Philadelphia this  
13 year.

14 In addition, I know that there have been  
15 considerable one-on-one discussions between you and  
16 your consumer safety officers concerning these  
17 changes.

18 I am also, as background for this  
19 workshop, going to share with you some information  
20 about our performance in the review of blood and  
21 component applications and our resources.

22 We currently function under a managed  
23 review system. By managed review, I mean the  
24 applications and supplements received for review are  
25 assigned to a reviewer or a team, tracked, assigned a  
26 review goal, sometimes with interim milestones,  
27 reviewed against an internal SOP, and checked by

1 supervisory staff for regulatory and scientific  
2 quality.

3           Reviewers are accountable for the quality  
4 and timeliness of their reviews. Review performance  
5 goals and measures are determined as part of Vice  
6 President Gore's National Performance Review. The  
7 initiative is Government Performance Review and  
8 Accountability or GPRA.

9           Currently, for blood and blood components,  
10 the GPRA goals are 12 months for the review of new  
11 applications and substantial supplements and six  
12 months for lesser supplements.

13           Now I know you think these times are too  
14 long. I was born at night but not last night.  
15 However, before you storm the podium, let me show you  
16 our performance data over time.

17           First I want to show you our application  
18 submission inventory by years. The fiscal year is  
19 represented along the x axis. We are on an October to  
20 September fiscal year. So for us here in the  
21 government, 1998 has already ended.

22           The y axis represents the number of  
23 submissions. I have lumped the received submissions  
24 and the pending submissions together, since they  
25 represent our in-box, and they are represented by the  
26 shaded box.

27           The solid blue bars represent the

1 submissions completed during the year. As you can  
2 see, our in-box grew in the early 1990s, while our  
3 completions remained fairly constant.

4           What happened in 1995? The big jump in  
5 received and pending submissions was due, in large  
6 part, to the licensing of irradiated blood components.  
7 However, in 1996 the in-box was substantially reduced,  
8 and this continued into 1997.

9           I am somewhat concerned about the lower  
10 number of completions in 1998, with the flatlined  
11 received/pending column, and I'm looking into the  
12 reason for this. At this point, I'm not sure if it is  
13 due to staffing, implementation of the revised 601.12  
14 regulation or perhaps other reasons.

15           One reason may be that we have just simply  
16 hit the critical mass in workers, and I'll show you a  
17 later slide on that; but is a marker for concern, if  
18 it continues into our current year.

19           My second overhead shows you our time to  
20 completions over time. Once again, the fiscal year is  
21 horizontal. The months to completion are represented  
22 vertically. I have split the original applications  
23 from the supplements to approved applications.

24           Applications are blue, and supplements are  
25 yellow. I have chosen to represent median time to  
26 completions rather than averages, since they seem to  
27 be less skewed by outliers. I have also chosen the

1 cohort of submissions completed in the year rather  
2 than the cohort of submissions received during the  
3 year.

4 This is because the 1998 and some of the  
5 1997 submissions have not yet been completed, or those  
6 that were received in those years, and hence those  
7 datasets are incomplete, and they would be,  
8 consequently, misleading, which is good enough for the  
9 President. It's not what I want to do, though.

10 As you can see, over time our completion  
11 times have generally decreased. The GPRA milestones  
12 were first established in 1997 using 1996 data. You  
13 can see from the graph how 12 months and six months  
14 were established as reasonable performance goals from  
15 the 1996 data.

16 These goals were not changed last year,  
17 even though our performance had improved, in large  
18 part because of the planned institution of the  
19 biologics license application and the changes to our  
20 system, including our computer system, that had to be  
21 done in order to accommodate the new filing system.

22 The bottom line was I was just plain  
23 scared silly that we would not be able to meet our  
24 review performance, knowing how many of our review  
25 resources were being used in planning for the  
26 biologics license application change, but as you can  
27 see, in 1998 our performance still improved.

1           In 1998 our median time frame for review  
2 of new applications was six months, and our review of  
3 supplements was just under four months. I am very  
4 proud of my staff for their efforts in reducing the  
5 time to review applications.

6           As I mentioned when I showed you the  
7 earlier slide, however, I am somewhat concerned about  
8 the pending versus completion ratio from last year,  
9 and will be monitoring that ratio.

10           My next overhead compares the number of  
11 completed submissions versus our full-time equivalent  
12 or FTE personnel resource burn. The FTE burn is  
13 calculated from our resource reporting system.  
14 Periodically, a reviewer reports how he spends his  
15 week. This information is generalized for the entire  
16 year.

17           The fiscal years are across the bottom of  
18 the graph, as in earlier slides. Along the left  
19 vertical is the number of completions. Along the  
20 right vertical is the number of FTEs used in the  
21 effort. The blue bars represent the completions and  
22 correspond to my first overhead blue bars. The orange  
23 line represents the full-time equivalents that it took  
24 to perform the application reviews.

25           I limited the FTE burn to application and  
26 supplement review only. As you can see, in 1992 15-  
27 plus FTEs completed fewer than 500 licensing

1 submissions. In 1998, just more than six FTEs  
2 completed nearly 700 licensing submissions. It shows  
3 that we are truly doing more with less.

4 The drop in FTE burn is due to a couple of  
5 factors. One, we have fewer people assigned to the  
6 work unit that reviews blood and blood component  
7 licensing submissions than we did in the past. We  
8 have had some downsizing in this area over the past  
9 few years, but also the staff we have are being asked  
10 to do a greater variety of operations.

11 The reviewers are not just doing reviews.  
12 They are developing policies, performing pre-license  
13 inspections, training and providing guidance to  
14 industry and FDA field personnel, working on  
15 initiatives for change within the Center, and probably  
16 dozens of other things that I can't think of right  
17 now.

18 So what does this mean to you? I know,  
19 you're looking at the 1992 FTEs and thinking, all she  
20 has to do is get back those 15 FTEs, and they can  
21 approve my application filings before I even put them  
22 in the mail. So let's all pack up, go to lunch, and  
23 spend the rest of the day shopping.

24 Now I have to burst your bubble and show  
25 you why we think we have to make even further changes  
26 in the licensing process in order to provide  
27 reasonable service to you, while protecting the health

1 of recipients.

2 I borrowed the next set of overheads from  
3 Mr. Mark Elengold, who is the Center's Deputy Director  
4 for Operations, hereafter referred to as the party  
5 pooper.

6 The first overhead in this series is what  
7 Mark refers to as the flying wedge. Once again, the  
8 years are across the bottom. On the vertical line,  
9 this time we have money in millions of dollars.

10 S&E is government language for salary and  
11 earnings. The red area represents how much money we  
12 were appropriated in the salary and earnings category  
13 of operating funds. This is where our people money  
14 comes from.

15 The black wedge represents how much money  
16 we would need to remain in a constant operating level.  
17 As you can see, it goes up ever so slightly over time.  
18 This is because "constant" is not really a flat line,  
19 because everything costs a little bit more now than it  
20 did in 1995.

21 Once again, the bottom line is that, in  
22 order for CBER to maintain our operations as they were  
23 in 1995, we would need roughly one-third more money  
24 than we have right now.

25 I am sure that you could show me similar  
26 representations for your own institutions. This is  
27 not unique, but it is a problem.

1           The next overhead breaks down CBER's  
2 operating allotment further into personnel monies  
3 under the prescription drug user fee program, called  
4 PDUFA, and monies for personnel in the non-PDUFA  
5 programs. I will not go into much detail, but PDUFA  
6 programs are those that are funded by money paid by  
7 drug companies to review their applications.

8           These allocations are protected by law in  
9 that money paid for the review of these applications  
10 cannot be diverted into other areas.

11           As you may have guessed by now, blood and  
12 blood components are not covered under the  
13 Prescription Drug User Fee Act and are non-PDUFA. On  
14 the graph, the non-PDUFA S&E base is represented by  
15 the aqua line at the bottom of the bar. As you can  
16 tell, the aqua line is getting smaller and smaller and  
17 smaller.

18           The last overhead represents the total  
19 CBER allocation of funds broken down by operating  
20 dollars versus payroll. Even with a constant number  
21 of employees, which we haven't had, the payroll money  
22 increases due to promotions and cost of living  
23 increases, and the President has just announced the  
24 other day that Washington area Civil Service employees  
25 are due, I believe, a 3.68 percent increase in  
26 January. That increase comes from our allotted funds.

27           Since the Center does need operating funds

1 beyond payroll, the only way to avoid cutting into the  
2 operating funds with the increasing payroll is to  
3 decrease the number of employees.

4 The Center's allocations are not going to  
5 increase. PDUFA funding is protected. Employees need  
6 their promotions and cost of living increases, and  
7 therefore, the staffing dedicated to the non-PDUFA  
8 review programs will keep decreasing.

9 This is why we are here today. We can  
10 keep doing what we are doing with fairly minor  
11 streamlining changes, such as the changes in the  
12 requirements for reporting changes to approved  
13 applications and the BLA implementation, manage our  
14 submissions under a pretty effective system of managed  
15 review and accountability, and still have you unhappy  
16 with us, because we will not be able to decrease  
17 further our review times and likely will increase our  
18 pending backlog; or we can float a trial balloon for  
19 a new licensing paradigm.

20 Yes, I hate that word, but it was the only  
21 thing that I could really think of to fit what we're  
22 doing.

23 Today we are going to present to you our  
24 ideas for licensing under a program of self-  
25 certification to a monograph standard. As Gil  
26 mentioned, we want this to be an interactive process,  
27 and Dr. Devine and Dr. Epstein also, I think,

1 mentioned that to you, that this is very important to  
2 us. We want and need your input into this concept.

3 Do you support or feel a self-  
4 certification licensing program would be useful and  
5 effective? We want your input on the specific areas  
6 that we have chosen to pilot.

7 One is designed for the blood bankers and  
8 involves licensing of irradiated blood components.  
9 The other is designed for the source plasma community,  
10 and addresses red cell immunization programs when the  
11 red cells are obtained from an already approved  
12 source.

13 The draft guidance for the irradiated  
14 blood program is hot off the press, and you were given  
15 a copy. It's on the Web, and it will soon publish for  
16 comment.

17 The other draft pilot guidance is not yet  
18 released. You will have to listen carefully to the  
19 presentation to see our proposed strategy for  
20 conducting this pilot.

21 We appreciate your coming to this  
22 workshop. We are looking forward to your comments and  
23 help in developing these pilot programs. Thank you  
24 very much for your participation.

25 (APPLAUSE)

26 MODERATOR CONLEY: Just like the review  
27 turnaround times that Mary showed you, the FDA is

1 getting shorter and shorter in its schedule. So we're  
2 a little bit ahead of schedule, and we will take that  
3 time in hopes of maybe letting you out sooner for  
4 lunch so that you can go to one of these nearby  
5 restaurants.

6 So we'll take a half-hour break now.  
7 Through some fluke in hotel package deals, we actually  
8 have refreshments. Please don't expect them at the  
9 next FDA meeting. However, we will reconvene at ten  
10 of the hour. Thank you.

11 (Whereupon, the foregoing matter went off  
12 the record at 9:23 a.m. and went back on the record at  
13 9:53 a.m.)

14 MODERATOR CONLEY: Mary told me that she  
15 had intended to tell a joke, but then forgot to.  
16 After her slides about the reductions at FDA in our  
17 support, she wanted to explain that, when I first  
18 started to work at FDA, I used to wear full-length  
19 ties.

20 We're starting to get into the meat of  
21 today's presentations. So pull out your pens and  
22 sharpen your pencils, and start to think about your  
23 comments, how you feel about the information that's  
24 being presented.

25 Our next speaker is Dr. Jong Lee. Dr. Lee  
26 is the Branch Chief at the Division of Blood  
27 Applications. He's been at the FDA approximately

1 three years. Jong will discuss the basic concepts  
2 behind the possible new regulatory approaches. Jong.

3 DR. LEE: Good morning, and welcome. I'm  
4 really glad that I was here on time to listen to  
5 Mary's presentation. That explains to me why I've  
6 been having so much trouble over the last several  
7 years, and it gives me renewed confidence that I'm  
8 doing the right thing. However, we are here to  
9 propose to you to do even better.

10 If I could have the first slide now -- We  
11 have heard a fair amount of general background  
12 material thus far, and those are very important points  
13 that were made in the background presentations.

14 Now we are beginning to delve into the  
15 specifics, and mine will be the most general  
16 presentation of the specifics of the pilot program  
17 that we'll be describing to you. I will focus on  
18 general basic principles, and I hope my presentation  
19 will give you a solid background to listen to the  
20 specific pilot programs that are to be described in a  
21 few minutes.

22 As in the way of brief overview, this is  
23 the listing of the ten basic concepts that I'll be  
24 discussing. By now you've heard from our previous  
25 speakers about the fact that this is an interactive  
26 workshop, and we need your input in telling us that we  
27 are going the right direction.

1           The first concept I will be discussing is  
2 that of self-certification and how this pilot program  
3 hinges on the idea of self-certifying to a set of  
4 CBER-prescribed guidance documents. I will explain  
5 then the difference between the pilot versus the pilot  
6 program, and there's a distinct difference.

7           I will explain how we propose to use this  
8 pilot within the pilot program as the new licensing  
9 mechanism, and I will go over how the pilots, specific  
10 pilots, and the pilot program fits in with the BLA and  
11 changes to reported streamlining initiatives.

12           I will go over how all of this falls under  
13 good guidance practice and that the proposals that we  
14 make today are not effective, but will be according to  
15 good guidance practice provisions.

16           I will make a comment or two about  
17 modifying the guidances or the inability to modify the  
18 guidances, to be more specific. I will then go over  
19 the legalities of how the pilots have to be conducted  
20 as a variance request, and I will end with two  
21 comments about evaluating the pilot and expanding the  
22 pilot to be of more general applicability.

23           I have organized this presentation into a  
24 series of ten basic concepts, and basic concept number  
25 1: We have been given the charge -- By we, I mean the  
26 Blood and Plasma Branch within the Division of Blood  
27 Applications -- to define the CBER pilot program to

1 streamline blood licensure, and our group chose to do  
2 this through an interactive dialogue with the  
3 regulated industry.

4           These are the current efforts already in  
5 progress in terms of streamlining, and there's the  
6 team blood and team biologics efforts that you've  
7 probably heard about, and these refer to the  
8 inspectional efforts. But in terms of submission  
9 review and with specific to licensure, you've already  
10 heard about the biologics license application  
11 initiative and changes to reported initiative.

12           With respect to blood and blood  
13 components, these two major licensing initiatives will  
14 be in the near future, we hope, supplemented by yet  
15 another streamlining initiative that we call the pilot  
16 program at this point.

17           So in terms of workshop goals, we propose  
18 to describe the new pilots, and there are two, to be  
19 specific, and we propose to describe them in terms of  
20 the overall pilot program which encompasses these two  
21 specific pilots.

22           We hope to engage you, and we hope to make  
23 sure that this is an interactive workshop, having a  
24 lot of ample time for question and answer sessions as  
25 well as discussion panels; and we invite you to write  
26 in comments, if you aren't able to provide them to us  
27 verbally at this workshop.

1           So having impressed upon you the fact that  
2 this is an interactive workshop, let me move on to  
3 basic concept number two: An applicant may self-  
4 certify adherence to CBER licensing criteria as  
5 outlined in a Pilot guidance, in lieu of submitting a  
6 conventional application that includes detailed  
7 standard operating procedures.

8           What do we mean by self-certification? We  
9 mean self-certification to a specific guidance that is  
10 released under the pilot program, and we hope to write  
11 these guidances in such a way that these are SOP  
12 oriented -- in other words, that they readily lend  
13 themselves to a conversion to a specific standard  
14 operating procedure that fits your center.

15           In a sense, these guidances that are SOP  
16 oriented are, in a sense, pre-reviewed by CBER. The  
17 traditional paradigm has been to submit -- to make a  
18 submission that describes the standard operating  
19 procedures and then review them and approve them.

20           In a sense, we propose to reverse the  
21 process. We have already reviewed, because these are  
22 -- this SOP oriented guidance document has been  
23 released by CBER, and your self-certification that you  
24 adhere to that would then simply constitute -- would  
25 simply constitute the submission. You're telling us  
26 that you have now adhered to the "pre-reviewed"  
27 guidance document, which allows us to simply proceed

1 with the next step of the review and, in these two  
2 specific pilots, the inspectional process.

3 This idea is not really new. This has  
4 been discussed widely among the industry in the past,  
5 and the American Association of Blood Banks has  
6 proposed in the past that we release FDA checklists,  
7 and we have done this, but we haven't quite  
8 encompassed the idea of their self-certification to  
9 the checklist as being enough for the licensure  
10 process.

11 The American Blood Resources Association  
12 has urged the agency in the past to write and release  
13 standard SOPs, so that they can simply submit the SOP  
14 that was written by the agency which would obviate the  
15 need to review them.

16 So what we are proposing today is sort of  
17 in between the two concepts already proposed in the  
18 past by the regulated industry. We are taking more of  
19 a detailed approach than simply releasing a checklist.  
20 However, we are not going so far as to actually write  
21 detailed standard SOPs, recognizing that true SOPs can  
22 only be written to fit individual centers.

23 Okay. So the whole cornerstone of the  
24 pilot programs is to self-certify to a previously  
25 established guidance document, and previous speakers  
26 have alluded to them as monographs. Whether it be  
27 called monographs or guidance documents, we mean

1 something written and released by CBER to which you  
2 can self-certify adherence, which would then allow us  
3 to move towards the next phase of evaluation -- that  
4 is, inspection.

5 Moving on to basic concept number three,  
6 the two pilots to be described in detail today are  
7 specific proposals under a broader, more slowly  
8 evolving pilot program. How do we define the pilot  
9 program?

10 Well, for now, pilot program centers  
11 around the idea that we are using guidance or  
12 monographs in lieu of detailed review of standard  
13 operating procedures. The pilot program is a broader  
14 concept than the specific pilots.

15 Then what are the specific pilots under  
16 the Pilot Program? We defined specific pilots as well  
17 defined regulatory areas, and these areas is to be  
18 defined by a specific guidance released under the  
19 Pilot Program or pilot guidance.

20 Today we are here to discuss in detail the  
21 irradiation pilot and the red blood cell immunization  
22 program pilot by two speakers following myself.

23 In trying to define the Pilot Program and  
24 the specific pilots, it's difficult to have everything  
25 mapped out right from the beginning, and the Pilot  
26 Program was defined by the idea of self-certification  
27 to a previously established monograph or guidance, and

1 that was enough of a long term goal to allow us to  
2 begin to think about the specifics.

3 Then how do we define the specifics? How  
4 do we take the first step towards this overall program  
5 goal? In trying to establish which areas to target,  
6 we had to take a step back and think about what the  
7 specific areas should fulfill to serve effectively as  
8 pilot candidates.

9 Whichever area that is selected, the  
10 regulatory area has to have some measurable outcome.  
11 That is, what is the impact of omitting review -- up-  
12 front review of detailed standard operating  
13 procedures? That effect has to be measurable.

14 In addition, whatever is learned from  
15 having conducted the pilot, that outcome should be of  
16 enough general applicability to be able to be of use  
17 in different settings other than the pilot itself.

18 Thirdly, we have to have enough resource  
19 to conduct the pilot and, hopefully, to expand the  
20 pilot to other areas for the whole thing to have  
21 practical implications and to be of true practical  
22 benefit.

23 Fourth, we would like to have the areas  
24 selected for the pilots to have some limited public  
25 health impact. In other words, we don't want to  
26 target an area where the implications for public  
27 health is too great.

1           Lastly, although we want to have limited  
2 public health impact, we want the public health impact  
3 to be enough so that there is sufficient interest in  
4 moving forward with the pilots. In other words, we  
5 don't want too much risk, but we don't necessarily  
6 want too little risk, because risk is almost always  
7 tied in with the interest level of the applicants.

8           In trying to come up with areas that fit  
9 those criteria, we took a look at the current way of  
10 reviewing and approving license applications. For a  
11 typical new license application, currently the  
12 establishment license application and the product  
13 license application, a detailed submission is  
14 reviewed, and then it is followed through by a pre-  
15 license inspection, and submission plus the inspection  
16 constitutes the entire review process.

17           For changes, manufacturing changes, to be  
18 reported to the license, once the license has been  
19 approved, it is done by a supplemental application.  
20 Typically, the supplemental application consists only  
21 of the submission only, submission without the pre-  
22 approval inspection.

23           There's two noteworthy exceptions to this  
24 current way of reviewing and approving license  
25 applications, and that is in reviewing the irradiation  
26 supplement and the red blood cell immunization program  
27 supplement.

1           Although these are supplements, the way  
2 that is reviewed parallels more closely that of the  
3 new license application. That is, a detailed  
4 submission which includes detailed standard operating  
5 procedures are reviewed, and then it is followed by a  
6 pre-approval inspection before a decision is made on  
7 the approvability of that application.

8           So irradiation and red blood cell  
9 immunization programs are exceptions in that they are  
10 supplements. Yet they are handled more like new  
11 license applications in terms of review elements.

12           It also just turns out that the Gamma  
13 irradiation supplement falls in the area of  
14 transfusion components; that is, components that are  
15 intended for direct transfusion into humans. We have  
16 used the memorandum issued in July of 1993 as the  
17 starting point from which to develop the specific  
18 pilot guidance that will serve as templates, so to  
19 speak, for you to use in converting that to a specific  
20 standard operating procedure, suited specific for use  
21 at your center.

22           Mary Ann Denham, the Consumer Safety  
23 Officer in the Blood and Plasma Branch, will go over  
24 this in detail. She has extensive experience as an  
25 inspector, as well as a reviewer, and she is regarded  
26 as the internal expert on the subject of Gamma  
27 irradiation of transfusion blood components.

1           The second area that jumped out at us from  
2 looking at how we review license supplements now is  
3 the red blood cell immunization program. Nicely, this  
4 represents -- This could be considered as the pilot,  
5 specific pilot targeted for the source components  
6 industry.

7           Although these are both blood components,  
8 source components are conceptually different from  
9 transfusion components in that these are components  
10 that are intended for further manufacture into other  
11 blood products or blood derivatives, and they are not  
12 intended for direct human transfusion.

13           So even though they look the same in terms  
14 of a physical product appearance, their intended use  
15 is entirely different and represents a -- the source  
16 industry represents a regulated industry that is  
17 distinctly different from transfusion components  
18 industry.

19           So, fortunately, review of the current  
20 ways of looking at license applications revealed two  
21 areas and, fortunately, the two areas happened to  
22 respectively lie in the source area as well as the  
23 transfusion area.

24           Similarly as in the Gamma irradiation  
25 topic, we have used the March 1995 memorandum on the  
26 subject on red blood immunization program as a  
27 starting point on which to build a specific guidance

1 to be released under the pilot which will serve as a  
2 template for you to convert into a specific operating  
3 procedure for your use.

4 Because CBER has written this pilot  
5 guidance, or will write the pilot guidance, we  
6 consider these as "pre-reviewed," allowing us to move  
7 directly into the inspectional phase of the evaluation  
8 and omit the detailed review of the standard operating  
9 procedure.

10 Elizabeth Callaghan, prior Consumer Safety  
11 Officer in the Blood and Plasma Branch, who also has  
12 extensive experience as inspector as well as a  
13 reviewer, will go over this topic with you, and she is  
14 our undisputed expert on red blood cell immunization  
15 program internally.

16 Now I should say one more thing about the  
17 red blood cell immunization pilot. The red blood cell  
18 immunization program basically consists of three major  
19 areas, the cell qualification area, the donor  
20 immunization and donor monitoring.

21 For purposes of the pilot, we have decided  
22 not to consider the cell qualification area, for two  
23 reasons. Firstly, the cell qualification process has  
24 a mandatory two-year quarantine period or at least one  
25 year, depending upon exactly where you are in the  
26 qualification process; and because of that mandatory  
27 quarantine period, we felt this to be of relatively

1 little interest for those interested in gaining time  
2 by not having CBER perform an up-front review.

3 Secondly, our prior inspectional  
4 experience has revealed that including this in the  
5 pilot would pose a public health risk that is more  
6 than what we are willing to accept at this point.

7 So based on considerations of public  
8 health risk, in turn based on our prior inspection  
9 experience, and because of the obligatory quarantine  
10 period associated with the cell qualification, we have  
11 decided not to consider this portion of the red blood  
12 cell immunization program as part of the red blood  
13 cell immunization pilot, and the pilot itself will  
14 then focus on these two areas.

15 So reviewing the current ways of license  
16 application evaluation generated two obvious areas to  
17 consider, and applying these five major criteria of  
18 measurability, generalizability, resource  
19 considerations, public health impact, and interest  
20 level has confirmed that these two areas, which  
21 readily lend itself to pilots, based on the current  
22 ways of reviewing applications, as two best candidates  
23 for the specific pilots to be initiated under the  
24 broader Pilot Program.

25 How well do these fit the criteria? We  
26 feel that, because of the inspectional element  
27 associated with the two supplemental applications,

1 that the outcome under the pilot will be imminently  
2 measurable through the inspectional findings.

3           How generalizable are these findings?  
4 That's a difficult question. However, recognizing  
5 that the transfusion components industry and the  
6 source component industry are really two separate  
7 worlds, however, within each world that the general  
8 operational concepts are similar, and we feel that  
9 having broken up into two separate areas that the  
10 outcome -- the experience that we gain under the Pilot  
11 Program will be, at least to some extent,  
12 generalizable and allow us to move forward to the next  
13 phase of the pilot.

14           What about resource considerations? We  
15 feel that, in terms of the Gamma irradiation pilot,  
16 that most blood centers interested in obtaining a  
17 supplemental approval for irradiation has already  
18 received them.

19           As Mary pointed out in previous  
20 presentations, the huge peak in 1995 was because of  
21 that, and that that peak has come and gone. However,  
22 there is still a steady baseline level of applications  
23 for Gamma irradiation, but that steady baseline level  
24 is a level that we feel we can handle with current  
25 resource allotment. However, we feel less sure about  
26 our resource considerations in terms of the red blood  
27 cell immunization program.

1           Our prior inspection experience has  
2 revealed that the inspectional process can be quite  
3 tedious, and the level of requests for red blood cell  
4 immunization program is at a level such that this  
5 makes us feel a little bit uneasy about our resource  
6 levels.

7           What about the public health impact?  
8 Again, our prior inspectional experience has revealed  
9 that this has truly limited impact, and that the  
10 industry is -- the understanding about the Gamma  
11 irradiation among the industry is such that we will  
12 not have too much concern in moving ahead with the  
13 irradiation pilot. However, again based on our prior  
14 inspection experience, we feel less certain about  
15 that, but having removed the cell qualification aspect  
16 of the red blood cell immunization program from the  
17 pilot, we feel more confident that this can be  
18 converted to an X.

19           What about interest level? Well, the same  
20 reason that limits the public health impact also  
21 lowers the interest level, as we anticipate. However,  
22 for the same reason of the concerns about resources  
23 and public health impact is the very reason that we  
24 feel that this is probably of reasonable interest from  
25 the industry.

26           So the two areas that we target are not  
27 perfect. However, this is as best as we can get, and

1 these are the two areas that we propose to you for in  
2 depth consideration today. So we are 30 percent done.

3 Basic concept number four: For each  
4 specific pilot under the Pilot Program, the viability  
5 of a new licensing mechanism will be tested. By now,  
6 I hope it's clear to you the difference between the  
7 specific pilots and the overall Pilot Program.

8 The pre-licensing inspection is the  
9 cornerstone of the two pilots, and that is the  
10 component of the pilot that allows us to assess the  
11 impact of conducting the pilot.

12 The pre-licensing inspection is to be  
13 conducted within 90 days of your self-certification to  
14 us that you adhere to the CBER prescribed guidance  
15 documents released under the Pilot Program, and it  
16 allows us to assess two things.

17 It allows us to assess the ability to  
18 self-certify. It allows us to assess your ability to  
19 self-certify, and this is an assessment at the  
20 individual application level. In addition, it allows  
21 CBER to assess the suitability of that particular area  
22 as a pilot candidate.

23 Basic concept number five: The two pilots  
24 are consistent with the existing biologic license  
25 application and changes to be reported streamlining  
26 initiatives.

27 You've already heard in some detail about

1 the BLA initiative and the changes to be reported  
2 initiative, and many of you probably have attended the  
3 full blown workshop last year on the same subjects.  
4 Here I would like to simply call your attention to how  
5 the two specific pilots that we propose today fit in  
6 with these two streamlining initiatives.

7 Now these are targeted for the specific  
8 pilots and not the entire Pilot Program. As the Pilot  
9 Program evolves, the relationship of how all of this  
10 fits may change, but we cannot do everything at once.  
11 We have to do things one step at a time.

12 We have an overall Pilot Program goal of  
13 self-certification, and how we implement that as a  
14 first step is the challenge here. Therefore, I have  
15 chosen to depict the relationship only for the  
16 specific pilots as it fits in the overall scheme of  
17 things.

18 What's shown in red is what's current and  
19 currently in effect, and what's shown in green is the  
20 future. We are currently operating under ELA and PLA  
21 licensing mechanism, and we are currently in a  
22 transition period to move over to the BLA initiative  
23 in the future.

24 The entire changes to be reported initiative --  
25 I called it initiative, because that was recently  
26 changed, October of 1997, by adding new reporting  
27 categories, the changes to be effected in 30 days, the

1 changes to be effected immediately, and the annual  
2 report mechanism, in addition to the already existing  
3 prior approval supplement mechanism.

4 This changes to be reported mechanism is  
5 already in effect, and the prior approval supplement  
6 is one category, one major category, under the changes  
7 to be reported licensing mechanism. What we are  
8 proposing are two pilots that fit in as options to the  
9 traditional ways of reporting prior approval  
10 supplements.

11 Just to look at this in a different way,  
12 the changes to be reported mechanism consists of three  
13 major elements, if you were to combine these two as  
14 one, three major elements: The prior approval  
15 supplement, the changes to be effected in 30 days or  
16 immediately or the annual report mechanism; and those  
17 categories are arranged according to their level of  
18 public health risk.

19 With low level of risk or at risk that we  
20 consider to be minor of public health impact, we have  
21 chosen to use the annual reporting mechanism where you  
22 can simply report to us what you have already done  
23 within the past year. Of course, if we happen to pick  
24 out some problems or questions, we will be in  
25 communication. Otherwise, you will not hear from us.

26 The changes to be effected in 30 days is  
27 basically the intermediate level where you will tell

1 us that you are going to do something either  
2 immediately or in 30 days, which gives us the ability  
3 to intervene either very shortly after or before the  
4 actual implementation of your proposed change.

5 We have chosen to use this mechanism for  
6 items of moderate public health impact. But we still  
7 rely on the prior approval supplement mechanism, and  
8 this mechanism, obviously, is targeted for those areas  
9 that we consider to be of major public health impact.

10 The sizes of circles here is chosen just  
11 to give you a qualitative idea of the number of  
12 supplemental applications that we receive under each  
13 category. By and large, the majority of the  
14 supplemental applications that are received still  
15 consists of prior approval supplements, although this  
16 -- the sizes of this circle here is increasing every  
17 day.

18 Now if you were to draw in the level of  
19 public health risk for new license applications --  
20 this whole slide is limited only to changes to be  
21 reported, but if you were to expand not only to the  
22 manufacturing changes to an approved license but  
23 actually include the requests for an application  
24 itself, it would be over here. It would be much  
25 higher.

26 So, basically, we have chose to insert  
27 this pilot to be implemented in the near future under

1 -- at a risk level where it's likely to be of  
2 sufficient interest because of its reasonable public  
3 health impact and not applications that one might  
4 consider trivial. However, we have chosen to stay out  
5 of the new license application area where we feel that  
6 the risk is definitely too much to be acceptable under  
7 a pilot program.

8           Just one more comment about the prior  
9 approval supplement, which is the category that  
10 contains the proposed two specific pilots. There's  
11 two types of prior approval supplements. You can  
12 categorize many things in many different ways, but for  
13 the purposes of this discussion I have chosen to  
14 categorize it this way.

15           There is a prior approval supplement that  
16 seeks to reduce the reporting level of a particular  
17 application request, and that request to report under  
18 a different category -- the request for an element  
19 that is pre-determined to be in the PAS category, a  
20 request to go from that category to something lower  
21 than that such as CBE-30 or CBE or even annual report  
22 -- such a request itself has to be approved up front  
23 as a prior approval supplement at least once but, if  
24 approved, that request will then allow you to report  
25 under a lower category.

26           This we have called the comparability  
27 protocol where the prior approval supplement proposes

1 to report the changes under a lower category than  
2 previously determined.

3 In addition to the comparability protocol,  
4 there is the more commonly understood PAS reporting  
5 category that's fixed -- that is, the reporting  
6 category as predetermined as a way of ensuring public  
7 health safety.

8 For those fixed reporting categories, we  
9 have those that have the pre-approval inspection as an  
10 element or those without that pre-approval inspection  
11 review element. So of the ones -- Of the fixed PAS  
12 reporting category with pre-approval inspection, I  
13 point out this is the exception, and this is the  
14 usual. We have two major exceptions, as you saw  
15 before, the irradiation and the red blood cell  
16 immunization program.

17 So pilots that we have selected are prior  
18 approval supplements with an inspection element which  
19 allows us to assess the impact of conducting the  
20 pilot, and again these are Gamma irradiation and red  
21 blood cell immunization programs, and I hope by now  
22 you have a good appreciation for the thought process  
23 that went into selecting these two areas as the pilot  
24 candidates.

25 So in terms of options for the applicant,  
26 if you are interested in supplementing your license to  
27 include Gamma irradiation for transfusion components

1 or the red blood cell immunization program for source  
2 components, you used to have just one option. You  
3 simply submit your submission to us, let us evaluate,  
4 let us do the inspection, and a decision will be  
5 forthcoming.

6 To that we propose to add an option, which  
7 is the self-certification to a CBER prescribed pilot  
8 guidance document or monograph, and that option  
9 represents the specific pilots.

10 Okay. Now we are 50 percent done. Basic  
11 concept number six: The two specific pilot guidances  
12 are currently being developed, and will be finalized  
13 under good guidance practice.

14 This speaks to the implementation date or  
15 the exact date of the pilot being effective. Under  
16 good guidance practice or GGP, it can either be three  
17 major steps or two steps, based on the level of public  
18 health risk.

19 What's shown in yellow here represents  
20 what would be, if it was a simple two-step process,  
21 but I'm afraid for the pilots we'll have to go through  
22 the entire process as it represents significant change  
23 and potential for public health risk.

24 The guidance has to be first developed and  
25 designated as being either level 1 or level 2, and has  
26 to receive internal clearance. That can then  
27 immediately move to the notice of availability of the

1 final guidance or it can go through notice of  
2 availability or NOA of the draft guidance in the  
3 Federal Register.

4           Following that notice will be a comment  
5 period during which the industry is invited to make  
6 comments. Those comments will be analyzed. The  
7 document will be accordingly revised, and we'll go  
8 through a repeat clearance process or some iterations  
9 between these two steps until the agency feels that  
10 there has been -- that the document is now ready for  
11 final guidance, at which time the notice NOA will be  
12 published in the Federal Register of the final  
13 guidance.

14           At that point of publication, the Federal  
15 Register will say exactly when the particular guidance  
16 will be effective. That's -- So look out for the  
17 notice in the Federal Register. It will tell you when  
18 exactly the pilot and the pilot guidance document will  
19 be effective.

20           So what we propose today here -- What we  
21 are describing today will not be effective until you  
22 see this notice, but the comments to this guidance are  
23 always welcome, even after its being effective.

24           Basic concept number seven: Once the  
25 pilot guidances have been finalized, once it has been  
26 finalized -- and finalized is the key word here --  
27 alternatives or modified versions cannot be considered

1 as a specific supplemental application.

2 In other words, alternatives or modified  
3 versions is always welcome at the level of the  
4 guidance document itself. In terms of shaping or  
5 reshaping the guidance document, the comments are  
6 always welcome and will be considered. However, at  
7 the level of each specific application, once it has  
8 been finalized, alternatives or modified versions  
9 cannot be considered, and here is why.

10 In terms of guidance documents, the  
11 typical CBER guidance outlined GMP recommendations  
12 and, if firms have an alternative route that affords  
13 equivalent public health protection, the applicants  
14 are welcome to propose that alternative way of doing  
15 things, and it will be considered -- reviewed,  
16 considered and approved, if appropriate.

17 The guidance to be released under the  
18 Pilot program represent, so to speak, "pre-reviewed"  
19 licensing criteria which was intended to obviate the  
20 prior review of that supplement. So if you propose to  
21 deviate from that, there is no way for us to assess  
22 the impact of that until we review it; and once we  
23 review it, it defeats the purpose of the pilot  
24 program. So by definition, no modifications can be  
25 considered under the pilot program at the level of  
26 specific license application.

27 Basic concept number eight: Applications

1 under the pilot must be submitted as a variance  
2 request under Title 21 CFR Section 640.120, a  
3 variance request to the regulation 21 CFR 601.12(b)(3)  
4 which outlines the requirements for the PAS reporting  
5 category within the changes to be effected reporting  
6 requirement.

7           What does 601.12(b)(3) say? It basically  
8 states that the prior approval supplement shall  
9 contain detailed descriptions, protocols and data to  
10 support the proposed manufacturing change and an  
11 assessment of the effect of that change on public  
12 health risk, as well as some other requirements.

13           As a pilot, we are endeavoring to deviate  
14 from this regulatory requirement, which is sound, but  
15 in terms of moving forward with a pilot program to  
16 test a different way of doing things, we cannot apply  
17 the rule in its literal sense. We have to move to an  
18 exception.

19           As an exception -- To move forward with an  
20 exception, that puts us in the variance request  
21 category or a legal mechanism that allows us to  
22 deviate from the detailed regulatory requirement  
23 specifically outlined in 601.12(b)(3). So I hope  
24 that's clear as to why we have to use this regulatory  
25 mechanism.

26           Basic concept number nine: The evaluation  
27 criteria to determine the success or failure of the

1 pilots have not been rigorously defined. That's of  
2 necessity and by design.

3 How do we determine whether or not a pilot  
4 is a success? In trying to determine whether or not  
5 we have a reasonable database to make an evaluation,  
6 to begin with, we have to have some idea of how many  
7 number of applications that we have to process, and we  
8 have to have some idea of the timeline. These are  
9 difficult decisions to make.

10 We have arbitrarily chosen approximately  
11 one year for the timeline, but we have no idea exactly  
12 how many applications will be received during that  
13 time. We have no idea of the interest level from the  
14 public and the regulated industry to take advantage of  
15 the optional PAS reporting category, as outlined by  
16 each specific pilot.

17 We hope to use the findings at inspection,  
18 again the cornerstone of this pilot program, as  
19 defined today, to determine the number of applications  
20 and the actual timeline that should be. What we find  
21 at inspections in terms of uniformity of the level of  
22 adherence or conformance to the CBER prescribed  
23 documents or monographs and the public health  
24 implications of each of those findings will determine  
25 how many applications we have to ultimately assess and  
26 what the actual timeline will be.

27 So in a sense that you can view this

1 process that we're following as being somewhat  
2 analogous to the drug approval mechanism, which may  
3 not be all that familiar to this audience, but  
4 typically when a new drug is being developed, sponsors  
5 or companies will follow under a investigational  
6 protocol Phase I, Phase II, Phase III developmental  
7 processes.

8           Phase I is where you typically test out an  
9 idea, and one of the major goals of the Phase I is to  
10 define parameters by which you will conduct a more  
11 definitive or Phase III study.

12           We are following a kind of a similar  
13 concept. We have, by design and of necessity, not  
14 defined the actual parameters at this point, because  
15 we have little to base that kind of decision. We  
16 don't have enough information database.

17           This initial pilot -- Under this initial  
18 pilot we hope to gain that information on which we can  
19 base a more definitive pilot, and that leads into  
20 expanding the pilot -- the pilot program, I should  
21 say.

22           So at this stage -- At this initial phase  
23 of the Pilot program, the two specific pilots are  
24 being conducted with some idea of the long term goal  
25 under the Pilot program, but without specific concrete  
26 milestones to capture, and this is again where we need  
27 your input as well.

1           In terms of the immediate outcomes once  
2 you make an application, what can we expect? Well, we  
3 hope it to be an approval letter as soon as the  
4 inspection is scheduled and conducted within 90 days.  
5 But that may necessarily not be the case, in which  
6 case you will receive a complete review letter, as you  
7 already have, when your application is not approved at  
8 the first go-round. But that review letter will be --  
9 will simply state whether or not -- Well, once that  
10 review letter is written, it will ask you to -- it  
11 will inform you that your application has withdrawn  
12 from the pilot, and it will explain the reasons why,  
13 and it's most likely going to specifically cite the  
14 inspectional findings as evidence of the fact that you  
15 have not been able to truly self-certify adherence  
16 according to the inspectional findings and, therefore,  
17 we are basically not considering your application  
18 under the pilot. But that is not to say that your  
19 pilot -- that your application cannot be considered.

20           Basically, once that review letter is  
21 written, then in your response back to us you have to  
22 apply conventionally. That is, you have to submit to  
23 us your operating procedure as you always have in  
24 obtaining approval for the changes that you propose.

25           Okay. So we are now at the last concept.  
26 We have -- In terms of expanding the Pilot, a plan to  
27 expand the Pilot program, currently loosely defined

1 based on the key idea of self-certification, to  
2 applications other than those covered by the two  
3 specific pilots has not been defined. This is where  
4 we need your input.

5           There has been some discussion within CBER  
6 as to how we might expand the pilot -- expand the  
7 Pilot program from these two initial pilot proposals,  
8 but those discussions are rather premature, because we  
9 have no experience gleaned yet from the two specific  
10 pilots.

11           We have some concrete ideas. However, we  
12 purposefully will not present them here, for the fear  
13 that you might misconstrue them as agency positions,  
14 and also to trigger you to independently think and  
15 propose to us, rather than simply parroting back on  
16 our initial proposals.

17           So the plan to expand the program, again  
18 of necessity and by design, has not been rigorously  
19 defined, and we would appreciate input on this.

20           So I have chosen the red background here  
21 to indicate to the audience that we are now at the  
22 concluding phase of this presentation, but after  
23 having done so, I realized that this list of ten basic  
24 concepts begin to look like the Ten Commandments. But  
25 I assure you, this is not the Ten Commandments.

26           These are simply basic concepts which is  
27 imminently modifiable, based on your input, and that's

1 the repeating theme of today's workshop that you've  
2 heard from speaker number one through -- that you will  
3 continue to hear until speaker number last.

4           The workshop is an interactive process.  
5 The whole idea of the Pilot program rests on the idea  
6 of self-certification. In fulfilling this goal we  
7 start out with two initial specific pilots under a  
8 broader Pilot program, and these two pilots represent  
9 optional PAS reporting categories as a new licensing  
10 mechanism.

11           The two specific pilots, which are  
12 elements of the options to the prior approval  
13 supplement reporting category, will support your  
14 supplement requests to the current ELA/PLA license,  
15 but in the future to the BLA, the biologics license or  
16 BL, I should say.

17           The whole specific pilot and the Pilot  
18 program itself will be implemented according to the  
19 guidelines established under good guidance practice,  
20 and this is specific guidelines that the agency has  
21 made public statements about in the past.

22           Once the pilot guidances or monographs  
23 have been finalized, modifications to that guidance  
24 cannot be considered at the individual application  
25 level, but can be considered at the overall program  
26 level.

27           The whole program has to proceed as a

1 variance request, because after all, the pilot is an  
2 exception to the usual way of doing things. Once we  
3 have gleaned sufficient information under the  
4 exception variance request route of conducting license  
5 reviews, then it behooves us to evaluate the impact,  
6 and we have to base our experience on this initial  
7 pilots that I have alluded to just a few minutes ago  
8 as being analogous to the Phase I stage of drug  
9 development. You might consider this being as the  
10 initial Phase I stage of a new policy development.

11           Based on that review experience gained  
12 under the specific Phase I stage, we will formulate a  
13 more concrete plan to expand the program so that it is  
14 of more use to you; in other words, in true  
15 streamlining effort to reduce the reporting burden,  
16 yet not compromise public health risk.

17           So we have allotted ample time today for  
18 panel discussions and question and answer sessions,  
19 and please write, if you don't speak today. There's  
20 various ways of doing that, but obviously, there will  
21 be dockets under each specific pilot guidance. But in  
22 addition to that, please feel free to communicate more  
23 informally directly to the Blood and Plasma Branch,  
24 and you're welcome to direct your comments to  
25 attention my name.

26           That basically summarizes the ten basic  
27 concepts that I've tried to go over. I hope that sets

1 the stage for more in depth discussion of the two  
2 specific pilots for the Gamma irradiation as well as  
3 the red cell immunization program. Thank you.

4 (APPLAUSE)

5 MODERATOR CONLEY: Jong's allusion to the  
6 Ten Commandments struck me, because you'll remember  
7 that the first time Moses went up on the mountain to  
8 get the Ten Commandments, he came down and found that  
9 the people had turned away from the Word. That is not  
10 the goal of this process to find that everybody has  
11 taken absolute liberty and freedoms with the right way  
12 to do the process, and we will want to discuss some of  
13 that -- those risks, as we proceed further this  
14 afternoon.

15 Jong has given you enough of an outline  
16 that you understand where we are in the process now,  
17 that we are discussing very much at the front end a  
18 potential new approach. One guidance document is  
19 available as of yesterday, a second to be done in the  
20 not too distant future. Comment will be important.

21 This is not something you can go home and  
22 do now or even when the draft guidances are published,  
23 but when they are published as a final, then it's  
24 something you can take action on.

25 As you listened to or think about what  
26 Jong had to say, and as you listen to the additional  
27 presentations today, we would like for you to think

1 about the discussion questions that are in your  
2 package.

3 So if you would pull that gray sheet out  
4 and look at it with me now briefly, I would like to go  
5 over it, to put them in your mind and to start the  
6 thinking process, not to draw boxes around what you're  
7 considering but to start the process of what you're  
8 going to think about.

9 Now my slide tray should have a second set  
10 of slides that you can cue it to, please, and we'll  
11 keep the lights up since people are reading. Not too  
12 low, please.

13 First, is the concept of self-  
14 certification valid? You don't want to be too full of  
15 yourself and the work you do, but as Consumer Safety  
16 Officers at the FDA, I can tell you we often review  
17 SOPs that are in conflict with each other, that may be  
18 ill conceived, that may be lacking detail, that may  
19 have outright errors in them, that may not support the  
20 regulations or good manufacturing practices that are  
21 out there.

22 So I would like to pose the question to  
23 the audience to consider, has the FDA review of your  
24 SOP become a critical part of your QA process? If it  
25 has, is it something that you can, within your own  
26 organizations, provide adequate substitutes for an  
27 equivalent review or not?

1           Can we expect that the blood industry will  
2 conform to a published standard? In other words, are  
3 the products that blood bankers deal with routinely so  
4 inherently variable that it will be difficult or  
5 impossible to publish a single standard that the  
6 industry is willing to adhere to; or to put it another  
7 way, are the temperaments of those that are in control  
8 of blood banking such that adherence to a published  
9 monograph or standard is not a reasonable approach?

10           We want to ask this afternoon how many of  
11 you here today represent an applicant who would be  
12 interested in participating in one of these pilots, or  
13 how many of you are aware of colleagues that you think  
14 would be interested in participating in one of these  
15 pilots, because again we have to prove that the system  
16 works before we can move ahead.

17           The future may be to have many or possibly  
18 all of the routine blood products through a monograph  
19 review. Clearly, we won't have the staff to always  
20 have a pre-license inspection be a component of that.  
21 So part of what we're trying to prove through the  
22 pilot and the pre-license inspection is that it is a  
23 system that can stand on its own. I think it's a real  
24 question I'll really be interested in your input  
25 today.

26           The next two questions are really  
27 companion questions, because they're about the two

1 particular pilots that we're talking about today, both  
2 irradiation technology and the red blood cell  
3 immunization approach.

4           The question really is technical in  
5 nature. Are the proposed guideline for one that you  
6 have in your handouts today or discussion about a  
7 guideline -- are they technically sound and  
8 scientifically sound and accurate to that point?

9           A lot of these kinds of comments will  
10 require supporting documentation about why you think  
11 that the technical issues should be addressed in a  
12 different way. You may not have that at your  
13 fingertips today. We certainly want to hear your  
14 comments, and again with the opportunity to respond in  
15 writing, then you can provide supporting  
16 documentation, scientific evidence why you might  
17 disagree with the outline.

18           Further, we have to decide what criteria  
19 we're going to use to evaluate this self-certification  
20 pilot. While we've discussed a lot internally, it's  
21 clear, as Jong said, that this is a new experience.

22           So how many participants should be a  
23 baseline before we would call the program a success or  
24 not? Three? Six? Ten? Twelve? Being that both of  
25 these approaches have been around for a while, it may  
26 be difficult to get large numbers, but it's important  
27 that we prove that the system works.

1           What objective evaluation criteria should  
2 be used to judge an individual self-certification  
3 applicant as either being successful or not under the  
4 self-certification program?

5           Obviously, one standard could be no 480  
6 cites on the inspection. I'm not sure if that's  
7 reasonable or not. Should we say only minor 483  
8 citations? What would constitute a minor citation?  
9 Again, we're in an arena that is new enough to us that  
10 we would really like the input from the industry.

11           If the concept of self-certification  
12 against a published standard proves to be sound, what  
13 products or processes should next be included in the  
14 program? We've started with two here in the pilot.  
15 If the approach proves sound, you heard Dr. Epstein  
16 say this morning that we're posed to move as quickly  
17 as possible forward in applying it to additional  
18 products to streamline.

19           Finally, what is the best way to involve  
20 the industry in future developments? There have been  
21 things that have been tried in the past. We've worked  
22 with the Coalition for Regulatory Reform. Perhaps  
23 that would be the group to work with again in  
24 developing new guidance documents or new monographs,  
25 but again, frankly, that's not totally clear to us.

26           We would like to hear from you, the  
27 industry, the manufacturers, do you feel that the

1 Coalition, the CFRR, is an adequate representation or  
2 representative for your needs and desires and things  
3 that are important to you, or would you prefer that  
4 the FDA assemble its own panel of representatives from  
5 licensed applicants. If so, how should that panel be  
6 assembled? Do you have a concept of how future  
7 guidance documents or monographs should be produced?

8           Even if you identify an agency  
9 representative that you think should work on these, do  
10 you prefer that FDA do the first draft and then come  
11 to them, or would you prefer that industry do a first  
12 draft and then come to FDA?

13           We're blazing new trails. Lots of options  
14 are open to us. The kinds of things that I've asked  
15 you to think about here should not draw boxes around  
16 what you're going to think about, but instead to just  
17 open up the area for discussion. So please think  
18 about those. This afternoon it's going to be your  
19 show, and hopefully, have some good give and take.

20           I'll remind you that there are cards in  
21 your folders where you can write down your questions,  
22 legibly and carefully considered. You're welcome to  
23 give them to me or to people at the front desk, and  
24 after lunch we will have people circulating in a room  
25 to collect those.

26           When we reach our discussion time, we will  
27 first try to answer the questions through our panel,

1 and then we will, after a break, invite open  
2 discussion on the issues. So, hopefully, you're  
3 ready.

4 Our next presenter is Mary Ann Denham.  
5 Mary Ann is a Consumer Safety Officer in the Division  
6 of Blood Applications. She joined the FDA in 1991.  
7 Prior to joining the FDA, she worked in a variety of  
8 administrative and technical positions in blood  
9 banking. She's a Registered Med. Tech. and a blood  
10 bank specialist.

11 She received her B.S. degree in medical  
12 technology from the University of Kentucky, and is a  
13 strong supporter of University of Kentucky athletic  
14 teams. She also has a certification in clinical  
15 immunohematology from the University of Tennessee and  
16 an MBA from Jacksonville University.

17 Mary Ann will present the information  
18 included in the most recent draft guidance document  
19 that you received this morning on the irradiation or  
20 blood products.

21 MS. DENHAM: Okay. Well, trust me. Just  
22 because the weather this past week was like Florida,  
23 you can get in the mood for Christmas. So this is  
24 where I'd rather be, on the beach.

25 I wanted to tease Mary. Since I have a  
26 degree from the University of Tennessee and the  
27 University of Kentucky, I'm rooting for the University

1 of Kentucky.

2 Today we're going to talk about Gamma  
3 Irradiation, and you got the draft document that was  
4 published yesterday afternoon. So I'm going to go  
5 over the points of the document.

6 As you know, I'm Mary Ann Denham. I'm a  
7 Consumer Safety Officer, and I'm giving you my phone  
8 number, my FAX number.

9 As you know, the reason why we irradiate  
10 blood and blood components is to prevent graft versus  
11 host disease. The reason why is the gamma radiation  
12 decreases the number of viable T lymphocytes. This  
13 occurs when viable T lymphocytes in the blood and  
14 blood components engraft, multiply and react against  
15 the tissues of the recipient.

16 Those patients that are at risk are those  
17 that are immunocompromised. Although there is some  
18 controversy over which immunocompromised recipients  
19 are at risk, that should be decided by the hospital  
20 transfusion service or the -- I should say hospital  
21 transfusion committee or the medical review board.

22 The other at risk group are non-  
23 immunocompromised recipients who receive blood from  
24 family members. I'm not going to go into all the  
25 details, but there is some background in your document  
26 and, of course, there's a lot in the literature.

27 The blood and blood components that have

1    been implicated in graft versus host disease are  
2    primarily those that contain lymphocytes and have been  
3    reported in the literature.  These are platelets,  
4    platelets pheresis, granulocyte pheresis, whole blood,  
5    red blood cells.

6                    Then the question comes up, well, how come  
7    you licensed other components for irradiation?  Well,  
8    when it came right down to it, we licensed those that  
9    requested irradiation.  So that's the reason for that.  
10   Those products are primarily ones who contain either  
11   no lymphocytes or few lymphocytes and are not  
12   generally reported in the literature.

13                   Now there's several methods of reducing  
14   leukocytes, washing, filtration, centrifugation.  I've  
15   put a little note here under filtration.  Since we're  
16   probably going to do wholesale leuko reduction in the  
17   near future, it's important to remember that leuko  
18   reduction does not eliminate the risk of graft versus  
19   host disease.  So even though we are doing leuko  
20   reduction, it's still important to do irradiation on  
21   those products as well.

22                   Of course, the only method that's known  
23   for inactivation of leukocytes is the gamma  
24   irradiation.

25                   Okay.  Now I want to make -- It's  
26   important to make clear that this is a proposed pilot,  
27   and this is our current thinking.  So we do appreciate

1 comments.

2 Irradiation performed by an applicant  
3 establishment: They should follow the GMP regulations  
4 in 21 CFR 606.210 and 211, and they should have an  
5 unsuspended or unrevoked license.

6 I wanted to mention training here, even  
7 though we didn't put it in the document, that training  
8 is part of GMPs. It's important that the people using  
9 the equipment for irradiation should be trained  
10 properly using the operator's manual.

11 They should know the risks of irradiation.  
12 They should be told what measures should be taken for  
13 irradiation safety, so that the anxiety and the fear  
14 of doing irradiation should be eliminated, and they  
15 should have annual retraining.

16 SOPs should be developed, approved,  
17 implemented, and maintained in the following areas,  
18 and we're going to discuss those, and I've given you  
19 the CFR cites.

20 The comment came up, who approves it. It  
21 should be an internal approval process, either by the  
22 authorized personnel or the QA, whoever in your  
23 facility is authorized to do that.

24 For the purposes of the pilot, we had to  
25 eliminate some variables to see if the pilot would be  
26 effective, and one of the areas we did this in was in  
27 the 510k cleared blood irradiators. In other words,

1 you have to be using a 510k cleared irradiator.

2           The next slide tells you the companies  
3 that have been cleared by the FDA to do blood  
4 irradiation. The reason we didn't include the linear  
5 accelerators is because the use of linear accelerators  
6 for irradiation of blood components is an off-labeled  
7 use, and that presents a lot of other variables in  
8 trying to regulate this area. However, if you want to  
9 use a linear accelerator, you can still apply under  
10 the regular PAS procedure.

11           Okay. So your equipment, of course,  
12 should have manufacturer's instructions. All  
13 equipment should be qualified for use, and the  
14 equipment should be calibrated.

15           Now then the next question comes up, what  
16 is the dosage and the time to deliver the dose? Well,  
17 in our previous memo we have used the 2500 Centigrade  
18 targeted to the central portion of the container and  
19 the minimum dose of 1500 Centigrade at any other  
20 point. So that's FDA's policy regarding the dose.

21           The time required to deliver the dose  
22 should be based on the irradiation intensity of the  
23 dose. Now each piece of equipment should be provided  
24 by the -- when you get your equipment, the  
25 manufacturer should provide a written calibration of  
26 the dose, the central test dose, and this calibration  
27 certificate specifies what the dose started out or the

1 intensity of the source started out -- I'm sorry.

2           The equipment that we've discussed before  
3 comes with either cesium 137 or cobalt 60. Now the  
4 intensity of the source -- the dose will vary over a  
5 period of time based on the decay of the dose -- I'm  
6 sorry, the decay of the source. So the source is  
7 constantly decaying. So the irradiation time must be  
8 adjusted periodically over the life of the source.

9           The manufacturer will provide a decay  
10 table, and the time must be calculated on the central  
11 dose rate that they've already provided and the  
12 decaying factor.

13           The maximum number of units to be  
14 irradiated at one time should be based on the  
15 manufacturer's instruction, and usually depends on the  
16 size of the canister.

17           The total irradiation dose should not  
18 exceed 5000 Centigrade to any portion of the  
19 container, and this we allowed because, if your  
20 indicator did not work, this gave you an opportunity  
21 to irradiate one more time.

22           Under the pilot another variable we  
23 eliminated is, if you want to use 3000 or another  
24 figure other than the 2500, that's not -- our proposal  
25 is not to allow that under the pilot program.

26           The next point is the indicators. The  
27 FDA's recommendation for irradiation has always been

1 that each batch should have at least one indicator.

2 This -- We have had several controversies over this,  
3 but that's our policy.

4           If you want to put an irradiator -- I mean  
5 an indicator on each product that you're irradiating,  
6 that's perfectly okay. Now there's several on the  
7 market. Most of them are based on X-ray film, and  
8 it's important that the indicator be stored in the  
9 proper conditions according to the manufacturer's  
10 directions; because if you're using something like X-  
11 ray film, if it's not in a dark area, then that  
12 changes the color or darkens it, as a rule.

13           You need to verify that the indicator has  
14 not been exposed to unacceptable temperatures. Some  
15 of these come with a little temperature card that  
16 changes the color with a dot. You should have an  
17 explanation of the expected results for each new lot.  
18 We recommend that you compare it with the old lot. In  
19 other words, just irradiate both the new lot and the  
20 old lot.

21           Your SOP should have corrective action, if  
22 the indicator doesn't work and, of course, this should  
23 always be documented.

24           Labeling: Permanently -- The product  
25 should be permanently labeled as irradiated on the  
26 product label. Even in the pilot as in the regular  
27 PAS, labels have to be submitted to CBER for review

1 and approval. Only FDA approved product codes and  
2 names should be used.

3           It's important to point out here that the  
4 indicator is not a label. I see that in SOPs and  
5 everything, but it is not a label. It's an indicator.  
6 That's the only purpose. The purpose of the indicator  
7 is to say you turned the machine on, and it operated.

8           The little purple attribute label that was  
9 put up in the lefthand corner in the original labeling  
10 requirements is no longer applicable, and there should  
11 be no tie-tags.

12           Okay. Now we're going to talk about the  
13 dating period for the products. As you probably know,  
14 the red blood cell products are the ones most affected  
15 by the irradiation. So based on scientific data, the  
16 28 days from the date of irradiation is the dating  
17 period on red cell products, or that should not exceed  
18 the original expiration date.

19           There's no information regarding adverse  
20 reactions for the platelets and plasma products from  
21 the irradiation. So that should not be changed. So  
22 it should be the same date.

23           Okay. Now let's talk about quality  
24 assurance. There's two points to the quality  
25 assurance, process validation and the quality control.  
26 When we're talking about validation for irradiation,  
27 it means measuring the amount of irradiation absorbed

1 by the product, including a load configuration using  
2 pre-determined parameters.

3 In other words, you need to follow the  
4 manufacturer's directions of how the machine should be  
5 packed and so forth. It should be performed on a  
6 fully loaded canister, whatever the manufacturer  
7 recommends, and it should be performed using a  
8 dosimetry system.

9 Now your dosimetry system should generate  
10 a dose map, using the dosage that is going to be used.  
11 If you're going to use 2500 Centigrade, don't do your  
12 dose map at 3,000. You'd be surprised at the number  
13 of submissions that come in that way. So 2500  
14 Centigrade should be what your dose map should use --  
15 be set for.

16 The dose map is used to evaluate the  
17 relative dose, not to adjust the time of the  
18 components. The dose map should be done when the  
19 machine is put into service and annually for cesium  
20 137 machines and semi-annually for cobalt 60 machines  
21 and, of course, after major repairs.

22 The dose map is the dose distribution.  
23 The dosimeters are used to map the dose distribution  
24 in the canister. This is examined to determine if  
25 there are areas where there's not going to be a 1500  
26 Centigrade level.

27 Usually this happens at the top of the

1 canister, at the bottom of the canister. A lot of  
2 people who have lower dosage at the bottom use a  
3 spacer. Most of those are usually styrofoam. If it's  
4 at the top, then they avoid packing at the top.

5           These dose maps are done using a phantom  
6 or a blood bag that has TLD chips. There are any  
7 number of ways to do that. The medium for dosimetry  
8 should closely resemble blood, and in the literature  
9 you have water. The acrylic is used. So whatever  
10 would -- is in the literature that would be  
11 recommended, but I think most people are using the  
12 water or the plastic.

13           Okay. In using your -- In starting up  
14 your machine or putting your machine into service, you  
15 should run three test runs. That means, in other  
16 words, you pack the canister like you plan to use it  
17 all the time, and run three procedures. You do this  
18 when you put it in service and, of course, after major  
19 repairs. It's important for QA to review these  
20 procedures.

21           Now quality control: Equipment: Quality  
22 control is performed on a scheduled basis. Usually  
23 this is determined by the manufacturer. Each date of  
24 use, the timer should be checked, and there should be  
25 a visual check at the turntable.

26           One of the areas where there have been a  
27 lot of problems is with the turntable. Some of the

1 machines have a window that you can check it through.  
2 Some of them have a period before you have to shut the  
3 door that you can see that the turntable is moving.

4 Your timer should be checked monthly  
5 against the National Institute of Standards and  
6 Technology's timer. This can be done by phone. They  
7 have it on a telephone that you can just call up and  
8 get the thing and just check your timer, or you can  
9 have a NIST certified timer.

10 The next area is periodically to do a  
11 leakage. This is to determine if you have leakage  
12 from your machine. These machines are really very  
13 safe. They have a credible amount of lead in them to  
14 prevent any leakage, but it is important to check  
15 this.

16 There are two ways this can be done. One  
17 is using a Geiger counter. The other is using a wet  
18 wipe and then counting the wipe.

19 We have not recommended employee badges,  
20 primarily because that's the purview of the Nuclear  
21 Regulatory Commission or the state who is responsible  
22 for radioactive material. However, if you do use  
23 employee badges, the current legal dose is 100  
24 millirams per week. I have also seen badges on the  
25 machine to check leakage. So --

26 Of course, record keeping: There should  
27 be documentation of the significant steps in the

1 process, the duration of the irradiation process and,  
2 of course, it's important that your products not be  
3 out of the storage temperature for longer than 30  
4 minutes.

5           The dose for each batch should be  
6 recorded, the identity of the person performing the  
7 irradiation, the date, time and site of the  
8 irradiation, if you're not the one -- if it's not  
9 being done at your facility.

10           Now in the pilot we did recommend that the  
11 irradiation could be performed by a contractor, as  
12 long as they were using the 510k cleared machines. So  
13 again here you have to have standard operating  
14 procedures so that the contractor knows what he's  
15 supposed to do, and you know what you're supposed to  
16 do.

17           The contractor should know that he has to  
18 register, and there are legal responsibilities. There  
19 should be a written agreement stating what they're  
20 doing and what you're doing, so that everybody is on  
21 the same wave length.

22           It should be noted here on the inspection,  
23 when the pre-license inspection is performed, the  
24 contractor will also be inspected. If in the future  
25 a contractor is added or changed, then a PAS  
26 supplement will have to be submitted.

27           Okay. We're back on the beach. If

1 anybody has any specific comments or questions about,  
2 you know, the specifics of the irradiation, I'll be  
3 glad to answer those. No? Back in the back?

4 MS. GALSKY: (QUESTION FROM THE AUDIENCE)

5 MS. DENHAM: As long as it's in the SOP,  
6 we don't have any -- We don't say they can't.

7 MS. GALSKY: I know.

8 MS. DENHAM: Most of them don't want to.  
9 At least that's been my understanding when I've  
10 inspected. They don't want to label the product.

11 MS. GALSKY: In our case it's only a  
12 transfusion service.

13 MS. DENHAM: I'm sorry?

14 MS. GALSKY: It's an associated  
15 transfusion service. It's under the same parent. It  
16 would be okay?

17 MS. DENHAM: Sure. It would be okay for  
18 them to do that, as long as it's in the SOP and  
19 everybody understands who's labeling and how. I think  
20 there's some feeling that, if they're -- The  
21 contractor should read the indicator. You know, they  
22 would have to be knowledgeable about the indicator so  
23 that they would know if the irradiation was performed  
24 properly.

25 So then they could put the label on.

26 MS. GALSKY: Okay, thanks.

27 MS. LeBEAU-LAIRD: Hi. Will the pilot

1 include both facilities that have their own irradiator  
2 as well as facilities that send their irradiation to  
3 another facility?

4 MS. DENHAM: Well, they would be the  
5 contractor. The other facility would be the  
6 contractor.

7 MS. LeBEAU-LAIRD: Okay. But I mean, that  
8 would be included in the pilot?

9 MS. DENHAM: That would be included in the  
10 inspection, yes.

11 MS. LeBEAU-LAIRD: No, no. In the pilot?

12 MS. DENHAM: Yes. Both the contractor and  
13 the other facility would be included. Okay? Did I  
14 answer your question? Okay. Anybody else?

15 MODERATOR CONLEY: Before you run off,  
16 just a comment on contract issues; because under -- As  
17 we become more like the rest of FDA in the regulatory  
18 process, we expect to see more contracting by licensed  
19 manufacturers.

20 Just remember that the product bears your  
21 license number, and you are responsible for the  
22 product. So as long as you have coordinated SOPs and  
23 have appropriate QA oversight over your contractor,  
24 there's no problem having a contractor do  
25 manufacturing functions, including labeling, on your  
26 behalf. Just make sure it's under control, and it's  
27 included in your QA oversight.

1                   We're doing very well on time. I'll  
2 remind you that you have cards for questions.  
3 Especially if you've got anything that's really going  
4 to stump us, it would be nice if you turned it in  
5 before lunch so we can argue -- discuss it over our  
6 own lunch.

7                   Other than that, we will break now. We  
8 will return promptly at 12:30 and begin again. You've  
9 got a nice lunch break. Enjoy your time in Rockville.

10                   (Whereupon, the foregoing matter went off  
11 the record at 11:29 a.m.)

1 A-F-T-E-R-N-O-O-N S-E-S-S-I-O-N

2 (12:40 p.m.)

3 MODERATOR CONLEY: Did everyone have a  
4 good lunch? The one thing I'm amazed about, since I  
5 came to FDA, are the number of restaurants that you  
6 can find up and down Rockville Pike in this  
7 neighborhood. You can usually find something you  
8 like.

9 A couple of additional reminders and  
10 asides. Out on the table this morning when you came  
11 in was the announcement of the availability of the  
12 ISBT labeling documents through the FDA. Just a  
13 reminder that you -- that's there to remind you that  
14 it's available, and it's something that we should all  
15 be looking toward, using that standardized labeling.

16 Also in your package are evaluation forms.  
17 I mention that now in case somebody does have to leave  
18 before the end of the meeting. How often do you get  
19 to evaluate the FDA? We would appreciate it if you  
20 would take time to fill that out about the usefulness  
21 of the workshop and the opportunity to comment on  
22 future initiatives.

23 I'll remind you again that you have cards  
24 in your folders or, if you've already used up your  
25 three cards, you can certainly borrow one from your  
26 neighbor or write it on a scrap paper. We have a nice  
27 stack of cards to start off our conversations this

1 afternoon, but we would appreciate more.

2 Our next speaker is Elizabeth Callaghan.  
3 Elizabeth is a Consumer Safety Officer in the Division  
4 of Blood Applications in CBER. She is presently  
5 detailed to the Office of the Director to work on the  
6 blood action plan and the rewrite of the requirements  
7 in the Code of Federal Regulations for blood and blood  
8 components.

9 She also provides guidance to the  
10 regulated industry, trade associations, consultants,  
11 consumers, FDA investigators, FDA district offices and  
12 other centers in FDA.

13 Elizabeth received her B.S. in Med Tech  
14 from the State University of New York at Stonybrook  
15 and her M.S. in biology from St. Johns in New York.  
16 She also has her SBB certification.

17 She will present the information included  
18 in the most recent internal draft of our proposed  
19 guidance document for the use of red blood cells for  
20 the immunization of plasma donors. Elizabeth.

21 MS. CALLAGHAN: Welcome back, now that you  
22 can all go to sleep and not pay too much attention to  
23 me.

24 Can I just do the first slide? The second  
25 pilot program that FDA is proposing is for the  
26 immunization of source plasma donors using immunogen  
27 red blood cells obtained from a licensed supplier.

1           After Gil's glowing introduction, this is  
2 sort of redundant, but Mary Ann insists I keep it in  
3 here for consistency. I would also like to take this  
4 time to thank Mary Ann for making up all these slides  
5 while I was in Florida on vacation.

6           The first section I would like to cover  
7 concerning the red blood cell immunization program is  
8 applicability. In order to participate in the pilot,  
9 the source plasma manufacturer must hold an  
10 unsuspended, unrevoked license for the manufacture of  
11 source plasma.

12           The purpose for participating in the pilot  
13 program is that the source plasma manufacturer seeks  
14 to supplement his or her license to include a red  
15 blood cell immunization program.

16           To participate in the pilot program, the  
17 source plasma manufacturer must obtain the immunogen  
18 red blood cells already thawed and deglycerolized from  
19 an approved manufacturer per a written agreement. The  
20 written agreement will be reviewed at the time of  
21 inspection.

22           The supplier of the immunogen red blood  
23 cells must hold an unsuspended, unrevoked license, and  
24 the supplier must be approved for the preparation of  
25 the immunogen red blood cells.

26           In order to apply to participate in the  
27 pilot program, the applicant must submit a completed

1 FDA Form 356h. Although this form is not approved yet  
2 for the use by blood and plasma establishments, it  
3 will be by the time these pilot programs go into  
4 effect, a self-certification statement that indicates  
5 the manufacturer's compliance with all applicable FDA  
6 regulations and conformance with the specific  
7 licensing criteria for the immunization of source  
8 plasma donors with red blood cells, proposed labels to  
9 be used on the product, and a request for a variance  
10 under 21 CFR 640.120 to the provisions of 21 CFR  
11 601.12(b)(3) which requires detailed submissions  
12 including SOPs and validation data.

13           At the time you submit the documents to  
14 FDA, you should be ready for inspection and have at  
15 least five donors participating in your red blood cell  
16 immunization program. In order to be considered for  
17 licensure under the pilot program, the source plasma  
18 manufacturer must have the following requirements in  
19 place: medical oversight and quality assurance;  
20 standard operating procedures which pertain  
21 specifically to the immunization program;  
22 manufacturing records and a final product labeling;  
23 and records including monitoring of the immunization  
24 red blood cell supplier.

25           Let's discuss these requirements one by  
26 one. First, medical oversight and QA: The applicant  
27 must be able to demonstrate that the red blood cell

1 immunization program is under the direction and  
2 supervision of a qualified licensed physician.

3           By qualified, we mean that the physician  
4 in charge of the program at the location seeking  
5 licensure must have a thorough understanding of what  
6 the program is about, what problems the donor may  
7 encounter and how to deal with them, why donor  
8 antibody titers are reviewed and their relation to  
9 whether immunization red blood cells should or  
10 shouldn't be given, and the physician must be able to  
11 clearly convey this information to the potential  
12 participants in the program.

13           Inspectional observations have found that  
14 this is where most programs are lacking. The  
15 physician in charge of the program does not seem to  
16 have a total comprehension of what he should be doing.

17           In addition, the applicant must  
18 demonstrate that their quality assurance program  
19 includes oversight of the red blood cell immunization  
20 program.

21           Second, let's discuss the SOPs. The  
22 source plasma manufacturer must develop and maintain  
23 standard operating procedures to control all relevant,  
24 specific aspects related to the immunization program.  
25 And to sound like a typical FDA person, these should  
26 include but are not limited to the receipt and storage  
27 of immunization red blood cells from a licensed

1 supplier, the procedures for donor-cell matching and  
2 for scheduling of immunization injections, the  
3 procedures for preparing the immunization red blood  
4 cells for injection, the procedures for obtaining the  
5 informed consent from the donor, the procedures for  
6 actually immunizing the donors using the red blood  
7 cells and for monitoring the donors, both for adverse  
8 reactions after the red cell injections and for the  
9 production of antibodies.

10           Okay. Now let's discuss some of the  
11 specifics of the SOP requirements. The SOP for  
12 receipt and storage of the immunization red blood  
13 cells should include: The immunization red blood  
14 cells must be evaluated upon receipt from the supplier  
15 in order to verify that the proper shipping  
16 temperature of 1-10C have been maintained and the  
17 labeling accurately reflects the product.

18           The label and any accompanying  
19 documentation should include the product name, ABO and  
20 Rh, the volume of the product, and identifying  
21 information which allows tracing back to the original  
22 donor and to all the procedures involved in the  
23 manufacture of the product.

24           The product label should also include the  
25 storage temperature, the expiration date, a cautionary  
26 statement for RBC immunization only, the name, address  
27 and registration number of the supplier, and the label

1 should not cover the entire vial to permit visual  
2 examination of the contents.

3           The immunization red blood cells should be  
4 stored between 1 and 6 degrees Centigrade, in order to  
5 help assure product sterility and the integrity of the  
6 red blood cell antigens.

7           The SOPs for donor cell matching and  
8 planning of the immunization schedule should indicate  
9 that a medical director selects the donors to  
10 participate in the immunization program, based in part  
11 on the knowledge that future pregnancy is not  
12 possible, whether the donor has preexisting  
13 alloantibodies, and the potential for developing new  
14 alloantibodies, any previous history of donor exposure  
15 to the red blood cell immunizations.

16           The exposure of the donors for  
17 immunization red blood cells should be minimized as  
18 much as possible in order to minimize the risks of  
19 developing unwanted alloantibodies, and the possible  
20 exposure to infectious disease agents, and a specific  
21 exclusion criteria for participation in the program.  
22 I'll discuss these in a little while.

23           A donor record file must be established  
24 and maintained for each donor participating in the  
25 program. The source plasma donors must meet all  
26 normal donor suitability requirements.

27           Now back to the inclusion and exclusion

1 criteria. The inclusion and exclusion criteria should  
2 indicate that a qualified, licensed physician  
3 responsible for the selection of donors, including  
4 ensure future pregnancy is not possible, the matching  
5 of the immunization red blood cells according to the  
6 donor's antigen cell type, review for any preexisting  
7 alloantibodies, and the development of additional  
8 alloantibodies, and a plan to evaluate each donor's  
9 specific immunization schedule based on the donor's  
10 response to the immunization and any prior history of  
11 immunizations to decide whether the donor should  
12 continue in the program.

13 Additional requirements for participation  
14 in an immunization program include: donors who have  
15 not been previously immunized with red blood cells, de  
16 novo donors, as we call them, may participate in the  
17 program, but should only be immunized against D.

18 Immunization with other red blood cell  
19 antigens should be limited to donors with  
20 corresponding, preexisting alloantibodies.

21 Both the immunization red blood cells and  
22 the source plasma donors must be tested at a minimum  
23 for ABO and an Rh antigen profile, including D, C, c,  
24 E, e, as well as K, Fy(a), FY(b), Jk(a), and Jk(b).

25 Selection of the immunogen red blood cells  
26 for a specific source plasma donor should include  
27 appropriate phenotypic matching in order to elicit a

1 rise in the antibody only -- a rise in only the  
2 desired antibody, limiting the donor's exposure to as  
3 few immunization red blood cell donors as possible.

4           Assessing the immunogenicity of the  
5 immunizing cells, evaluating the immunological  
6 response of the source plasma donors in general,  
7 screening for alloantibodies and identification of the  
8 antibodies, if any are detected, the immunization  
9 schedule should be established prior to the first  
10 injection and continuously monitored for response  
11 after each immunization.

12           The immunization schedule for de novo  
13 donors should be limited to no more than 4ml per  
14 injection, five injections a month, and a limit of ten  
15 injections in a six-month period. Oh, yes, it is on  
16 the slide. It's not on the next one. Donors who do  
17 not respond after receiving a total of 150ml of  
18 immunogen red blood cells should be dropped from the  
19 program.

20           Donors with preexisting alloantibodies  
21 should be immunized with an antigen that corresponds  
22 to their preexisting alloantibody, and the  
23 immunizations should be limited to no more than 4ml of  
24 red blood cells per injection, no more than five  
25 injections a month, and a limit of ten injections in  
26 a six-month period and -- unfortunately, this didn't  
27 come out on the slide -- not to exceed a total of

1 150ml per year.

2           The immunization schedule must indicate  
3 the information pertaining to the immunization red  
4 blood cells, including lot number and any other  
5 pertinent information found on the vial, volume to be  
6 administered at each injection and the site of  
7 injection, the interval for booster immunizations and  
8 the criteria for discontinuing a source plasma donor  
9 in the program.

10           The criteria for discontinuing a donor in  
11 the immunization program include: Voluntary  
12 withdrawal on the part of the donor; if a donor  
13 experiences severe adverse reactions; if the donor  
14 elicits no response or an inadequate response after  
15 being immunized with red blood cells of 150ml.

16           Let's move on to processing the  
17 immunization red blood cells in preparation for  
18 administering to the donor.

19           The thawed deglycerolized immunization red  
20 blood cells should be stored between 1 and 6 degrees  
21 Centigrade for a period not to exceed the expiration  
22 date on the product label.

23           Prior to the release for injection the  
24 immunization red blood cell product should be examined  
25 to detect abnormalities, including hemolysis,  
26 discoloration and microbial growth. If the  
27 immunization red blood cells are not used within four

1 hours after being removed from the storage vial, they  
2 should be destroyed.

3 All donors participating in the  
4 immunization program must sign an informed consent  
5 specific for the red blood cell immunization program.  
6 The informed consent must be obtained after a  
7 qualified, licensed physician has explained the  
8 immunization program and the hazards involved,  
9 including the risks of a hemolytic transfusion  
10 reaction, the possible exposure to infectious disease  
11 agents.

12 The explanation must be given in a manner  
13 that allows the donor to make an intelligent, informed  
14 and voluntary decision to participate in the program  
15 and should also include the expected rate of success,  
16 the volume of the red blood cells to be injected, the  
17 route of administration, the need for booster  
18 immunizations, the criteria for discontinuation in the  
19 program, a statement that the donor has had an  
20 opportunity to ask questions, a statement to inform  
21 the donors they may participate in only one  
22 immunization program at a time, and a statement to  
23 advise the donors that they may withdraw from the  
24 program for any reason at anytime.

25 In addition, the donor should be informed  
26 that testing for antibody detection and identification  
27 should continue for a minimum of 12 months after the

1 last immunization, even if the donor has withdrawn  
2 from the program, of possible adverse reactions and  
3 that they must be incapable of becoming pregnant, of  
4 problems which may arise if blood transfusions are  
5 needed in the future and the potential for infectious  
6 disease transmission.

7           On to the actual immunization and  
8 monitoring of the donors who are receiving the  
9 immunization red blood cells. The injection of the  
10 immunization red blood cells must be performed by a  
11 qualified, licensed physician or a person under the  
12 physician's direction and control who is trained for  
13 such procedures. However, the qualified licensed  
14 physician must be on the premises when the red blood  
15 cell immunizations are being given. There are no  
16 qualifications other than that.

17           Immunization recipients should be observed  
18 for at least 15 minutes following the injections. A  
19 qualified, licensed physician must assess the donor's  
20 response to the immunization red blood cell  
21 injections, determine if the donor is eligible to  
22 continue in the program and evaluate any adverse  
23 reactions.

24           Additional donor monitoring should include  
25 a review of the pre-immunization antibody titer, any  
26 post-immunization antibody titer results, antibody  
27 detection and identification panels, and the

1 cumulative immunization red blood cell exposure, and  
2 any adverse reactions to receiving the immunization  
3 red blood cells.

4 A source plasma donor should be monitored  
5 for a minimum period of 12 months from the last  
6 immunization red blood cell injection for potential  
7 infectious disease transmission and for the  
8 development of alloantibodies.

9 Any unexpected findings should be  
10 investigated and reported to the supplier of the  
11 immunogen red blood cells, and be documented in the  
12 donor record file.

13 Manufacturing records and final product  
14 labeling: The source plasma label must indicate that  
15 the product has been collected from an immunized donor  
16 as well as indicate the antibody specificity.

17 The performance of each step in the  
18 manufacturing of the source plasma must be documented  
19 as part of a permanent product record, and records  
20 must include the immunization red blood cells used and  
21 the disposition of the source plasma. All donor  
22 specific information must be documented in the donor  
23 record file.

24 Last but not least is the applicant's  
25 monitoring of the immunization red blood cell  
26 supplier. The applicant must assure that the  
27 immunization red blood cell supplier manufactures the

1 cells according to the standards established in the  
2 CFR and in compliance with current good manufacturing  
3 practices.

4           The applicant should perform a periodic  
5 review and an audit of all records relevant to the  
6 supplier's manufacturing of the immunization red blood  
7 cells, verify that the supplier performs all  
8 appropriate look-back investigations, product  
9 withdrawals and any other product related  
10 notifications thoroughly and a timely manner,  
11 assurance that the immunization red blood cell donors  
12 meet all donor suitability requirements and that all  
13 manufacturing procedures, including cell  
14 cryopreservation, deglycerolization and aliquoting  
15 comply with current good GMP.

16           Hopefully, when this pilot program is  
17 finalized, your desk will look a little less like the  
18 one in the foreground and a little more like the one  
19 in the background, so that instead of filing SOPs with  
20 the FDA, you can be doing more exciting things like  
21 reviewing Internet IPOs.

22           (APPLAUSE)

23           MODERATOR CONLEY: I'm beginning to sound  
24 like a bit of a nudge, but I'll remind you there are  
25 cards in your folders. At the close of the next talk,  
26 we will have people circulating in the room to pick up  
27 those questions, because we'll move right into the

1 question and answer session.

2           So if you have any questions regarding the  
3 immunogen red blood cell future guidance document and  
4 our thoughts on that or, as the next speaker  
5 discusses, the licensing issues behind this pilot, by  
6 all means, jot them down and we will answer them first  
7 in our question and answer session.

8           Our next speaker is Dr. Leslie Holness.

9 Les is a medical officer in the Division of Blood  
10 Applications. Dr. Holness received his B.A. from New  
11 York University and his M.D. from the Faculty of  
12 Medicine in Bucharest, Rumania.

13           He joined CBER after pathology training  
14 and practice at Harlem Hospital in New York, and I  
15 think he misses New York daily. He loves the place.  
16 He also did a fellowship in transfusion medicine at  
17 the New York Blood Center.

18           Dr. Holness has been with CBER for seven  
19 years. He's worked on policy revision for donor  
20 suitability, health hazard evaluations, and review of  
21 investigational new drug submissions, IND submissions.  
22 He also manages our FAX inquiry system for rapid  
23 response on current policy.

24           Dr. Holness will discuss the application  
25 process, how it will work under the proposed pilot  
26 program.

27           DR. HOLNESS: Thanks, Gil. It looks like

1 I have the other half of your tie.

2 As Gil mentioned, I'm Les Holness to talk  
3 about the implication of self-certification. As John  
4 mentioned this morning, the program is a variance  
5 under 21 CFR 641.20, and I will try to explain the  
6 application process for the pilot.

7 As you heard, the pilot is a proposal for  
8 manufacturers to self-certify conformance to specific  
9 criteria set out in the guidance. There are some good  
10 things about the program.

11 There's no CBER review of submitted  
12 information, as is normally done in the BLA or PLA  
13 supplement filing. There's no SOP submission, and  
14 there's no data to be submitted derived from  
15 validation or QC testing.

16 Because of the significant risk to public  
17 health, both programs are prior approval supplements.  
18 The products may be manufactured but not distributed  
19 interstate until the supplement is approved.

20 A draft version of the document reviewed  
21 by Mary Ann is available to workshop participants, and  
22 the document that Liz reviewed will be published  
23 according to the following sequence of events.

24 There will be a notice of availability of  
25 the documents published in the Federal Register.  
26 There will be a 90-day comment period, after which the  
27 final document will be published.

1           As Liz mentioned, the prerequisite for the  
2 program is an unrevoked, unsuspended license for the  
3 parent products. This means for irradiation, you must  
4 be licensed for the products you're irradiating -- for  
5 example, red blood cells, whole blood, platelets,  
6 etcetera. For the red blood immunization program, you  
7 should be licensed for source plasma.

8           Now on to the submission. Submission  
9 includes a request to the Director of CBER for an  
10 exception to filing a supplement to your product  
11 license under 21 CFR 641.20; secondly, a self-  
12 certification statement certifying that the  
13 manufacturer is in compliance with all the FDA  
14 regulations and meets criteria set forth in the  
15 applicable document.

16           Application Form FDA 356h, which Liz  
17 mentioned, is not in use at the moment for blood and  
18 blood products, but will be by the time the program  
19 pilot is implemented.

20           Labels should also be submitted. Receipt  
21 of the documents will indicate readiness for  
22 inspection. The FDA will review the documents,  
23 schedule and conduct the pre-license inspection within  
24 90 days.

25           This slide is for label submission.  
26 Labels should accompany one form of the FDA 2567, two  
27 copies of each label, and a copy of the circular of

1 information, if applicable.

2 This is the address for the application  
3 form, and it's in your handout. Gil insists that I  
4 include a cartoon in my presentation, and the caption  
5 says, "It won't be easy to get everyone to wear that  
6 all the time."

7 The inspection will be conducted by CBER,  
8 together with the District, and it will include the  
9 firm and appropriate contractors. This will be a  
10 comprehensive and in depth inspection, and will take  
11 longer than the routine pre-license inspection for  
12 supplement approval. It will not save the FDA any  
13 resources.

14 The inspection will concentrate on the  
15 process and the SOP, and will verify conformance with  
16 the guidance documents with respect to missing  
17 requirements in the document, etcetera.

18 The inspectors will be looking for  
19 deficiencies of quality assurance that may affect  
20 product safety, purity and potency. Compliance with  
21 all good, current manufacturing processes will be  
22 reviewed, and a 483 will be issued, if warranted.

23 Most manufacturers that have not complied  
24 with the guidance will be asked to submit a complete  
25 BLA supplement with appropriate documentation.

26 After approximately one year, depending on  
27 the number of participants, the FDA will evaluate the

1 program and make the evaluation available to the  
2 public. As the FDA has an ongoing commitment to  
3 streamlining the licensure process, if the program is  
4 effective and efficient, it will be extended to other  
5 blood products.

6           Once a notice of availability is published  
7 in the Federal Register, the document can be obtained  
8 at this address in your handout. Just send them a  
9 self-addressed adhesive label. They will send you a  
10 copy of the document.

11           These are the numbers in your handout for  
12 the CBER voice information system and the CBER FAX  
13 information system. Document number 9999 is a  
14 complete list of documents. Document number 9998 are  
15 documents added in the last 30 days.

16           If you're on the information superhighway,  
17 there's a complete list of documents by bounce-back E-  
18 mail at the address in the handout. For specific  
19 documents there's an E-mail address with document  
20 name. For questions and comments about biologics, the  
21 Office of Communications and Manufacturer's  
22 Assistance, OCTMA, has the last E-mail address in the  
23 handout.

24           That concludes my comments for today.

25           (APPLAUSE)

26           MODERATOR CONLEY: I'll ask those who were  
27 speakers today, please come forward and join us here

1 at the tables. Joe, could you be sure someone  
2 circulates in the room now to pick up any questions  
3 that people have.

4           While people are coming forward, it's a  
5 good time to say thank you to the speakers today, and  
6 also to the planning committee for this workshop, the  
7 people who were listed in the flier that was  
8 distributed announcing the workshop. That included  
9 Dr. Lee as Chairperson, Judy Ciaraldi, myself, Mary  
10 Ann Denham, Dr. Holness, Joanne Pryzbylik, and Ken  
11 Zemann, although in fact, being a small group within  
12 our branch, we pretty much all do everything together,  
13 and everybody in the branch is to be thanked.

14           We should also thank Daria Reed who works  
15 in our office and punched up a bunch of our slides  
16 with some color and a little bit more organization,  
17 and also thanks to Joe who is bringing me more  
18 questions. He's like the de facto member of every  
19 presentation effort that comes out of the Office of  
20 Blood.

21           Also, thanks to all of you for writing  
22 clearly, at least in the cards that I read at  
23 lunchtime, and the second batch will be the surprise  
24 questions. Since we've seen these others, we'll start  
25 with them.

26           We're doing very well on schedule, and  
27 when we finish all the questions and answers, I will

1 be asking you all to participate, and we'll also make  
2 a group decision as to whether we want to skip the  
3 afternoon break and plow on through and maybe go home  
4 a little bit early. But let's see how the time goes.

5 First is a question for Mary Ann. If a  
6 licensed facility has previously submitted a package  
7 on irradiation, will the facility convert to the pilot  
8 program or will you allow the package to rest with  
9 CBER?

10 MS. DENHAM: Well, considering how long it  
11 would take for the pilot thing to go through, we  
12 probably -- it would be better off to leave it where  
13 it is, but we would not automatically change it to the  
14 pilot program. No.

15 MODERATOR CONLEY: Can you all hear  
16 adequately? Okay, good.

17 Also for Mary Ann: Can I participate in  
18 a pilot study for irradiation if irradiation will be  
19 performed by an already licensed facility? Will that  
20 facility have to be reinspected?

21 MS. DENHAM: The answer is, yes, you can.  
22 We discussed the fact of whether the licensed facility  
23 would have to be inspected again. There will probably  
24 at the discretion of the inspector, and it would  
25 depend on when the licensed facility was last  
26 inspected and if irradiation was covered on that  
27 inspection.

1           So it would be primary discretion of the  
2 inspector.

3           MODERATOR CONLEY: With each of these  
4 questions, I'll try to look out in the audience. So  
5 if it was your question that's not been fully answered  
6 for you, raise your hand and come to one of the  
7 microphones, and we'll get clarification.

8           For Mary Gustafson, two questions on this  
9 card: First, what is your plan if a sufficient number  
10 of pilot submissions are not received?

11          CAPTAIN GUSTAFSON: Well, first of all,  
12 the notice of availability for the first pilot will  
13 have not only a request that you make comments on the  
14 guidance document that would be used to standardize  
15 the pilot, but also to see if there's any interest in  
16 the pilot.

17          If there is no interest in one or both of  
18 these pilots, we won't give up the project. We will  
19 try to substitute with another pilot area, and that's  
20 where, you know, we would really like your input into  
21 what are some of the areas that you would be  
22 interested in.

23          Unlike other drug development initiatives  
24 where you have an investigational phase and you can  
25 look at your IND workload to try to determine what  
26 your licensing workload is going to look like, we  
27 don't have that in the blood component area.

1           We, you know, can sometimes glean what's  
2 kind of coming down the pike from our discussions with  
3 industry, from published articles, and I'd say maybe  
4 the transfusion area is a little bit more predictable.

5           In the plasma area, we never really can  
6 foresee what changes are going to be happening in the  
7 future. So we really do need your input to see  
8 whether we've selected two pilot areas that we will  
9 have adequate participation or whether, you know,  
10 maybe we should forego one of them and go to another  
11 area. But we don't plan on giving the whole thing up  
12 unless there's absolutely no interest from anyone in  
13 any type of self-certification licensing.

14           MODERATOR CONLEY: Second question for  
15 Mary on the same card -- really, a series of  
16 questions: Must pre-license inspection be a component  
17 of any pilot? Could evaluation of the product be  
18 substituted -- for example, platelets? Could  
19 examination of QC data for product be used in place of  
20 pre-license inspection and evaluation of the product  
21 by FDA?

22           CAPTAIN GUSTAFSON: For the two areas that  
23 we have selected, the pre-license inspection would be  
24 an integral part of it. That's how we're going to  
25 evaluate whether the self-certification is adequate.

26           As Dr. Lee mentioned, these are areas  
27 where we now have pre-approval inspections as a part

1 of the approval process for these supplements.

2 For future pilots, I think we are amenable  
3 to any suggestions from you. It doesn't necessarily  
4 hold that the pre-license inspection has to be built  
5 into the self-certification. There could be other  
6 ways of evaluating pre-approval, and I think those  
7 were, you know, good suggestions, either physical  
8 samples, you know, quality control data.

9 I think, as we start rolling out self-  
10 certification, we will be wanting to have your ideas  
11 on how -- you know, what the parameters should be and  
12 how we can best evaluate each pilot. They're not all  
13 cookie cutters, and I think for the different product  
14 areas, there should be different ways to set up the  
15 pilot and evaluate it.

16 MODERATOR CONLEY: A question for Les:  
17 Since there continues to be enormous variability in  
18 the FDA inspection process, how will you assure that  
19 the evaluation of the pilot program via the inspection  
20 process is not similarly skewed by the inspector  
21 differences? Will the assessment inspections include  
22 CBER?

23 DR. HOLNESS: Yes, the inspections will  
24 include CBER, together with the district. So that any  
25 problems with an individual inspector probably can be  
26 discussed with the inspection team, and the  
27 deficiencies can be ironed out or problems can be

1 ironed out in that manner.

2 MODERATOR CONLEY: A question for Jong:

3 Do the pilot programs exclude the possibility of  
4 approval of comparability protocols on the same  
5 subjects? Have we wasted our time in attempting to  
6 develop comparability protocols?

7 DR. LEE: I wouldn't say that any time was  
8 wasted in developing a comparability protocol. I  
9 think the pilot is not in effect now and, if you have  
10 a protocol already developed and ready to be submitted  
11 and maybe even being submitted, even being evaluated  
12 or have already been submitted, that would be fine.

13 Simply, you will gain approval through  
14 that route rather than the pilot. As for the mutual  
15 exclusivity, we have not defined the pilot program,  
16 the overall program per se, to really make definite  
17 exclusions about anything.

18 The cornerstone, the key idea behind the  
19 pilot program is that we use the self-certification to  
20 adherence to a previously prescribed set of licensing  
21 criteria as the basis to evaluate -- basis to approve  
22 licensure supplements or applications.

23 So given that basic long term goal and  
24 central idea, the individual -- the specifics have not  
25 been worked out, but the two pilots that we discussed  
26 today under the program is more clearly defined, and  
27 we do have to make some clear definitions in order to

1 make progress and in order to take the first step.

2           The two specific pilots are geared towards  
3 the inspectional process, and the fact that you are  
4 submitting a comparability protocol to do anything but  
5 prior approval supplementation route indicates that  
6 you are trying to obtain approval without a review of  
7 a particular plan for demonstrating your reason and  
8 justification for down-classifying.

9           If you have a plan justification and good  
10 reasons to down-classify a particular supplemental  
11 request from prior approval to anything other than  
12 prior approval supplement, then those have to be,  
13 obviously, reviewed in order for us to agree with you.

14           These are -- Comparability protocols are  
15 specific proposals that you make to us, and in order  
16 for us to agree with you, it has to be reviewed. For  
17 that reason, I think, we cannot really subsume  
18 comparability protocol into the pilot program as  
19 defined today.

20           I think the whole idea of self-  
21 certification to something already published,  
22 discussed and agreed upon basically precludes the idea  
23 of comparability protocol.

24           Now it's possible to extend the definition  
25 of the pilot program to include this. Right now, I  
26 can't think of a way to do that. It's not clear to me  
27 how the definition could be expanded to include

1 comparability protocol and not sacrifice public  
2 health. However, maybe -- perhaps some of you have  
3 some real bright ideas as to how that could be  
4 accomplished.

5 So in short, I can't see it being part of  
6 the pilot as defined today, but in the long term it  
7 could be, and that's based on how you propose and  
8 justify the idea of combining the two ways of  
9 obtaining licensure.

10 That's a long-winded answer, and it  
11 perhaps was more confusing than clarifying.

12 CAPTAIN GUSTAFSON: Just -- You know, I  
13 might add, there were discussions early on on the  
14 comparability protocol notion that perhaps -- It's  
15 mainly in the drug industry -- that perhaps there  
16 could be generic comparability protocols -- you know,  
17 templates for a comparability protocol that then could  
18 be used by, you know, everyone.

19 I think that the straight drug section of  
20 the industry kind of gave that idea up, that these  
21 were very specific manufacturer changes, you know,  
22 either as something that would need to have a long  
23 development phase but needed to be implemented fairly  
24 quickly, and so you would want the FDA to look at a  
25 protocol and approve it ahead of time, but then let  
26 the change be downgraded to lesser reporting  
27 categories so it could be implemented more quickly; or

1 as I have said before, as use of comparability  
2 protocols to more standardize a roll-out of a new  
3 manufacturing process in multiple manufacturing  
4 facilities.

5 I think most people have kind of decided  
6 that those are pretty manufacturer specific, but you  
7 know, there may be times that there might be a generic  
8 comparability protocol that then could be picked up  
9 and used by others. I think that -- You know, that  
10 could be under consideration, but at the time the  
11 comparability protocol is a prior approval supplement,  
12 but it's not included at least in these two pilots.

13 These two pilots are -- you know, but as  
14 we see them, would have some fairly specific  
15 standardization that someone would just agree that  
16 they would adhere to the guidance document, and we  
17 would then review at inspection to see whether they  
18 actually did, and issue the license based on that.

19 MODERATOR CONLEY: Next question, also for  
20 Mary: How will you guard against immortalizing less  
21 optimal practices because improvements will be  
22 precluded by the "no variation" rule? This change  
23 barrier already exists to some extent because of the  
24 review process, but it will get worse when you have to  
25 wait for a guidance document change. Sad to create  
26 barriers to improvement.

27 CAPTAIN GUSTAFSON: I think this is a very

1 good question and, of course, it always comes up. You  
2 don't want standardization to impede creativity, but  
3 on the other hand, there's a lot of things that are  
4 done in blood banks and plasma centers that are very  
5 well standardized and that don't change a lot over  
6 time, and we spent -- You spend a lot of time filing  
7 submissions about them, and we spend a lot of time  
8 reviewing them.

9 I think that's the area that we really  
10 want to capture under the umbrella of self-  
11 certification to a monograph standard. For the  
12 innovative ideas, I think there's always going to be  
13 the prior approval supplement route where data would  
14 be submitted to support a change that is, you know,  
15 outside of licensing criteria that we have published.

16 I think also another issue is how do we  
17 keep up on guidance. It's also an issue on how do we  
18 keep people's license applications current and state  
19 of the art, not only in the blood area but the rest of  
20 the biologics.

21 Investigators will do an inspection of  
22 someplace, and they will cite someone for GMP  
23 deficiency. They will say, well, we had this  
24 approved, it's under our license. When you look, it  
25 was approved maybe 12 to 15 years ago.

26 So there is a need to keep people's  
27 licenses current as one issue, and also to keep the

1 practices, the licensing practices, state of the art.  
2 I think, as we develop -- as we roll out the idea of  
3 self-certification, we are going to want industry  
4 input into guidance documents.

5           You know, Gil asked earlier today with his  
6 questions -- There's a group, Coalition for Regulatory  
7 Reform, which has been formed to represent the blood  
8 and plasma industry. You know, what are your ideas on  
9 perhaps having CFRR set up expert panels for different  
10 areas where they could make comments on updates of  
11 guidance documents and, you know, have those then come  
12 through us and go through the GGP protocol, the  
13 process in order to get them published as final  
14 guidances.

15           I think you could probably tell from my  
16 slides that we're not going to keep having an influx  
17 of staff to write guidances. So we are going to  
18 depend more and more on the industry to help us  
19 develop standards and licensing criteria.

20           So I think this is a shared  
21 responsibility, to make sure that we keep -- the  
22 government keeps up to date on licensing criteria, but  
23 also the industry then keeps up to date on their  
24 practices.

25           MODERATOR CONLEY: Jong did a real good  
26 job through his talk of letting us know how far we  
27 were along in the process. I have 26 cards here, and

1 we are on Card 7. This will be a question to Les.

2 To what extent will the overall compliance  
3 profile of a company affect their eligibility for  
4 pilot program approval?

5 DR. HOLNESS: Well, basically, you must  
6 have an unrevoked, unsuspended license, and other  
7 companies that are in other compliance situations will  
8 probably dealt with on a case by case basis.

9 MODERATOR CONLEY: More than ever, you  
10 want to have your act together when the FDA comes to  
11 visit, because you have certified performance to a  
12 standard criteria.

13 CAPTAIN GUSTAFSON: I might add that we  
14 have not proposed limiting the pilot to any particular  
15 compliance status, other than having an unsuspended  
16 and unrevoked license, and that this would be  
17 supplementing it. But as Gil said, I think it  
18 behooves anyone, if they know they are under  
19 compliance problems, if they're really having  
20 difficulties in maintaining compliance, they might not  
21 be the best candidate for participation in the pilot;  
22 because we will be evaluating the pilot based on the  
23 pre-license inspection, and we will be using that to  
24 decide how much further to go in this.

25 MODERATOR CONLEY: I have some mixed  
26 concerns. One, I don't want to skew the industry's  
27 ability to adhere to a pilot by saying you should

1 self-select yourself out of the process if you are  
2 having trouble. But at the same time, you would not  
3 want to enter into a self-certification process  
4 without full confidence that you could demonstrate  
5 compliance to the base document.

6 This question will go to Elizabeth, even  
7 though it references Dr. Lee's presentation.

8 What is Dr. Lee's definition of what's  
9 included in his category, donor monitoring, i.e., does  
10 this include the laboratory methods for antibody  
11 detection, identification, and quantitation?

12 MS. CALLAGHAN: I think that would depend  
13 on whether or not you have -- you're doing the  
14 identification and everything yourself or whether  
15 you're having someone else do it.

16 I think it's going to be at the discretion  
17 of the inspector when they go in, whether or not they  
18 want to see who's doing your antibody panels, who's  
19 doing your donor monitoring. However, I guess one of  
20 the questions we always run into is the cells are  
21 picked by our center medical director, and he is the  
22 one who makes the decision whether or not the cells  
23 should be given.

24 That's fine and wonderful, and if you have  
25 a centralized medical director making these decisions,  
26 that's okay. However, the physician at the facility  
27 has to have an idea of what's going on in the program.

1 As I hoped I got across in my talk, this is where we  
2 find most of the problems.

3 The center physicians at each location has  
4 no idea of why he's giving these cells, why he should  
5 give more, why he shouldn't give them, what he should  
6 be evaluating in any kind of adverse responses.

7 I think one of the things we really have  
8 to look at is if the center physician at each location  
9 has control of the program, regardless of what the  
10 corporate medical director makes a decision about.

11 Does that answer your question, I hope?

12 MODERATOR CONLEY: Sure. Ann, would you  
13 come to the mike, since we are recording this, and  
14 identify yourself for the record.

15 MS. HOPPE: I guess what I'm asking here  
16 is whether a change in a laboratory method would be  
17 something that would be covered under the pilot  
18 program? For example, we've been waiting nine months  
19 to get an improved antibody quantitation method  
20 approved, and there's clearly a much better method  
21 titrations done manually; but, you know, we're doing  
22 things in duplicate. We're spending a lot of money  
23 when it's a better method.

24 Would, under the pilot program, for  
25 example, you be able to make that kind of a change?  
26 Is that part of donor monitoring, which was listed as  
27 one of the things that would be under the pilot

1 program?

2 MS. CALLAGHAN: If you're approved for  
3 that procedure, I guess it would be okay. I don't --  
4 You know, I guess I'm not quite sure of what you're  
5 submissions are.

6 CAPTAIN GUSTAFSON: If I can butt in -- I  
7 think that it's not really included in the pilot at  
8 this time. If there are new innovative changes, they  
9 would still be a prior approval supplement.

10 The pilot, as we foresee it, would be a  
11 fairly controlled, you know, limited adherence to  
12 certain criteria.

13 MS. HOPPE: So laboratory methods would  
14 not be something covered under donor monitoring?

15 CAPTAIN GUSTAFSON: I think, if there are  
16 -- You know, the methods that are ones that are well  
17 recognized methods, I think it would be. If it's some  
18 new, you know, truly innovative approach to looking at  
19 titers or whatever, I think that it would come under  
20 a prior approval supplement.

21 DR. LEE: But if I may add one additional  
22 comment, that is not to preclude you from proposing  
23 your series of laboratory measurements to be included  
24 in the pilot guidance. In other words, we can  
25 implement the pilot under the current guidance, once  
26 it's finalized, but if you happen to think of a better  
27 way to monitor laboratory values and monitor the

1 donor, you could propose that as possible changes to  
2 the pilot guidance, which could be version B of the  
3 pilot for the same subject.

4 MS. HOPPE: Yes, except that's obviously  
5 problematic from a proprietary, competitive  
6 standpoint, but there have to be things you don't  
7 really wish to divulge to the whole world but that are  
8 better ways to do things.

9 DR. LEE: Right. Now if that's the case,  
10 in order to protect confidentiality, we obviously  
11 cannot have a prescribed, widely publicized, pre-  
12 agreed upon set of licensing criteria, but you will  
13 have to tell us what you're thinking, and we'll have  
14 to agree with you, which almost by the way it's set up  
15 cannot obviate a review.

16 We'll have to review what you're  
17 proposing, and that's -- Although that process can be  
18 moved along very quickly, depending upon how familiar  
19 we are with your proposal and how well you put your  
20 application together, I'm afraid the basic concept of  
21 the pilot is beyond that.

22 The concept of the pilot is to move  
23 through without necessarily a detailed review, because  
24 we have already discussed up front to a set of  
25 licensing criteria, and we have already publicly  
26 agreed upon that, and we are basing not performing the  
27 review on that basis of prior discussion.

1           Obviously, confidentiality and private  
2 discussion are mutually exclusive.

3           MODERATOR CONLEY: Correct me if I'm  
4 wrong, but historically, general laboratory practices  
5 such as the testing for infectious disease markers has  
6 pretty much fallen in the purview of the field and  
7 their routine inspections under CGMP requirements.  
8 Those kinds of tests are not typically submitted as  
9 part of a CBER review package.

10           So laboratory practices that are generally  
11 followed practices would be inspected under that  
12 method, I believe. However, if you are doing things  
13 that are new and innovative and, therefore, not  
14 generally understood GMPs, then that would have to be  
15 a submission.

16           CAPTAIN GUSTAFSON: I think, you know, in  
17 terms of the laboratory procedures where you're using  
18 the test kits that have defined manufacturer's  
19 directions for use, it's simply GMP. If it's an  
20 innovative way of doing something that is not  
21 generally recognized as the standard way of  
22 performing, it would be innovative, pre-approved --  
23 prior approval supplement.

24           MODERATOR CONLEY: So if you're going to  
25 innovate widely, then you're going to have to submit  
26 for FDA approval for the manufacture of a licensed  
27 product, and we want to discuss some of that a little

1 bit more and get some more feedback from you all this  
2 afternoon.

3 The next question is also for Mary. It  
4 sounds like this is still a location by location  
5 process which appears to conflict with the stated  
6 goals of the BLA process which was purported to  
7 provide mechanisms for approvals that apply system-  
8 wide. Why is the blood area not approaching this in  
9 a way more consistent with the BLA objectives?

10 CAPTAIN GUSTAFSON: Well, I think we are.  
11 There's nothing in the biologics licensing application  
12 process that precludes facility performance. That's  
13 not in any area of drug or biologics approval.

14 The performance within the manufacturing  
15 facility is an important part of the pre-approval  
16 process. The establishment of the -- I mean, the  
17 elimination of the establishment licensing had to do  
18 with not requiring a separate filing for each and  
19 every single location.

20 It does allow lumping in a single filing  
21 multiple changes at multiple facilities, but if  
22 there's validation data that would need to be  
23 submitted and reviewed, that's facility specific, that  
24 would still be required to be sent in.

25 In selecting the two pilot areas, we  
26 selected areas specifically where we have retained  
27 facility review, because of the variations in the

1 facilities -- the individual facilities to implement  
2 both the irradiation processes and the red cell  
3 immunization.

4           In terms of irradiation, one company may  
5 use multiple types of blood irradiators, including  
6 linear acceleration, and they may have facilities that  
7 do on-site irradiation, and they may have facilities  
8 that have contract irradiation, either one of their  
9 own facilities or something that's clear out of their  
10 organization.

11           With red cell immunization, I think, if  
12 Elizabeth has said it once, she's said it about four  
13 dozen times, the primary variable in the facilities in  
14 red cell immunization programs is the medical director  
15 on-site and the ability of that medical director to  
16 perform medical supervision over what is going on in  
17 the red cell immunization program.

18           Not that he has to be the expert on which  
19 antigens are on the red cell -- In fact, I think we  
20 are more comfortable with having some of those  
21 centrally controlled by someone who really understands  
22 immunohematology -- but in being able to give informed  
23 consent to the donor and, particularly, in being able  
24 to answer questions about the red cell immunization  
25 program.

26           So in both of the areas that we have  
27 selected, we feel that there are enough facility

1 variability issues that we are retaining looking at  
2 those facility issues.

3 In other areas, I think we do take a  
4 corporate approach. Changes in donor suitability  
5 forms and procedures -- we readily feel that a firm  
6 can roll out how that question is asked and training  
7 on the SOP for the historians.

8 So, you know, there are particular areas  
9 where we do let corporate changes just happen,  
10 regardless of the number of facilities, but when it  
11 really impacts the individual product because of the  
12 individual variability, whether it's because of  
13 equipment, personnel training or supervision, we do  
14 retain the facility -- looking at the facility issues.

15 MODERATOR CONLEY: Question for Jong:  
16 Please describe in greater detail what the perceived  
17 health risks are that led to the cell qualification  
18 aspect of red blood cell immunization programs not  
19 being included in the pilot program.

20 DR. LEE: For the cell qualification  
21 process, we have to keep in mind that these cells are  
22 to be used on donors who will receive absolutely no  
23 benefit from receiving those cells as part of the  
24 immunization process. So we have a fairly heavy  
25 obligation to the donor that the donor receives an  
26 immunization and that that donor's health is not  
27 compromised.

1           Unlike a transfusion where a small amount  
2 of risk is accepted, based on the return, the greater  
3 benefit to -- the medical benefit from the transfusion  
4 itself, that's not true for red cell immunization.  
5 Donors receive cells, and absolutely no medical  
6 benefit, strictly for the purpose of that donor to  
7 perform better as a blood donor in the future, i.e.,  
8 that plasma will contain a particular antibody  
9 directed to some selected set of red cell antigens.

10           For that reason, there are a strict set of  
11 criteria built into the cell qualification process.  
12 The cells are collected form the donor, and the donor  
13 is periodically monitored and is re-qualified at the  
14 end of the year. If that donor -- Now I'm talking  
15 about the initial donor, way back in the beginning of  
16 the process.

17           When that donor returns after one year and  
18 is free of all infectious disease that we anticipate  
19 to be problematic for transfusion, then the cells are  
20 halfway qualified. However, that's not enough. We  
21 feel that that's not enough cell qualification because  
22 of the obligation to protect the donor who has no  
23 medical benefit.

24           So once that cell has been halfway  
25 qualified, then those cells are then used in up to,  
26 but no more, than three other donors or, in this case,  
27 I should refer to these donors as immunization

1 recipients. Then those donors are in turn followed  
2 for another year.

3 So we have the initial year plus a  
4 secondary year spent on maximum of three donors. If  
5 all testing is negative throughout the period of two  
6 years, then we have pretty good confidence that these  
7 cells which were collected two years ago and  
8 cryopreserved is indeed fairly safe, and we deem them  
9 qualified.

10 Now because of this lengthy process of  
11 cell qualification, it does not lend itself well to  
12 the idea of self-certification for the purpose of  
13 reducing reporting burden or saving time in terms of  
14 receiving CBER approval. You will have to wait two  
15 years anyway once you begin the process, and it is the  
16 standard operating procedures that is being discussed  
17 here.

18 Once you have a set of procedures in  
19 place, you could simply send it in to us and let us  
20 review over the two-year period, and it doesn't really  
21 matter when we get back to you, I suppose, in this  
22 particular instance, because you have to wait two  
23 years anyway.

24 So that's part of the reason why the cell  
25 qualification process was excluded. Number one, it's  
26 not going to be of much interest to you if you  
27 understand what we are talking about precisely.

1           Secondly, the public health impact, the  
2 obligation that we have to the donor and the  
3 obligation that we have to protect the plasma that's  
4 collected from all donors once cells are deemed  
5 qualified.

6           Once they're qualified, then they can be  
7 used on any donor under the program without further  
8 monitoring of the cells, because these cells have been  
9 quarantined for two years and everything cleared, and  
10 this is analogous to the FSP donor re-tested idea,  
11 basically re-testing the donor to make sure that the  
12 product is of optimal safety.

13           If we were to simply allow self-  
14 certification to the fact that the cells are  
15 qualified, I think we are taking too much on leap of  
16 faith; and basically, again for those two reasons, to  
17 optimally protect the donor as well as the subsequent  
18 products collected from the donor, and in the interest  
19 of you as an applicant in saving time in receiving  
20 CBER approval, we have elected not to include that  
21 portion of the red blood cell immunization program  
22 under the pilot.

23           I can't seem to answer any question with  
24 short, clear sentences.

25           MODERATOR CONLEY: We're on card 11 of 26,  
26 and this one snuck in two questions. The second  
27 question I'm going to add to the second card. It's a

1 similar question. I'm going to ask Judy Ciaraldi to  
2 come to one of the microphones on the floor or at the  
3 table, because she's been involved in a CBER committee  
4 looking at this.

5 The question says: What does a  
6 comparability protocol look like?

7 MS. CIARALDI: Can everybody hear me?

8 Okay.

9 Jong and Mary have both described or  
10 summarized what a comparability protocol is. What I'm  
11 going to do is just take all their information and put  
12 it together in some bullets to try to consolidate what  
13 a comparability protocol is.

14 To answer specifically what it is, it's a  
15 set of paper -- that's what it looks like. But to get  
16 on beyond that, a full discussion of comparability  
17 protocol is beyond the scope of this workshop but, as  
18 I said, I'll define it in some bullets.

19 Comparability protocol is another option  
20 of submitting supplements or reporting changes to your  
21 approved application. It's described in the newly  
22 revised 21 CFR 601.12. So you can see a description  
23 of it in there.

24 The filing of a comparability protocol may  
25 allow for in the future -- when implementing that  
26 change that's approved on the comparability protocol,  
27 you may be able to report it in a lower reporting

1 category, and you may be able to implement the change  
2 a little bit more quickly than you would originally.

3 To define a comparability protocol, it is  
4 a protocol or a group of procedures, a set of  
5 standards that describes in detail the implementation  
6 of a specific process or the implementation of the  
7 specific change that you want to report or that you  
8 want to perform.

9 A comparability protocol includes things  
10 like procedures, acceptance criteria for determining  
11 the acceptability or the effectiveness of the change,  
12 validation methods data and a variety of other things  
13 that are listed in that Code of Federal Regulations  
14 601.12.

15 The comparability protocol initially is  
16 submitted as a prior approval supplement, a PAS. We  
17 will review all of the procedures. We will review all  
18 of the data, everything that is submitted that you  
19 have given us to describe what you're going to do to  
20 implement the change, determine that you've  
21 implemented it in a proper procedure.

22 If we have approved your comparability  
23 protocol, when you implement that change in the  
24 future, then you can report that change that you've  
25 implemented to us in a lower reporting category. For  
26 instance, if it was originally a change that fell into  
27 the prior approval supplement category and in our

1 approval letter we tell you your comparability  
2 protocol is approved and in the future you may report  
3 this change to us under the CBE 30 reporting category,  
4 as you implement the change then you just report it to  
5 us as a change that's being effected in 30 days and  
6 you may start doing the change within -- and  
7 submitting products prepared under the change within  
8 30 days after we've received your notification of the  
9 change or your supplement showing us your change.

10 A description of a comparability protocol  
11 is included in the guidance document that Mary told  
12 you about. As she said, the general guidance document  
13 for describing the 601.12 for the biologics was a  
14 little druggy, and I had to agree with her. You as an  
15 industry complained and said we need something in our  
16 own language.

17 So we are actively working on that, and it  
18 includes a section on the comparability protocol for  
19 blood and plasma products. The Center is also working  
20 very hard on developing a general guidance document on  
21 comparability protocols. It will include in a little  
22 more detail the specifics of what goes into putting  
23 together a comparability protocol package for  
24 submission.

25 If you do have specific questions on  
26 comparability protocols, please don't hesitate to send  
27 them in or to -- by FAX or, you know, by letter or

1 please phone us, and we'll be glad to answer your  
2 specific comparability protocol questions.

3 Has that answered a little bit more of  
4 what a comparability protocol is? Thank you.

5 MODERATOR CONLEY: Change processing and  
6 shifting paradigms or whatever you want to call it,  
7 we're all in the midst of it. I liked the one slide  
8 earlier today that showed the tightrope walk between  
9 two points, because we're definitely in the midst of  
10 a lot of transition and, hopefully, we'll come out on  
11 the other end with everything being a lot clearer for  
12 all of us.

13 Okay, I'm going to combine the second  
14 question on this card and a second one. This goes to  
15 Mary Ann. They're pretty much on the same topic.

16 On the first card: Under the pilot  
17 program for Gamma irradiation, would a participant  
18 already licensed for irradiating red blood cells need  
19 to be inspected if supplementing their license to  
20 include irradiated platelets or any other component?

21 The second card reads: If a facility is  
22 currently licensed for both red blood cells irradiated  
23 and red blood cells leukocytes reduced, under which  
24 license should a supplement for red blood cells  
25 irradiated/leukocytes reduced be submitted, if the  
26 above supplement is the above supplement, just a  
27 submission of appropriate labels?

1 MS. DENHAM: Well, if you're licensed for  
2 Gamma irradiation, you are licensed for the process.  
3 So, basically, if you had gotten approval for red  
4 blood cells irradiated or red blood cells leuko  
5 reduced irradiated, then you can just send in the  
6 labels for the others for label review.

7 So that's basically, if you've already  
8 been licensed for Gamma irradiation and you want to  
9 add other products, then you can just send in your  
10 labels for label review.

11 MODERATOR CONLEY: Okay. This is for  
12 Jong, two questions:

13 Will pre-license inspections be the  
14 cornerstone of all self-certifications?

15 DR. LEE: Well, it's certainly the  
16 cornerstone of the two specific pilots described  
17 today, but that doesn't necessarily mean that it will  
18 remain the cornerstone of the entire program.

19 As we referred to in prior presentations,  
20 the program is a bigger concept, has one firm basic  
21 idea in mind -- that is, to allow self-certification  
22 for adherence to a set of pre-agreed upon licensing  
23 criteria. That's the basic concept. However, beyond  
24 that basic concept, exactly how to administer or  
25 evolve the program is unclear.

26 Obviously, we have to start somewhere, and  
27 we've chosen two specific areas where we can make some

1 concrete statements about how we're going to implement  
2 this program and, as defined for the two specific  
3 pilots, it does remain the cornerstone. However, the  
4 pre-license inspection or pre-approval inspection may  
5 or may not be omitted, depending upon the experience  
6 we gain under this current pilot and depending upon  
7 the level of interest and your arguments to back up  
8 whatever you propose.

9 Quite possibly, we could use the routine  
10 inspection as a way to get around the pre-license  
11 inspections, since routine inspections are being  
12 performed biannually all the time anyway. However,  
13 that also raises a set of complications which must be  
14 carefully considered.

15 So in summary, I would say it does not  
16 necessarily have to remain the cornerstone of the  
17 entire program, but it does so for the two specific  
18 pilots described today.

19 MODERATOR CONLEY: On the same card it  
20 goes on with a comment/question/concern. I want to  
21 say .com, but --

22 Timeliness of availability of guidance,  
23 especially given the fact that the guidances need to  
24 go through good guidance practice issued prior to  
25 being finalized, may as well do a straight submission.

26 It's not a question. Do you want to  
27 comment on that, Jong?

1 DR. LEE: Okay. That's true. If you have  
2 something ready to go right now, might as well send it  
3 in under the traditional way of doing things, because  
4 that's the only route available to us today, and might  
5 as well start moving forward; because you don't know  
6 when this pilot program is actually going to be  
7 implemented, although we have some good expectations  
8 about timelines.

9 I wouldn't necessarily say I'll just wait  
10 until it gets effective, because you might be  
11 unpleasantly surprised.

12 That statement is true for as it is today.  
13 However, a year from now after the program has  
14 actually been implemented, then you have a choice of  
15 pursuing the routine route or actually taking  
16 advantage of the speed that the option -- the prior  
17 approval supplement option will afford you under the  
18 pilot.

19 So I would say at this point, it's not of  
20 immediate benefit to you, but it will be of benefit,  
21 and we anticipate it to be in the very near future.

22 MODERATOR CONLEY: With that answer, we  
23 mark the halfway point in the cards. I congratulate  
24 the audience for staying awake. A few of you, would  
25 you please pour a glass of ice cold water, hand it to  
26 the person next to you. There are a few that are  
27 having trouble hanging on. Come on, we're going to

1 plow ahead.

2 Under additional pilot requirements -- and  
3 it says page 7, last point -- IRBC and SP donors  
4 tested for ABO, Rh, K, Fy(a), Fy(b), Jk(a) and Jk(b),  
5 the question is -- and I think this may allude to what  
6 Mary was talking about earlier, people who have SOPs  
7 that may have been approved years ago.

8 The question is: Will facilities that are  
9 using approved SOPs that are not testing for Fy(b),  
10 Jk(a) and Jk(b) be required to test for these newly  
11 added antigens?

12 MS. CALLAGHAN: If they're going to be  
13 part of the pilot program, yes; and if you're not  
14 testing, why?

15 CAPTAIN GUSTAFSON: This is one of those  
16 things where keeping up with state of the art is  
17 important. When we were discussing this guidance, we  
18 really thought that, even though the old guidance  
19 didn't include all of this, that by looking at what  
20 has come into us and, you know, SOP changes and all,  
21 that we clearly thought that the industry had moved to  
22 doing all of the testing that is reflected in  
23 Elizabeth's presentation.

24 MODERATOR CONLEY: This one probably also  
25 goes to Elizabeth: Does the agency require any  
26 notification prior to immunizing the five donors  
27 required for pre-license inspection?

1 MS. CALLAGHAN: Notification to us, I  
2 assume, is what you're talking about.

3 MODERATOR CONLEY: Yes.

4 MS. CALLAGHAN: Okay. If you are going to  
5 be participating in the pilot program -- and remember,  
6 we're not implementing the programs just yet, but if  
7 you're going to be participating in the program, no,  
8 you do not have to notify us when you start  
9 immunizing. However, you do have to have at least  
10 five people participating in the program when you send  
11 it in and be ready for inspection.

12 CAPTAIN GUSTAFSON: You know, going into  
13 a program like this, we take some risks as well as you  
14 taking some risks. This is one area that we have had  
15 considerable discussion about, but as part of this  
16 self-certification, once the guidance is finalized,  
17 you would be expected to be in conformance with that  
18 guidance under the pilot before you immunized anybody.

19 So -- but in terms of advising us and  
20 setting up the inspection, no, you could already  
21 institute to prepare yourself for your pre-license  
22 inspection by following the guidance. But don't do it  
23 yet, not until a final guidance, and not unless you  
24 actually intend on filing a supplement for red cell  
25 immunization program. We don't want people just out  
26 there sticking people with red cells. Yes, Ann?

27 MS. HOPPE: At what point does the product

1     become saleable then?

2                   CAPTAIN GUSTAFSON:   At the point you  
3     started collecting the product under the pilot, if in  
4     fact you get approval.

5                   MODERATOR CONLEY:   When the approval is  
6     received from FDA following the on-site inspection in  
7     the pilot program, the product would be saleable.  
8     Correct?

9                   CAPTAIN GUSTAFSON:   Yes.  Yes, and it  
10    would include everything that you had, that you had  
11    made under your plan of self-certification.  I mean,  
12    we're giving a lot on this as well as --

13                  MS. HOPPE:   I'm missing something.  What  
14    are you gaining by this pilot program if nothing  
15    happens until after the inspection?

16                  CAPTAIN GUSTAFSON:   What you're gaining is  
17    not having an in depth review by FDA prior to having  
18    your inspection done, an in depth review of your SOPs.  
19    But still it is a prior approval supplement.  You  
20    could not ship product until you actually received  
21    approval.

22                  DR. LEE:   I'm glad you asked that  
23    question, because I wasn't sure if that point was  
24    adequately made clear in the presentations.

25                  The two pilot, specific pilots, that we  
26    have selected have two review elements to it, the  
27    review of the submission followed by the pre-approval

1 inspection.

2           What the two specific pilots propose to do  
3 is to abbreviate or just about eliminate at least one  
4 element of the two processes; that is, the up front  
5 review of the submission, and go right into the pre-  
6 approval inspection.

7           Again, that's speaking from the standpoint  
8 of the two specific pilots, and that's not necessarily  
9 the way it's going to be throughout the program.  
10 That's going to evolve as we find out how we should  
11 expand it.

12           As defined today, you gain by not having  
13 to submit a detailed SOP, which will take some time  
14 for it to be reviewed and "preliminary approved"  
15 enough to move forward with the inspectional aspect of  
16 it.

17           Now if you think that having to wait for  
18 five donors is going to be a time consuming process  
19 during which you can have your submission sent in to  
20 the agency and reviewed and the thing is already  
21 moving forward anyway -- if that's your concern,  
22 that's a very good concern, and exactly we have  
23 grappled with that point.

24           We have thought about whether or not the  
25 requirement -- the traditional requirement of five  
26 donor immunization experience is too lengthy to be of  
27 timesaving benefit to you, and we have thought about

1 the idea of reducing that number to possibly three or  
2 any number that you think is justified from a public  
3 health standpoint.

4 This is again where we need your comments.  
5 Tell us what the number ought to be. Tell us why, and  
6 tell us your justification for it, and it may or may  
7 not make its way into the next version, next draft of  
8 the pilot guidance, which at the current point is  
9 headed towards five donor immunization requirement.

10 CAPTAIN GUSTAFSON: I think, in terms of  
11 the pilot, we are talking smaller steps first, but in  
12 terms of the overall concept of self-certification  
13 licensing, I think we're willing to look at an entire  
14 scenario that may involve a deemed approval as soon as  
15 you submit a self-certification.

16 We're not ready for that. I mean, this is  
17 going to be a step-wise process, but you know, the  
18 initial steps are -- The pilot, definitely we have to  
19 have something that we can evaluate in order to  
20 determine whether we want to go further with this,  
21 whether it is a viable concept.

22 DR. LEE: I think, basically, what you're  
23 saying is that the targeted pilot, specific pilot, for  
24 the red cell immunization program does not ideally  
25 meet all the criteria that one would like in a pilot  
26 such as this, and that's true. But I think that's the  
27 best we can find at the moment and the best starting

1 point.

2 I don't think you will ever come across an  
3 ideal situation, no matter what you do.

4 MODERATOR CONLEY: Card 16: If immunogen  
5 red blood cells are not purchased but are produced  
6 internally following all regulatory requirements, can  
7 the institution still participate in the pilot  
8 program? Elizabeth, I guess.

9 MS. CALLAGHAN: I guess I'm kind of  
10 confused. If you're already producing your own red  
11 blood cells, you must already have a license. So why  
12 do you have to participate in the pilot program?

13 I don't know who wrote this question, but  
14 could you clarify it for me, please?

15 MODERATOR CONLEY: Could you clarify the  
16 question?

17 CAPTAIN GUSTAFSON: Well, I think one of  
18 the issues is do you have to buy it from an outside  
19 source or internally, if you have in another part of  
20 the country a facility that's already approved within  
21 your organization to prepare the cells, can another  
22 facility on the other side of the country get those  
23 cells; and the answer is yes.

24 It doesn't have to be an outside  
25 contracting situation. It can be, you know, internal  
26 adding a new facility that's using your own cells.

27 MS. CALLAGHAN: I guess we tried to

1 clarify that by saying a licensed supplier. So,  
2 obviously, if you have another facility that's  
3 licensed under the same number you are, it's a  
4 licensed supplier.

5 CAPTAIN GUSTAFSON: But the key is that it  
6 can't be a new red cell program. I mean, you would  
7 need to use cells that are prepared by someone who is  
8 already approved, whether it's another one of your  
9 facilities or an outside source.

10 MODERATOR CONLEY: The next question I  
11 will mention, but I will set aside, because really it  
12 enters the next set of discussion, which is what  
13 should we consider adding to the program next.

14 The question was: Would you consider a  
15 pilot program for licensing red blood cell suppliers?  
16 This would be useful. So I'm going to set that side,  
17 because that may be one of the next things that we  
18 consider for the program.

19 Card 18: Please repeat the list stating  
20 requirements to be in the informed consent forms for  
21 red blood cell recipients that were discussed in Ms.  
22 Callaghan's talk.

23 MS. CALLAGHAN: I really think you should  
24 wait until the pilot program and the guidance becomes  
25 available. It all will be enumerated in there. I  
26 don't think anybody wants to hear that one over again.  
27 But it will be in the guidance document.

1           MODERATOR CONLEY: Stay tuned. Judy is  
2 sneaking more cards in here. Our goal is now 30  
3 cards. Stay awake a little longer. Hang with me.

4           AUDIENCE PARTICIPANT: Shoot the  
5 messenger.

6           MODERATOR CONLEY: It's her. It's her.  
7 Why am I compulsively counting cards?

8           When is the red blood cell immunization  
9 program guidance expected to be available? When is  
10 BLA expected to be ready for blood? Does FDA plan to  
11 list the approved providers of immunogen red blood  
12 cells?

13           I'll answer the BLA question. For BLA,  
14 the final rule is back at FDA. I know we have a  
15 meeting next week to discuss the comments on the BLA  
16 rule. When we are done with the comments and publish  
17 it as a final rule, that will settle BLA.

18           For blood and blood components, you will  
19 begin to use the 356h and begin to refer to  
20 supplementing your biologics license application when  
21 the CMC guidance documents is published in final form.  
22 That -- Again, the comment period is closed. There  
23 are three comments sitting in a folder on my desk, and  
24 hopefully, in the first quarter of next year we'll be  
25 getting to that, and that will be published.

26           So then back to questions 1 and 3 on this  
27 card: When is the red blood cell immunization program

1 guidance expected to be available?

2 CAPTAIN GUSTAFSON: Well, it's a few  
3 months behind the one that we just got out on the Web  
4 yesterday. So I would say, you know --

5 MODERATOR CONLEY: Stay tuned.

6 CAPTAIN GUSTAFSON: Yes, stay tuned, but  
7 I'd say between March and June, a draft. Even though  
8 the docket is not open you have the cite that  
9 Elizabeth had today. I mean, we're willing to take  
10 your comments, even your written comments, you know,  
11 based on this workshop.

12 DR. LEE: If you noticed, Elizabeth's and  
13 Mary Ann's slides were quite full of words, and that  
14 was by design; because although -- well, at least for  
15 the irradiation document, it's already out, but at the  
16 time we prepared the workshop packet we anticipated it  
17 not being out, and we had thought that it was -- it  
18 might be premature to release even the draft version  
19 in a public way. But we still tried to capture all  
20 the information in a way that's useful to you.

21 In an effort to include as much detail,  
22 specific detail, as possible so that it can be of use,  
23 the slides became very wordy. So the irradiation  
24 document is behind the other document. Its current  
25 thinking stage is not enough to allow it to be shared  
26 directly, but the slide content reveals our current  
27 thinking, and the best time to influence our current

1 thinking is at the inception stage.

2 MODERATOR CONLEY: And the last question  
3 from the same card: Does FDA plan to list approved  
4 providers of immunogen red blood cells?

5 CAPTAIN GUSTAFSON: No, we don't. I think  
6 that is a breach of confidentiality.

7 MODERATOR CONLEY: How does the inspection  
8 for a supplement such as the irradiation pilot affect  
9 the regular annual inspection process? Is the  
10 supplement inspection performed by field investigators  
11 or for the pilot by FDA headquarters personnel?

12 DR. HOLNESS: Well, as I mentioned before,  
13 it will be performed by headquarters personnel with --  
14 the district will be invited. So it will be both. It  
15 will be a team inspection with both headquarters and  
16 district.

17 MODERATOR CONLEY: Once you have completed  
18 this initial pilot, would you consider accepting  
19 applications based on a facility's track record in  
20 meeting GMP requirements instead of specifying  
21 products that it can be used for?

22 In other words, what we presented today --  
23 I think the question is asking we've presented a  
24 product by product release of a new program, a self-  
25 certification program. They're asking if the gates  
26 can be thrown open a little wider so that somebody who  
27 wants to do something new would be judged largely on

1 their history of GMP compliance.

2 DR. LEE: Well, I guess what you're saying  
3 is can the pre-licensing inspection be eliminated  
4 based on track record. We have no plans of doing so  
5 under the current pilot as described today.

6 I think what you're talking about is more  
7 closely along the lines of a comparability protocol  
8 where you could propose to us -- which will have to be  
9 submitted and evaluated and, therefore, it falls out  
10 of the pilot program, but it's still of benefit to  
11 you; because it will save you time and reporting  
12 burden in a different route.

13 You could propose to us that you've done  
14 this, this, this and this, and therefore, we've  
15 eliminated substantial risks and have been able to  
16 reduce what's perceived as major risk to some other  
17 lower risk, moderate or minor, and you tell us what  
18 you did, what the effect was, why the rationale is  
19 sound, and if that's the case, then it's conceivable  
20 that you might receive approval in a broader fashion  
21 for many facilities rather than facility by facility  
22 approach.

23 Sounds like you're approaching the idea of  
24 a comparability protocol there rather than the pilot  
25 program. Now keep in mind, all of the various  
26 streamlining initiatives are different tools of  
27 reducing burden while protecting public health at the

1 same time, and just because we are here talking about  
2 the pilot program doesn't mean we have to use that  
3 tool to achieve every -- and that you see around you,  
4 just because you have a hammer in your hand doesn't  
5 have to -- you don't mean that you always have to use  
6 the hammer to pound in a screw. You might use a  
7 screwdriver.

8 We're trying to come up with various ways,  
9 and we've added one more to existing methods and  
10 that's the changes to be reported, the BLA initiative  
11 and the pilot program under the changes reported, to  
12 allow more -- greater and greater flexibility in  
13 achieving the same goal of reducing reporting burden  
14 while protecting public safety.

15 MODERATOR CONLEY: The next question is  
16 regarding immunization: Are already approved 640.120  
17 variances revoked if they conflict with what was on  
18 the slides as required for red blood cell  
19 immunizations; i.e., to participate in the pilot under  
20 the stated requirements, we would appear to lose  
21 ground. Why should this be necessary?

22 CAPTAIN GUSTAFSON: I'm not sure of the  
23 specifics of this case, but if you have a 640.120  
24 that's approved -- you know, a variance to something  
25 that's approved, that's not revoked just because we  
26 set up a pilot program that had a set of criteria that  
27 doesn't include what you happen to be doing.

1           The pilot, as we foresee, would be  
2 somewhat restrictive in the licensing criteria,  
3 because it would be a standard approach that you would  
4 self-certify that you're following the standard  
5 approach. However, there's always the option that, if  
6 you want to do something really different, you know,  
7 you file it as a regular supplement approval.

8           I hope that's answered the question,  
9 because what we have proposed so far in these  
10 guidances would be one way of doing either of these  
11 types of operations, and by the review of the  
12 applications that we have seen, it is the primary way  
13 that the industry is performing these operations.

14           So that's why we would develop it as a  
15 standardized approach, that if someone wanted to self-  
16 certify, that they would against this approach. It  
17 doesn't say that that's the only way that you can do  
18 red cell immunization or it's the only way that you  
19 can perform irradiation.

20           You know, we will review other ways of  
21 doing it, but what we foresee as a pilot now would be  
22 a somewhat restrictive category in order to limit the  
23 variables. But you know, your comments on this are  
24 more than welcome.

25           MODERATOR CONLEY: I think we have a nice  
26 mixed group here today, because we have plasma people  
27 that aren't usually concerned about irradiation. We

1 likely have red cell and whole blood people who aren't  
2 usually immunizing donors.

3 I suspect it's the root of this question:  
4 How can receipt of documents include five donors  
5 already in a program if this is a new program for that  
6 center? Elizabeth?

7 MS. CALLAGHAN: I guess I'm not quite sure  
8 what you mean by receipt of --

9 MODERATOR CONLEY: Part of the submission  
10 requires the five donors, even though it's not an  
11 approved program.

12 MS. CALLAGHAN: I'm sorry. I wasn't  
13 listening. When you apply to this program under the  
14 pilot, you should have five donors participating in  
15 your program, and as part of starting up this program  
16 -- and you must realize that you self-certify that I  
17 am doing everything according to the protocols within  
18 the pilot, and you have five people participating.

19 Then you tell us I have five people  
20 participating, please come out and inspect, and that's  
21 what we do. I guess I don't understand why they  
22 shouldn't be there.

23 DR. LEE: I guess, if you keep in mind the  
24 fact that a meaningful review -- a meaningful  
25 inspection, pre-approval inspection, cannot be  
26 performed unless there is donor immunization already  
27 going on.

1           So if you tell us that you're inspection  
2 ready because you already implemented all the SOPs  
3 according to the criteria outlined in the pilot  
4 guidances, then you're certifying to us that you are  
5 inspection ready; and unless you have donors already  
6 in there, we cannot assess from an inspectional  
7 standpoint.

8           MODERATOR CONLEY: Yes, Judy?

9           MS. CIARALDI: I just want to add a  
10 question that might help direct your responses. Can  
11 they not apply first and -- you know, the time that  
12 they submit their self-certification, and then be  
13 rejected for the pilot? Not everybody that requests  
14 participation in the pilot, you know, is accepted. I  
15 mean, there are times when we could reject some  
16 people. Would that ever happen?

17          CAPTAIN GUSTAFSON: Well, I think, you  
18 know, if the inspection showed that they were not  
19 actually adhering to the guidance, we would revert  
20 them to a regular review, and we would want to look at  
21 their SOPs.

22          I guess, you know, the issue -- The  
23 difference would be are they just doing acceptable  
24 alternatives or are they really out of compliance from  
25 a GMP standpoint? The former would kick them out of  
26 the pilot, but not kick them out of licensing for red  
27 blood cell immunization.

1           The latter might, in fact, mean that your  
2 work is in vain. You may have problems that would  
3 preclude you being able to be approved for red cell  
4 immunization program.

5           MODERATOR CONLEY: Did we adequately  
6 answer that question? Does anybody want more  
7 clarification?

8           MS. HOPPE: I guess that seems a little  
9 inconsistent where currently you have to wait for a  
10 reference number before you can do the first  
11 immunization, and here you're saying you have to have  
12 at least five people. Finally, if you've done one,  
13 you have to manage to find five. So you may have been  
14 running this program for months before you send in  
15 your first piece of paper.

16           I guess industry shouldn't complain about  
17 that, but it does make you wonder.

18           MS. CALLAGHAN: Well, I mean it is one  
19 area that we were willing to take a risk on, and you  
20 know, I think by looking at our inventory that one of  
21 the problems maybe is that you're having trouble  
22 finding the donors to immunize, not that our review of  
23 all of the paperwork is holding you up.

24           So that may be the apparent inconsistency  
25 in this, but you know, if, you know, you go into a new  
26 area. You have five donors that are thrown in your  
27 lap that you can look at a guidance document and say

1 I'm doing all of this, and start immunizing them  
2 tomorrow and send in your self-certification for your  
3 inspection within 90 days, I mean, you would be the  
4 perfect candidate for this pilot.

5 Maybe that's not what's happening out  
6 there. It may be taking you a lot longer to find  
7 donors who are willing to participate. So the actual  
8 review process is not what's holding you up.

9 We would be interested to hear that as  
10 well. I mean, maybe this is not the pilot area for  
11 the plasma folks, but you know, we want to hear your  
12 thoughts. You know, we were seeing a lot of  
13 submissions for supplements for red cell immunization,  
14 and that's one reason why we selected this, and most  
15 of them were being contract immunization facilities.

16 So we thought, well, maybe this is an area  
17 where we can really facilitate the industry being able  
18 to incorporate this into their programs through a  
19 self-certification. You know, if it's not, tell us.  
20 Give us ideas on another area.

21 MS. HOPPE: Well, I think the difficulty  
22 is that the vast amount of time spent in the process  
23 is waiting for a pre-license inspection and waiting  
24 for what happens after, and this doesn't seem to  
25 address things. As it happens, the review process is  
26 pretty good.

27 You guys have made a lot of very positive

1 changes on the review process itself, but the pre-  
2 license inspection part and the post-pre-license  
3 inspection is a killer.

4 MS. CALLAGHAN: Well, I guess what we have  
5 seen with the red cell immunization is right now we  
6 have an inventory of places that we've been ready to  
7 inspect for, some of them, a year and a half, and the  
8 firms have asked us not to come.

9 So -- and of course, when we set out to  
10 talk about this pilot, we only knew of having lots and  
11 lots of supplement submissions, and we were trying to  
12 figure out a way to cut down the burden of that. But  
13 it seems perhaps not to be, you know, the real  
14 problem, and we do want to hear your ideas on that.

15 Maybe if there are areas that would be  
16 better to pilot, areas that are more standardized,  
17 areas that are more cookie cutter, that what you think  
18 are no-brainers that we shouldn't be looking at at  
19 all, let us know that.

20 DR. LEE: It is our hope that the  
21 efficiency that we gain by not reviewing the detailed  
22 SOP can be diverted to actually performing the joint  
23 district/CBER inspections.

24 Also, in terms of justification for not  
25 going through the reference number assignment  
26 process, we're banking on the fact that by starting  
27 with cells that have already been qualified from a

1 licensed supplier and banking on the fact that you are  
2 able to adhere to CBER criteria in terms of actual  
3 donor immunization, that gives us equivalent  
4 protection that is substitutable for the reference  
5 number assignment process, because the submission is  
6 reviewed enough to allow the immunizations to go on.

7           So I think omitting the reference number  
8 step in terms of allowing the process to move forward  
9 -- we have basically provided alternate means of  
10 affording the same public health safety level while  
11 omitting the review. And in terms of the inspectional  
12 concern, that's why I had that question mark under  
13 resources.

14           Inspectional resources has always been a  
15 problem, and we're not so sure if we can meet our own  
16 expectations, guarded expectations at this point, but  
17 there is some efficiency gained by not performing the  
18 review, and our reviewers will probably spend more  
19 time in the future as a part of the pre-licensing  
20 inspection team rather than submission review alone.

21           MODERATOR CONLEY: I will remind all of  
22 you that we are using a transcriptionist, and so that  
23 the record of the meeting is complete, please use the  
24 microphones when making comments, and these  
25 microphones in the center are portable. So we can  
26 bring them to you, if need be.

27           Okay. We're on card 24 of 31. I will

1 encourage everybody to abbreviate their answers, so  
2 that we can get a break at 2:30.

3           Instead of identifying a change that has  
4 already reached a peak in applications, why not  
5 validate this pilot with one for which a real impact  
6 can be seen, such as the upcoming move for leukocyte  
7 reduction of blood products? That would be something  
8 that you can really get data for and see if it is  
9 effective.

10           CAPTAIN GUSTAFSON: That's a good idea.  
11 Obviously, we didn't know where the world is going on  
12 leuko reduction when we first set out to do the pilot,  
13 but whoever commented on that, I think you're right.  
14 I think the industry is at this point going to be  
15 moving towards universal leuko reduction.

16           A lot of the industry is already approved  
17 for leuko reduction, though. So, you know, it may be  
18 not as big of an issue. I don't know, but the comment  
19 is very well received, and thank you.

20           DR. LEE; Obviously, to every good  
21 suggestion, there is a downside. It's not clear how  
22 we will evaluate the impact if we move directly to  
23 self-certification of leuko-reduction. As it's being  
24 currently done now, the submission is reviewed for  
25 controls built in to assure safety of the actual --  
26 safety and efficacy of the actual leuko-reduced  
27 product.

1           If we were to abbreviate that process,  
2 then how will we know that we've done the right thing?  
3 There is no inspection element traditionally for the  
4 review of leuko-reduction submissions. If the  
5 proposal is to include replace inspection in lieu of  
6 submission review rather than simply abbreviating  
7 submission review, that's a viable alternative.  
8 However, it sort of defeats the purpose of gaining  
9 time and reducing the reporting burden.

10           So it's a good process, but then again, it  
11 seems to fall somewhat outside the scope of the spirit  
12 of the pilot program.

13           Sorry, though, I didn't mean to make my  
14 answer so long.

15           CAPTAIN GUSTAFSON: Yes, rain on her  
16 parade, Jong. I think what we will need to do is go  
17 back and see, you know, what percent of the industry  
18 is already licensed for leuko-reduction; and if you  
19 could, you know, think of maybe evaluation criteria  
20 that we could use in a pilot -- Like Jong said, we  
21 don't inspect facilities now for a leuko-reduction  
22 supplement. We look at it in terms of the controls  
23 and process and the data.

24           We're open to suggestions on that.

25           MODERATOR CONLEY: For facilities that  
26 want to be part of the pilot, could the FDA submit a  
27 checklist that the facility could use to prepare for

1 the pre-assessment inspection?

2 DR. LEE: Well, first of all, such a  
3 checklist already exists, and what we are hoping to  
4 accomplish through the specific pilot is that we have  
5 a document that's better than the checklist.

6 It will tell you exactly how to -- It's  
7 difficult to convert the checklist into your standard  
8 operating procedure, which has to be institution  
9 specific, and we can't simply take your word for it  
10 that you've done the right conversion.

11 The checklist is a very cursory, bullet-  
12 line overview of things that we would look for.  
13 Obviously, all the details are filled in by the  
14 individual reviewers at the review stage.

15 Since there is too much of a question mark  
16 in using simply the checklist, what we are proposing  
17 here are specific pilot guidances which will lend  
18 itself better to a self-conversion to an institution  
19 specific SOP.

20 So such a checklist already exists, but it  
21 doesn't fit the purpose of the pilot program, and  
22 that's why we are beginning to implement specific  
23 pilots using pilot guidances as monographs as improved  
24 versions of the checklist.

25 CAPTAIN GUSTAFSON: If I could add a  
26 little bit to that, because we have a bureaucratic  
27 reason also. I mean, the reviewers, obviously, use

1 internal checklists to determine whether they have  
2 performed a complete review of submissions, to make  
3 sure that they have gotten all of the major  
4 categories, but it's not a detailed enough checklist  
5 to truly be a guidance.

6           There's another issue with us developing  
7 a checklist that you would fill out. That becomes a  
8 form, and a form has to have OMB clearance with  
9 reporting burden evaluated and a justification for  
10 that form being made.

11           So, you know, there's other problems with  
12 using kind of the checklist form rather than a  
13 guidance under the good guidance practices. But I  
14 think, as Jong said, I think we're trying to get to  
15 more detail in the guidance than we would have in a  
16 checklist. But I think one of the areas that we would  
17 want your comments on is how much detail do you think  
18 you need in a self-certification standard?

19           MODERATOR CONLEY: And we'll take that up  
20 after the break.

21           Using the Gamma irradiation pilot, what  
22 would be included in a firm's initial submission to  
23 CBER?

24           A second question on the same card:  
25 Assuming the pilot becomes available to the public,  
26 would 483 citations on inspection require submission  
27 of a complete BLA submission?

1           So, first, what's included in the initial  
2 submission?

3           MS. DENHAM: Well, basically, it's the  
4 same as Les mentioned in his talk, the 356h when  
5 that's available. Right now, it's the PLA. Then you  
6 would have your self-certification, and that's  
7 basically -- well, and a request for the variance  
8 under 640.120, and labels. Actually, yours isn't a --  
9 Yeah, yours is a variance. They all are variance.

10           All the pilots are a variance under  
11 640.120. So it's a request for the variance, the  
12 labels, the regular form, whether it's the PLA or the  
13 356h, and the self-certification statement that you  
14 meet the criteria.

15           CAPTAIN GUSTAFSON: And there have been a  
16 lot of questions on why are we retaining the label  
17 reviews. One of the big reasons for that is because  
18 of the transition to the ISBT-128, and there's not a  
19 one to one transition between coda bar and ISBT-128.

20           You're seeing that, and we're seeing it in  
21 terms of review. So I think, in order to make that  
22 transition as smooth as possible, we want to retain  
23 the label review function during that transition  
24 period.

25           MODERATOR CONLEY: And the second part of  
26 that question, assuming the pilot becomes available  
27 for the public, would 483 citations on inspection

1 require submission of a complete BLA submission? I'll  
2 field that, because it seems like it's asking two  
3 things.

4           Anything that's reported on a 483 is  
5 discoverable under Freedom of Information. So as that  
6 information, 483s from your inspections is typically  
7 available, this information would be available. If  
8 the citations are sufficiently severe, and we really  
9 haven't determined what that means yet, then you would  
10 be asked to step out of the pilot program and submit  
11 through normal prior approval supplement CBER review  
12 process.

13           CAPTAIN GUSTAFSON: But it's the same  
14 process under a regular inspection now. If you have  
15 a pre-license inspection, the inspector who did the  
16 inspection reviews the response to the 483 to see if  
17 that's adequate to get a license. So it would be a  
18 similar type thing.

19           If the inspector didn't feel that the  
20 response was adequate, then we would ask for a regular  
21 PAS.

22           MODERATOR CONLEY: Card 27 of 31: I have  
23 a very difficult time locating Web sites and pages to  
24 find guidelines and Federal Registry. Have we reached  
25 a moment in time that, if you don't surf for changes,  
26 you come up lacking with FDA? This is unsatisfactory.

27           Again, I'll comment to that, because I

1 find the Web easier to use than my bookshelf. If you  
2 find the CBER Home Page, there are what's new items  
3 that you can click on that will discuss the  
4 availability of CBER related documents.

5 True, there are Federal Register  
6 announcements that aren't necessarily announced on  
7 those pages, but again your professional organizations  
8 generally do an excellent job of informing you when  
9 these things are available.

10 I don't know if anyone else wants to  
11 comment or not. It's a matter of becoming familiar  
12 with the Web pages you use most often.

13 CAPTAIN GUSTAFSON: Well, we had an open  
14 public hearing for the device action plan, and I guess  
15 it was just last week. It seems like about a month  
16 ago now, so much has gone on.

17 Some of the comments from that meeting,  
18 too -- they weren't -- I mean, weren't really  
19 complaints about the CBER Web page, because I think  
20 people are appreciative of having the information  
21 available, but said that it wasn't as user friendly as  
22 the Center for Devices and Radiological Health Web  
23 page.

24 I think we did have people from the OCTMA  
25 group that monitors the Web page, and I think they did  
26 hear that. So I can't tell you that changes will be  
27 made. Quite frankly, you know, I'm appreciative of

1 the CBER Web page and the ability to go online and  
2 find things without trying to figure out where in the  
3 world I may have filed a piece of paper. But,  
4 obviously, the Center for Biologics is more than --  
5 will be more than agreeable to look at ways to make  
6 this electronic source more user friendly.

7 DR. LEE: I guess the concern is that,  
8 through the sophisticated use of the computer network,  
9 you've converted what at one point had been a passive  
10 process to an active one in which, unless you think of  
11 looking on your own, you're left out. Whereas, before  
12 you got a piece of guidance document or whatever in  
13 your mail. And that's true, but I don't think that's  
14 a burden that's overly cumbersome in trying to  
15 regularly visit the Web site.

16 CAPTAIN GUSTAFSON: Yes, the individual  
17 mailings throughout the year of guidance documents is  
18 just not going to happen anymore. You know, due to  
19 the ability to have electronic -- and that's not just  
20 the Web site. I mean, you can have the FAX-back as  
21 well, but also the expense of the individual mailings  
22 is something that we can no longer shoulder.

23 DR. LEE: Also, it forces you to take  
24 active participation in the process rather than just  
25 sitting back and taking in what the agency announces.

26 MODERATOR CONLEY: One of the speakers  
27 mentioned that titers must be done after every

1 immunization, which is a new criteria, not part of all  
2 currently approved licenses. High red blood cell  
3 titers don't hurt donors. What is the FDA's concern?

4 MS. CALLAGHAN: As part of the pilot  
5 program, you should be monitoring what your antibody  
6 titers are on your donors. Obviously, if you're  
7 immunizing a donor and they reach a plateau of 2,000 -  
8 - a titer of 2,000, and you can't get them to respond  
9 anymore, should you continue giving red cells and  
10 exposing this donor to possible infectious disease or  
11 possibly to forming an alloantibody?

12 This is something that the medical  
13 director has to make a decision about. I should think  
14 you would be monitoring your donors as far as their  
15 titer levels go so you know whether or not you should  
16 continue to immunize or if they do need a booster, and  
17 it is part of the pilot program, regardless of what  
18 you are approved for before.

19 MODERATOR CONLEY: Okay. I have three  
20 cards left, two of which I'm going to answer and, if  
21 anybody on the panel thinks that I've answered wrong,  
22 they will correct me when you come back. So be sure  
23 you come back and find out if I was right. The third  
24 one I'm also going to use as kind of a lead-in for our  
25 discussion when we return, because I think we're going  
26 to come to probably the most important of the day  
27 after a break.

1           First, is a facility -- If a facility  
2 wants to participate in a pilot, who should be  
3 notified at CBER?

4           Once these documents publish in final  
5 form, you will apply to the same CSO you always have.  
6 If you just want to do so to show interest in the  
7 pilot program so that we know that there's interest in  
8 the industry, then again call the CSO that you  
9 normally deal with and express your interest, and  
10 we'll be sure to keep track of that information.

11           Next, can the FDA afford to do this new  
12 program? You are adding travel, hotel and food  
13 expenses that currently are not being paid to CBER  
14 staff.

15           Again, it is a pilot. Whether pre-license  
16 inspections would remain part of this issue as we go  
17 on, I don't know if that burden of cost will continue  
18 to be there or not. Right now, quite frankly, it's  
19 just a matter which pocket it comes out of, and most  
20 inspectional issues are coming out of somebody else's  
21 pocket, but I doubt that in the long run that that  
22 would be allowed to go on, that we're robbing Peter to  
23 pay Paul.

24           So you're right. It is a cost concern,  
25 but it is a pilot program that may not stay in the  
26 same format in the future.

27           When we come back, one of the things I'd

1 like to hear discussed further with the people in the  
2 group as well as the panel is this statement: Isn't  
3 letting the industry write regulatory guidance and  
4 provide self-certification a conflict of interest, and  
5 is this really serving the public interest?

6           So that would be a good place to head off  
7 when we come back. We'll take a 15 minute break.  
8 We'll reconvene at ten of. Please come back. If you  
9 can't come back, though, fill out the evaluation  
10 forms, and I hope you participate as well the rest of  
11 the day as you did on the questions. Thank you.

12           (Whereupon, the foregoing matter went off  
13 the record at 2:40 p.m. and went back on the record at  
14 2:58 p.m.)

15           MODERATOR CONLEY: Okay, let's everybody  
16 grab your cookie and your caffeine, whether it's  
17 carbonated or out of the coffee pot, settle down, and  
18 we'll get moving again.

19           In regards to some of the questions that  
20 we were doing right at the close of the session before  
21 the break, it was pointed out to me that, at least for  
22 the two items that are proposed for the pilot, we do  
23 on-site inspections anyway, and they have always been  
24 -- included CBER personnel from our office.

25           So there is no additional expense at this  
26 level of the pilot. As the program may expand into  
27 new arenas and we may consider evaluating performance

1 through different ways, those may be issues to  
2 consider.

3           Since we're kind of entering into the  
4 brainstorming section of the meeting where we want to  
5 share ideas back and forth, we can share things. I  
6 don't want at this point to imply the things that we  
7 discussed as possible future courses are FDA policy or  
8 it's a direction we're definitely going.

9           Being at the FDA about three and a half  
10 years now and doing more and more public speaking,  
11 I've been very impressed with the -- impressed may not  
12 be the word; frighten may be the word -- by the fact  
13 that when you stand behind the podium and you're from  
14 the FDA, you may read in the next week that "according  
15 to an FDA representative."

16           So I find that my lectures, I write an  
17 awful lot and ask two or three people to look at them,  
18 and then I'm afraid to expound too much behind the  
19 podium, because I don't want to be setting FDA policy.  
20 It's not supposed to be the way we do it. It's done  
21 through public hearings and opportunities for comment.

22           So we have a lot of things to discuss, and  
23 we'll go back to the questions that we posed earlier  
24 to open things up. Now I have a lavalier microphone up  
25 here, and these mikes that are down here in the center  
26 are portable. If I have to, I'll play Phil Donahue in  
27 order to get you to talk, but hopefully, you'll come

1 to the mikes on your own.

2 I will remind you that the transcript is  
3 being produced. So, please, do come to the microphone  
4 to speak, identify yourself so that that is captured  
5 in the record.

6 If you want to come to the mike and say --  
7 you don't want to identify yourself and you're  
8 speaking off the record, but you want the FDA to hear,  
9 we'll do that, too. It's important that we hear from  
10 you.

11 Why don't we start with this last  
12 question. Isn't letting the industry write regulatory  
13 guidance and provide self-certification conflict of  
14 interest, and is this really serving public interest?

15 That really comes to the first question  
16 that we posed for possible consideration. Can we turn  
17 on the slide projector, please?

18 Is the concept of self-certification  
19 viable? So let's -- I know some people on the panel  
20 might want to comment on this, but can we hear  
21 somebody? Is there such a conflict of interest built  
22 into self-certification that it's not viable?  
23 That's not meant to be a yes or no.

24 CAPTAIN GUSTAFSON: Can I start  
25 discussion, hopefully not close discussion. But I  
26 think you in the blood industry, and we who regulate  
27 you are in a difficult position, because blood is

1 viewed different from other drugs and medical devices,  
2 and it hasn't been so long ago that it was either the  
3 President or the Vice President as part of the  
4 Reinventing Government said break down the barriers  
5 that prevent you from listening to your regulated  
6 industry.

7           It all sounded very, very good, but then  
8 when it came into practice, for blood it's, oh, no,  
9 that's an illegal advisory committee; it's in  
10 violation of the Administrative Procedures Act, you  
11 know, on and on and on and on, and you're being too  
12 friendly with industry.

13           I think, you know, the complaint that  
14 often happens with CBER or has since the Eighties is  
15 that, you know, we are in bed with industry; so,  
16 therefore, we cannot be effective regulators.

17           So we have had to be extremely careful.  
18 I mean more than the drug and device industry. HIMA,  
19 who represents Health Industry Manufacturers  
20 Association represents the device industry. They will  
21 come to CBER, and they will say why can't you be more  
22 like CDRH; we work with them all the time, we work  
23 with them in developing guidance documents.

24           Of course, we look to CDRH and we say, how  
25 do you do that. I think that there is a mechanism,  
26 even with GGP, for having industry input at the very  
27 beginning, but still have the guidances go through the

1 internal review process within the FDA and also out  
2 for public comment according to the GGP SOP that we  
3 function under.

4 The Coalition for Regulatory Reform was  
5 established to be a mechanism for dealing with FDA of  
6 a group to represent the entire industry, and we have  
7 worked with them somewhat with the 601.12.

8 Now, you know, I will share with you that  
9 when it got out in public that we had met with the  
10 CFRR, questions came from the Hill, why did you meet  
11 with them, what was the topic of your discussion, and  
12 are you in bed with industry again.

13 So we have to be careful, but I think,  
14 you know, from the President on down, there is a  
15 directive to communicate with the regulated industry  
16 to bring them into some of the standard setting.

17 You are the ones who are out there doing  
18 the work. So you are the ones who really should know  
19 what the standards should be and, yes, we do still  
20 plan to regulate you, and we have the final say, and  
21 it's not that you would be developing standards and  
22 then saying, okay, FDA, here it is, take it as it is;  
23 but it would be having a mechanism to have input,  
24 hopefully earlier than before a draft guidance goes  
25 out.

26 I think all of you feel -- and you know,  
27 honestly, so many of our guidances that have gone out

1 have been considered to have public health  
2 implications. So we have asked that they be  
3 implemented immediately during the comment period.

4 So from your standpoint, it's kind of a  
5 done deal before it gets published as a draft. For  
6 these two pilot areas that we are developing right  
7 now, we want you to know that it's not a done deal, by  
8 any means, and we don't want you to implement it when  
9 it's published as a draft. We want the comments.

10 Developing these two pilots was part of  
11 the overall blood action plan, and that plan did not  
12 have built in an industry communication component  
13 early on. However, that's not to say for additional  
14 pilots that we cannot devise a mechanism to have, you  
15 know, groups work with FDA in developing the initial  
16 guidance, and then having the guidance go through GGP  
17 with a public comment period, and with FDA having the  
18 final say-so.

19 So I think it's input. I don't think it's  
20 conflict of interest. I think it's the ability to  
21 listen to you at the formative stages of these pilots  
22 and developing the guidance document and the licensing  
23 criteria.

24 Your comments?

25 MS. HOPPE: Yeah. I think it's completely  
26 possible for industry to participate. We consider the  
27 highest standards possible to be our competitive edge,

1 but we believe we can meet higher standards better  
2 than the rest of the industry in general.

3 So there's no objection to having high  
4 standards. I think part of what is a little bit  
5 disturbing, though, is some of the information in the  
6 current proposal, for example, seems to reflect  
7 exactly what was there in the 1980 guidance. I don't  
8 think it's kept pace with what's gone on in the  
9 industry.

10 I think, to some extent, it reflects  
11 insufficient knowledge of what the industry really is  
12 and does, and I think one particular point that I  
13 would take issue with is the sort of location by  
14 location idea being applied to a red cell immunization  
15 program that's run off centrally developed SOPs.

16 I can see with blood irradiation equipment  
17 that the facility by facility issue is real, but the  
18 fact is, even though the individual physician on site  
19 makes a big difference, he can change any day of the  
20 week. He can change the day after you issue the  
21 license.

22 At that point, the companies reevaluate,  
23 approve the paperwork, and the FDA basically doesn't  
24 have even something in their file that indicates who  
25 the new person is. So making people wait many months  
26 so that you can come out and personally meet the  
27 physician who may change tomorrow doesn't make a lot

1 of sense, doesn't add a lot of value.

2 I would like us to see us put all of this  
3 effort into something that adds more value, and I  
4 think it's a good initiative. I don't think  
5 eliminating the review process on this particular  
6 program gives us as much return for the effort as we  
7 might in some other ways.

8 CAPTAIN GUSTAFSON: Okay. So, hopefully,  
9 you and some of the other members of the industry will  
10 give us some ideas on a pilot that might be more  
11 beneficial.

12 MODERATOR CONLEY: Essentially, if I hear  
13 you right, Ann, you're saying that the added value in  
14 the approval process of visiting the actual location  
15 is not a significant one, that instead you think there  
16 are alternative ways that you can demonstrate  
17 physician performance at the actual location where  
18 immunizations occur.

19 MS. HOPPE: I think, if you really want to  
20 add value to that process, having some genuine  
21 standards for the physician and for what he must know  
22 would be useful. I think, to a large extent, even  
23 though CBER personnel are involved, there is  
24 difference form one inspector to the next, and I'm not  
25 complaining about people being too difficult, but I do  
26 think sometimes I see people that are too easy.

27 Well, I don't want to see my competitors

1 get licensed with an easier inspection than I had, and  
2 it comes down to that, that I'd like to see a uniform  
3 standard. I'd like to see the right questions being  
4 asked. I'd like to be sure that every facility meets  
5 the same standard.

6 I think physicians are important, but I  
7 don't think the pre-license inspection process really  
8 does much to ensure that.

9 MODERATOR CONLEY: Ann, before you leave,  
10 I'd like to hear you expand on your comment --  
11 concerns about ease of licensure, especially for  
12 competitors, in the concept -- is the concept of self-  
13 certification viable? Do you think it increases the  
14 risk of -- if we use a self-certification approach for  
15 certain products, that you may have competitors that  
16 get by easier than the standard you set for yourself?

17 MS. HOPPE: No, because I think what's  
18 being missed here is the fact that, for the most part,  
19 red cell immunization protocols are being run by major  
20 companies, and there's already a sufficient amount of  
21 control and a sufficient experience with the license  
22 submission process that sending you another bundle of  
23 paper just means you run the Xerox machine again.

24 I mean, it really isn't changing  
25 industry's burden very much to say we're going to  
26 waive the review. In essence, it's already waived,  
27 because it's a repetitive process with additional

1 sites.

2 MODERATOR CONLEY: Okay.

3 MS. HOPPE: But you've got an SOP in  
4 place. So I don't think that part of it changes very  
5 much.

6 DR. LEE: Those are excellent points, and  
7 we thank you. One thing to keep in mind, though, is  
8 to decide whether or not this whole idea of self-  
9 certification is a drastic change from the traditional  
10 ways of doing things.

11 If you feel that the self-certification is  
12 not that different, not a major change from the way we  
13 have been regulating the blood industry for years,  
14 that it's not such a significant departure from that,  
15 then I think we can encompass more drastic measures  
16 such as the ones you propose. However, if your answer  
17 to that question is, no, this is a major change, this  
18 is a major departure from the way the blood industry  
19 has been regulated for years, then I think the  
20 approach is to make very small steps, to make small  
21 incremental steps and look around as you go.

22 The two pilots that's proposed today  
23 represent just that. They don't purport to be the  
24 answers to streamlining in one step. What we propose  
25 is simply the step one of a number of steps. We don't  
26 know how many steps it will be, but I think starting  
27 cautiously rather than jumping to the fruit is a

1 reasonable approach at this point.

2           It's certainly better than not doing  
3 anything, I think, in terms of streamline initiatives.  
4 At least, people are thinking about it, talking about  
5 it, and we're moving forward. Once you've begun the  
6 process, I think you're 100 percent better off than  
7 not having begun the process, and to what degree  
8 you've begun the process is less important than the  
9 fact that you've begun the process, in the first  
10 place.

11           That's all I have to comment as a response  
12 to that, but those are excellent points, and we  
13 wrestle with that question internally.

14           MODERATOR CONLEY: Jan, please identify  
15 yourself, and your comments.

16           MS. SIGMON: Jan Sigmon from the  
17 Department of the Navy.

18           I want to say a couple of things. One is  
19 that I see this forum as a really an interesting and  
20 innovative way of addressing some of the issues that  
21 may have been brought up to you last year in December  
22 with your first workshop at NIH that you brought up on  
23 the BLA and the changes that were coming.

24           I know that that was an interesting  
25 session. I'm part of an organization that's actually  
26 small and yet has a big voice sometimes, and sometimes  
27 we have a very little voice; and I don't pretend to

1 speak for the entire Department of Defense. Please  
2 understand that right now. This is Sigmon talking.  
3 So I should have just said Sigmon.

4 I'm really confused, because I'm hearing  
5 that you're -- First of all, I guess this idea that  
6 you're doing a proposal for a small tool that would  
7 help you and maybe help us do things faster. It 's a  
8 tool in a basket of other options to do the same  
9 thing.

10 I don't have a problem with that. I think  
11 it's great when you come up again with a new tool or  
12 a new possibility. The problem that I have is  
13 severalfold. One is that where I'm sitting here and  
14 automatically in my head developing this idea, oh,  
15 great, if we can do this, maybe I can get platelets  
16 pheresed, you know, supplement to that quicker. I can  
17 do this quicker. I can do that quicker.

18 Then I'm hearing that if I self-certify  
19 myself and you come out on a couple of occasions and  
20 see that my supplement is good and that I'm doing  
21 well, can I then continue to maybe go through this  
22 same avenue to get other supplements, and at the same  
23 time then I'm told no, because on some of those things  
24 we have to see the documentation first. We have to  
25 see the validation first. We have to do this other  
26 first, because we can't trust you to give us the  
27 information, even though you may have already self-

1 certified in some other areas.

2           So, Dr. Lee, you did rain on my parade a  
3 little bit there. I'm saying that, you know, again,  
4 self-certification is a very thing. I think that all  
5 of us have gone through a tremendous rise in  
6 standardization and trying to do better with the QA  
7 and the documents that came out in '83 and '85, but I  
8 also am concerned because last year at that same  
9 meeting I also heard the Coalition make a statement  
10 that I was just horrified at as a part of -- I think  
11 we were one. The Department of Defense was one of  
12 five people in that -- or five groups or six groups in  
13 that organization.

14           A statement was made about self-  
15 certification and doing it, and what difference was it  
16 making. I don't want to misquote, but there was a  
17 real slight that was put on the FDA in that, and I was  
18 very appalled at that statement that was made, and it  
19 reflected on, you know, paying inspectors to come in.

20           I think that that's one of the things  
21 where I appreciate a totally unbiased perspective from  
22 the regulatory industry coming into my association to  
23 see am I complying according to what you would like  
24 for me to comply with. That doesn't bother me in the  
25 least.

26           I open my doors and say come anytime, even  
27 though sometimes my doors are squeaky. They're there,

1 but I do know I'm going to get -- Maybe it's going to  
2 be a little bit -- some inspectors are going to be a  
3 little bit more picky than others, but at least I'm  
4 going to get a perspective that somebody totally  
5 unrelated -- I didn't have to pay them -- is coming  
6 here and has given me this information; and yes, in  
7 fact, I need to comply with it. I don't have a  
8 problem with that, again, because of public safety.

9           You know, I'm listening. I've seen B-PAC.  
10 I've seen all this other stuff, and I keep thinking  
11 the one people that's not being very well heard here  
12 are the small centers, the transfusion services who  
13 don't have the money to go out and to buy prisms to do  
14 their testing.

15           They're going to have to go to bigger  
16 associations to get their testing done, because  
17 they're saying, you know, if we don't have that kind  
18 of money, does that mean that we can't do it as well  
19 if we have the instruments and the devices. But the  
20 leading industry has a lot more money to go out there  
21 and tell you guys what to do and get you to move in  
22 their interest rather than the little guys.

23           I mean, ISBT-128 is one of those things  
24 also. It's like we've implemented a great deal of  
25 high tech stuff the last couple of years, and there  
26 are some people out there that are left behind,  
27 because they don't have the money, and they don't have

1 the -- They don't have the ability under a consent  
2 decree to focus on it to bring themselves up to a  
3 standard that now is higher than the little guy can  
4 do.

5           So my question is -- to all of you, as you  
6 do this, it's like we're putting a lot of stuff in the  
7 same -- in the bucket, self-certification and looking  
8 at individuals who say, yes, we can self-certify; but  
9 they have money to do this, and they have more time  
10 and effort to do it maybe.

11           Then at the same time, some of us are  
12 trying to work to self-certify, and yet our data is  
13 not accepted, you know, in the same level. So I'm  
14 just saying that all of this is together. I'm very  
15 confused as to what is good and what is bad. I'm  
16 confused as to does the industry speak for me? I  
17 don't think so, actually, because they are moving a  
18 higher level of SD plasma and PCR testing.

19           Again, these are leading the little  
20 centers out to where they can't -- They have to go out  
21 and send for their stuff to be done by somebody else.  
22 They lose control over it, and look again, what  
23 happened to one center that supplies a lot of  
24 reference testing for somebody. Now the entire  
25 country is going out trying to recall and do look-  
26 backs for five or six years.

27           So my question is what are we doing to all

1 of us out there?

2 Finally, and I do mean this finally -- I'm  
3 going to sit down -- is that with BPAC and everything  
4 else, I've sat through those, and we're letting the  
5 public tell us what to do.

6 We're -- They're telling us what to do  
7 without scientific and medical evidence. I heard --  
8 You know, you're put in a position where you have to  
9 listen, but isn't there any kind of statement that the  
10 FDA can come back to say that -- The blood industry  
11 has improved. The incidence of transfusion  
12 transmitted disease is down a great down over the last  
13 15 years.

14 Isn't there anything we can say to make a  
15 statement that says we are getting the best that we  
16 have and we can, and we continuing to improve?  
17 However, the continued litigation against the blood  
18 industry over silly things like can we control whether  
19 CJD is going to pop up in the blood 30 years from now  
20 -- we can't do that, but we can give somebody an  
21 improved life for the next year for transfusing them  
22 now.

23 Why can't there be somebody that will  
24 stand up and say we're going to save your life today  
25 with this blood transfusion; if five years from now  
26 you come down with a TTD, then -- you know, again if  
27 it's because we neglected to do something, that's

1     okay; but it was the best thing for you at that point  
2     in time, and it gave you five or six extra years.

3             Can we ever say that to them? Why do we  
4     have to continue to try to raise our standard higher  
5     and we omit Chagas' disease, which is a very important  
6     disease in blood transfusion and could possibly cause  
7     problems, and we're looking for CJD 30 years from now.

8             I'm sitting down now.

9             MODERATOR CONLEY: Jan, don't leave the  
10    mike, because I want to recap, and I want you to tell  
11    me if I'm got things wrong, because there was a lot  
12    said there, and I'd like to kind of bullet point it  
13    for the sake of discussion.

14            I heard you say that there's a lot that  
15    FDA does in oversight that you actually value in the  
16    practice that you do as a manufacturer of blood and  
17    blood products.

18            MS. SIGMON: Absolutely.

19            MODERATOR CONLEY: I heard you also  
20    express some concerns that are beyond the regulatory  
21    purview of the FDA, concerns about the way the  
22    industry is going and whether the small guy is going  
23    to be able to survive in this any longer or not, and  
24    I'm not sure that that's the FDA's role.

25            I know it's not the FDA's role to be a  
26    champion for the safety of blood products in  
27    particular other than to demonstrate that we're

1 fulfilling our role as a regulator. If you want  
2 somebody to be able to cheer the blood industry on, I  
3 don't think that's FDA's role, and I'm sure Mary will  
4 be able to comment even better on that.

5 Yes, we're driven by the public, and we're  
6 driven by the legislature as to what are the key  
7 issues and critical issues. Is full safety of blood  
8 possible? This has been debated endlessly, and what  
9 are the key issues? That's very difficult, and again  
10 other than to assure the public safety as is dictated  
11 by the law and the legislature and the public, our  
12 hands are kind of tied.

13 I'm sure Mary wants to comment, too.

14 CAPTAIN GUSTAFSON: And why are you sure  
15 that Mary wants to comment?

16 You know, Jan, you have very good points,  
17 and you're kind of preaching to the choir, I think.  
18 Is blood banking policy science based right now? I  
19 think the answer is no. You know, science enters in,  
20 but we're still ruled a great deal by the public  
21 perceptions from the Eighties, and I think, you know,  
22 we took a hard blow, and it's going to be crawling  
23 back slowly.

24 You know, when I read in the paper about  
25 bad drug reactions on a drug that hasn't been on the  
26 market for very long, it's like, oh, yeah, you know,  
27 that's -- it might be mentioned once on the news.

1 Might not even be mentioned on the news.

2 I think, gee, you know, if that had been  
3 blood from a blood bank, this would be discussed for  
4 weeks and weeks on end, and we would have all these  
5 things, what are you doing, you know.

6 So I think we are still reeling, and I  
7 think even the book that you told me about, the one  
8 that's out -- can't remember the author now, but it  
9 starts out by saying blood is different; it has a  
10 different meaning than other therapeutic products, you  
11 know, just historically.

12 I think your points are very well taken.  
13 You know, what I heard from you is concern that the --  
14 by industry input that it will be the large players  
15 that will rule rather than, you know, some of the  
16 individual transfusion services that maybe don't have  
17 the money to move quite as fast.

18 MS. SIGMON: And if I can add one more  
19 thing that goes along with that, what I would like to  
20 say again is that everything I have to say is actually  
21 I applaud the FDA. I applaud the FDA's looking and  
22 what Elizabeth said about the problem is in some of  
23 these plasma centers is the doctors.

24 I don't know about the plasma centers.  
25 I've never worked in one, but I do know about blood  
26 banks, and I know that many times the medical  
27 directors -- they decide to waive a standard here or

1     there, just because this donor is needed at this  
2     point.

3             I think a lot of times they do not know  
4     what's really going on, and I think that, to say that  
5     -- I mean, I can see where that's a big problem, and  
6     I applaud your unwillingness to let it go and to go on  
7     and to certify centers with thinking that the medical  
8     director is going to be fine; because I think that  
9     that's a big problem in a lot of places.

10            Again, I have a lot of oversight over a  
11     lot of different centers and have had a lot of  
12     experience in my career at seeing different centers,  
13     and a lot of times the doctors don't know, and they  
14     don't really take a vested interest in what's going on  
15     in the donor room where a lot of things can come down.

16            So I'm just saying I do applaud most of  
17     your efforts. I do have a problem with the industry  
18     speaking for everybody, because I think that they  
19     don't.

20            MODERATOR CONLEY: If we were going to  
21     seek industry input for the development of future  
22     monographs, do you have an opinion on how FDA should  
23     solicit that input and --

24            MS. SIGMON: I can only tell you that I  
25     have 24 centers, and we can't do standardized SOPs,  
26     because, no matter what, doing things by committee is  
27     very difficult, and everybody in the committee has a

1 hard time with accepting one little glitch there or  
2 one little glitch there.

3 So I wish you luck. If you can do that  
4 and get those monographs to where everybody agrees  
5 with them, then you're doing better than I can do with  
6 the Navy, and I really better get down at this point.

7 MODERATOR CONLEY: Okay. The next person  
8 from the floor, please.

9 MS. JETT: I'm Betsy Jett from NIH. I  
10 wanted to add one comment to Jan's about how industry  
11 standards become standards and tell you a story about  
12 my last FDA inspection. I'm going to preface it by  
13 saying that I, too, appreciate the inspection process,  
14 and I always learn something new.

15 In the last one we had several discussions  
16 about what I considered trivial points, and they had  
17 to do with the level of documentation under CGMPs and,  
18 you know, do you have to record the lot number of this  
19 or that.

20 In the end, the argument was, well,  
21 everybody else is doing it. So you need to do it,  
22 too. That's industry standard. I thought of calling  
23 around every other place and seeing if that was true,  
24 but I didn't.

25 So what ends up happening is, you know,  
26 with everybody under a consent decree, and we are  
27 applying these rigorous documentation requirements, I

1 think, artificially -- you know, without a good, valid  
2 reason for it except that, well, you know, the  
3 inspector said. It's easier to do it than to argue  
4 about it.

5 I would ask that, when something new like  
6 that comes along and you ask us to document something  
7 under CGMPs, the burden of proof that it's effective  
8 and will make it a safer environment should be on you  
9 and not on us, because if we weren't having a problem  
10 to begin with, adding a new level of documentation is  
11 potentially less safe, because it distracts you from  
12 what you're doing. But anyway, that wasn't what I got  
13 up for.

14 What I wanted to say was to make the self-  
15 certification viable, I think we have to have viable  
16 guidance documents. Where the irradiation one looks  
17 okay, just from skimming it, the last one I remember  
18 trying to help write an SOP from is the HCB lookback,  
19 and that was -- I mean, I think that I have some  
20 pretty sophisticated people at my facility, and it was  
21 tough going through and trying to figure out what the  
22 expectations were on that document.

23 So I have some suggestions. The first is  
24 to heed Al Gore's directive for plain English  
25 documents. I would suggest, before you print the  
26 draft, run it by somebody in the office, the  
27 housekeeping staff, and see if they can understand

1 what you wrote. Ask somebody to review it that wasn't  
2 really involved in creating the document, because it  
3 really is hard to implement something that you don't  
4 understand.

5 I just want to say that I think, you know,  
6 a noncompliance is not intentional in most facilities.  
7 It's because we don't really understand what you're  
8 asking us to do.

9 The second thing would be to allow more  
10 easy dialogue in the pre-submission phase. If you  
11 want us to be able to self-certify, we have to  
12 understand what you want from us. So it won't be  
13 successful unless we understand what your expectations  
14 are.

15 To do that, maybe you could empower your  
16 employees to talk on the telephone more freely,  
17 because I find that when I call on the phone, people  
18 are -- and you just said it a few minutes ago. You're  
19 afraid to make a statement, because somebody is going  
20 to quote you the next day.

21 So we don't get the information that we  
22 need, and a casual conversation, if we promise not to  
23 use your name, I think, would be appropriate.

24 MODERATOR CONLEY: If I could interject at  
25 that point, I think you're on the mark when you  
26 discuss guidances that have been published that are  
27 difficult to read and interpret.

1 I believe that most of the consumer safety  
2 officers in our group have no problem making a  
3 statement of fact on a policy that they understand.  
4 It's when they're being asked to interpret something  
5 that the agency has not taken a clear stand on that  
6 you will probably find them less willing to make such  
7 a statement.

8 Basically, we share the same problem. I  
9 know Judy and I at a workshop at AABB this year heard  
10 from many participants how helpful their consumer  
11 safety officers are and how quick they are to respond  
12 when they can. Hopefully, that's the issue, and what  
13 it really ties into is your first point.

14 Have the things been published so that  
15 they're clear for us, so that we can give you a clear  
16 answer. But I don't want to cut you off. You had  
17 another point.

18 MS. JETT: Yes. The next part, and still  
19 talking about the documents themselves, is it may be  
20 useful after you've published the document to validate  
21 it, as we have to validate our SOPs, by using the 483s  
22 and the things that appear there and assume that maybe  
23 that item is on the 483 because people didn't  
24 understand the document.

25 So use the information from the inspection  
26 to improve the guidance document.

27 Then finally, I would like to see you

1 develop a knowledge base on the Web where, as people -  
2 - you know, people interpret regulations and guidance  
3 documents every day through the inspection process  
4 through licensing or whatever other mechanism you do  
5 it, and it would really be helpful to be able to share  
6 the experience and the knowledge of other people by  
7 publishing that in a knowledge based system on the  
8 Web, so that your staff could use it and we in  
9 industry could use it to help understand how to  
10 interpret and how to implement.

11 That's it.

12 CAPTAIN GUSTAFSON: Betsy, could I ask you  
13 a question? Do you mean perhaps a Q&A format on the  
14 Web along with the guidance that maybe would clarify  
15 areas that seem to be in question?

16 MS. JETT: You know, there's a lot of  
17 different mechanisms for a knowledge base. That's one  
18 of them, and there's others like, you know, if you  
19 have some sophisticated computer people there,  
20 developing sort of an intelligence base where you  
21 could -- you can go see a subject and dig down and  
22 find, you know, how something has been interpreted or  
23 what applies here and there and how you can apply it.

24 You know, that's a computer technology  
25 kind of question that I'm not an expert in, but I know  
26 I've seen, you know, in other FDA sites things like  
27 that starting to develop. I couldn't tell you where

1 they are, but I've seen them and said, oh, I wish CBER  
2 would do that, too.

3 Part of it is questions and answers, but  
4 it would also be how -- you know, like -- I don't know  
5 -- in the legal profession, you know, how a case was  
6 decided and what was the rationale behind that case.  
7 Those are published.

8 MODERATOR CONLEY: Good comments. Thank  
9 you. Ann?

10 MS. HOPPE: Is it completely out of the  
11 question to think about self-certification to an  
12 existing approved SOP versus a single monograph that  
13 everyone has to do the same thing?

14 I mean, what disturbs me about it is that  
15 none of it seems to be performance based in terms of  
16 successful programs, that I may have a protocol that's  
17 slightly different than yours, but if I'm getting a 90  
18 percent success rate and other people have 50 percent,  
19 maybe it would be more valuable to approve my program  
20 rather than saying, you know, I have to give up the  
21 exceptions I have approved if I want to use this  
22 standard process.

23 MODERATOR CONLEY: Is there a reason why  
24 you could not approach exactly what you're asking for  
25 under a comparability protocol?

26 MS. HOPPE: No, but the subject today is  
27 this process.

1           MODERATOR CONLEY: Yes.

2           MS. HOPPE: And it would be nice if there  
3 were a process like this we could use short of having  
4 to put the resources into developing comparability  
5 protocols. It seems to me that it would make more  
6 sense, and things like, you know, the admonition to  
7 test for alloantibodies -- sure, we test for  
8 alloantibodies.

9           You're not commercially viable if you  
10 don't produce products that are relatively free of  
11 extra antibodies. But again, if I have a performance  
12 history of .1 percent production of unwanted  
13 antibodies and other people got 10 percent, maybe my  
14 differences are sufficiently good that I should be  
15 allowed to keep doing them and still use this process.

16           I think -- You know, again this is sort of  
17 superficial in a way, rather than doing something  
18 that's really going to add value and be something we  
19 can use. I mean, we're the largest red cell  
20 immunizers probably in the world, and I can tell you  
21 I'm not going to use your process the way it's  
22 written.

23           MODERATOR CONLEY: I think standardized  
24 processes -- it's a relatively small step for us to  
25 accept applications self-certified on an industry  
26 standard accepted SOP monograph, but to make the leap  
27 that everyone will be able to write their own SOPs

1 that they will self-certify under -- that's a leap.

2 I would not be ready to advocate that yet.

3 I don't know where we'll end up in a few  
4 years.

5 DR. LEE: I appreciate your comments about  
6 the scope of applicability and usefulness as currently  
7 defined today, but once again, this is only step one.  
8 I think what you're envisioning is step 10 of the  
9 process.

10 Once we get there, we may very well wind  
11 up embracing some of the ideas that you just  
12 expressed, provided that we receive from you  
13 appropriate rationale and justification and  
14 demonstration that that is indeed the case, and that  
15 the case for you is also generalizable to other  
16 centers, not just in your management but under other  
17 people's management.

18 Then we will certainly welcome the --  
19 embrace that idea. However, I think there is a long  
20 bridge between that end goal, which we hope to  
21 eventually arrive, and where we are today. That's  
22 based on inspectional experience.

23 To make a single step jump would be  
24 premature, and we're taking cautious steps. So I'm  
25 afraid that, if you're not going to use our process  
26 today, that's certainly your option, and that's simply  
27 -- that's the end of that.

1           I'm regretful that it's not useful for  
2 you. However, we hope to invite you to comment, as  
3 you just did, perhaps with a little bit more  
4 substantiation behind your arguments, so that it's  
5 useful in expanding the pilot program, as once again  
6 we are only at the rudimentary stages, and we're not  
7 clear exactly how to take the next step.

8           We have taken just the first step, and  
9 your comments will be very welcome in taking the next  
10 steps towards some vision that you already have in  
11 making the process more efficient.

12           MODERATOR CONLEY: Let's take a comment  
13 form the back, and then we'll come up to you, Kay.

14           MS. LeBEAU-LAIRD: All right. I'd like to  
15 address that question. Is the concept of self-  
16 certification viable? First of all, is that term  
17 correct, self-certification? I just fail to see how  
18 we are certifying ourselves.

19           To me, the difference in this paradigm is  
20 the location of the documents. Before, we would send  
21 in SOPs and QC documents, and you would look at them  
22 at CBER. Now we're going to be sending in just the  
23 submission, and then you will come out, and you will  
24 look at our SOPs and our QC documents.

25           So would you explain to me how this could  
26 be called self-certification? I feel like dumb and  
27 dumber here.

1           MODERATOR CONLEY: I'll try first. We are  
2 in a validation stage of a process. So during the  
3 pilot an on-site certification will be used. If it is  
4 demonstrated that you may self-certify in these  
5 instances, an on-site inspection may cease to be a  
6 part of the self-certification.

7           We are validating an approach which --  
8 You've all been through validations now. What the  
9 future holds will depend on the performance we find  
10 when we go out and look during the pilot. It may well  
11 be -- and, you know, what's the future hold?

12           My own bias with interest in QA is that we  
13 would sample a designated subset in some kind of a  
14 directed audit in the future, assuming that the first  
15 initial validation is good.

16           Somebody want to add to that?

17           CAPTAIN GUSTAFSON: No. I think you did  
18 fine. That's exactly -- I mean, we recognize that, as  
19 the pilots are designed right now, that we are just  
20 moving the review to the inspection rather than really  
21 accepting at face value your self-certification. But  
22 we feel that we need to do that in order to see  
23 whether this is really viable.

24           There are issues -- You know, one basic  
25 non-compliance, but as Betsy just mentioned, there may  
26 be problems with the guidance that didn't come through  
27 during the comment period even. So we're validating

1 both your compliance and our own guidances.

2 MS. LeBEAU-LAIRD: I see. So if you go  
3 out and say 95 percent of the facilities in the model,  
4 in the project, look fine, then is what I'm hearing  
5 that maybe you won't be going out to do inspections  
6 after that for these license applications?

7 CAPTAIN GUSTAFSON: Yes. That is a  
8 possibility. That's what under consideration, that if  
9 the pilot is so successful and the industry shows that  
10 they are able to certify to a guidance and follow it,  
11 then I think we would license without the pre-approval  
12 inspection.

13 MS. LeBEAU-LAIRD: All right. Thank you.

14 MODERATOR CONLEY: Give me some feedback  
15 on that before you leave the mike. You used 95  
16 percent, I'm sure, off the top of your head. If we  
17 had 12 people submit to participate in the irradiated  
18 pilot and 11 of them were certified immediately  
19 following inspection, and the 12th was egregiously  
20 horrible -- people weren't trained, products were  
21 being irradiated at 3500 Centigrade, abandoned twice  
22 if they forgot to put the sticker on, people weren't  
23 trained -- is that a successful system?

24 What do you think we should look for in  
25 order to judge whether we have a successful pilot?

26 MS. LeBEAU-LAIRD: I'd have to think about  
27 that.

1                   MODERATOR CONLEY: Okay. Think about  
2 that, and write in.

3                   MS. LeBEAU-LAIRD: That's what we have  
4 been thinking about.

5                   DR. LEE: Well, obviously, five percent is  
6 not always five percent. I mean, one out of 12 is not  
7 the same thing as ten out of 120. Each carries a  
8 different weight of being able to serve as in a  
9 probability model.

10                   So I think you have to think about  
11 confidence intervals. First of all, five percent is  
12 too high, to begin with. I mean, if you are proposing  
13 .1 percent, perhaps we can consider that. If that .1  
14 percent is validated enough based on statistical  
15 analysis that it's actually .1 percent, no matter how  
16 many such studies you conduct, then perhaps it's  
17 acceptable; but then at that point it becomes a  
18 judgment issue as to what level of risk you are able  
19 to accept and what level you are unwilling to accept.  
20 It becomes more of a judgment call.

21                   At some point, with every statistical  
22 analysis, there's judgment involved, first of all,  
23 what's acceptable and what's not. Then once you have  
24 clarified those ideas, then you begin to run numbers  
25 and assess the predictability of that particular  
26 outcome to other broader situations.

27                   So I think this is why we are in the

1 initial "Phase I" stage of this -- exploring this new  
2 policy, to get an idea, initial idea, of the  
3 experience based on which we can perform larger  
4 studies which are then geared to actually deriving  
5 some numbers that give us numbers about predictability  
6 as applicable to other bigger situations.

7 MODERATOR CONLEY: It's pretty clear to  
8 all of us that, if we applied standards comparable to  
9 HIV risk and CJD risk, probably nobody would get  
10 licensed for anything. Are we science driven anymore?  
11 I'm not sure.

12 Let me just mention in passing, because I  
13 see more and more people sneaking out, there is an  
14 evaluation form. We very much would appreciate it if  
15 you complete that and leave it on the desk outside, as  
16 to whether you have found today's meeting useful or  
17 not, and thank you for waiting, Kay.

18 MS. GREGORY: Hi. Kay Gregory from AABB  
19 and frequently a spokesperson for CFRR, for those of  
20 you who might not know me.

21 I just want to express my thanks for  
22 having the workshop today. I think it's been very  
23 useful. We've heard a lot of good information.

24 In response to this particular question,  
25 I think that self-certification is very viable. I  
26 would echo some of what Betsy had to say in terms of  
27 I think one of the key ingredients is that we all need

1 to understand what it is we're trying to certify to.

2           So we need a good guidance document. We  
3 need good understanding of what it is we're trying to  
4 do. I don't think any of us deliberately don't comply  
5 with something. We simply don't understand that it's  
6 meant to be interpreted this way or that way or some  
7 other way.

8           You're writing guidance documents. I know  
9 it's very difficult. I do a lot of writing, and  
10 people write back and say, well, you said, and that  
11 wasn't what I intended at all. So trying to write in  
12 plain English -- and I think maybe the idea of a  
13 checklist wasn't so much the idea that we just want a  
14 simple checklist, but maybe a -- or guidance document  
15 with bullet points instead of long sentences that I  
16 can't figure out what they mean, you know.

17           So I think that was one possibility for a  
18 checklist, is not just a checklist where you go down  
19 and check, but where it would really give you what you  
20 really intended it to be, if there are limits that you  
21 want it to fall within this or that or whatever.

22           So I think the concept of self-  
23 certification is one that we should explore. If I'm  
24 hearing things right today, the pilots are really just  
25 a beginning step, and you need to have some way to  
26 sort of evaluate whether you're going the right  
27 direction or not, and I think this may be a way to do

1 it.

2 I'm not sure that for the blood side  
3 you've chosen the pilot project that will have a lot  
4 of interest, but I think you won't find out until you  
5 float it and see. I was glad to hear that, if you  
6 think there's not enough interest in this one, you  
7 would look for something else that you could do on a  
8 pilot basis.

9 So again, I'd like to thank you for having  
10 the workshop. I've found it very useful.

11 MODERATOR CONLEY: Thank you, Kay. How  
12 many of you either represent an applicant or know of  
13 somebody, another applicant, who would be interested  
14 in participating in one of the two pilots we described  
15 today? If you both know somebody and you are one, you  
16 can do this.

17 So there's some interest in our relatively  
18 small group here today. I see about five hands, I  
19 think, and it is not a huge representation.

20 Cheri?

21 MS. JENNINGS: Yes. As the concept is  
22 being presented on a basic level, I think it's a very  
23 good one. When my institution has been unsuccessful  
24 in a license application, it has been because we have  
25 failed to address some key issues that you think are  
26 very important.

27 When we have been successful on the first

1 try, it's because someone like Gil, our consumer  
2 safety officer -- in other words, Linda Alms -- has  
3 said make sure that you address the following items.

4 So if these are put into the guidance  
5 document that we can understand clearly and with the  
6 possibility of knowing that our application will be  
7 complete within a 90-day period, I know people at my  
8 institution particularly would be very favorable to  
9 that.

10 I know there's a lot of work that needs to  
11 be done, but the concept as you presented it today to  
12 me seems like a sound idea.

13 MODERATOR CONLEY: Again for our record,  
14 that was Cheri Jennings from Gulf Coast.

15 Please come and use the mike.

16 MS. VAWTER: My name is Mary Lou Vawter,  
17 and I'm with San Diego Bio Health. I have a concern  
18 about the self-certification as far as the small guys  
19 like myself. We're just a small, little plasma  
20 center, but I've been doing red blood cell  
21 immunization since '85, and I've worked for some  
22 really good people and I've worked with some really  
23 bad people.

24 Unfortunately, the bad people are really  
25 bad, and it isn't until somebody comes forward and  
26 reports it that something happens. But I'm afraid  
27 that bad people might get into this again. You know

1 what I'm saying?

2 MODERATOR CONLEY: You mean, and ruin the  
3 pilot?

4 MS. VAWTER: Yes. I mean, who's to say  
5 that somebody that has had their license revoked can't  
6 use somebody else's name and get back into the  
7 industry again and just go back with the same  
8 shenanigans that he had before.

9 It concerns me, because I mean, I've been  
10 dealing with the same donors since 1985, and I don't  
11 want my donors to be at risk with people that are in  
12 it for just the money.

13 CAPTAIN GUSTAFSON: Are you saying that  
14 perhaps this is too risky of an area to pilot?

15 MS. VAWTER: The red blood cell -- I'm  
16 kind of -- I kind of feel that way, but I mean, I know  
17 I try my best to be in compliance at all times, but  
18 when you have somebody that you once worked for that  
19 wasn't and telling you different things that aren't  
20 really true -- you know, I mean, I'm afraid other  
21 people will get into this and really have no business  
22 being in this industry.

23 DR. LEE: Given the fact that we have the  
24 license -- actual pre-licensing inspection retained as  
25 one of the review components, and given the fact that  
26 we have limited this to the users of qualified cells  
27 as supplied by others, do you think that this affords

1 less public health protection than the current ways of  
2 doing things?

3 MS. VAWTER: Well, that's true. I didn't  
4 think of it that way, but who's not to say that he  
5 goes -- or somebody can go to someplace that's already  
6 licensed and then go ahead and get a red cell? You  
7 know, I mean --

8 DR. LEE: Yes. We have thought about  
9 that.

10 MS. VAWTER: Where there's a will, there's  
11 a way.

12 DR. LEE: I'm glad that you are thinking  
13 along the same process that we've already pursued.  
14 That's quite correct, but I think those are risks that  
15 are already existing, and we hope not to increase risk  
16 but just to find some means of improving the process  
17 without increasing the risk and, perhaps at the same  
18 time as a by-product, maybe increase safety as well.

19 MS. VAWTER: Okay.

20 DR. LEE: But the pilot may fail, but then  
21 it fails for a good reason, and then we'll be very  
22 glad it failed, but then that doesn't mean that the  
23 whole program has died. We will simply move to  
24 another specific area of regulations.

25 MODERATOR CONLEY: It's heartening for me  
26 to hear some of the industry express some of the same  
27 concerns that we have had internally as we try to find

1 more efficient ways. Unfortunately, we don't regulate  
2 just the good guys or we don't have a way of splitting  
3 out and regulating just the bad guys. We make a  
4 regulation that has to be fairly applied to all and,  
5 hopefully, we limit the bad guys in the industry.

6 Go ahead.

7 MS. JETT: Yes. A comment on how you  
8 might evaluate the program itself. Somebody had  
9 mentioned, well, you know, is it going to be --  
10 there's no 483s or no significant ones.

11 I would say maybe you should compare it to  
12 the number of 483s you get using the traditional  
13 approach. I can't imagine that there's none under the  
14 current program. So why would you think there would  
15 be less under the new approach?

16 MODERATOR CONLEY: Excellent point. Make  
17 sure we are at least doing as well or better than we  
18 were under the old approach. Very good.

19 DR. LEE: Well, once again not to rain on  
20 the parade, but under the traditional approach, the  
21 483s must be addressed before an approval is released.  
22 So is the pilot.

23 If you -- I mean, that -- Oh, I see what  
24 you're saying. Yes. But I guess in terms of  
25 accepting the ultimate -- the application in terms of  
26 the final approval, it's rendered after all  
27 deficiencies have been properly addressed, and we

1 certainly want to do that under the pilot as well, but  
2 how do you declare success of the pilot?

3           If we always have to -- If we are throwing  
4 people out of the pilot because they don't cut mustard  
5 at inspection, then that doesn't mean that they can't  
6 be licensed. They will be licensed through the  
7 traditional means, but the pilot has died.

8           So I think, of course, we will keep in  
9 mind the number of observations cited under the  
10 traditional system, but that's going to be way too  
11 high. The number that we're aiming for has to be far  
12 less than that in order for the pilot to actually be  
13 declared a success.

14           Well, because -- not necessarily it's good  
15 or bad, but just because the fact that if the number  
16 of observations are high, then we are continuously  
17 falling back to the traditional ways of reviewing  
18 things, and by definition, the pilot has failed.

19           Basically, we're trying to arrive at a  
20 number which we can -- which gives us confidence that  
21 we can move forward to the next stage of the program,  
22 that we do not have to fall back on the traditional  
23 review, that the initial self-certification is indeed  
24 self-certification as we want it, and move forward.

25           So unless the findings at the inspectional  
26 stage of the pilot is only of fairly insignificant  
27 public health importance, I think by default the

1 program, as defined in that area, cannot move forward.

2 So I think the ultimate number has to be  
3 much better than the current inspectional experience  
4 under the traditional program.

5 MS. JETT: Then maybe I'm misunderstanding  
6 the intent of the whole program. I thought it was a  
7 streamlining thing, not an improved safety program  
8 necessarily.

9 DR. LEE: Well, we endeavor to streamline,  
10 but not at the expense of increasing -- not at the  
11 expense of safety. Basically, if the pilot program --  
12 If the findings under the pilot forces us to  
13 continuously throw people out of the pilot program,  
14 then the answer to your question would be, well, the  
15 pilot program is not viable.

16 MS. JETT: Okay. But I just don't see why  
17 you would expect a facility to be more successful at  
18 implementing guidance in the pilot program than under  
19 the traditional process unless you're changing the --

20 DR. LEE: We don't necessarily expect  
21 anything at this point. I mean, if you submit an SOP  
22 to us and review it, and we get it to the shape that  
23 we want it, then we know it's okay, because we had an  
24 input into the process.

25 MS. JETT: Okay, I see what you're saying.

26 DR. LEE: But without that -- I mean, we  
27 tried to tailor these guidance documents released

1 under the pilot -- we try to tailor them to be very  
2 SOP oriented and detailed and specific, not leaving a  
3 lot of room for other considerations. It's  
4 intentionally written that way so that it can simply  
5 be taken as it is and be readily converted into an  
6 institution specific SOP.

7           Whether or not the industry can acceptably  
8 do that depends on, as you said, the clarity of the  
9 document and the willingness to comply. We believe  
10 that, in general, people are willing to comply, but  
11 often are not able to comprehend exactly what should  
12 be in their institution specific SOP, and the  
13 challenge is on us to make sure that these guidance  
14 documents are written clearly.

15           Part of the good guidance practice  
16 provision is to allow your input which, among other  
17 things, will add clarity to the document.

18           MS. JETT: Would the specifics contained  
19 in the guidance document become de facto standards  
20 outside of the pilot program?

21           DR. LEE: Well, that's moving on to a  
22 broader question. That may very well be the case, but  
23 that's not our intent. Our intent was to provide a  
24 mechanism where -- which represents the majority of --  
25 the bulk of the potential applicants.

26           We want to find out the most common ways  
27 of doing things, and we want to convert that into a

1 system that readily lends itself to "self-  
2 certification" to previously written guidance  
3 documents. But that's not to discourage other people  
4 from proposing more creative, better, more efficient  
5 ways of doing things. However, we can't just do that.  
6 Those have to be evaluated.

7 Under the spirit of the pilot program,  
8 once you begin to evaluate, you fall down. As it's  
9 defined today, I think we want to concentrate on the  
10 fact that we are -- at least for the initial stage,  
11 the purpose is to obviate detailed review after  
12 receiving submission but be able to move right into  
13 the inspection.

14 So by default, it may -- The industry  
15 forces may be such that what you just said might wind  
16 up being the outcome, but that's sort of beyond the  
17 scope of what we can control.

18 MODERATOR CONLEY: I think our guidance  
19 documents, as we publish them now, do become de facto  
20 standards. They do not carry the weight of law nor  
21 the weight of regulation, but in that the industry  
22 complies with them generally, they do become good  
23 manufacturing practices.

24 So more difficult to defend in a court of  
25 law if FDA pursued an action against a licensed  
26 manufacturer, but still very doable, because they do  
27 become de facto standards.

1           So I don't think these will be any  
2 different, but we have to recognize what they are  
3 right now and that we've tried to remove a lot of the  
4 variables.

5           Things that you might have been able to  
6 successfully defend under an earlier guidance  
7 document, if you're going to pursue it under a pilot  
8 study, what you're saying is I'm doing it exactly that  
9 way so that I can have an expedited review. So that's  
10 the difference between the two.

11           You may still apply through traditional  
12 prior approval supplement approach, if you want to do  
13 something a little bit differently, if you want to  
14 irradiate at 3000 rather than 250 Centigrade; but if  
15 you're going to participate in the pilot, then we've  
16 simplified it. We've made it straightforward, but we  
17 have not tied the hands of manufacturers on how they  
18 do things.

19           MS. JETT: Just make that clear to  
20 everybody. I mean, you know, include that in the  
21 title of the document, because I think otherwise there  
22 will be confusion about what's the requirements for a  
23 product versus the requirements to participate in the  
24 pilot.

25           DR. LEE: Yes. Actually, we have tried to  
26 incorporate into the guidance title by making sure to  
27 include the word pilot.

1 MS. JETT: Oh, okay.

2 DR. LEE: I appreciate your points.

3 MODERATOR CONLEY: I put the next couple  
4 of questions up, which are really on technical issues,  
5 so that people can -- if you have any questions about  
6 the technical or scientific basis in the documents, we  
7 can come to that. But Steve was already up and has a  
8 comment.

9 MR. KASSAPIAN: Steve Kassapian from the  
10 American Red Cross.

11 Your previous slide, those are the ones  
12 I'm addressing. I believe that this is a significant  
13 change, and I believe it is viable; but it's not only  
14 viable. I think it's necessary, and I don't see it at  
15 all as a conflict of interest.

16 I think that industry can help in the  
17 development of these guidances. I think that in the  
18 long run the industry is closer to the manufacturing  
19 process, and in many cases they would be more  
20 strengthened.

21 So that's why I don't see a conflict of  
22 interest. I also see that we would be able to get  
23 improved products to market faster, and that's again -  
24 - there's no conflict of interest here.

25 So it is definitely viable. It is  
26 necessary, and we should do it. Having said that, I  
27 just want to step back one, because I want to say I

1 like this concept, but I also like the concept of the  
2 BLA and the changes to 601.

3 I think the problem with both of those is  
4 how we implement this process. I think this can prove  
5 Mary's point, that we're not in bed together, because  
6 even though they get input from industry, they don't  
7 always necessarily -- you don't always necessarily  
8 implement it the same way or exactly in the fashion we  
9 would want, and that's understandable. But we're  
10 going to give you our two cents anyway. I think  
11 implementation of this will be something that we can  
12 debate as well.

13 You wanted some areas of interest for  
14 pilots. Somebody already mentioned leuko-reduction.  
15 I would absolutely agree.

16 I would also mention platelet pheresis.  
17 This isn't the first time I would mention platelet  
18 pheresis. It won't be the last.

19 Here's one that I don't know that you've  
20 thought about and, from my organization, it would be  
21 very helpful -- changes to SOPs in the big six  
22 categories. That would be donor suitability, high  
23 risk, etcetera.

24 I think that would fit in nicely to this  
25 concept, because here you're giving us -- we're saying  
26 we're certifying that our SOPs, our changes to the  
27 SOPs, address your concerns, and we have them.

1           In fact, if you wanted to do a pre-license  
2 inspection, which I don't think would be necessary,  
3 you would come in, and you would look at the SOPs more  
4 effectively. You would look at how the SOPs actually  
5 work in the real world.

6           So I would think I would like to see -- I  
7 say I think. I would like to see this type of thing  
8 for SOPs, just as a separate part -- you know, changes  
9 to SOPs.

10           I think the question -- you asked the  
11 question also, how much detail should we put in these  
12 guidances. Somebody asked that one. I think in that  
13 case you would want to put in the concepts as opposed  
14 to the details.

15           The only details you would really want  
16 would be the specific ones that would be required,  
17 such as, say, 2500 Centigrade or the specific details  
18 that are absolutely necessary set points or whatever.  
19 But by and large, I think that my comment is that this  
20 is absolutely doable, and we should move forward with  
21 it.

22           As somebody else mentioned, this is only  
23 one tool. You can use this for something else. You  
24 could use a comparability protocol for something else.  
25 This may not fit for what somebody else was  
26 discussing, but there's another tool to use.

27           So the more tools you can give us, the

1 happier I'm going to be. Thanks.

2 MODERATOR CONLEY: Good. Thank you for  
3 your comments, Steve.

4 Any -- Express any concerns or questions  
5 about scientific or technical issues in either of the  
6 two guidance documents? Perhaps this may be an issue  
7 that you would rather go home and put your data  
8 together and respond in writing.

9 We really talked a little bit already  
10 about what criteria should be used to evaluate the  
11 self-certification pilot, and got some good ideas on  
12 that. Steve has already kicked off the idea of what  
13 next products should be included in the program, and  
14 what would be the best way to involve the industry.

15 We've also heard some comments, too, and  
16 especially some comments and some concerns that maybe  
17 the representatives in like CFRR may not represent the  
18 small guy in blood banks, and maybe -- Good, Kay is  
19 going to address that.

20 MS. GREGORY: I don't pretend that we  
21 represent everybody, because we don't hear from  
22 everybody. Certainly, if you let us know what your  
23 concerns are, we do try to represent especially the  
24 small guys, because we're afraid you don't have a  
25 voice of the big guys. But if you don't tell us,  
26 there is no way that we can represent you either.

27 So I guess my plea would be to let someone

1 know what your concerns are. You know, CFRR was  
2 specifically designed to try to work on these issues,  
3 and we're certainly happy to do so. We're certainly  
4 happy to let somebody else work on it for a while as  
5 well, but we can only represent what we know about.

6 Frankly, we have trouble getting industry  
7 input sometimes. So I know most of you here probably  
8 are the ones who respond anyway, but if you can take  
9 the message back home that not only does FDA want to  
10 know what you think, but industry, AABB, the CFRR --  
11 we all want to know what you think as well, so that we  
12 can represent you as best we can.

13 MODERATOR CONLEY: The floor is wide open  
14 for anybody on the panel or in the audience.

15 DR. LEE: Well, I'd just like to make a  
16 comment, that I am actually very glad about the size  
17 of the audience today, because that allows each one of  
18 you to adequately express your concerns and truly come  
19 to an understanding of what we presented.

20 Had we had a much bigger audience, I think  
21 the case would be too many cooks in the kitchen, and  
22 we wouldn't be able to really reach the level of  
23 clarity that we are striving for.

24 The burden is for all of you to go back  
25 and discuss this with your neighbors so that you each  
26 individually serve as a spokesperson of the changes to  
27 be implemented in the future. So in that way, not

1 only by giving us your direct feedback, but to sort of  
2 serve as indirect spokesperson, I think we can achieve  
3 the same goal in a more efficient way.

4 I guess one more comment about in  
5 brainstorming ideas for expansion of the pilot program  
6 to include other regulatory areas. I think whether or  
7 not it's a suitable candidate may become more clear if  
8 you ask the question, self-certification to -- self-  
9 certification for adherence to? That's the area that  
10 -- the blank that you want to fill in.

11 If you just think about self-  
12 certification, period, that just means that you self-  
13 certify, and that you say that you're okay. If you  
14 think along those lines, I think you will find  
15 yourself thinking in an unclear way. But if you ask  
16 yourself, self-certification for my adherence to, and  
17 then the question is how do you want to come up with  
18 a particular monograph or pilot guidance which spell  
19 out the provisions of adherence.

20 Those are my two final closing comments.

21 MODERATOR CONLEY: Let me just  
22 editorialize a little bit, too. When these documents  
23 publish in draft, they are open to public comment from  
24 everyone. Every comment that is sent to the FDA is  
25 read and considered on its merit in the publishing of  
26 the final guidance document.

27 Often in our busy lives, it's easy to

1 presume that AABB or CFRR or ABC is already responding  
2 on our behalf. In fact, that is the best guard for  
3 the small place that feels like they're being left  
4 out, is to take time to comment on a guidance  
5 documents; and I know how hard pressed everybody is  
6 for time, and it's difficult, but that's still the  
7 best way to get your comments in to the FDA, because  
8 we're not tied to any one manufacturer in asking for  
9 support.

10 I think things are starting to wind down.  
11 Closing comments from the panel?

12 CAPTAIN GUSTAFSON: Well, I'm very, very  
13 grateful for the turnout today. I was worried. I was  
14 worried both in terms that we didn't have enough  
15 material to fill a day, and also that we wouldn't have  
16 enough people except for FDA folks to have any  
17 discussion.

18 So I'm very, very pleased that you came.  
19 I'm very, very pleased that you participated, and I  
20 hope that you will continue and comment on the written  
21 draft and send in written comments for us to chew on  
22 as well.

23 We will have the transcript. We plan on  
24 studying all of your comments, but you know, keep  
25 telling us what you think. I think I've got the idea  
26 that the concept is good. You like self-  
27 certification, but the devil is in the details, and

1 whether we have the right pilot, we have the right  
2 evaluation criteria are things that, I think, are  
3 still under discussion, you know, as we move along.

4 I think I get the idea that you like the  
5 overall concept.

6 MODERATOR CONLEY: Are there anymore  
7 comments? One more comment.

8 MS. FORD: Kenra Ford, Director of Labs,  
9 Inventory Management, the Oklahoma Blood Institute.

10 I'm very excited about this potentially  
11 new pathway. I'd like to strongly recommend that this  
12 be considered, and this may be a way to launch off  
13 this new opportunity.

14 For those products where you're already  
15 licensed, and you made a major manufacturing change  
16 that constitutes re-licensure or new application, for  
17 example, donor retested plasma, you've got an  
18 apheresis technology and you go to a new version  
19 upgrade where it constitutes re-licensure, that may  
20 allow you to get the data that you're looking for in  
21 a more controlled situation, because you've already  
22 got a licensed product in a center that has experience  
23 with that process, so that you don't roll in bad  
24 outcome data up front that would crater this.

25 I think this is a great opportunity for a  
26 lot of areas, but maybe not all of them.

27 MODERATOR CONLEY: Very good. Thank you.

1                   Well, thanks to all of you. Thanks for  
2 today's participants. I think we all owe each other  
3 a big hand.

4                   (APPLAUSE)

5                   MODERATOR CONLEY: Complete your  
6 evaluations, and drive safely wherever you need to go  
7 tonight.

8                   (Whereupon, the foregoing matter went off  
9 the record at 4:12 p.m.)
