Official Transcript of Proceedings

NUCLEAR REGULATORY COMMISSION

Title: Draft Environmental Impact Statement

Peach Bottom Power Station, Units 2 & 3 License Renewal - Afternoon Session

Docket Number: (not applicable)

Location: Delta, Pennsylvania

Date: Wednesday, July 31, 2002

Work Order No.: NRC-491 Pages 1-162

NEAL R. GROSS AND CO., INC. Court Reporters and Transcribers 1323 Rhode Island Avenue, N.W. Washington, D.C. 20005 (202) 234-4433

1 P-R-O-C-E-E-D-I-N-G-S 2 (1:30 p.m.)Good afternoon, 3 FACILITATOR CAMERON: 4 everybody, and welcome to the Nuclear Regulatory 5 Commission's public meeting this afternoon. My name is Chip Cameron, and I'm the 6 7 special counsel for public liaison at the Nuclear Regulatory Commission, or NRC, as you will hear that 8 9 acronym a lot today. 10 is my pleasure to serve as 11 facilitator for the meeting this afternoon. 12 that role I'm going to try to help all of you, who are here today, to have a productive meeting. 13 14 The subject of today's meeting is the 15 application to, from Exelon Generation, Corporation, to renew the licenses for units 2 and 3 at the Peach 16 17 Bottom atomic power station. We were here last year, on November the 18 7th, to give you a little bit of background on the 19 NRC's process for evaluating these license renewal 20 21 applications. And, specifically, to get your ideas 22 and suggestions on what we should include in the 23 environmental review that we do, as one part of the 24 evaluation of the license renewal application.

discuss the findings in a draft environmental impact statement that we have prepared. And our objectives today are to describe what those findings are, to make sure that everybody understands what the license renewal process is all about, and what the NRC's responsibilities are.

That is one objective, to give you background and answer your questions. The second objective is to listen to any comments that you might have on the draft environmental impact statement, or license renewal, generally.

We are accepting written comments on these issues, and you will hear from the NRC staff in a little bit more detail on that process. But we did want to be with you, in person, this afternoon to talk with you, and to hear your comments.

You may hear some information from the NRC, or other people in the audience today, that stimulate you to submit a written comment. But I do want to emphasize that anything that you say today will carry the same weight as a comment that is submitted in writing.

Before we get on with the meeting, the substance of the discussion, I wanted to just talk briefly about the format for the meeting, and the

ground rules for the meeting.

The format is, basically, corresponds to the objectives that we have for the meeting. The first segment of the meeting is to give you information. And we have some, a series of brief, and I will emphasize that, brief NRC presentations on various aspects of license renewal.

And, of course, on the most important subject, the findings in the draft environmental impact statement. After each of those NRC presentations we will go out to you for questions to make sure that you understand what we are talking about.

The second part of the meeting is where we hear from you, and that is where we will have people probably most comfortable, come up here, and give us your comments. But we do have other microphones available that you can talk from.

There is a sign-up card if you want to speak. And it is not like it is a requirement for you to speak. We do want to know, have an idea of how many people want to talk today, so that we can structure the time, so that everybody gets an opportunity to talk.

But that is our format, and in a minute

I'm going to introduce all of our speakers, and give you a little bit of an idea on what their background is, so that you know more about them.

In terms of ground rules during the first part of the meeting, where we are going to try to be interactive with you and see if you have questions, if you do have a question just signal me, and I will bring you this talking stick, and give us your name, your affiliation if appropriate.

We are taking a transcript of the meeting, that is going to be our record of the meeting, and that will be available at the NRC's website. And if anybody wants a hard copy of it we can get you that, also.

I would ask, as a second ground rule, that only one person speak at a time. That will help us to keep a clean transcript so that our stenographer knows who is saying what at the moment. But most importantly it will allow us to give our full attention to whomever has the floor at the time.

A third ground rule I would ask you to be concise. And this is so that everybody who wants to say something this afternoon has an opportunity to say it. So I would just ask you to try to be brief in your questions.

1 I know this is a complex issue, an issue 2 of concern, and sometimes it is hard to be concise. 3 But I would just ask you to try to do that so that we 4 could give the other members of the audience time to 5 say whatever they want to say today. During the second part of the meeting when 6 7 we go for formal comment, I'm asking you to follow a five to seven minute ground rule. That is a little 8 9 bit fuzzy, we are not going to be keeping a timer on you, but I would ask you to try to limit your comments 10 11 to that amount of time. 12 If you have a written statement that you want to submit to the record, we will be glad to 13 14 attach that to the transcript for today's meeting. 15 And I would just thank all of you for being here today. The NRC's decision on whether to 16 17 renew the licenses is an extremely important decision, and we thank you for being here to assist us with that 18 decision. 19 20 And what I would like to do now is just to 21 briefly introduce our speakers, and give you an idea 22 of what the agenda is going to be for today's meeting. 23 I've asked John Tappert, who is right here, to also 24 give you a short welcome.

And I've asked John to do this because he

1 is the section leader of the license renewal and 2 environmental renewal branch. He is the section leader for the environmental review. 3 4 And John and his staff, any license 5 renewal application that comes in, they are the ones who are responsible for supervising the preparation of 6 7 the environmental review. And John has been with the NRC for approximately 11 years. 8 9 He has been a resident inspector at nuclear power plants in NRC's Region One, which is the 10 11 region that covers the Peach Bottom plant. He has a 12 master's degree in environmental engineering, and his bachelor's is in oceanographic 13 and 14 engineering. 15 After John is done we are going to go right to our first substantive presentation, and that 16 is going to be on the license renewal process, 17 generally, and the safety evaluation that is done as 18 19 a part of that process. 20 And we have Mr. Raj Anand, who is right 21 Raj is the project manager for the safety 22 evaluation for this license renewal application, the

one that has been submitted for Peach Bottom.

And Raj is with, again, the license renewal and the environmental impact branch. That is

23

24

within our office of nuclear reactor regulation at the Commission.

He has been with the NRC for 22 years dealing with system and plant design. He has a bachelor's in mechanical engineering, and has taken graduate courses in nuclear science from Catholic University.

We will go to you for questions about the license renewal process, the safety evaluation, and then we are going to get to the specific reason we are here tonight, which is to discuss the environmental impact statement, the draft environmental impact statement.

And we are going to turn to Duke Wheeler who many of you might know. Duke is the project manager for the environmental review on the Peach Bottom license applications.

And he has been with the NRC for 21 years in power plant licensing, project management responsibilities for these power plants. He also has inspection experience, and he has a bachelor's degree from the military academy at West Point.

And he will be giving you an overview of the environmental review process, go out to you for questions, again. And then we are going to get to the

real heart of today's meeting.

And that is going to be what are the findings in the draft environmental impact statement?

And as you will hear the NRC is helped in its environmental review responsibilities by some expert scientists and consultants that the NRC hires.

And we have Bruce McDowell, right here, who is the task leader for the environmental review on the Peach Bottom license renewal applications. And Bruce is with the Lawrence Livermore National Laboratory in California. And he is an environmental assurance manager there, in the environmental protection department.

He has master's degrees in economics and business, and is going for a PhD in atmospheric sciences. And he will present that part of the environmental impact statement to you. We will go to you for questions on that.

The final presentation is on one aspect of the environmental impact statement, and that is severe accident and mitigation alternatives. And to tell us about that particular part of the statement we have Bob Palla, who is right here.

Bob is an NRC employee, he is with the probabilistic safety assessment branch at the NRC.

1 Again, this is in our office of nuclear reactor 2 regulation. And his expertise and experience is in risk analysis, and severe accidents. 3 4 He has been with the Agency for 21 years, 5 and he has a master's degree in mechanical engineering from the University of Maryland. 6 7 And with that I'm going to ask John Tappert to give you a brief welcome, and then we will 8 9 go to Raj Anand, and then back out to you for 10 questions. 11 John? 12 MR. Thank you, Chip, TAPPERT: and welcome. As Chip said, my name is John Tappert, I'm 13 14 chief in the environmental section in the office of 15 nuclear reactor regulation. And, again I would like to welcome you to 16 this meeting, and thank you for participating in our 17 18 process. 19 As Chip mentioned, there are several 20 things we would like to cover today, and I would like 21 to briefly reiterate the purposes of this meeting. 22 First we would like to give you a brief overview of 23 the entire license renewal process. 24 This includes both a safety review as well 25 as an environmental review, which is the principal

focus of today's meeting. Second we will provide you the preliminary results of our environmental review, which assesses the environmental impacts associated with extending the operating license of the Peach Bottom units for an additional 20 years.

Finally we will provide you the schedule for the balance of our review, and also give you information about how you can participate in this process by submitting written comments on our draft environmental impact statement.

At the conclusion of the Staff's presentation we will be happy to receive any questions or comments that you may have on our draft environmental impact statement.

But first let me provide some context for the license renewal program. The Atomic Energy Act gives the NRC the authority to issue operating licenses to commercial nuclear power plants for a period of 40 years.

For Peach Bottom Units 2 and 3 these operating licenses will expire in 2013 and 2014, respectively. Our regulations also make provisions for extending these operating licenses for an additional 20 years, as part of the license renewal program, and Exelon has requested license renewal for

both of these units.

As part of the NRC's review of that license renewal application we conducted an environmental scoping meeting here last November. At that meeting we provided information on the license renewal process, and also sought your input on issues to be included in the environmental impact statement.

As we indicated at the scoping meeting, we return now, today, to provide the preliminary results of our review. And, again, one of the principal reasons for the meeting today, is to receive your questions and comments on that draft.

And with that brief welcome I would like to ask Raj Anand to give a brief overview of the safety portion of the license renewal.

MR. ANAND: Thank you, John. Good afternoon, ladies and gentlemen. My name is Raj Anand. I'm the project manager for the safety review of the application for license renewal for the Peach Bottom Atomic Power Station, Unit 2 and 3.

The Atomic Energy Act, and the National Environmental Policy Act, provides that the Nuclear Regulatory Commission is responsible for the public health and safety, protection of the environment, and the common defense and security.

It also provides that each power reactor would have a 40 year license term. But the Atomic Energy Act went on to say that those licenses could be renewed. The original 40 year license term was based on the antitrust and economic factors, not on the technical limitation of the plant design.

License renewal is governed by the requirements of 10CFR Part 54. This license renewal rule defines the regulatory process by which a nuclear utility, such as Exelon Generation Company, applies for a renewed operating license.

License renewal rule incorporates 10CFR Part 51 by reference. 10 CFR Part 51 provides for the preparation of an environmental impact statement, or EIS. The license renewal rule process defined in 10 CFR Part 54 is very similar to the original licensing process in that it involves safety reviews, and environmental impact evaluation, plant inspections, and review by the Advisory Committee of the Reactor Safeguards, ACRS.

The ACRS is a group of scientists and nuclear industry experts, who serves as a consulting body to the Commission. The ACRS performs an independent review of the license renewal application, and the staff's safety evaluation, and they report

1 their findings, and recommendations directly to the 2 Commission. The next slide illustrates two parallel 3 4 processes. You will see one at the top of the slide, 5 the other toward the bottom of the slide. The two parallel processes are the safety review process, and 6 7 the environmental review process. These processes are used by the Staff to 8 9 evaluate two separate aspects of the license renewal The safety review involves the Staff's 10 application. 11 review of the technical information in the application 12 for renewal to verify, with reasonable assurance, that the plant can continue to operate safely during the 13 14 extended period of operation. 15 The Staff assesses how Applicant proposes to monitor or manage aging of certain structures, or 16 components, that are within the scope of license 17 renewal. 18 The Staff's review is documented in a 19 20 safety evaluation report and the safety evaluation 21 report is provided to ACRS for review, and an ACRS 22 report is prepared to document their review of the 23 Staff's finding. 24 The Staff's process also involve two or

three inspections which are document in the NRC

inspection reports. These inspection reports are considered with the safety evaluation report, and the ACRS report, in NRC's decision to renew the operating licenses.

If there is a Petition to Intervene, sufficient standing can be demonstrated, and an aspect within the scope of the license renewal has been identified, then the hearings may also be involved in the process. These hearings will play an important role in the NRC's decision on the application, as well.

At the bottom of the slides I another parallel process, the environmental review, which involves scoping activities, preparation of the draft supplement to the generic environmental impact statement, solicitation of public comments on the draft supplement, and then the issuance of the final supplement to the generic environmental impact statement.

This document also factors into the Agency's decision on this application. During the safety review the Staff assesses the effectiveness of the existing, or proposed inspection, and maintenance activities to manage aging effects applicable to a defined scope of passive structures and components.

1 Part 54 requires that the application also 2 include evaluation of time limited aging analyses, 3 which are those design analyses that specifically 4 include assumption about plant life, usually 40 years. 5 Current regulations are adequate for addressing active components, such as pumps, valves, 6 7 which are continuously challenged to reveal failures and degradation, such that corrective actions can be 8 taken. 9 10 Current regulations also exist to address 11 other aspects of the original license, such as 12 security, and emergency planning. These current regulations will also apply during the extended period 13 14 of operation of the plant. 15 Two parallel products from the NRC staff safety evaluation 16 the report, are 17 environmental impact statement. Those are taken together with two other pieces. 18 One is an independent review of the safety 19 issues by the Commission's Advisory Committee on 20 21 Reactor Safeguards. That is an independent body of 22 experts from the industry and academia, who have the 23 particular expertise on safety issues, and they look 24 at the quality of the Staff's safety findings.

There is also an independent inspection

1 program that verifies certain key elements of the 2 Staff's safety findings. Our decision on this license renewal application will rely on a safety evaluation 3 4 report, and environmental impact statement that 5 developed with public participation, an ACRS report, and an independent inspection report. And those are 6 7 the four principal products. The schedule for this activity is about a 8 25 month schedule, because for this application we 9 have had no petitions to intervene for a hearing. Had 10 11 there been a petition for a hearing submitted and 12 granted, then the schedule would have been 30 months to get through the whole process. 13 14 I will be available, after the meeting, if 15 there are any questions that you have about the aging management program review, or the specifics of the 16 17 safety review process, or the contents of the safety evaluation report. 18 19 Now, I'm going to turn it over to Mr. Duke 2.0 Wheeler. 21 FACILITATOR CAMERON: Raj, let's see if 22 there are some questions for you. And I just wanted 23 you to clarify one thing before we go out to the 24 audience.

You said the schedule was 25 months.

1 you give people a specific target date, or month, for 2 when this decision is supposed to be made? MR. ANAND: The Commission plans to issue 3 4 operating licenses for both units, units 2 and 3, in July 2003. 5 FACILITATOR CAMERON: You mean they will 6 7 issue their decision on whether to renew the licenses? 8 MR. ANAND: Right. 9 FACILITATOR CAMERON: All right. You 10 heard Raj talk about the overall process specifically, about the safety evaluation. 11 We are going to go on to other subjects. 12 Are there any questions about the process 13 14 at this point? Yes. And give us your name, please. 15 MR. GUNTER: My name is Paul Gunter, and I'm with the Nuclear Information Resource Service in 16 17 Washington. We have been following the issue of --18 19 there are a whole host of issues, particularly with 20 regard to age related deterioration of the reactors. 21 And the vulnerability of some of the 22 materials that make up the reactor are being evaluated 10, 12 years in advance of the issuance of the 23 24 license. And what we are seeing is that by and large 25 there are more uncertainties with regard to how cracks

1 grow, how they initiate, how quickly they can grow to 2 failure. 3 And, yet, this license proceeding is 4 taking it, basically, approaching this issue of age related deterioration, 10, 12 years in advance of when 5 this license will be necessary. 6 7 Can someone address, to us, why license renewal proceeding is occurring 12 to 14 8 9 years, in some cases, before the license is actually 10 to expire? 11 FACILITATOR CAMERON: Thanks, Paul. 12 I not only would like the NRC staff to answer that question, but I think the implication in Paul's 13 14 question is between the time the decision is made on 15 these license renewal applications, if there was an affirmative decision, how will the NRC monitor 16 continued aging types of impacts after that point. 17 We are going to John Tappert. 18 19 MR. TAPPERT: All right. Yes, you are accurate, we do it often well in advance of the 20 expiration of the license. Our regulations allow them 21 22 to submit an application up to 20 years before the original license expires. 23 24 The reason for that is to allow them to

make economic decisions if, in fact, the license is

1 not renewed, to replace base-load power. 2 long lead time for those kinds there is 3 facilities. What we are assessing is to make sure that 4 5 they have aging management programs in place to identify cracking and to replace components as they 6 7 are needed. Additionally, just because the license is 8 9 renewed doesn't mean they are exempt from regulatory oversight. If a mechanism has come to our attention, 10 11 I'm sure you are familiar with the Davis-Besse head 12 degradation event, that is an operating reactor issue, and we are dealing with that, with all of the entire 13 14 fleet of PWRs, irrespective of whether they are coming 15 into license renewal or not. So we still have a variety of regulatory 16 17 means to go out and do inspections, and request actions for the licensees to respond to aging 18 19 management or any other degradation mechanisms. 20 FACILITATOR CAMERON: Okay, thank you 21 Let's go to -- yes, ma'am? 22 is Frieda MS. BERRYHILL: Му name 23 Berryhill, and I'm concerned with this aging 24 management program because we had a lot of problems

with the cracks and embrittlement in the nozzles,

1	particularly.
2	Will this be managed centrally from
3	Washington, or does each plant have a managing program
4	concerning aging?
5	FACILITATOR CAMERON: That is a great
6	question. Can we have someone talk about how the NRC
7	headquarters and regions, in our regional office,
8	divide up responsibility for not only the license
9	renewal review, but continued aging management issues?
10	Does someone want to try to handle that?
11	We are going to go to John.
12	MR. TAPPERT: The question is, is the
13	program being run out of headquarters, and the
14	regional offices?
15	MS. BERRYHILL: Centrally, yes. We cannot
16	address our concerns due to aging because that is
17	really the main problem that concerns us.
18	MR. TAPPERT: Yes. I would say
19	headquarters is we are running the license renewal
20	review out of headquarters. I'm out of headquarters,
21	most of these gentlemen are also out of our
22	headquarters office, and the office of nuclear reactor
23	regulation.
24	And we are doing the reviews of the aging
25	management programs to make sure that they are in

1 place, and acceptable. The region has a role, they do 2 inspections for us, they inspect to make sure that 3 they are looking at the right components, and that 4 they have appropriate programs in place. 5 They also have ongoing inspection 6 activities at the plant. You may or may not be aware 7 we have NRC employees stationed at the plant, around 8 the year. And those are regional employees. 9 So all the inspection activity is coming out of the region, but this particular review is being 10 11 run out of headquarters, and we have contact numbers 12 that will be provided in the presentation, to get a hold of us. 13 14 MS. BERRYHILL: But aging managing is the 15 new --We need to get 16 FACILITATOR CAMERON: 17 everybody on the transcript, so let me bring this out to you if you have a follow-up question. If you could 18 19 just repeat that question, the last one you asked for? 20 MS. BERRYHILL: Yes, aging management is 21 a new department, do we have someone to address when 22 something like this comes up? FACILITATOR CAMERON: Absolutely. 23 John, 24 why don't you go up to that mike and I will stay out 25 here.

1 MR. TAPPERT: Okay. The branch that I'm 2 part of is called license renewal and environmental 3 And one of the sections looks at aging 4 management programs. 5 And Raj Anand is the safety project manager who specifically is overseeing that review. 6 7 We are going to give you a bunch of names at the end. You can contact any of us, and we will get you in 8 9 contact with the right person. Actually Dr. P.T. Kuo is the one who is actually heading our organization. 10 11 FACILITATOR CAMERON: Thanks, John. 12 I would just emphasize, when we are done with the meeting today, please take the opportunity to talk to 13 14 the NRC staff that are here, they will try to be 15 helpful with questions. And I think we do have some of our 16 17 regional staff here, today, too. Let's go to this gentleman, and then we will go over here. 18 19 MR. NELSON: Allan Nelson, NEI. 20 just like to respond a bit to the woman's question, if 21 I may. 22 The NRC has developed a document called 23 Generic Aging Lessons Learned, where it takes into all 24 the operating experience that have occurred up to 25 April 2001. From that point on it is up to the NRC,

1 and the licensee, to evaluate any aging lessons 2 learned that can take place from that time forward, and incorporate it into its license. 3 4 And then as part of its ongoing program 5 continue to evaluate operating lessons learned, and implement those into their program, as they see fit 6 7 for that particular licensee. FACILITATOR CAMERON: Thanks, Allan, for 8 9 that additional information. Let's go to you. 10 MR. SILVER CLOUD: Rutisa Lugisky, here 11 locally. That is Silver Cloud in the English language. 12 The question I have, has any forethought been given to 500 years, 1,000 years from now, as to the aging 13 14 management thing? Honestly, has anyone thought that 15 far out? 16 FACILITATOR CAMERON: Okay, thank you 17 Silver Cloud. And I'm not going to try to say the Cherokee word for your name, for obvious reasons. 18 19 John, Raj, you heard the question, and it 20 deals with continual evaluation. And do you have something for Silver Cloud? 21 22 MR. TAPPERT: This particular review that we are doing now is to relicense the plant for an 23 24 additional 20 years. So the focus is to have aging 25 management programs to cover that period of time.

1 When you are talking to these longer time 2 frames, it is not so much this particular facility, 3 which will not be operating in those times, but there 4 will be a geological repository to handle the spent 5 fuel waste, and those areas we do look at those kinds of time frames. 6 7 FACILITATOR CAMERON: When this license, if this license is renewed, it will be renewed for a 8 9 specific period of time. Can you just tell people, you or Raj, what that renewal period is? 10 11 MR. TAPPERT: Right. The current 12 expiration is 2013 and 2014, they will be adding another 20 years to that, 2033 and 2034. 13 14 FACILITATOR CAMERON: Thank you very much. 15 Any other questions on this part of the process, before we go to the environmental? 16 17 (No response.) FACILITATOR CAMERON: Okay, thank you very 18 19 much, and thank you Raj, thank you John. Now we are 20 going to go to Duke Wheeler, who is the project 21 manager for the environmental review, and he is going 22 to give you an overview of the environmental review 23 process. 24 MR. WHEELER: Good afternoon. said, I'm Duke Wheeler, I'm the environmental project 25

manager responsible for the development of the draft environmental impact statement associated with the proposed licensing action to renew licenses for Peach Bottom Units 2 and 3.

It is my responsibility to coordinate the efforts of the NRC staff, and our National Labs, to develop this environmental impact statement.

The National Environmental Policy Act of 1969 requires a systematic approach in evaluating the impact of proposed major federal actions. Consideration is to be given to the impacts of the proposed action and mitigation, where appropriate, for significant impacts.

Alternatives to the proposed action, including the no-action alternative, are also to be considered. The National Environmental Policy Act is a disclosure tool and, by its design, it involves public participation.

Our NRC regulations require that an environmental impact statement be prepared for license renewal actions. We have drafted an environmental impact statement, we have published it for comment, and we are holding this meeting here today, to provide one means for the public to make comment on our draft environmental impact statement.

1 Our decision standard is, stated simply, 2 are the environmental impacts of the proposed action 3 great enough that maintaining the license renewal 4 option for Peach Bottom 2 and 3 is unreasonable? 5 Please note that we do not decide ourselves as to whether or not Peach Bottom Units 2 6 7 and 3 will operate for the additional 20 years. decision is made by other regulatory agencies, and the 8 9 licensee. Very quickly, the process that we are 10 11 following for the environmental review, and if you 12 recall the flow chart that was up here a few minutes ago, it was slide number 5, this is basically an 13 14 expansion of the bottom line of that chart. 15 Exelon submitted their license renewal application to us in July of last year, and we 16 17 published an NRC notice in the Federal Register, of develop an environmental 18 our intent to 19 statement and conduct scoping. 20 We had a scoping, there was a scoping 21 period, we had a scoping meeting here, as a matter of 22 fact it was on November 7th at the Peach Bottom 23 Inspection, to accept comments from the public on

things that we should take into consideration during

our environmental review.

24

In conjunction with that activity, on the next day, on November the 8th, our team of laboratory experts, and other people involved with the development of the environmental impact statement, conducted an on-site audit, where they actually walked the ground, interacted with other federal, state, and local agencies, and talked with representatives of the licensee, who participated in development of their environmental report.

We did have one request for additional information, which we sent to the licensee in December of last year, and we got the information we needed. We prepared our draft environmental impact statement, and published it at the end of June of this year.

On July the 5th of this year, approximately three weeks ago, the Environmental Protection Agency published their Federal Register Notice, that we had filed this environmental impact statement with them, and that started a 75 day public comment period.

We are now having this meeting to provide one means for you, the public, to provide us comments on that draft environmental impact statement. And you see the term GEIS, it is a draft supplement, the Peach Bottom supplement is supplement 10, to a generic

environmental impact statement that was prepared for license renewal.

We are on schedule to publish our final environmental impact statement, which would be the final supplement 10, in February of 2003. During the development of the draft environmental impact statement we interacted with federal, state, and local officials, as well as local service organizations.

We also considered comments received from the public during the scoping period. I issued a scoping summary report in April of this year, and the sections of that report that are applicable to our environmental review is attached to our draft environmental impact statement as appendix A.

We've assembled a team of experts in various environmental disciplines to assist in the development of this environmental impact statement. The disciplines include atmospheric sciences, radiation protection, socioeconomics and environmental justice, terrestrial ecology, land use, archeology, and cultural resources, nuclear safety, regulatory compliance, aquatic ecology, and hydrology.

If there are no questions on my comments to this point, what I would like to do is turn the meeting back to Chip Cameron, who will introduce the

1	next speaker, Bruce McDowell, who will provide some
2	detail findings on our environmental review to date.
3	FACILITATOR CAMERON: Let's see if there
4	is any questions on the process. And Duke will be
5	back, later on in the program, to just give you some
6	more information about where to submit comments.
7	Yes, ma'am?
8	MS. MARKS: Marcia Marks, from Maryland.
9	My question is, you listed all the experts, but who
LO	are your experts on public health? I didn't hear
L1	anyone doing environmental health surveys to find out
L2	what is happening to populations.
L3	FACILITATOR CAMERON: Duke?
L4	MR. WHEELER: We do have, on our team, an
L5	expert in radiological impacts from an environmental
L6	health perspective. Am I
L7	MS. MARKS: Who would that be?
L8	MR. WHEELER: That is Mr. Hank Con.
L9	FACILITATOR CAMERON: And Hank is with us
20	here today, right Duke?
21	MR. WHEELER: Yes, Hank is here today.
22	FACILITATOR CAMERON: So Marcia, maybe
23	after the meeting you can talk to him. We also have
24	other NRC experts on these issues with us today.
25	MR. WHEELER: Yes. Marcia, if after the

1 meeting, or at some other time, we also have Patricia Milligan, who is an expert in this particular area, as 2 3 well, who is also here to respond to these kinds of 4 interests. 5 FACILITATOR CAMERON: And Trish is with the NRC staff, health physicist. 6 7 Any other questions on the environmental review process, before we go on to -- yes, Paul? 8 9 I will make this really MR. GUNTER: I guess the concern for all of us is, when we 10 11 talk about, particularly about radiation protection, 12 who is the critical population that we want to 13 protect? 14 And for many of us that is about the 15 When -- in my dialogue with the Nuclear children. Regulatory Commission, though, I find a disconnect. 16 Because the standard that we have actually considers 17 a 250 pound male that the standards are set against. 18 19 I'm wondering if you could help 20 enlighten me on the disconnect that exists when we are 21 talking about who the critical population is that we 22 want to protect, when the most vulnerable of us is not 23 really considered in the standard. 24 FACILITATOR CAMERON: And Paul, thanks for 25 that question. And I think it would make more sense

1	to answer that directly during Bruce's presentation,
2	and allow Trish to chime in on that.
3	So can we hold that question?
4	MR. GUNTER: Certainly.
5	FACILITATOR CAMERON: Okay. And we will
6	get to it during this next presentation. And I think
7	the question was clear. Unless, Duke, you want to
8	MR. WHEELER: No, I think you've got it.
9	Well, I defer to Paul, is that the question?
10	MR. GUNTER: That is fine.
11	FACILITATOR CAMERON: We know this is an
12	awkward way to phrase what you've asked, but at least
13	it will let us go back to your question and try to
14	answer it.
15	Any other questions for Duke?
16	(No response.)
17	MR. WHEELER: Thank you.
18	FACILITATOR CAMERON: Now we are going to
19	get to Bruce to talk about the findings in the draft
20	environmental impact statement, and we will get to
21	questions such as the one that Paul just asked, after
22	that.
23	MR. MCDOWELL: As Chip said, my name is
24	Bruce McDowell, I work at the Lawrence Livermore
25	Laboratory, and I'm the task leader for the team that
	•

prepared the supplemental EIS for the Peach Bottom Power Plant.

This slide shows the approach that we use in making this analysis. The generic environmental impact statement, which Duke has referred to as the GEIS, NUREG 1437, identifies 92 environmental issues that are evaluated for license renewal.

Sixty nine of these issues are considered generic, or category one, which means that the impacts are the same for all reactors, or the same for all reactors with certain features, such as plants that have cooling towers.

For the other 23 issues, referred to as category 2, the NRC found that the impacts were not the same at all sites, and therefore a site-specific analysis was needed. And on this slide it shows the category 2 approach.

Only certain issues addressed in the GEIS are applicable to Peach Bottom. For those generic issues that are applicable to Peach Bottom, we assessed if there was any new information related to the issue that might change the conclusion in the GEIS, which is the new and significant information on the slide.

If there is no new information, then the

1 conclusions of the GEIS are adopted. Ιf new 2 information is identified, and determined to be 3 significant, then a site-specific analysis would be 4 performed. 5 For the site-specific issues related to Peach Bottom, a site-specific analysis was performed. 6 7 And, finally, during the scoping period, the public was invited to provide information on potential new 8 issues, and the team during their review looked to see 9 if there were any new issues that needed evaluation. 10 11 For each issue identified in the GEIS, an 12 impact level is assigned. These impact levels are consistent with the Council on Environmental Quality 13 14 Guidance for NEPA analysis. 15 For a small impact the effect is not detectable, or too small to destabilize, or noticeably 16 alter any important attribute of the resource. 17 For example, the plant may cause the loss 18 of adult and juvenile fish at the intake structure. 19 If the loss of fish is so small that it cannot be 20 21 detected in relation to the total population of the 22 river, the impact would be small. 23 For a moderate impact the effect is 24 sufficient to alter noticeably, but not destabilize

important attributes of the resource. Using the fish

example, again, if losses at the intake canal cause 1 2 the population to decline, but then stabilize at a lower level, the impact would be moderate. 3 finally, for an 4 And, impact 5 considered large the effect must be clearly noticeable and sufficient to destabilize important attributes of 6 7 the resource. So if losses at an intake canal, for 8 instance at Peach Bottom, cause the fish population to 9 decline to the point where it cannot stabilize, and 10 11 continually declines, that impact would be large. 12 In Chapter 2 of the draft supplemental EIS we discuss the plant and the environment around the 13 14 plant. In Chapter 4 we then looked at the potential 15 impacts for an additional 20 years of operation at the Peach Bottom Nuclear Power Station. 16 17 The issues that the team looked at are issues related to the cooling system, the transmission 18 19 lines, radiological issues, socioeconomic issues, 20 groundwater use and quality, and threatened and 21 endangered species. 22 I'm going to take a few minutes to discuss 23 the highlights of our analysis. If you have any 24 questions about our findings, Chip will give you an

opportunity to ask them.

1 One of the issues we looked at, closely, 2 is the cooling system for the Peach Bottom station. This is the ladder, the cooling intake, and the 3 4 canals. 5 Although there are a number of category 1 issues related to the cooling system, and remember 6 7 that we said that category 1 issues are those that have been determined to have the same significance for 8 all plants, no new and significant information was 9 identified, either during scoping, by the Applicant, 10 11 or by the Staff during the review. 12 The issues that the team looked at on a site-specific basis include water use conflicts, 13 14 entrainment, and impingement of fish and shellfish, 15 heat shock, and enhancement of microbiological organisms. 16 17 We found that the potential impacts in these areas were small and additional mitigation 18 19 measures were not warranted. 20 Radiological impacts are a category 1 21 issue, because it is often a common concern to the 22 public I want to take a minute to discuss this issue 23 at Peach Bottom. We looked at the effluent release and 24 monitoring program during our site visit. We looked 25

1 at how the gaseous and liquid effluents were treated 2 and released, as well as how the solid wastes were 3 treated, packaged, and shipped. 4 We also looked at how the Applicant 5 determines and demonstrates that they in compliance with the regulations for release 6 of 7 radiological effluents. This slide shows you the near site, or on-8 site location the Applicant monitors for atmospheric 9 releases and direct radiation. There are a number of 10 11 other monitoring stations beyond the site boundary, 12 including locations where water, milk, fish, and food products are sampled. 13 14 Our review of the releases, and the 15 resulting dose calculations, found that the doses to the maximally exposed individuals in the Peach Bottom 16 vicinity, were very small fractions of the 17 environmental radiation standards. 18 19 addition we found and new 20 significant information relating to this issue. The 21 releases from the plant and the resulting off-site 22 potential doses are not expected to increase on a year 23 to year basis, during the 20 year license renewal

During scoping comments were received with

term.

24

claims of elevated childhood cancer resulting from releases of strontium 90. I'm going to do a short summary at the end of my presentation. Any questions, I think, would best be directed toward Tricia, who is here from the NRC.

But to summarize the findings in Section 4.7, doses to the public from routine Peach Bottom emissions were specifically evaluated in the 1996 generic EIS for license renewal, and were found to be within regulatory limits.

In-plant monitoring of effluent streams establishes that there have been no significant releases of strontium 90 from the Peach Bottom plant. In addition no causal relationship has been established between levels of strontium 90 and deciduous teeth, and childhood cancer.

Lastly there is a unanimous consensus, in the scientific community, that current radiation protection standards are protective of public health. Therefore the team concluded that the information provided during the scoping period, regarding strontium 90 releases is not new and significant, and does not change the conclusion in the 1996 GEIS, that the radiological impacts are small.

The last issue I would like to discuss

1 from chapter 4 is that of threatened and endangered 2 There are no federally listed aquatic species. 3 species that occur, currently occur, within the 4 vicinity of Peach Bottom and the Conaowingo pond. 5 There are a number of terrestrial species listed as threatened and endangered that may occur in 6 7 the range of the Peach Bottom Power Station and the transmission lines. 8 9 The lower Susquehanna river is an important bald eagle area in Pennsylvania, and one of 10 11 the areas in the state where bald eagles can be 12 observed year round. There are ten active bald eagle nests near 13 14 the Conowingo pond, and recent surveys indicate that 15 as many as 10 to 15 eagles over-winter in the vicinity of the Peach Bottom discharge canal, which may be the 16 only part of the river that is not frozen. 17 Bog turtles are known to occur in the 18 19 vicinity of the transmission line, but a survey 20 performed on the line did not find any suitable 21 habitat of those areas in the corridor. 22 Peregrine falcons are very rare in the 23 Peach Bottom area, although the area is within their 24 There is a plant species called the swamp range.

pink, which was not observed during surveys of the

transmission corridor.

In other chapters of the GEIS we evaluated the uranium fuel cycle and solid waste management, and decommissioning. All issues for the uranium fuel cycle and solid waste management, as well as decommissioning, are considered category 1.

For our analysis we did not find any new or significant information related to these issues, and so we adopted the conclusions in the GEIS.

The team evaluated the potential environmental impacts associated with the Peach Bottom power station not continuing operation. The team looked at no-action, new generation from coal-fired, gas-fired, and new nuclear, purchased power, alternative technologies such as wind, solar, and hydropower, and then a combination of different alternatives.

For each alternative we looked at, we looked at the same type of issues. For example, we looked at land use, terrestrial ecology, aquatic ecology, socioeconomics that we looked at during the license renewal term.

Our preliminary conclusion for the alternatives, and this includes the no-action alternatives, is that these alternatives may have

1 environmental impacts that at least in some impact 2 categories, reach moderate or large significance. 3 Now I would like to turn this back over to 4 Chip, and if there are any questions specifically 5 regarding the radiation issues? FACILITATOR CAMERON: Okay. I think that 6 7 we might have some follow-ons to Paul's question on radiation and other questions. So perhaps the easiest 8 thing to do is to find out, to ask, to deal with the 9 questions that are on other aspects of the draft 10 11 environmental impact statement, get those questions in 12 to Bruce, and answers, and then start off with Trish Milligan addressing Paul's question about who the 13 14 regulations, NRC regulations, are targeted to. 15 So with these non-radiation questions, Judy, and Marcia. 16 17 Judith Johnsreud. MS. JOHNSREUD: I do want to ask Mr. McDowell to repeat his statement that 18 19 I jotted down as: There is unanimous agreement in the 20 radiological public health sector that the existing 21 standards are adequately protective of public health. 22 Did I get that correct, based on what 23 you've just said? 24 MR. MCDOWELL: I can read it again. 25 MS. JOHNSREUD: Yes, please.

1 MR. MCDOWELL: I said: Lastly, there is 2 near unanimous consensus in the scientific community. 3 MS. JOHNSREUD: Yes, I don't think you 4 said near before, did you? Go ahead, I'm sorry. 5 MR. MCDOWELL: I may have misspoke. There in the scientific 6 unanimous consensus 7 community that current radiation protection standards are protective of public health. 8 9 MS. JOHNSREUD: Have you looked at the, 10 what I believe is, the current ICRP reexamination, specifically of tritium? 11 12 MCDOWELL: This like MR. sounds radiation question that I think Trish Milligan could 13 14 better answer. 15 MS. JOHNSREUD: I have a second question 16 I will come back to my second one if it comes 17 to me. FACILITATOR CAMERON: Marcia, I'm going to 18 19 come over to you. But let me just make a point. 20 that even though Judy Johnsreud had a question about 21 have you considered, and we are going to go to that 22 for answers, that some of these questions implicitly raise comments on the draft environmental impact 23 24 statement, and we will take them as such, comments to 25 consider in our review.

1	Marcia:
2	MS. MARKS: My question was on
3	consideration of alternatives. I didn't see up there
4	conservation. I mean, take a look at this room right
5	now. If you would use some proper lighting you could
6	reduce the energy needs extremely.
7	And I think this is one of the best ways
8	to reduce energy needs.
9	FACILITATOR CAMERON: Okay, Bruce, how was
10	conservation considered in terms of alternatives?
11	MR. MCDOWELL: As I said at the start of
12	this presentation, this is sort of the highlights of
13	our presentation. But conservation is considered in
14	chapter 8 of the supplemental EIS.
15	FACILITATOR CAMERON: Okay. Another
16	question before we go to the radiation? Yes, and give
17	us your name, please.
18	MS. SMITH: I'm Sandy Smith, a member of
19	Pennsylvania Environmental Network. I don't know, is
20	this the time to ask a question that I have on
21	environmental impact? I just heard you mention it.
22	I'm concerned, I know some people that
23	have lived here all their life, and they have fished
24	here all their life. And starting in the '80s they've

noticed carp in this area that are one-eyed, have

1 strange fins, are different, they don't fight much to 2 be caught. 3 And I'm under the impression, I don't fish 4 or anything, but this is not common for carp. 5 this seems to be the only area around here that there seems to be some sort of a problem with the carp. 6 7 Have you, has anyone brought this to your attention, have you done anything about it, has it 8 been identified, what is happening to the carp? 9 FACILITATOR CAMERON: 10 Thank you. MR. MCDOWELL: During our analysis we met 11 12 with the Fish and Wildlife Service, and with the responsible for the Fishery 13 people that are 14 Restoration Program, where they do sampling, and they 15 inspect, or they monitor the progress of the Shad Restoration Program in the river. 16 17 And so the people that we talked to I think were fairly familiar with the fishery in the 18 19 river, and this has not come up. This has not come 20 It may be a valid comment, it has not come up in 21 our conversations with the state and local agencies. 22 Would you look into it? MS. SMITH: 23 FACILITATOR CAMERON: Absolutely, Sandy, 24 we will consider that as a comment on this, that will 25 be evaluated.

1 Judy, do you have that second question? 2 MS. JOHNSREUD: Yes. 3 FACILITATOR CAMERON: All right. 4 MS. JOHNSREUD: It came back to me. So 5 Pennsylvania is in process of the introduction of a substantial package of legislation resulting from our 6 7 joint state government commission's work this past 8 year, that would foster the use of alternative 9 sources, with particular emphasis on wind development. Now, I do know, understand, that Exelon 10 11 had been considering a 100 megawatt PB, peebble bed 12 modular plant, and has apparently decided not to do 13 so, reactor. 14 And we will be having, to my understanding 15 from the Penn State Research Center, approximately that amount of additional electricity committed from 16 wind by the end of this year. 17 So my question is, how and to what extent, 18 19 did you handle the potential for wind development to satisfy future demand, alternatively, from the Peach 20 21 Bottom plants? 22 MR. MCDOWELL: If you would like to look 23 in chapter 8, that is where it is discussed. 24 general approach to looking at alternatives were 25 looking at alternatives that would replace the

1 capacity of the Peach Bottom plant. 2 And we looked at a report, I can pull out 3 the exact report for you, that analyzed or looked at 4 the potential for wind sites in Pennsylvania. 5 lot of the wind sites, as I remember, were inaccessible locations, or were in environmental 6 7 sensitive areas. And that limited the number of wind sites, 8 and made some, I think, uneconomic. But due to the 9 fact that wind power is not a very economic, or all 10 11 the economies, it is not competitive, economically, 12 and the fact that there is not very many locations within Pennsylvania, it didn't look in our analysis, 13 14 and I will have to go back and show you what we looked 15 at. That the -- I'm sorry, did you want to 16 17 rephrase that? FACILITATOR CAMERON: Judy, do you have a 18 19 follow-up? 20 MCDOWELL: That there wasn't MR. 21 potential for wind power to replace the site. 22 MS. JOHNSREUD: In your economic analysis 23 of wind were you including in comparison with the 24 operation of the nuclear reactor, waste costs for

management and disposal?

1	MR. MCDOWELL: I think it was all costs.
2	MS. JOHNSR E UD: All costs of wind. And
3	what were the waste costs associated with wind that
4	you considered, please?
5	MR. MCDOWELL: No, I didn't say that there
6	were waste costs of wind. I said we considered all
7	the costs associated with the operation.
8	MS. JOHNSR EU D: So were there costs
9	associated with waste, related to wind generation?
10	MR. MCDOWELL: I think that in any
11	operation there is some waste.
12	MS. JOHNSR EU D: And what would the waste
13	be with respect to wind?
14	MR. MCDOWELL: Well, I think you would
15	have maintenance waste.
16	MS. JOHNSR $\overline{\mathtt{EU}}\mathtt{D}$: And how does that compare,
17	in cost analysis, with the waste generated by the
18	Peach Bottom reactors for the additional 20 years of
19	operation?
20	MR. MCDOWELL: We did not do a comparison
21	of waste streams between wind
22	MS. JOHNSR EU D: Thank you.
23	MR. MCDOWELL: power and nuclear.
24	MS. JOHNSR EU D: Thank you.
25	FACILITATOR CAMERON: And, Judy, again the

1	implication, I guess, is there is a critique implied
2	there of the analysis. Sandy?
3	MS. SMITH: It kind of took me back. You
4	said there were places that would be good for wind,
5	but it would be inaccessible. I can't imagine any
6	place being inaccessible, when you think of where all
7	the high tension utility wires are going through right
8	now.
9	It almost looks like it would be
10	inaccessible, and yet they are there. What place in
11	Pennsylvania would be inaccessible for wind?
12	MR. MCDOWELL: I'm sorry, I didn't mean it
13	was inaccessible for wind, I thought it was
14	inaccessible for connection to a transmission grid.
15	MS. SMITH: I don't understand if the
16	wires can go there?
17	MR. MCDOWELL: I can show you in the
18	report. It is hard for me to talk without having the
19	report in front of me. But we can talk about this,
20	and I can discuss it with you, off-line.
21	FACILITATOR CAMERON: And, Sandy, is that
22	okay with you if we do it specifically? All right,
23	okay.
24	Let's do a couple more questions, and
25	let's get to the radiation issue. All right, Silver

1	Cloud, do you have a quick question for us? And then
2	I'm going to ask Bruce if it is okay if Trish shares
3	the microphone, comes up there to answer the
4	questions?
5	MR. MCDOWELL: Sure.
6	FACILITATOR CAMERON: Silver Cloud?
7	MR. SILVER CLOUD: Well, this is actually
8	a statement of fact. I'm glad the lady made mention
9	of something about the fish. But ten years ago my
10	family, we decided not to take any fish, or partake of
11	any fish out of the lake, because we noticed ten years
12	ago that sores and abnormalities on fish in the lake.
13	We love perch, and we love etcetera,
14	etcetera, the various things, the blue gill. So this
15	is not a new thing, it is going on. And, apparently,
16	not enough investigation is going on to really check
17	this out.
18	I can say this because I have seen it with
19	my own eyes, and I do not lie.
20	FACILITATOR CAMERON: Thank you, Silver
21	Cloud. In other words, well not in other words, but
22	another comment on issues to explore.
23	And, Trish, could you come up and at least
24	start with this issue?
25	MS. MILLIGAN: Hi, I'm Trish Milligan, I'm

1 a certified health physicist with the NRC. I'm also 2 a pharmacist, I'm licensed to practice pharmacy in 13 3 states, including Pennsylvania. 4 I spent a number of years as a nuclear 5 pharmacist, dealing with radioactive drugs diagnostics, and also for treatment. 6 I've spent a 7 fair number of my professional career working for 8 nuclear reactors. I also worked for myself for a while, it 9 didn't work out too well, and then I came to the NRC. 10 11 To answer your question here, who we are 12 trying to protect? When we do, we require licensees to file each year an annual effluent report. And in 13 14 that annual effluent report we expect them to 15 characterize the waste stream, and then we expect them to do dose calculations. 16 17 In fact we require them to do dose calculations, looking at all of the critical groups. 18 19 And the critical groups include infants, because we 20 know infants are more than just small adults, they 21 aren't, they have very different metabolisms, they 22 breathe at different rates, they have different dose 23 factors connected with infants. 24 We also have them do calculations that

look at children, and then we have them look at

calculations for adults. And when they go through and do these calculations, and I've done these for a number of years for myself when I was working for a utility, that was my responsibility, was to do these calculations.

You would do the calculations, and then one would float to the surface, if you will, as the critical group. Sometimes it was children, sometimes it was infants, occasionally it was adults, but typically it was children.

These doses were reported in the annual effluent reports which are available publicly through the NRC, and I believe the licensee, Peach Bottom can supply them to you, also.

And in these reports you look at what these doses are, and they are typically reported in milli rem doses. They are appendix I limits, which are very conservative limits, 5 milli rem whole body, and numbers that are similar to that for organ doses.

And these doses are typically infractions of milli rem doses. So we look at these constantly. Each year that the licensee operates they file with us this report. So we have an ongoing understanding of what the doses are to the whole range of the population. Not just organ doses, but skin dose, and

1	whole body dose.
2	Does that answer
3	FACILITATOR CAMERON: Paul, does that
4	answer your question? And if you have a follow-up, if
5	you wouldn't mind using that microphone?
6	MR. GUNTER: Well, obviously this is
7	I'm Paul Gunter with Nuclear Information Resource
8	Service.
9	Obviously there is an ongoing dialogue
10	here. But just a simple question, in administering
11	therapeutic radiation, do children get the same dose
12	as adults, or is it recognized, in the therapeutical
13	use of radiation, that children have a lower tolerance
14	to radiation?
15	Is that generally correct?
16	MS. MILLIGAN: It depends on what you are
17	treating, and what
18	MR. GUNTER: I'm just saying generally.
19	MS. MILLIGAN: you are doing.
20	MR. GUNTER: Is it acknowledged that
21	children have a lower threshold to radiation than
22	adults?
23	MS. MILLIGAN: You would typically give a
24	child a lower dose because it is a lower body mass.
25	MR. GUNTER: Right.

1 MS. MILLIGAN: But you are talking, 2 terms of therapy, you are talking extraordinarily high 3 doses that are well above NRC dose limits, well above. 4 MR. GUNTER: My point, though, is that in 5 considering a 20 year license extension, that what our concern is that there is a cumulative value there. 6 7 And that the children, in our mind, is the target population, the critical population when evaluated the 8 cumulative effect of 20 years additional operation of 9 10 that reactor. And it is our concern that that be the 11 12 determining factor for a 20 year license extension. MS. MILLIGAN: And you want us to look 13 14 specifically at child dose? 15 MR. GUNTER: I think, again, I'm going to 16 try to restate this clearly. 17 Tn considering а 20 year license extension, and 20 years additional operation, in our 18 19 view the critical population that would determine that 20 operation is the children. And that the cumulative 21 effect, that there is a cumulative effect of 20 years 22 additional operation, with ongoing routine releases 23 that build up in the environment, that bio-magnify. 24 The focus of our concern, and it should be 25 your concern, is the bio-magnification to the children

1 in this area. And it is our concern that that is not being addressed in the environmental impact statement. 2 When we look at, in the 3 MS. MILLIGAN: 4 operating reactor space, the dose limits that are set 5 up from our appendix I limits, are very, very small. To give you an example, if you ate one 6 7 medium sized banana a day, every day for a year, you would come up with approximately a two milli rem dose 8 9 to your whole body, from eating that banana, from natural radioactivity that is in that banana. 10 11 Our dose limits, whole body, for appendix 12 I is 5 milli rem. So you double your banana dose a day, and you've got our effluent limits from our 13 14 plants. 15 So when we look at what our licensees are actually releasing, they are releasing, typically, a 16 17 tenth to a hundredth of that, in a total year's worth of dose to that particular critical group. 18 19 So we are looking, very closely, and we 20 watch closely, at what our licensees are allowed to 21 release, and the doses are very, very small. You get, 22 like I said, two bananas a day, and you are at our 23 appendix I limits, and very few of our licensees, I 24 think, have ever approached our appendix I limits. 25 FACILITATOR CAMERON: I think that we do

1 have a comment there from Paul, is that the analysis 2 in the environmental impact statement, or the analysis 3 or radiation doses should be the critical path item, 4 so to speak, not only the effect of radiation on 5 children, but the cumulative effect over a 20 year 6 period. 7 And Trish is, I take it, that what you are saying is that -- do we look at cumulative effects, in 8 terms of -- it is all factored into the process? 9 10 MR. SHANBAKY: name is Mohamed 11 Shanbaky, the branch chief, region I'm one, 12 responsible for the inspection program at NRC, and inspection program at Peach Bottom. 13 14 As far as cumulative effect, the doses 15 that are being calculated are mostly a committed dose, both national and international expert, they calculate 16 internal doses of radioactive material, based on 50 17 18 years. 19 And when you talk about committed dose, to 20 a child, it is still a very, very low fraction of what 21 the EPA regulations say as to exposure to minors. So 22 it is still, even if you consider the cumulative, and 23 you talk about committed dose, it is still very low. 24 FACILITATOR CAMERON: Okav, thanks, 25 Mohamed.

1 Let's take a few more questions on this issue, and then we are going to have to move on to 2 3 consider severe accidents. 4 This gentleman? 5 MR. AUGUST: My name is Bernard August. My question to you is, I've gotten a bit jaded about 6 7 corporate responsibility, and things of this nature, recently, because we have all been affected by it. 8 What guarantee that the information that 9 you are getting from the utilities that run nuclear 10 11 power plants is accurate? 12 Well, we have resident MS. MILLIGAN: inspectors at the sites that live there. We also have 13 14 inspection teams that go out and routinely look at all 15 these different parts of the NRC program, of the 16 licensee's program. So they are inspected on a 17 regular basis. Does anybody from 18 FACILITATOR CAMERON: 19 NRC want to supplement --20 MR. SHANBAKY: I'd like to say one word on I have, as we speak right now, have resident 21 this. 22 inspectors from the NRC, what they are doing, they are 23 walking down systems, they are looking at equipment, 24 and they are looking at maintenance activities. The licensee gives us unfettered access to 25

1 all the plant's area, including all the vital equipment in the plant. We look at them, we touch 2 3 them, feel them, we test them. 4 So it is not just we take the word of the 5 We trust, but we verify, we go out and 6 verify that the licensee is giving us factual 7 information. 8 FACILITATOR CAMERON: Thanks, Mohamed. 9 Let me see if there is anybody that has a question that we haven't heard from. 10 11 Let's take Judy, and then Marcia, and then 12 let's go to Bob Palla. And, Trish, I think these may be questions for you, I'm not sure. 13 MS. JOHNSREUD: Yes, thank you, Judith 14 15 Johnsreud. It is my understanding that the dose 16 standards have been decided upon in terms of standard 17 man. That is the measure for the setting of the doses 18 19 that, then, presumably the plant will operate below. 20 And it raises a couple of questions. 21 geneticist has asked me, repeatedly, how the NRC, in 22 determining dose impacts, deals with not only the 23 child, and not only the fetus, and not only the 24 embryo, but cumulative impact upon the ova that a

woman carries through her life, and that are the basis

1 of, of course, the ultimate embryo, fetus, and child? 2 That is one question. And related to it 3 is the issue of how the NRC will incorporate the 4 additive doses received from deregulated released, 5 recycled, and reused radioactive materials, not only those generated at the plant, and then subsequently 6 7 released, either as materials or waste, for recycle, but also essentially the other doses, each of them 8 presumably small, that would be received from other 9 sources of recycled radioactive materials. 10 11 And I'm thinking here, in particular, of 12 the fact that not only the NRC is considering a large expansion of release and recycle but, in fact day 13 14 before yesterday the comment period closed on Part 71, 15 the transportation harmonization regulations that also involve exemptions. 16 17 Plus -- well, T-Norm is coming up, I guess, as well. So there are, suddenly, a great many 18 19 additive sources for exposures. And it is not clear 20 how those are incorporated in your analyses. 21 MS. JOHNSREUD: Let me answer the first 22 part of your first question. 23 When we established dose limits for the 24 public, which is everyone in the public domain, not an

occupational worker, we established doses that are at

a considerably lower level, so 100 milli rem per year, for example, is a dose limit for the public.

With that we feel that we have, that we provide good protection to the public from radiation.

Now, I referred earlier, and we've talked about the EPA limits, which are 5 milli rem per year, so that is one-twentieth of what our limits are for our general Part 20 limits for radiation to the public.

So we are looking at a very small fraction. And if you look at what is actually, what the members of the public receive from our power plant effluents, that is a fraction of a tenth, or a hundredth below that as well.

So with that kind of protection you are looking at, it would be extremely low doses, to a woman's ova. Now, if you look at the contribution, from background radiation, from just living here, living in Pennsylvania, where we have a high background, eating naturally radioactive food, you see a dose contribution including from other sources, such as medicine, somewhere around 300 to 400 milli rem per year.

I'm sorry? So you look at our limits are very, very small. And you look at other parts of the country that have even higher natural background

1 radiation limits, and you see adequate protection 2 provided by our licensee limits, from that added 3 incremental dose. 4 FACILITATOR CAMERON: And, Trish, is there 5 anything that you can say on Judy's second question about how, I guess, new sources of radiation are dealt 6 7 with through the regulations? MS. MILLIGAN: When we look at release of 8 9 recycled materials, we create a series of scenarios, a whole series of scenarios that look at this recycled 10 metal becomes a fork, for example, or becomes a tire, 11 12 or table, or pick anything. We look at what would be the exposure, 13 14 what would be the people, what would be the 15 contributing dose assuming a resident time of, you know, maybe 20 hours a day sitting on top of that 16 table, what would be your dose? 17 We consider all these various exposure 18 19 scenarios, and then we come up with a dose limit that 20 says, at this point this amount of material could, potentially, be released. 21 22 But I don't work on the materials side of 23 the house, and I can't talk to all the regulations and 24 what they are doing, I strictly work on the reactor

And the materials side has put a lot of work

side.

1 into that, and I don't know all the regulations. 2 What we could do would be to direct you to the appropriate people in the materials side that 3 4 could answer your questions much better than I can. 5 FACILITATOR CAMERON: Thanks, Trish and Let's take one last question from 6 thanks, Judy. 7 Marcia and let's bring Bob Palla up to talk about severe accident mitigation alternatives. 8 9 I think that Judy asked my MS. MARKS: 10 first question, which was exposure to the pregnant 11 woman, and to the ova over a woman's lifetime. And 12 she asked that. And most of the public isn't aware, Dr. 13 14 Ellis Stuart just died, and she was able to prove 15 transgenerational effects of radiation to the pregnant woman, onto the children. 16 17 My question, though, is when you are -- on your measurements, you said you measure the effluent. 18 19 And if I read this correctly, in the environmental 20 impact statement, you measure the strontium 89 only 21 every four months. 22 If the half life is only 50 days, how in 23 the world are you finding it? How often do you 24 measure this effluent? You talked about a yearly 25 report.

1 MS. JOHNSREUD: What you are asking is how 2 often do the licensee's measure their effluent stream? The licensee's monitor their effluent stream on a 3 4 regular basis, regular being daily, minute by minute, 5 hour by hour, day by day. They have a good handle on what their 6 7 water chemistry is, and what their effluent stream is. 8 MS. MARKS: Then what I read in the report 9 was not --10 MS. JOHNSREUD: No, the numbers 11 tabulated quarterly. All the effluents and the water 12 chemistry is done on a daily basis. FACILITATOR CAMERON: Okay. 13 Thank you, Marcia, thank you Trish, thanks Bruce. Let's bring 14 15 Bob Palla up who is going to talk about the section of the draft environmental impact statement that deals 16 with severe accident mitigation alternatives. 17 We are going to go on. Let's hold that, 18 19 Alan, and we will go on with this right now. 20 MR. PALLA: Good afternoon. My name is 21 Bob Palla, and I'm with the probabilistic safety 22 assessment branch of NRC. 23 I will be discussing the severe accident 24 mitigation alternative analysis done for Peach Bottom, 25 also referred to as the SAMA analysis.

1 The license renewal rule requires licensee, a license renewal applicant to consider 2 alternatives to mitigate severe accidents. 3 4 Staff has not previously evaluated SAMAs for that 5 plant. Now, since SAMAs had not been previously 6 7 assessed for Peach Bottom, they were assessed as part of the environmental review. The Staff's review of 8 SAMAs is described in section 5.2 of the environmental 9 impact statement supplement for Peach Bottom, and is 10 11 the subject of my presentation. 12 The purpose of the SAMA evaluation is to ensure that plant changes with the potential to 13 improve 14 substantially severe accident safety 15 performance are identified and evaluated. The potential plant improvements that we 16 17 considered include hardware modifications, procedure changes, training program improvements, changes of 18 19 that sort. 20 The scope of the SAMAs includes SAMAs that 21 may either prevent core damage, which we termed 22 preventive SAMAs, or improve containment performance, 23 given that a core damage event were to occur. And we 24 term those SAMAs mitigative SAMAs.

The SAMA evaluation process is a multi-

1 step process, and I'm going to briefly describe the 2 major steps, so that you have a sense as to how this 3 analysis was conducted. 4 The first step is to characterize the 5 overall plant risk and the leading contributors to This involves extensive use of the plant-6 7 specific probabilistic risk assessment study, also 8 known as the PRA. effectively identifies 9 The PRA the different combinations of system failures, or human 10 11 errors, that would be necessary for an accident to 12 proceed to core damage, or to containment failure. The second step is to identify potential 13 14 improvements that can further reduce risk. The 15 information from the PRA, such as dominant accident sequences, is used to help identify potential plant 16 17 improvements that would have the greatest impact in reducing risk. 18 Improvements identified in other NRC and 19 20 industry studies are also considered. This includes 21 the severe accident mitigation design alternative 22 evaluations performed for the Limerick plant, and the 23 Hatch plants, both of which are boiling water reactors 24 similar to the Peach Bottom plant.

We also looked at improvements that were

1 identified in PRAs for other plants. The next step 2 would be to quantify the risk reduction potential and 3 the implementation costs for each improvement. 4 The risk reduction and implementation 5 costs are, typically, estimated in a bounding fashion. The risk reduction is generally overestimated by 6 7 assuming that the plant improvement is completely effective in eliminating the accident sequences that 8 it is intended to address. 9 10 And the implementation costs generally, underestimated by neglecting certain cost 11 12 factors, such as maintenance costs, and surveillance In conjunction this leads one to a more 13 14 conservative assessment, which would tend to include more of the potential SAMAs for further evaluation. 15 The risk reduction and the cost estimates 16 17 are used in the final step to determine whether implementation of any of the improvements can be 18 19 justified. 20 And in determining whether an improvement 21 is justified, we looked at three factors. The first 22 is whether the improvement is cost beneficial. is, are the estimated benefits greater than the 23 24 estimated implementation costs? 25 The second factor is whether the

improvement provides a significant reduction in total risk. For example, does it eliminate a sequence, or a containment failure mode that contributes a large fraction of the plant risk?

And the third factor is to look at whether the risk reduction is associated with aging effects during the period of extended operation.

The preliminary results of the SAMA evaluation are summarized on this slide. 204 candidate improvements were identified for Peach Bottom based on review of the plant-specific PRA, relevant industry and NRC studies on severe accidents, and SAMA analyses performed for other plants.

So 174 SAMAs were eliminated during an initial qualitative screening. The factors considered during this initial screening included whether the SAMA has already been implemented at Peach Bottom, is not applicable to Peach Bottom due to design differences; addresses sequences or failure modes that are not risk significant at Peach Bottom, or has an expected implementation cost that is far in excess of the expected risk reduction benefit.

The cost benefit analysis was performed for the remaining 30 SAMAs. The group of 30 was further reduced to 5 candidate SAMAs based on

1 quantitative comparisons of implementation costs, with 2 a maximum benefit, if all of the risk were eliminated. 3 And plant-specific risk, or operational 4 considerations, were also factored in to this final 5 screening. A more detailed conceptual design and cost estimate was developed for each of the five remaining 6 7 SAMAs. None of these five SAMAs were found to be 8 cost beneficial when evaluated in accordance with NRC 9 guidance for performing regulatory analyses. 10 11 based on our review of Exelon SAMA analysis, we 12 conclude that none of the SAMAs evaluated are cost beneficial. 13 14 conclusion we believe t.hat. no 15 additional plant improvements to further mitigate severe accidents are required at Peach Bottom Units 2 16 and 3. 17 I will take any questions. 18 19 FACILITATOR CAMERON: Thank you very much. Yes, sir? 20 21 MR. AUGUST: In light of the fact that --22 Bernard August -- that this plant here gets its water 23 from the river, was any consideration at all given 24 just in case a natural disaster, like the dam breaking, 25 like that, taken

anything

or

into

1 consideration during this report? 2 MR. PALLA: Dam break type of events, and 3 floods, external floods, these type of events are 4 considered in what was -- we term it the individual 5 plant examination for external events. It is a type of a risk study that was 6 7 done. These studies are not strictly quantitative 8 type analysis, they are more of a -- it is an 9 engineering assessment, really. But the results of those studies were 10 11 submitted to the Staff, and reviewed as part of our 12 review of the individual plant examination. They were found to be much lower in risk than the risk from 13 14 internally initiated events. 15 So they did not play a role in this analysis. The risks that we are trying to reduce here 16 17 is largely driven by internally initiated events, which did not include those types of events. 18 19 FACILITATOR CAMERON: Okay. Mohamed, 20 before we go to the gentleman behind you, do you want 21 to make a clarification? MR. SHANBAKY: 22 A quick clarification on 23 this. That was assessed in the original plant design. 24 The plant have emergency cooling towers. Emergency

cooling towers would provide adequate cooling for all

1 necessary equipment shut down. 2 The water supply is on hand, at the base 3 of the tower you have, I believe, 3.7 million gallons 4 of water that you would be using, it would give you 5 seven days of water use to cool down the plant. So that was assessed, and the equipment is 6 7 operational, and on-site. 8 FACILITATOR CAMERON: Thank you, Mohamed. 9 Let's go to this gentleman right back here. 10 MR. EGBERT: Lawrence Egbert from 11 Baltimore. You eliminated 174 candidate improvement 12 possibilities, and then you subsequently eliminated 25 of the remaining 30. 13 14 What was the difference between the way 15 you eliminated them? Well, it was a sequential 16 MR. PALLA: 17 process. It began, the large number was the result of basically throwing out a large net, trying to look at 18 19 analysis that were done at several different plants, 20 and effectively including those as candidate SAMAs. 21 And then so you start with a large number, 22 many of which you know at the outset, probably aren't 23 going to pass an initial screening, because in some 24 cases an improvement might really have been evaluated

another plant, which is a pressurized water

reactor.

So it may not be applicable, at all, in concept to a boiling water reactor, such as Peach Bottom. So it is -- we actually outlined it fairly clearly, I think, in our report what that sequential process was.

But, as I mentioned earlier, the process was to eliminate things that had already been implemented. Sometimes you might have two different alternatives that by and large do the same thing, so you can combine them into a single alternative that you can consider further.

So there is some collapsing there, as well. Some of these fixes may address sequences that don't have any significant contribution to the risk profile, this would be another reason.

And then some are so clearly resource intensive and expensive that you can tell that even if you eliminated all of the risk at the plant that this would not be cost beneficial.

So there is some confusion, it wasn't a very straightforward process, it was a multi-phased process that I think is explained in the report. But I could talk to you more about it, later, if you have some specific questions.

1 FACILITATOR CAMERON: Okay, they very 2 much, Bob. 3 MR. PALLA: We look at that process to see 4 that it is systematic, and logical, and that the 5 criteria used to screen these things is reasonable. 6 FACILITATOR CAMERON: Okay. We have one 7 more question for you, and then we are going to get to Duke Wheeler, again, for the conclusion, so that we 8 9 can hear from everybody that has comments. Yes, sir? 10 11 MR. MCCONNELL: Sam McConnell, and I'm a 12 Peach Bottom resident. What is the agreement, or how does NRC 13 14 operate with FERC, the Federal Energy Regulatory 15 Commission, in regards to nuclear accidents, who takes priority, the requirement for electricity, or the 16 17 nuclear accident? FACILITATOR CAMERON: Do we have -- who 18 19 wants to address that specific question, perhaps, 20 within the general context of emergency planning? I 21 think we will go to John Tappert for that one. 22 And, John, you heard the specific question 23 that the gentleman had? 24 MR. TAPPERT: Yes. I mean, obviously, the 25 mandate of the NRC is the health and safety of the

1 public. So if there were an incident, or something, at the facility the first mandate of the Agency is the 2 3 safety of the plant. 4 So energy concerns really aren't part of 5 that picture. 6 FACILITATOR CAMERON: Do you want to 7 comment on --8 MR. GUNTER: I just wanted to -- Paul 9 Gunter, Nuclear Information Resource Service. The term that the NRC uses is called as 10 11 low as reasonably achievable, ALARA. Now, ALARA is 12 used a lot in determining cost beneficial analyses for 13 safety. 14 And I'm sure you worked ALARA into the 15 license extension. But one of the principles of ALARA, one of the principal considerations of ALARA is 16 economics. So -- and it is stated right there in the 17 Code of Federal Regulations. 18 19 So when you talk about balancing dose, for 20 example, against continued operation, economics does 21 come into play through the ALARA principle. 22 FACILITATOR CAMERON: And, Paul, that is 23 a good comment. And I think that maybe it would give 24 Bob an opportunity to, when you talk about doing cost 25 benefit on whether a particular SAMA should be

1 implemented, you are talking about based on the 2 assumption that the NRC regulations are being met. 3 All of these things are over and above 4 what is necessary to provide adequate protection to 5 public health and safety? MR. PALLA: This is -- economics is deeply 6 7 ingrained in this whole process. The SAMA evaluation is essentially looking at ways that risk can be 8 9 reduced, these each have a cost. And then they would result in a reduction in core damage frequency, or 10 11 person rem at the site, and the surroundings. 12 And these are all put in terms of dollars comparing 13 and compared. You are of 14 implementation against costs that are associated with, 15 you know, the benefits of reducing, or eliminating the accidents. 16 17 So, yes, economics is really what this is. FACILITATOR CAMERON: Okay, thank you, 18 19 We are going to go to Duke Wheeler for summing 20 up for us. And I should remind everybody, there is 21 ice tea, coffee back there. We are not taking a 22 break, so please help yourself, it is in the back of 23 the room. 24 And, Duke, can you finish this up for us, 25 and then we are going to go to our speakers.

1 MR. WHEELER: Yes, I can. In conclusion 2 what we determined in our draft environmental impact statement for Peach Bottom was that for all the impact 3 4 areas, the impacts of the proposed license renewal are 5 small. As we were looking at alternatives we 6 7 noted that for various impact areas, of the various 8 alternatives, the range was all the way from small to 9 large impact. And our bottom line recommendation, at this point, is that any adverse environmental impacts 10 11 of license renewal for Peach Bottom units 2 and 3, are 12 not so great that preserving the license renewal option is unreasonable. 13 14 Now, where to from here? As I noted 15 earlier we did issue the draft environmental impact statement in June. We have a 75 day comment period, 16 17 currently running, beginning on July the 5th, and ending on September the 17th. 18 19 expect to publish the 20 environmental impact statement February of 2003. Now, 21 as points of contact with the NRC, I would just like 22 to leave you with my name and phone number, as the one point of contact. 23 24 And if you have other interests, outside

the scope of our environmental review, where other

1 parts of the NRC should be brought into play, for 2 example NMSS, another part of the house that Trish 3 Milligan referred to, go ahead and give me a call, and 4 I will contact the right people with the NRC, and get 5 you to, in a dialogue with them. There is a toll free telephone number for 6 7 me on the slide. And I've also placed drafts of our 8 environmental impact statement as reference documents 9 in three local libraries that might help you access 10 the document. 11 If you go up to the Collinsville Public 12 Library, up the road in Brogue, if you talk with Martha Gunder, or Essiey Day, they will be happy to 13 14 steer you toward a couple of the copies that we've 15 left with them as references for you. And also the Quarryville Public Library, 16 the director, Katrina Anderson, would be happy to 17 assist you there, in taking you to just where these 18 19 documents are available. 20 And at the Whiteford Branch Library, just 21 down the road in Whiteford, if you talk to George 22 Mine, he then can help you there in Whiteford, to find the environmental impact statement, take a look at it. 23 24 I didn't have sufficient numbers to give

large quantity, so these are reference

them

1 documents for them. But this is a draft document, it 2 is available. If you want a copy give me a call, give me your mailing address, and I will send you a copy. 3 4 Now, the draft can also be viewed, and 5 downloaded, via the internet, at the internet address that is on the slide. I'm not going to go through and 6 7 read the whole thing for you, but it is there on the handouts that you received when you came in. 8 9 Other ways, excuse me, ways to provide us There are a couple of different ways. One 10 11 is by mail to the chief of our rules and directives 12 branch at the address shown on the slide. Now, given our location here, it is not 13 14 completely unreasonable that somebody may wish to come 15 down to our office in person, since we are located in Rockville, and provide us comments. We are located on 16 17 Rockville Pike, approximately halfway between downtown Rockville, and the beltway, if you are familiar with 18 19 the area. 20 You may also email your comments. I found this to be a popular way. And I have established an 21 22 email address, with the NRC, for the express purpose 23 of receiving This is your comments. 24 peachbottomeis@nrc.gov.

And if you access the draft environmental

1 impact statement online you will also find a link, at that website, to a comment form, and you may click on 2 3 that, and follow the procedure that is laid out in 4 front of you. 5 And that about concludes my remarks. And what I would like to do is turn the mike back over to 6 7 Chip, who will basically open the mike. 8 FACILITATOR CAMERON: Thank you very much. 9 We are going to go right into our public comment 10 portion of the program. 11 And our first speaker is Joe Mangano. 12 And, Joe, I hope I'm pronouncing your name right. correct that if I didn't. And Joe is with the 13 14 Radiation Public Health Project. And he has come down 15 from New York City. And because of 16 that I have to everybody to try to be brief, and I talked about the 17 five to seven minute ground rule, because we do have 18 19 a lot of speakers, and we do want to hear all of you. Because Joe has come down from New York 20 21 City, national group, we are going to give him just a 22 couple minutes leeway, he make his so can 23 presentation. 24 And, Joe, if you would come up? And I'm 25 going to move this out in the center, and you can

1 refer to it as you want, okay? 2 MR. MANGANO: Good afternoon, everyone. 3 Again, I'm Joseph Mangano, I'm the National 4 Coordinator for the Radiation and Public Health 5 Project in New York City. professional 6 We are group of 7 researchers. In the last eight years we have published 17 articles in medical journals, and written 8 five books about the health effects of radiation 9 10 exposure. 11 My comments today will be about, will be 12 addressed to the environmental impact statement draft. And my -- the nature of my comment will be that, in 13 14 essence, this is a very limited document to make any 15 sort of decision on whether to extend the license of this plant for 20 years. 16 17 I will break my comments into three, very briefly. First of all, major meltdowns and accidents; 18 19 number two, nuclear waste; number three, routine emissions and cancers. 2.0 21 First of all, in terms of accidents, we've 22 known for a long time that any kind of a major core 23 meltdown in a nuclear plant like Peach Bottom would be 24 the worse environmental catastrophe in the United

States history.

Twenty years ago the federal government did a study and showed that if either one of the cores of the Peach Bottom reactors had a full meltdown, 72,000 people would die, 45,000 would suffer acute radiation poisoning, and 37,000 others would develop cancers.

Now, remember, this is a minimum estimate, because if both reactors had meltdowns you could double that. This was done 20 years ago, the population has grown since, it only considers the area within 30 miles of the plants, and it ignores the stored fuel, the radioactive waste, which consists of much, much more radiation than is in the core.

In fact, there is hundreds of Hiroshima bombs worth of radiation in there. The EIS ignores this. It does not ignore the issue of an accident, but it ignores two new threats that we have here, beyond when the plant was opened.

First of all, September 11th changed everything. We now have this very new, and very clear, and very serious threat of a terrorist attack towards a nuclear plant, which certainly calls out for a new study, and consideration of safety factors.

Number two, we are not talking about a plant that is just about to open. We are talking

1 about a nuclear plant that is going to be operating 2 from age 40 to 60. Now, so far the oldest reactor has been 3 4 Big Rock Point in Michigan. It lasted 34 years, it is 5 now closed, okay? We don't know what a 40 or 50, or 60 year nuclear plant will be like; will the plants 6 7 wear out mechanically? just observed, recently, that 8 9 Davis-Besse reactor, in Toledo, Ohio, because of corrosion from the cooling water, a six inch steel 10 11 lid, on top of the plant, was corroded down to 3/8ths 12 of an inch of steel that was bent, and was found not by a routine inspection, but just by accident. 13 14 So it is clear here that we need to see 15 more in terms of what would happen in terms of an aging plant, and in terms of a possible accident. 16 17 Number two is nuclear waste. The spent fuel pools that exist at Peach Bottom, and other 18 19 reactors, were thought of as a temporary means of 20 storing these radioactive fuel rods. They are still 21 temporary, okay? Only they are filling up now. 22 Almost 30 years later the fuel pools here 23 at Peach Bottom are almost full. In fact they are 24 putting some into dry cask storage, and the issue of

Yucca Mountain, Nevada, being a permanent site, is

1 moving along but it is still up in the air. It will be at least eight years before any transfers are to be 2 3 made from there. 4 That goes unaddressed here, as well. And the existence of this fuel, again, presents a threat 5 to the public's health. 6 7 Now, in terms of routine emissions, the position of the NRC, traditionally, has been that 8 emissions will be monitored, the environmental levels 9 of radiation will be monitored. If they fall within 10 the federal safe permissible limits, therefore they 11 12 are declared to be harmless. believes that this 13 group 14 presumptuous attitude to take. You don't know. For 15 example, look at what happened at the World Trade Center. The Trade Center was attacked, and numerous 16 chemicals, such as silicon, and asbestos, were put 17 into the atmosphere at higher levels. 18 19 Well, the EPA went in, did a study and 20 said, yes, the levels are higher, but they are within 21 safe limits, therefore they are harmless. At the same 22 time this is happening about a guarter of the workers were suffering from some sort of respiratory ailment. 23 24 Three percent of them so badly that they

are on the verge of having to retire. So we think the

1 same should occur here in terms of nuclear reactors. 2 And to do that you need two items. 3 Number one, you must look at the disease 4 rates, and particularly at the cancer rates in the 5 local area. Our group spends lots and lots of time I will just point a few out here in the 6 doing that. 7 Peach Bottom area. In Lancaster and York counties, which 8 9 flank the reactor, in the years before, the 25 years before the plant opened, childhood cancer deaths in 10 the two counties were seven percent below the U.S. 11 12 rate. Since 1987 the rate is 31 percent above 13 14 the U.S. average, okay? Something happened that 15 turned a low childhood cancer area into a high childhood cancer area. Is it radioactive, is it some 16 sort of other factor that must be looked at? 17 Among adult cancers in Lancaster, York, 18 19 and Chester county, the three closest counties, the 20 rate since '87, the rate of all cancers is 9 percent 21 above the U.S. Breast cancer is 26 percent above the 22 Thyroid cancer, which is very sensitive to U.S. radioactive iodine, 60 percent above. 23 24 Again, these are questions that remain 25 unanswered. Whether or not radioactive plays a role,

1 or not, has to be determined. And the way 2 determine that is to look at the amount of radioactive 3 in the body. 4 It is one thing to measure emissions, it 5 is one thing to measure how much is in the air, and 6 the water, and the grass. But the real question is, 7 how much gets into the body? This is not something that we invented, this was done in St. Louis, years 8 ago, to measure how much bomb test fallout went into 9 10 people's bodies. And it has been done in the 1990s in four 11 12 different countries, in Greece, United Kingdom, former West Germany, and in the south Ukraine to measure how 13 14 much is coming out from nuclear reactors like 15 Chernobyl and Sulleyfied in England. And in each case they looked at baby teeth 16 and the amount of radioactive strontium 90, which only 17 comes from atomic bombs and nuclear reactors. We are 18 19 doing a study right now. I've collected almost 4,000 20 teeth. 21 Unfortunately here in Pennsylvania, 22 southeast Pennsylvania, we only have 22 teeth, we need many more. We've collected many more, but are still 23 24 in our processing them.

So far, based on just these 22 teeth, the

1 average level of strontium 90 is 68 percent higher 2 than the other six states that we've collected teeth 3 That is Pennsylvania, Connecticut, New York, 4 New Jersey, Florida, and California. 5 There is a reason for this. The EIS spent nine pages discussing, and challenging our baby teeth 6 7 study, making the claim that this strontium 90 was all left over from the bomb test in the '50s and '60s. 8 9 Well, back in the '50s and '60s the strontium 90 levels in teeth were pretty much average, 10 11 compared to the rest of the country, now they are much 12 I don't think it is because of old bomb higher. testing. 13 14 And the other thing we found, so far, in 15 southeast Pennsylvania and elsewhere, the children born in the 1990s have higher levels of strontium 90 16 17 than do those born in the '80s, they are going up slightly in Pennsylvania up 12 percent. 18 This cannot be due to the old bomb test 19 20 fallout just decaying, it has to be due to a current source of strontium 90 which is, can only be nuclear 21 22 reactors. 23 My time is almost up, here. Again, low levels, we are not talking about high levels of 24

radioactive, here. This is not Hiroshima here, this

1 is not Chernobyl, these are low levels of radiation. 2 But, again, before we make the conclusion that it is harmless, or harmful, we must do these 3 4 studies. And we've been wrong in the past, before. 5 Years, until the '50s doctors did pelvic x-rays on pregnant women saying that these x-rays were too low 6 7 a dose to be harmful, until they found that the risk of the child getting cancer doubled. 8 9 For many years the Government said that bomb test fallout from the Nevada tests were harmless, 10 11 even if it was getting in the milk, and the water, and 12 the food. Finally in 1997 a study was done, by the federal government, showing that up to 13 14 americans developed just thyroid cancer from these 15 bomb tests. So this is a learning process, this is a 16 17 relatively new technology, we are learning things, and we should engage in the same type of process with 18 19 nuclear reactors. 20 So in conclusion I would highly recommend that no decision be made, by the NRC, to extend the 21 22 license of this plant until a much more thorough 23 assessment of environmental health threats are made. 24 Thank you.

FACILITATOR CAMERON: And, Joe, thank you.

1	And if we could, I don't know if it is possible to get
2	a reduction of that map, an eight and a half by eleven
3	that we could put on the transcript? We can try to
4	work with that.
5	But since we have you here, live so to
6	speak, and to make I guess I shouldn't say so to
7	speak. Since we have an opportunity to talk to you,
8	let me put it that way, I'm sorry.
9	Would you mind if there is any questions
10	that the NRC staff has to enable them to better
11	evaluate this? And I don't want to get into a debate
12	on this, okay? in terms of challenging. Could they
13	ask you any questions that they have?
14	MR. MANGANO: Go right ahead.
15	FACILITATOR CAMERON: Is there any
16	questions related to our evaluation? Trish?
17	MS. MILLIGAN: Yes, I just have two quick
18	questions. NRC is always interested in new
19	information, and we are constantly evaluating
20	information on a regular basis.
21	On your report, there, if you could hold
22	that up for me real quick? It says, right up here,
23	strontium 90 concentrations in baby teeth measured at
24	birth.
25	My first question is, how do you measure

1	baby teeth at birth? Because that would be very new
2	for us, to understand how you do that.
3	MR. MANGANO: Sure. The child aged 7, or
4	whatever, loses a tooth, donates it to us, we measure
5	it, and we
6	MS. MILLIGAN: Back calculate?
7	MR. MANGANO: BaSed on the half life of 29
8	years of strontium 90, extrapolate that level back.
9	Most of the uptake is in the fetal, in the early
10	MS. MILLIGAN: Right, so this is actually
11	back calculation?
12	MR. MANGANO: So it is pretty close, that
13	is what they did in St. Louis years ago.
14	MS. MILLIGAN: I just wanted to make sure
15	that was clear. And the second thing is, could you
16	please share with us your data on these increased
17	cancer rates, so that we could see the data that you
18	are looking at?
19	MR. MANGANO: Sure, I brought copies with
20	me.
21	MS. MILLIGAN: Terrific, that would be
22	great.
23	MR. MANGANO: Where I got them from, and
24	all that, because I thought someone could use it.
25	MS. MILLIGAN: Thank you very much.

1 FACILITATOR CAMERON: Thank you very much, 2 And we would be interested in a copy, a small 3 copy, and I'm sure that there are members of the 4 public that might be interested in looking at a copy 5 of that, too. Thank you very much, Joe. 6 You had a 7 question on, for Joe? 8 MR. PALLA: Yes. 9 FACILITATOR CAMERON: Joe, we have one 10 more question from the NRC staff. 11 MR. PALLA: I had a question, at the 12 beginning of your presentation you had some statistics about fatalities from major core melt events. And my 13 14 question is, have you looked at, or are aware of more 15 recent studies than the 30 or 40 year old? I forget 16 exactly what -- okay. 17 Have you looked at anything more recent than that, as far as the plant specific analyses that 18 have been done for Peach Bottom, for example? Because 19 20 the results from those studies are considerably lower 21 than the numbers that you had cited. MR. MANGANO: To my knowledge that study, 22 23 there has been one more subsequent study done after 24 that, what they call the crack 2 report, in 1982 by

25

Sandia National Labs.

1 It was done in 1989, and it makes updated 2 judgements on what would happen during an accident, but it does not give any specific numbers yet. So at 3 4 this point that is all we have to go on. 5 It is probably most useful not to make an exact judgement on exactly how many people would be 6 7 injured, but just to give people an idea that, yes, hundreds of thousands of people would be involved, 8 would either become ill or die. 9 FACILITATOR CAMERON: Okay, thank you and 10 thanks, Bob. 11 12 are going to go to our on speakers. And our next three speakers. And thank you 13 14 again, Joe. Silver CLoud Washburn. Silver Cloud, 15 would you come up and please talk to us? And then we will go to Alan Nelson, and 16 Dr. Judy Johnsreud. 17 Firstly I would like to 18 MR. WASHBURN: 19 start off by saying, to the person, the omnipotent, 20 the it that made it possible for me to be here today, grandfather, Jehova. 21 22 And I thank grandfather that everyone who 23 is here is here, because they are concerned about this 24 My major concern with this issue, and my 25 prayer is simply this.

1 Has anyone, from the inception of the nuclear energy program, whether it be reactors or 2 3 bombs, given any thought to what would happen seven 4 generations in the future? 5 I would postulate to you, no. your opinion doesn't think that way. But I want you 6 7 to know that the Native-American thinks about things Not all of us, because there are 8 in these terms. rotten apples in our barrel, too, undoubtedly. 9 But the big concern that I have here is 10 11 the future generations. We are talking 250,000 years 12 of financial indentured servitude. Because the Exelon Corporation is not going to pay for the maintenance 13 14 and the overhead costs of this facility for 500 years, 15 1,000 years, and so on. Who is going to do it? It is our children, and our grandchildren, 16 and our great-grandchildren, and countless future 17 generations. Exelon Corporation is only interested in 18 19 what they can extract financially out of this deal. 20 I don't know if they are in bed with 21 Enron, but I tell you what, Exelon, when they are done 22 with it, probably already has secret plans to simply 23 go bankrupt. And when they do, who pays the bill? 24 Not only do NRC's progeny, and mine, and

everyone else's, but it is passed down, and it is more

1 than a lifetime sentence of debt, and burden. 2 you look at this debt and burden what is going to 3 happen in the future, when the people decide we have 4 had enough, we are not paying anymore. 5 Well, then the deterioration will begin at all of these plants. I don't know how many there are, 6 7 exactly, 100 and some in the United States. know it doesn't make any sense to me, because what has 8 9 happened here, the European came to these shores, and they gave the Native-American its bullets and disease. 10 11 And now, since we are all here, and I 12 accept you, I'm not angry with anyone, but now they are going to give all of us their toxicological waste. 13 14 And no provision or thought was given to this at the 15 inception of these plans, none. hope you are thinking about 16 17 gentlemen. I hope the people hearing my voice are thinking about this. Because this stuff must be 18 19 contained. And Yucca Mountain, really, may not be the 20 solution. 21 I would pray to Grandfather that it is, 22 and that it has been well thought out. But it seems 23 funny to me, why didn't they put it in the middle of

New York City? Why did they have to put it on indian

land?

24

Think about it, we constantly are 2 punished. Well, you know something? There is not 3 going to be enough trees left on the planet earth to 4 print the money that it is going to take. 5 The word is a guguplex of dollars, it is not there. And I just beg you, I will tell you this, 6 7 I will give you the shirt off my back, I will give you everything I own, to shut this plant down. 8 9 stand here and allow you to take my life because I love all people so much. 10 11 Shut it down. I would walk out of here 12 naked, I would be a pauper and a vagabond, I would be happy to do this. That is my contribution to the 13 14 people. You have to understand that this is 15 foolishness. Whatever happened, in the name of heaven, 16 17 to common sense? You can go to college and get all the education you want from the books. But you all 18 19 fail to realize, and most people do, and even I, until 20 I was in my 40s, realized that common sense is the 21 higher level of intelligence. 22 And once you get in touch with the creator

of all things, and ask to be shown, through these words given to me by a sacred spirit, isha del talalatacna (Phonetic) open my eyes that I may see.

23

24

25

1 That voice told me, use these words 2 wisely. Use them where you see a need to do good. to you people, you wonderful people who I love, 3 4 Gonkieue (Phonetic) in my tongue that means I love 5 you. Isha delta lalatacna (Phonetic) open my 6 7 eyes that I may see. This is my prayer for everyone in this room. Please shut this place down, let us 8 9 begin to bear this burden, and figure a way out of it. 10 Thank you. 11 (Applause.) 12 FACILITATOR CAMERON: Thank you very much, Silver Cloud. And I would not want to follow Silver 13 14 Cloud on presentation, because he 15 impressive. Alan Nelson will follow him, though. 16 17 MR. NELSON: Well, how do you pick your 18 spots? License renewal is the 19 Good afternoon. 20 best option for Peach Bottom. My name is Alan Nelson, 21 I'm a senior project manager at the Nuclear Energy 22 I'm pleased to have the opportunity to Institute. 23 join this discussion today, among interested citizens 24 of Pennsylvania, and Maryland, state and local

officials, NRC staff, and other parties on license

renewal for Peach Bottom.

By way of background, the Nuclear Energy Institute coordinates energy policy for the U.S. energy companies that own a nuclear power plant. The institute also represents industry suppliers, fuel cycle companies, universities, and colleges, and other organizations involved in the beneficial uses of nuclear technologies such as medicine, agriculture, and food safety and space exploration.

Nuclear energy provides electricity for one of every five homes and businesses in America. Here in Pennsylvania electricity customers get their electric power from nine nuclear reactors, including Peach Bottom, as well as Limerick, TMI, Susquehanna, and Beaver Valley.

The purpose of today's meeting is to discuss environmental issues related to the license renewal application for Peach Bottom that Exelon has submitted to the NRC back in July 2nd, 2001.

Exelon is the tenth utility to seek nuclear plant license renewal. In March of 2000 the NRC, for the first time, approved a 20 year license extension for two reactors at the Calvert Cliffs Nuclear power plant on the shores of the Chesapeake Bay, in Maryland.

1 That approval was a landmark in the 2 industry and evidence of tremendous long term energy 3 and environmental benefits of nuclear power. To date 4 ten reactors have received 20 year license extensions 5 from the NRC, and the Agency is reviewing requests from 14 others, including Peach Bottom. 6 7 More than half of all 103 U.S. reactors are expected to submit applications over the next 8 9 several years. Many more are expected to join them. 10 nuclear power plant licenses for 11 additional 20 years is economical compared to the 12 development of alternative energy resources. As both the Nuclear Regulatory Commission 13 14 and stakeholders have become more familiar with the 15 process, we expect the license renewal process to become even more efficient. 16 17 Moreover there is a growing recognition, among the public and policy makers, both in the United 18 19 States, and internationally, that we must maintain the clean air and other environmental benefits of nuclear 20 21 energy. 22 The White House recognized, very clearly, 23 air benefits of nuclear energy in its comprehensive

energy strategy. Vice President Dick Cheney has said,

"If you are really serious about

and I quote:

24

reducing green house gases, one of the solutions to the problem is to go back and take another look at nuclear power."

There are tremendous air quality advantages from nuclear energy, for both the health of Pennsylvania citizens, and from an economic view. License renewal for nuclear power plants is important to our nation's future energy, security, and environmental needs.

Today's public meeting is part of an extensive process to help ensure that no important environmental issues are overlooked as the NRC continues to evaluate the Peach Bottom license renewal application.

Throughout its review the NRC will continue keep interested citizens, stakeholders, appraised of its progress. One of the requirements in the environmental review is for Exelon to compare the environmental impacts of alternative of evaluating possible energy sources as part alternatives to relicensing Peach Bottom.

The results of that evaluation are worth noting. For example, photo-voltaic cells generating the same 2,200 megawatts of power produced at Peach Bottom, will consume about 77,000 acres of land.

The draft generic environmental impact statement also evaluates other alternatives for providing electricity for the people of Pennsylvania, including power plants that burn coal, natural gas, oil, wind power, as well as hydro, geothermal energy, and biomass derivative fuels.

The GEIS even considers no-action alternative that was stated, do nothing. The report concludes that these alternative actions, including the no-action alternative, are not feasible, or have environmental impacts οf moderate to high significance.

In contrast the report concludes that environmental impacts associated with renewing the Peach Bottom license are small. With the extension of the license it means 20 more years of environmental and economic benefits, and continued reliable electricity for consumers and businesses in southeastern Pennsylvania.

What exactly does license renewal mean? I happen to think it is a necessary option. Let me give you three key reasons why. First, license renewal will maintain economic electric generation that does not produce green house gases, or other air pollutants, such as sulfur dioxide, nitrogen oxide,

99 1 and particulates. 2 Second, license renewal will preserve good jobs for this area, and communities like Delta and 3 4 Peach Bottom Township, where these plants are located, 5 will benefit from the plant's continued operation. Third, renewal of Peach Bottom's license 6 7 is far more economical than building a new power 8 plant. Many people don't realize that nuclear 9 10 is the largest source of emission free 11 electricity generation in America. It represents 12 nearly 70 percent of our nation's emission free generation. 13 14 Hydroelectric power is second, with 29 15 percent, photo-voltaic cells, and wind power, each represent less than one percent of emission free 16 17 generation. It is obvious, from these figures, that 18 nuclear energy provides vital clean air benefits to 19 southeastern Pennsylvania, and the United States, 20 considering that each state must control emissions 21 22 from electric generating sources, through the Clean 23 Air Act.

25

and

1 affordable electricity. I want to close by saying 2 that the draft GEIS is factual and complete, and could 3 contribute to a fair and objective review of an 4 environmental impact of license renewal at Peach 5 Bottom. And I would like to commend Exelon, and 6 7 the nuclear professionals at Peach Bottom, for their continued excellent record of safety performance, and 8 9 commitment, to protect the public health and safety, and the environment. 10 Together these are the key factors, in the 11 12 NRC's conclusion, in the draft GEIS, that supports a positive decision on renewing the license for an 13 14 additional 20 years. 15 Thank you very much. 16 FACILITATOR CAMERON: Thank you, Alan. 17 next we are going to go to Dr. Judy Johnsreud. Do you want to talk from here, or from there? 18 19 MS. JOHNSREUD: Chip, I've already had a 20 number of comments, and I think it would be preferable 21 for others who have been silent, to proceed. And if 22 I may, I would like to speak a little bit later. 23 FACILITATOR CAMERON: Thank you, Judy. 24 Let's go to the next three speakers, then, and we can

circle back to Judy. First Marcia Marks, then Paul

1 Gunter, then Sandy Smith. Marcia? MS. MARKS: My name is Marcia Marks, and 2 3 I live in Bethesda, Maryland. 4 have about 40 years front line 5 experience in public health, and social services. And I would like to talk to you, really, about what we are 6 7 seeing in the community. If many of you have seen this, there have 8 9 been five full page ads in the New York Times saying, why are more kids getting brain cancer, why can't 10 11 Johnny read, sit still, or stop hitting the neighbor's 12 kid? There are increases in asthma, diabetes, 13 14 and many other diseases. Book titles by scientists, 15 international scientists, "Our Stolen Future", "Our Children's Legacy", "Generations at Risk", 16 17 "Terminus Brain". What we are seeing in the public health 18 19 community is a very straight deterioration of human 20 health, and the health care costs are out of control. 21 In 1962 Rachel Carson wrote in her book, "Silent 22 Spring": Chemicals and radiation are changing the 23 very nature of this world". And that is what we are 24 seeing. 25 In reading the environmental impact

1 statement there were at least 132 references to the 2 word small, and then in caps, SMALL, small risks, 3 small environmental impacts, small significance, 4 etcetera, etcetera. 5 What is meant by small risks? Does that mean if my family and I get sick, that is just a small 6 7 amount? What happens as the environmental impact statement said, that in 45 years the increase in 8 population will be 62 percent, does small then become 9 medium risks? 10 11 The nuclear industry is protected by 12 Congress, under the Price-Anderson Act, because no insurance company would take a financial risk of 13 14 insuring a nuclear reactor. 15 Who will protect me and my family if we get sick? Certainly not the federal government. The 16 record and history has proven the government does not 17 take financial responsibility when it harms 18 19 citizens. 20 It took 50 years to get compensation for nuclear plant workers, and those who worked in the 21 22 industry during the war. Gulf War veterans have 23 received no remuneration. 24 My next question is, and I have a lot of

Why has the government stopped taking in

questions.

1 body measurements of strontium 90 in bones and teeth? 2 The U.S. Agency for Toxic Substances and Disease 3 Registry, is starting to measure toxic chemicals to 4 determine human exposure. 5 This is the best proof of toxins in the The same needs to be done for radio 6 environment. 7 nucleides, particularly SR90 in the bones and teeth. Why hasn't the government done this since 1963? 8 9 Shouldn't the public be made aware of why Peach Bottom 1 was closed in 1987? It is true that 10 11 the cause was operators were sleeping on the jobs, and 12 taking drugs? Where are the records published about the plant violations, such as those in 1982, '83, and 13 14 the death of an employee in 1985? 15 Is it true that the NRC called Peach Bottom one of the worse plants in the nation, and shut 16 down Peach Bottom 1 in 1987? Do you think people are 17 more efficient today? I certainly don't. 18 19 general maintenance is improving. Maybe the people 20 that are fixing the plant would like to come to my 21 house, because my house is only 35 years old. 22 time I repair one thing, something else breaks down. It is -- maintenance is a continual 23 24 problem. Look at today's schools where the children

are getting sick because of maintenance problems, and

1 other reasons. 2 Peach Bottom is the agriculture area for many parts of the east coast. 3 How often are 4 measurements done on the milk, and milk products that 5 enter our communities? Isn't it interesting that the schools get free milk and free cheese? 6 7 When milk is mixed from different farms it becomes impossible to trace it to its source. 8 often are these products tested for strontium 90 and 9 cesium 137, the longer acting isotopes? 10 What about measurements in fish? That was 11 12 mentioned today, but it is well known that people eat the fish they catch, even if it is in contaminated 13 14 water. 15 Until such time as the government promise to protect present and future generations, 16 17 Peach Bottom should not have its license renewed. 18 Thank you. Oh, one other thing, for those of you who 19 20 don['t have much knowledge about nuclear waste, I 21 suggest you read the July 2002 issue of National 22 Geographic. 23 It was written by an ex-Marine officer who 24 believes in the defensive mechanisms of nuclear, and

he is appalled at the waste across this country.

1 is an excellent article. Thank you. 2 FACILITATOR CAMERON: Okay, thank you, Marcia. And if after the meeting, perhaps one of the 3 NRC staff could just talk to Marcia about the 4 5 availability of the records that she was talking about. They should be public, but we will find out if 6 7 they are. 8 Paul Gunter. 9 MR. GUNTER: Thanks, Chip. My name is Paul Gunter, I'm the director of the Reactor Watchdog 10 11 Project for Nuclear Information and Resource Service. 12 would like to focus comments, mУ tonight, on the environmental impact statement as it 13 14 relates to one specific structure, the containment. 15 In 1972 the United States Atomic Energy Commission, their top safety advisor, Steven Hanavuer, 16 17 in a confidential memo to the general, regarding the General Electric 18 Mark Ι containment pressure 19 suppression system, as used at Peach Bottom, concluded 20 that the safety hazards inherent in the GE containment 21 design were preponderant, in excessive prevalence, and 22 recommended that the Atomic Energy Commission not permit any more designs to be built. 23 24 Joseph Hendrie, later to become chairman

of the AEC successor agency, the Nuclear Regulatory

1 Commission, wrote in an internal response that banning the Mark 1 pressure suppression containment could well 2 end nuclear power and "would generally create more 3 4 turmoil than I can stand thinking about." 5 The AEC then issued operating licenses to Peach Bottom 2 in 1973, and unit 3 in 1974. By 1985 6 7 the Mark 1 boiling water reactor, or BWR, was again singled out by the NRC for special attention, because 8 of strong indications of a high probability that its 9 containment would not survive several accident 10 11 scenarios. nuclear 12 NRC. director of reactor regulation, Harold Denton, told an industry conference 13 14 that the Mark 1 has a high probability, as high as 90 15 percent, for some accident sequences, such as an overpressurization accident. 16 17 And as one NRC staffer described, the containment's effectiveness, in an over-temperature 18 19 accident, core melt, as "like a hot knife through 20 butter." 21 By 1989 the NRC and the boiling water 22 including Philadelphia Electric reactor owners, 23 began work on the Mark 1 containment Company, 24 improvement program.

With NRC approval Peach Bottom's operators

1 installed an 8 inch diameter pipe, or hardened vent, 2 that can be opened from the control room, to vent the 3 reactor's primary containment through the 300 foot 4 tall stack, bypassing the station's radiation 5 filtration systems. Operators at Peach Bottom now have the 6 7 option to deliberately vent Peach Bottom's containment to the environment through controlled releases of the 8 9 tremendous internal pressure of a nuclear accident, and its radioactive materials, such as noble gases. 10 Vent containment to save it. A botched 11 12 design, a proposed ban by its own safety officials. Its primary containment system later verified to have 13 14 an irreversible design flaw. A principal safety 15 boundary jury rigged, and Peach Bottom was given its first new lease on life with significant reduction of 16 its often touted defense in depth hardware 17 philosophy. 18 19 Today these badly designed 20 deteriorating reactors are being relicensed for an 21 additional 20 years only if increased risk of adverse 22 environmental impact to our safety, and the economy, and the water, and the land resources. 23 24 The environmental impact statement does

not address security concerns regarding the structure

vulnerabilities of Peach Bottom's elevated irradiated fuel storage ponds.

Every refueling cycle Peach Bottom's operators offload one third of the highly radioactive, and extremely hot nuclear fuel from the reactor core, and submerge it into a 40 foot deep elevated storage pond, for thermal cooling and radiation shielding, for a minimum of five years.

The Peach Bottom elevated storage ponds are located approximately between the sixth and the tenth story of each reactor building. Referred to as the spent fuel pool, in industry jargon, each storage pond is currently filled with hundreds of tons of high level radioactive waste.

As long as the reactors are operating they are constantly cycling thermally hot radioactive fuel rods into the attic of the reactor. It is NIRS stated concern that these elevated storage ponds are extremely vulnerable to a variety of acts of sabotage, radiological terrorism.

The environmental impact statement does not adequately address the increased risk by significantly extending the Peach Bottom operating license, and the adverse environmental impact associated with a successful terrorist attack on this

vulnerable target.

As reported by NRC's own technical study on spent fuel pool accident risk at decommissioning nuclear power plants published in October 2000, before the attack on the World Trade Center, and the Pentagon "Mark 1 and Mark 2 secondary containments generally do not appear to have any significant structures that might reduce the likelihood of aircraft penetration of the spent fuel pool. Although a crash into one of four sides of the BWR secondary containment may be less likely to penetrate because other structures are in the way of the aircraft."

In other words, the Peach Bottom's 40 foot deep spent fuel pool shares only one of its walls in common with the exterior of the reactor building.

NRC goes on to state, based on studies in NUREG CR 50.42, the evaluation of external hazards to nuclear power plants in the United States, "it is estimated that one of two aircrafts are large enough to penetrate a five foot thick reinforced concrete wall."

The NRC report goes on to state: "It is further estimated that one of two crashes damage the spent fuel pool enough to uncover the stored fuel. For example, 50 percent of the time the location of

the damage is above the height of the stored fuel." 1 2 As stated earlier, the top of the reactor building surrounding the open surface of the spent 3 4 fuel pool is basically a sheet metal siding with 5 specified blow-out rating. Now, basically, this references the blow-6 7 out panels that are around the top third of the 8 reactor building. These are basically sheet metal 9 siding that are rated to blow out at a quarter pound 10 per square inch. 11 This raises the question for NIRS, what is 12 the blow-in rating for such, for this particular section of Peach Bottom? Where has NRC structurally 13 14 analyzed this section of the reactor building and 15 evaluated the degree of risk associated with extending which we are vulnerable 16 time at consequences of off-site radiation releases from an 17 act of radiological sabotage at Peach Bottom? 18 19 NIRS contends that the identified 20 vulnerability unacceptable is an risk, with 21 unacceptable consequences, in the clear and present 22 danger of a post September 11th world. 23 A relicensing proceeding that turns a 24 blind eye on this glaring vulnerability is a sham on

the public health and safety, and the environment.

1 There are copies of this statement out 2 front, and I will also submit a copy to NRC. 3 FACILITATOR CAMERON: Great, thank you 4 Paul, we will attach that to the transcript, also. 5 Sandy? MS. SMITH: Good afternoon. I would like 6 7 to comment, I didn't even think about it until I was standing here, listening to everyone's speeches. But 8 my grim reaper outfit was made very quickly last night 9 by my daughter, who is in theater, and so forth. 10 11 And I was pregnant with Gretl when TMI was 12 30 minutes from meltdown. So I guess this is a very apropos outfit that, in fact, I do wear to this. 13 14 grim reaper needs her glasses. 15 FACILITATOR CAMERON: And this is, I'm sorry, I didn't fully introduce you for the record, 16 17 Sandy Smith. 18 MS. SMITH: And I'm member of а 19 Pennsylvania Environmental Network, and the human 2.0 race. 21 Thank you for letting me speak today. 22 Although I'm angered that this old nuclear plant is 23 even up for the license renewal, the NRC's own 24 standards stated Peach Bottom was supposed to close 30 25 plus years ago.

1 What has changed? Has anyone from the NRC 2 personally inspected every piece of rusty metal, worn parts, fractured cement? There is no way Peach Bottom 3 4 can operate safely, or economically, and should be 5 shut down, according to the Nuclear Regulatory Commission's own figures. 6 7 When death, health, and environmental desolation are added up, Peach Bottom is not a cheap 8 9 source of energy, only a cheap way for the owners to make billions. 10 11 Is Peach Bottom required to put up a bond, 12 and for how much? Is there any insurance for an accident, and what amount of insurance? 13 14 happen if and when the plant becomes so unsafe that 15 our land values go down, and we can no longer live 16 here? 17 Will the owners of Peach Bottom go into bankruptcy, like Enron? What will happen, who will 18 19 pay for all this? According to the Federal Register 20 Notice, each relicensing is expected to be responsible 21 for the release of 14,800 person rem of radiation 22 during its 20 year life extension. 23 The figure includes releases from the 24 nuclear fuel chain that supports reactor operation, as

well as from the reactors themselves.

25

The NRC

1 calculates that this level of radiation release, spread over the population, will cause 12 cancer 2 3 deaths per unit. 4 And I think I figured that wrong, because 5 I thought per unit meaning per nuclear facility, but we have two units here, so I guess that is maybe 24 6 7 deaths, instead of 12, I'm not sure about that. Accidents radiation 8 and non-routine releases are not included in the NRC's figures, and 9 could cause still higher casualties. The NRC only 10 11 calculated likely cancer deaths. So deaths from other radiation induced 12 diseases, and non-fatal cancers, are not included in 13 14 the calculations. I don't think there are 12 people 15 in York County willing to give up their life for Peach 16 Bottom. And TMI is close by. 17 The NRC has said it expects as many as 100 reactors to apply for relicense extensions. 18 This 19 would result in some 12,000 cancer deaths among the 20 U.S. population, but probably more because of the 21 miscalculation on units. 22 Pennsylvania also has, is the second 23 highest number of nuclear reactors, and is the second 24 highest amount of nuclear waste. Because of this

Washington says we have to have a nuclear dumping

site.

Pennsylvania doesn't want a nuclear dumping site, so why do we have this reactor going off, why are we creating more nuclear waste?

Nuclear power is not an admission free technology. The entire nuclear fuel chain, the uranium, primary mines on the lands remaining to the indigenous people, uranium conversion, enrichment, fuel fabrication, each step possesses workers, exposes workers and communities to radioactivity, and each step generates radioactive waste.

It defies the concept of disposal, they don't go away, they just get moved around. There is no such thing as a nuclear dump that won't eventually leak. The NRC acknowledges that the allowable limit, 100 milli rems a year, for radiation exposure, via air, from any reactor to the general public, will cause a fatal cancer in 1 out of 286 people exposed.

This is very high when compared to the standard of 1 in a million considered an acceptable level of human sacrifice for industrial activities.

The 1986 catastrophe at Chernobyl has seriously affected the health and welfare of the byelorussian people. I was there, I met them, I know what I'm talking about, I saw the children.

1 The average life expectancy of women has declined by five years. Only ten percent of the 2 3 children are completely healthy. Cancer among adults 4 and children have increased in Ukraine and Moldova as Two-thirds of Ukraine is contaminated, and 70 5 well. percent of the food. 6 7 The watershed of Kiev basin has been so contaminated that it would require 200 billion dollars 8 9 just to purify the water. 40 million people have to drink it and, yes, they are drinking it now. Children 10 11 are drinking it, everybody is drinking it now. TMI was 30 minutes from meltdown. 12 How much disaster insurance does Peach Bottom carry for 13 14 York County? We have a right to know. Are you going 15 to pay for our land when it becomes useless? What will happen? 16 17 NRC has offered to pay the cost for two day's supply of potassium iodide pills to people 18 living within ten miles of a nuclear power plant. And 19 this is not Laugh-in, or Friday Night Live, this is 20 21 really it, or Saturday Night Live. 22 Thyroid cancer is a major result 23 nuclear accidents. The exposures can continue for 24 days, even after one leaves the area. It is in your

blood, and so forth.

1 If a nuclear accident occurred during a 2 natural disaster, earthquake, hurricane, blizzard, ice 3 storm, or an attack, evacuation would be difficult and 4 time consuming, and people would need at least ten 5 days to a month's supply. EPA's manual even states that it should be 6 7 taken, the iodine tablets, three or four hours after 8 the exposure if it is really going to work. 9 The NRC would also have to stockpile iodine pills in schools, day care centers, places of 10 11 work, and so forth. Soaring rates of thyroid cancer 12 are still appearing in children from the former Soviet Union, who were exposed to Chernobyl nuclear accident, 13 14 and who received too little potassium iodine, and too 15 late. There is no way, even the seemingly simple 16 17 protection can be carried out. Why do our tax dollars 18 have to pay for Peach Bottom, a private company, 19 hazardous operation? 20 In the past three years older, worn out 21 equipment has caused dozens of accidents in plants, 22 causing them to shut down. In May and August of 2000, 23 Peach Bottom unit 3 was forced into an emergency 24 shutdown when its instrument valve failed, and caused

a leak of contaminated reactor coolant outside of

primary containment.

Much to the discussion, since the September 11th attacks, has focused on the resistance of reactor contaminant structures to aircraft strikes.

I wonder about Peach Bottom. We all know it was built way too long ago, it won't hold up.

We must assess the nuclear age itself in the wake of Chernobyl. These children are still going to Kiev, they are going to Israel for decontamination, coming back, and then suffering from radiation over, and over, and over again. But the mushrooms are big, let me tell you.

We must asses the nuclear age very carefully. There are more than 450 reactors in operation on the planet today. Each generates radioactive waste that will be a threat to human life for hundreds of thousands of years. That is everybody's children.

Each routinely releases radioactivity into the air and water. Poland was the only country that protected their children with iodine pills. And that is not a polish joke.

To this day Scotland, sheep in Scotland are contaminated, and the land is contaminated from Chernobyl.

1 We have seen how far radiation can spread, 2 which depends on the wind. We have also witnessed 3 smoke from the Canadian forest fires. Radiation 4 travels the same paths. 5 If nukes are so safe why do our phone books have an evacuation route, why is the industry 6 7 trying to figure out where to dump their deadly waste, and why is 46,000 dollars of your county's budget, our 8 9 money, going yearly to radiation emergency response? If the NRC does not close down Peach 10 11 Bottom we will not have to worry about the terrorists, because we have our government representing the 12 corporate world of nuclear energy already terrorizing 13 14 us. 15 Thank you, let's hope we can stop this. 16 FACILITATOR CAMERON: Okay, thank you 17 And the next three speakers that we have are Donna Cuthbert, Alliance for a Clean Environment; Sam 18 19 McConnell, and Lawrence Egbert, from International 20 Physicians for Prevention of Nuclear War. 21 Donna? 22 MS. CUTHBERT: I am here today to address 23 the common sense issues of this problem. The Alliance 24 for a Clean Environment is a group founded in the

greater Pottstown area, which is focused on harmful

environmental health impacts in our region.

In the greater Pottstown area there is an enormous elevated childhood cancer rate. We also live right at the Limerick nuclear plant. It has been found that in our county there is an elevated cancer rate of childhood cancer deaths, ages 1 to 14, that have increased by 71 percent, from the '80s to the '90s.

Is it the Limerick nuclear power plant? Who knows, but it certainly had a part in it. Thyroid cancer has increased in the general population by 96 percent from the '80s to the '90s in that county, where we have the Limerick nuclear power plant.

Based on Peach Bottom's threat to human health and safety, as well as long-lasting destruction of our environment, we urge the Nuclear Regulatory Commission to deny the license renewal for Peach Bottom.

Closing Peach Bottom is clearly in the best interest of the health and safety of all residents in this region, and the best economic interest of the public, in general.

The President keeps reminding us that our war on terrorism is not likely to end in the near future, if ever. Why would the NRC renew the license

1 for such a major target for terrorism? 2 The potential to destroy so much, and harm 3 or kill so many people must be ended, not renewed. 4 Even people in the greater Pottstown area could have 5 their health adversely impacted by a terrorist attack, or accidental disaster at Peach Bottom. 6 7 Pottstown is only about 50 to 55 miles If prevailing winds blow only 8 Peach Bottom. about 10 miles per hour, radiation can arrive in 9 Pottstown in as little as five hours. 10 11 Why would the NRC renew the license of any 12 nuclear plant, when it costs the public so much money to protect these facilities from terrorism? How long 13 14 can we afford to absorb that kind of cost? 15 What kind of debt would we be planning to leave for our children, and their children, just for 16 the constant surveillance of nuclear plants? 17 Why would the NRC renew the license for 18 19 any nuclear plant when there is no safe way to dispose of the radioactive waste these facilities produce? 20 21 Spent fuel rods present enormous risks to 22 public health and safety, to store, or to transport. 23 When spent fuel rods can't be disposed of safely, why 24 would the NRC allow the process to continue, which 25 produces more of them?

1 Transporting spent fuel rods from nuclear 2 plants such as Peach Bottom in Pennsylvania, across the nation to Yucca Mountain, opens the door for all 3 4 kinds of natural and terrorist catastrophes all along 5 the way. Leaving the nuclear waste on site presents 6 7 additional risks to the surrounding populations. face far, far too much risk from nuclear waste 8 9 already. Common sense tells us that the older the 10 nuclear plants get, the more chance there will be for 11 accidental disasters. Why would the NRC allow this 12 increased risk? In 1990 the National Academy of Science 13 14 report called the biological effects of ionizing 15 radiation stated that even, even quick decaying radiation is not necessarily safe. 16 17 Realistically there is no safe level of radiation. Why do we play these safe level radiation 18 19 Why do we do that? games? 20 Nuclear power plants contain a toxic soup 21 of extremely carcinogenic radiation. There is no way, 22 there is no way to protect people from the ongoing 23 radiation releases at a nuclear facility. 24 There is also no way to protect people

from exposure as a result of a nuclear accident.

1 Realisticaly this is not truly a guarantee. Some 2 kinds of radiation from nuclear power plants remain in 3 the human body forever. 4 So why would we continue a process when we know it does this kind of harm to human health? 5 Ι believe Peach Bottom has the potential to be an 6 7 enormous, enormous health risk. In fact, even people who live in Pottstown 8 could ingest airborne particulates routinely escaping 9 from Peach Bottom. The Pottstown area gets much of 10 11 its milk from dairies located in Lancaster and York 12 counties, near Peach Bottom. And people ingest Peach Bottom milk. 13 14 Logically speaking it is irresponsible, 15 and illogical, to extend the life of Peach Bottom. 16 ACE urges you, urges you, to protect the enormous population which can be adversely affected by what 17 18 happens at Peach Bottom. Please, please, value the health and the 19 Please deny Exelon's application to 20 environment. 21 extend Peach Bottom's license. Thank you. 22 FACILITATOR CAMERON: Thank you, Donna. 23 Is Sam McConnell with us? Sam, do you want to come up 24 and say a few words to us? 25 MR. MCCONNELL: My name is Sam McConnell,

1 I'm a local resident, and I'm concerned and presently 2 involved with local environmental, health, welfare, 3 and safety issues. 4 My background that allows me to, in my 5 opinion, to become involved and voice my desires, is I have 20 years in military nuclear power, including 6 7 operation and maintenance, RADCON, radiation control, setting up checkpoints, radiophysics, nuclear physics, 8 9 and more importantly, probably, from a standpoint of understanding what happens, I was the team leader for 10 11 the nuclear power plant casualty response team. 12 Ι have οf environmental one year assessment of a fossil fuel plant permit application 13 14 to PADET. I'm not now, or have ever been, involved 15 financially with any commercial electric plant. I personally have been through the Peach 16 Bottom application, its environmental impact volume 17 twice, which is rather boring, but I did it. 18 The 19 safety volume, once, because I can understand what 20 they are talking about. And the draft impact 21 assessment, once. 22 Unfortunately family got in the way, and 23 I couldn't really tear it apart and digest it like I 24 would have liked to. As of today I'm personally in favor of 25

1 approval of the application, as a local, for the 2 following reasons. 3 Extending the license will be less of a health, welfare, and safety impact 4 local 5 constructing a new plant, either nuclear, or fossil fuel. 6 7 The findings, the second reason is the findings of ongoing studies that show that fossil fuel 8 plants emissions are considerably more damaging to the 9 local health and welfare than previously thought. 10 11 Personal experience with the NRC oversight 12 and control, for 20 years I had to live with them, and it was not easy, in the service. And NRC has been 13 14 involved in monitoring nuclear power plants, and the 15 military will tell you that it is rather grueling, what you go through, dealing with the NRC. 16 17 The fourth reason is because Peach Bottom has been a good neighbor. I've heard questions about 18 19 release of information. I have news for you, we knew 20 about the operators sleeping, as soon as it happened. 21 So far as I know we've known about every 22 problem Peach Bottom has had. is local That 23 information. 24 In summary, because I live here, in the real world today, and know that another plant will 25

1 fill the void less by Peach Bottom shutting down, I'm 2 in favor of the licensing extension as more desirable 3 than new construction of more nuclear reactors, or a 4 fossil fuel facility, that would take their place in 5 this void. Because, unfortunately, we are in the 6 7 Susquehanna river basin, and we will see, in fact 8 today we generate more electricity, probably, than any 9 other place in this country. I've done the DOE studies, and we generate 10 17 percent more power than we can use in Pennsylvania, 11 12 and we are doing it for people who don't live here. So we are getting the emissions that would have to 13 14 come from a fossil fuel plant, right here, with no 15 benefits. Thank you. 16 FACILITATOR CAMERON: Thank you very much, 17 Mr. McConnell. And now Lawrence Egbert. Is it Dr. Egbert? Yes, Dr. Egbert could come up and speak to 18 19 us. 20 My name is Lawrence Egbert, DR. EGBERT: 21 I'm a physician licensed in Maryland, and I live in 22 Baltimore. I'm told that Baltimore tends to be downwind from here, but maybe Pottstown is worse. 23 24 I work with the International Physicians 25 for the Prevention of Nuclear War in Texas, and we

became very interested in the transportation of nuclear waste across New Mexico, and then evaluated, the Veteran's Administration evaluated the training of the physicians in the various hospitals along the route where waste would be transported.

And found that in New Mexico, at any rate, they weren't. So the physicians weren't trained to take care of the casualties, radioactive casualties, if a truck happened to have an accident in carrying the waste through their particular town.

We did a similar, but not as thorough, a study of the transportation across interstate 40 through Oklahoma, and also interstates 30, 10, and 20 in Texas, and basically came to the same conclusion.

If you have an accident with one of these trucks carrying the waste, do not expect us to be capable of good care. So I'm sorry about that. As far as I know, at the present time, it is still in the state of lack of preparedness.

I would say another thing about Baltimore. Baltimore had a little accident last summer, in one of our tunnels a train carrying chemicals, so that we are a little sensitive about the possibility that any waste materials that might come from here, might come down interstate 95 and maybe go through some of our

tunnels.

The U.S. chapter, I'm from the Baltimore chapter of the International Physicians for the Prevention of Nuclear War, but our national, United States national chapter, has explicitly said do ont transport your waste to Yucca Mountain.

And not just for the reasons that I'm telling you, we are not prepared to take care of the casualties if there is accidents, but because of the general idea of terrorists, and also the idea that the waste, if you are going to carry the waste, if you are going to create the waste, then it is best to have it stored at the most local site that there is, in terms of general hazard.

We would, therefore, come to the conclusion, especially in Baltimore, and our steering committee has authorized me to tell you, keep your waste here, don't bring it through Baltimore, which is essentially saying close the plant down, and don't make any more waste.

Thank you.

FACILITATOR CAMERON: Thank you, Dr. Egbert. We have four remaining speakers, and possibly we will have some time, if Dr. Johnsreud wants to talk to us for a little bit.

1 But we have Frieda Berryhill, Bernard 2 August, Amy Donohue, and Mike Ewall. Frieda? 3 MS. BERRYHILL: When you started you told 4 us of the experiences of the people with the NRC, and 5 years of service. I was an intervenor when Delmarva Power 6 7 and Light Company planned to build a nuclear power plant in Delaware, and that was in the early 1970s, 8 and I've been at it ever since. 9 So as far as years of study, and interest 10 goes, I'm older than all of you. I have read more 11 12 documents than you can possibly imagine. As a matter of fact, when we got started 13 14 Dr. Judy Johnsreud and I were young and beautiful. 15 Now we are only beautiful. I'm well aware that these hearings, we 16 have been to so many CYR hearings, Ms. Johnsreud and 17 I, you can't imagine, and how many papers we have 18 19 submitted, and how many studies we have read. 20 CYR hearings are called public hearings. 21 We have no delusions that our being here has any 22 effect on anything, never has had. The nuclear 23 industry self-destructed, not because of our efforts, 24 and we know that. But it is our religion, it has

become our religion, you see.

1 Well, Peach Bottom at this time is one of 2 seven nuclear power plants with active relicensing 3 applications. Four plants have been licensed so far, 4 and there is no indication that any statement in our 5 position to this dangerous practice has any impact at all. 6 7 As a matter of fact, having any new, having no nuclear power plants to work with, the NRC's 8 willingness to keep their jobs going, with the same 9 10 disregard for safety concerns, and concerns 11 opponents, is quite clear. 12 Some years ago one of the NRC men said to me one time, well, no more new plants, we are out of 13 14 a job. Well, now you are safe for God knows how many 15 years. Most licenses do not expire for another 15 16 17 to 20 years. So I ask myself why now? The present license hasn't expired, and they are already apply. 18 19 Don't you want to know why? To amortize the plant's debt further, further into the future. 20 21 Therefore padding corporate 22 The NRC knows that, we know that, everybody today. 23 This old worn and dilapidated plants knows that. 24 originally licensed for 30 years, which was then

considered to be reasonable. Having an extension for

1 that reason only, keep the money going, just follow 2 the money, and you have the answer. 3 To make my point, cracks and leaks, and 4 embrittlement of the material in aging plants is well 5 known by the NRC. Nozzle cracking in the pressurized water reactors started in the late '80s, and only two 6 7 months after Oconee was given the 20 year extension, the nozzle cracks were discovered. 8 And I have an explanation, in the back of 9 my statement, for anyone that wants to read it, what 10 11 those nozzle cracks are. 12 And, again, after extension the nozzle cracks were discovered. And earlier this year Ouartz 13 14 City in Illinois reported a problem with those. 15 that is a dangerous problem. I urge you to read them. Two other plants currently going through 16 licensing process where cracks were found, that is 17 North Anna, and Surrey. On March 7th, 2002, First 18 19 Energy's Besse-Davis nuclear power in Ohio experienced 20 the problem, which should alert the NRC to immediately 21 halt all renewals. Boric acid corroded a six inch hole into 22 23 the reactor vessel, leaving only a third of an inch 24 metal cladding as protection against the reactor

breach. The consequences could have been devastating.

1 And they discovered this by accident. I'm 2 certain you will not permit me to list all the so-3 called close shaves and mishaps, and sloppiness with 4 which this industry operates. Stupid mistakes with 5 regularity. At General Electric's Trojan plant the 6 7 control room operator was listening to a baseball game while radioactive water was overflowing from a tank, 8 and flooding the adjacent building. 9 On July 26th at Susquehanna a dry fuel 10 11 storage cask had accidently been filled with argon 12 helium gas in its place, instead of the correct 100 percent helium gas. Nobody knows what the effects on 13 the storage system are, of this. 14 15 Now, how can you make a mistake just -- it is beyond imagination. 16 17 Finally, I would like to direct the NRC's attention to the international situation concerning 18 19 nuclear power in general. And the reason I do this is 20 because in all the 30 years we were told how wonderful 21 the French have their nuclear program under control. 22 And the French nuclear power program from 23 Framatome has been held up as a marvel. 24 chickens are coming home to roost. With an original

price tag of 4.3 billion dollars, the Phoenix ran for

1 a total of 30 months, over a dozen years since it went 2 into operation. And the world's largest fast reactor 3 is now closed for good. And that was the model held 4 up to us for all these years. 5 And, by the way, the breeder reactor in Japan are no better. If the serious accident 6 7 investigating general commit suicide. We are finally beginning to look into the nuclear industry's claim as 8 9 to the actual contribution to the nation's energy 10 pool. 11 And this has not yet hit the national 12 But there are groups now working on consciousness. this, and this is very interesting. The production of 13 14 nuclear power is extremely energy intensive. 15 The energy consumed by future needs, such as shipping 77,000 tons of nuclear waste all over the 16 17 country, much more being produced, this doesn't even figure into the calculations. If the trillion dollar 18 19 taxpayer investment, it delivers little more energy 20 than wood. 21 Globally it produces less energy than 22 renewables. In the 1990s global nuclear capacity was 23 only one percent a year, versus 17 percent for solar

cells, 24 percent last year, and 24 percent for wind

power.

24

1 Last California added year more 2 decentralized megawatts than its two nuclear power 3 plants. Does anybody really want these plants? 4 Over the last few years utilities have 5 been trying to sell them. Maine Yankee even created a white page complete with color photographs to 6 7 promote the sale. There were no takers, the plant was retired. 8 When will this country find its sanity? 9 What are we doing to this planet? 10 Its sanity. 11 Plutonium is radioactive for 250,000 years, and some elements like iodine and tecnitsium technetium won't 12 decay for millions of years. 13 14 I think it is time to stop, and maybe I 15 will be here another 10 or 15 years. Thank you. FACILITATOR CAMERON: Thank you, Frieda, 16 and we hope you are here with us for another 10 or 15 17 18 years. 19 I should just say that we are here to listen to everybody today, and if there are comments 20 21 made that need to be factored into our environmental 22 or safety reviews we will do that, and that is the 23 main purpose for why we are here. 24 Our next speaker is Bernard August. 25 MR. AUGUST: My name is Bernard August,

1 I've been an activist for 37 years. Of course I'm a really good activist, 2 3 because I was trained by Mrs. Berryhill. So I want to 4 give her credit for sticking my neck out like this, 5 and not giving up. My specialty has always been to study the 6 7 social consequences of this technology in relation to evacuation zoning, and the study of these plans. 8 These plans are totally required by law, in each 9 state, to comply for a nuclear power license. 10 11 But the evacuation planning is a farcical 12 project in itself. There is no way that anybody escapes out of a ten mile EPZ safely, within a certain 13 14 amount of time. 15 Because what is expected of the society that live around the plant, is that they are giving 16 17 proper notice that the accidents occur, and evacuation will be forthcoming. 18 19 The social consequences of a nuclear 20 evacuation has been underplayed and on the side line 21 for the last 30 years. It really has come to fore 22 because of 9/11, and now the redistribution of 23 potassium iodide tablets. 24 This idea that people will evacuate under sort of system is completely baseless 25 some

irrelevant. There has been reports that come from the accident at Three Mile Island, whereas earlier the doctor mentioned about not having adequate physicians, and people to use in the evacuation. Will they be around?

This has been determined that nuclear accidents are not the same as natural disasters.

This has been determined that nuclear accidents are not the same as natural disasters.

People who are responsible, who want to be, the system relies for their jobs to show up, will not show up.

Out of the doctors that were reported to show up for Three Mile Island, 70, I think only five or six showed up. That doesn't include the people who are going to have to drive the buses to bring the people out of the zone, the traffic police, and whatever.

And what is going to happen if a nuclear evacuation is called? There is going to be spontaneous evacuation outside the ten mile EPZ, further jamming up the highways, and making it impossible for anybody to get out.

So as I always say at these hearings, when I go to them, is that the least you can do is to tell the people to stay put in their houses. Because being on the road, in a disaster such as a nuclear accident, will lead to further loss of life, and environmental

destruction.

KI must be given to all the populations within at least 50 miles of the plant. I think the new federal law stated that because of the war in terrorism, the Homeland Security Act, that the evacuation plans are going to be extended to 20 miles now, instead of 10.

I live in Delaware. I am surrounded by approximately six or seven nuclear power plants on all sides. There is no way in hell that I'm going to get off the Delmarva Peninsula, and there is no way in hell that they are going to be able to distribute KI to me, after the announcement has been announced.

So, therefore, the social premise of nuclear power, the fact is that it receives multi million dollar subsidies to keep it operating, is a sham, and a technologic lie.

Human nature cannot permit, does not permit perfection in its though process, and its designs, of such an egregious technology. It cannot be achieved.

The idea that technocrats, bureaucrats can sit down and degrade human liberty and freedom to an insurance risk assessment is totally bizarre. And I know our lives are lived this way in this country,

1 because everybody has their ox to protect. 2 But as the technology has proven, with its 3 people who are in pursuit of nuclear weapons, and the 4 security structures that are required for nuclear 5 technology can't, and will never be there, for the total protection of the population at large. 6 7 Thank you. 8 FACILITATOR CAMERON: Thank you Mr. 9 Do we have Amy Donohue? August. 10 MS. DONOHUE: I was going to prepare a 11 written statement but I got a little frustrated with 12 it, so you will have to bear with me. After the last meeting that the NRC held 13 14 here I submitted, probably, an 18 to 20 page report to 15 And I prefaced that report with the following them. 16 statement: 17 I said, first of all let me be clear. I know that it doesn't matter what I say, or what 18 anybody here says, during this process to relicense 19 20 Peach Bottom nuclear power plant. 21 The regulations say you, meaning the NRC, 22 has to get public input. So you let us have our say. 23 But in the end the decision will be made despite anything we have to say. 24 Sometimes I really hate being right. I've 25

1 put a lot of work into 18 pages, and what I've read in 2 the draft environmental impact statement totally 3 negated everything that I said. 4 I haven't read the entire thing because I 5 haven't had that time yet. But I had a particular interest in alternative power, because I live off the 6 7 grid. I make all my own electricity by solar panels, solar photo-voltaic panels. I buy no electricity from 8 9 PECO. So I've turned to page 8-43, to read what 10 11 you had to say about solar power, I was quite amazed. 12 Running Peach Bottom nuclear power plant for 20 more years, you are telling me, has a small environmental 13 14 impact. 15 But to replace nuclear power with solar power, you are telling me has a large environmental 16 impact. Quite amazing. How can you say this and get 17 away with it? 18 19 I'm serious, I mean, it is laughable, if 20 it weren't so serious. I was planning to have a poster 21 sized photograph of my panels, but time ran out, so I 22 don't have that. 23 If anybody is interested, let me know, and 24 I will share with you the great possibilities that 25 solar power has for us.

1 Underneath what it says about solar power 2 is that it costs too much per kilowatt, I guess that 3 is how it is. Well, let's talk about that, because I 4 know that our federal government, meaning me the 5 taxpayer, subsidizes the nuclear power industry quite 6 a bit. 7 Everything from the insurance that Peach Bottom has that all nuclear power plants have is paid 8 9 the taxpayer, through the federal by me, 10 Is the Federal Government going to pay 11 my insurance? I don't think so. 12 The other thing is we fund the nuclear regulatory industry through our taxes. I don't know 13 14 how much you all make, but I bet it can buy a lot of 15 solar panels. Let's see, Yucca Mountain. If you decide 16 17 to put that waste at Yucca Mountain how much are you planning on spending to do that? How much do you 18 19 spend in regulation and cleanup from the mining of 2.0 uranium? 21 I mean, you put all that money together, 22 it can buy a hell of a lot of solar panels. 23 all my own electricity with just a few. That is quite 24 a lot of solar panels that can be bought.

I know all this because I do a lot of

1 reading. But as I was preparing this afternoon to come here, actually this morning, I was going through 2 3 trying to find a phone number, and I came across 4 something that is called Pennsylvania Solar Manual, 5 and it is produced by the Pennsylvania Energy Office. So this is a Pennsylvania government 6 7 publication. Within that, let me see if I can find it very quickly, in that manual it says, so this isn't 8 9 coming just from me, it is coming from our state 10 government. 11 Present day energy suppliers benefit from 12 billions of dollars in subsidies. And this was published in 1993, so that is 1993 dollars, I guess, 13 14 we are talking about. 15 It is estimated that over 50 billion dollars per year is spent by the Federal Government in 16 17 directly subsidizing the costs associated with fossil and nuclear fuels. 18 These subsidies take the form of 19 20 research and development, environmental breaks. 21 cleanup, health costs, and military expenditures to 22 ensure energy supplies. These costs do not show up in 23 the price we pay for energy, but we pay for them just 24 the same.

We pay for them in our tax dollars, we pay

for them with our lives, in cancer. If these hidden costs, often referred to as externalities, were included in the price we pay for energy, then solar energy would be in a far better position to compete with conventional fuels.

So it is not just me saying that. I, like I said, have a particular interest in solar because that is the way I live. And the reason I live that way is because I don't want to buy my energy from a nuclear power plant.

I live eight miles, approximately, from Peach Bottom. I hear the sirens go off, I have probably called the emergency number in our telephone book too often because sometimes I think I hear them, and I'm not quite sure, so I call to make sure.

I hear them in the middle of the night in the last couple of years. There was no emergency, it was a mistake. I said it at the first meeting. We live in a state of denial in the shadow of this nuclear power plant.

Somebody else is talking about how we will evacuate. I live next door to an aAmish family, lots of buggies here, lots of buggies. Very dangerous, normally, on route 74 with those buggies. I can't imagine evacuating all the people from this area.

1 You know, I have an interest in organic 2 farming. If that melts down, if we get contaminated, 3 that is gone. My land is useless for that, useless 4 for pretty much anything. 5 So I want to get back to solar, I'm going The other thing you said about 6 off here, I'm sorry. 7 that solar is we don't havE enough sun in 8 Pennsylvania. So I found it, again, Pennsylvania Solar 9 Manual put out by the Pennsylvania Energy Office. I 10 11 know we have enough sun because that is the way I get 12 my electricity. amount of solar 13 The energy 14 Pennsylvania each year is 140 times greater than all 15 the electrical and fossil fuel energy consumed in the 16 state annually. 17 Even if the conversion efficiency of sunlight to energy is only 5 percent, solar energy 18 19 could still supply 7 times more energy than is 2.0 consumed. 21 Yes, we have a lot of cloudy days, but the 22 sun does come up every morning. There is no way for 23 my solar panels except for, oh, maybe 20 years from 24 now I may have to replace the batteries.

But those batteries can be recycled. They

1 are not going to create cancer to populations around 2 the country, around the world. The panels that I use are by a company 3 4 called Astropower. And Astropower is an independent 5 solar panel company, and they produce their panels from recycled materials from the computer industry. 6 7 So even the materials used to make the 8 panels is good for the environment, because they are 9 using recycled materials. So when I read that the environmental 10 11 impact of replacing nuclear energy with solar power 12 was large, and the impact of continuing Peach Bottom for 20 more years was small, I was totally blown away. 13 14 I don't need to read the rest of the 15 report although I will, and I will submit, probably, another 20 page comment on it, to know that there is 16 not a whole lot that I'm going to believe in that 17 18 report. Because this was just four paragraphs in 19 20 I wonder where you got all your your report. 21 information from? The numbers that are cited have NRC 22 in parentheses. Since when is the Nuclear Regulatory 23 Commission experts on solar energy? 24 give you, right now, 25 telephone numbers of people who are experts on solar

1 energy. I've spoken with them, they would agree to 2 talk with you, they would agree to talk with the press, because they have studied it, they know. They 3 4 are the experts. 5 You may think you are experts on nuclear industry, but you are not on solar. 6 7 The other thing that I want to say, just briefly, is somebody else Sandy, I believe, talked 8 about the twelve extra cancer fatalities as a result 9 of each unit for another 20 years. 10 11 If somebody came into this room with a gun 12 and killed 24 people in this room, promised not to kill anybody else for the next 20 years, would we 13 14 allow them to walk out? Would we allow them not to be 15 held responsible for those 24 lives in this room? 16 is what the Nuclear Regulatory 17 Commission is saying, that they are going to give a license to Peach Bottom to continue to do, 24 deaths. 18 I would like to see the hands of 24 NRC or 19 20 Exelon personnel, right now, who would be willing to 21 give up their lives. Because you are asking us, those 22 of us who live here 8 miles from that power plant, to 23 do that. 24 FACILITATOR CAMERON: Amy, I quess I'm 25 going to have to ask you to wrap up.

1 MS. DONOHUE: Okay, I'm done. 2 FACILITATOR CAMERON: And if you have the 3 patience and willingness, maybe, after the meeting the 4 NRC people can talk to you about what methodology was 5 used in terms of the solar analysis, and we appreciate your comments on that and, thank you. 6 7 And we have Mike, Michael Ewall, now, to 8 speak to us. Mike? 9 MR. EWALL: My name is Mike Ewall, it is 10 E-W-A-L-L, with the Energy Justice Network. 11 I testified back in November, and from my 12 experience there I know that my comments will be ignored, because my comments were ignored then. 13 14 they actually told me why, so they weren't even 15 pretending they were going to take them into consideration. 16 I spoke the last time about terrorism 17 impacts, and I was told that that was not something 18 19 that we are allowed to really give comments on. 20 that we are not allowed to give comments to, but that 21 we are not going to be listened to and, obviously, 22 none of it ended up in this EIS report, because that 23 is being handled in a separate process that is generic 24 to all reactors. 25 And while that is admirable that you have

1 that, I think it would also be appropriate to have site specific terrorism impact information in here. 2 You talk about -- you had a great acronym for it, 3 4 severe accidents. 5 But there is nothing about severe, like, deliberate damage being done to this reactor. And as 6 7 Paul Gunter gave, on some very clear testimony on the vulnerability site specifically to this reactor, I 8 think that needs to be addressed. 9 I don't have any illusions, either, that 10 11 my comments are going to affect this in any way. I 12 know also because some other things I said the last time solar and wind, and 13 about conservation 14 efficiency, also did not make it into this report. 15 I will go more into that in a minute. One of the things that I think need to be addressed in 16 here, though, that I just looked through this and 17 noticed, is that there is nothing addressing the spent 18 19 fuel, and where that would go. And even if Yucca Mountain is built, and 20 21 even if it manages to ship all the waste there with no 22 accidents, and all these things that we are all hoping, some people are hoping would happen, I don't 23 24 want to see Yucca Mountain at all.

But even if that happens Yucca Mountain is

1 not going to have room for the waste that would be 2 created in these extra 20 years. So you need to be 3 talking about this in this report. Where is that 4 waste going to go? 5 Because Yucca Mountain is not for that waste, it is only for the waste up to a certain point. 6 7 Now, if a lot of that waste has to be temporarily 8 stored in dry cask storage, we have a number of oops, mistakes, going on with dry cask storage, including 9 10 one from just this past week. 11 Actually Frieda already made mention of 12 it, in Northeast Pennsylvania, where they filled the dry casks with the wrong gases, argon and helium 13 14 instead of just helium. 15 Now the NRC report from that stated that they don't know what impacts that might have, but it 16 17 might degrade the effectiveness of these containers. And these are containers that we do not have the 18 19 technology, or ability to repackage this waste, to put 20 it back in the fuel pool. So without those kinds of alternatives it 21 22 is a big deal that they are filling these casks with 23 the wrong gases. And in Point Beach, Michigan, and 24 Palisades, you have the same kind of -- not the same

kind, but you have other dry cask storage incidents

1 with hydrogen bubble explosions, and wind several 2 times blowing several feet off of the surface, near defective wells with dry casks. 3 4 Now, why are we possibly allowing more of 5 the spent fuel to be created when we can't fit it in this reactor? We are not going to have any place to 6 7 throw it away, like Yucca Mountain. And the dry cask storage facilities don't 8 9 even work, and they are glaring terrorist targets, and we know this, and I talked about this the last time, 10 it was after September 11th, then too. 11 before 12 knew about this well And we September 11th, and things got ignored. 13 14 at how things are getting ignored now. 15 The no-action alternative in here I think is the best alternative and ought to be adopted, of 16 course. And if you look, and I just downloaded this, 17 right this morning, from the PJM interconnection 18 19 website, PJM are the folks that run our grid around 20 here. 21 And if you add up all the nuclear capacity 22 in this state you get about 9 to 10,000 megawatts of capacity. Now, I have been helping communities fight 23 24 off all these unneeded natural gas power plants,

because Pennsylvania is already the largest exporter

of electricity of any state.

We export so much electricity, I know it is not done on a state by state basis, but how much is generated versus used in each state? Pennsylvania is the largest exporter. And we export so much that we can fill all the deficits in the states from Vermont down to Virginia, and out to Michigan.

So that is quite a bit of excess electricity, and that is not including the fact that West Virginia and a lot of other states also have excess capacity.

Now, on top of that excess capacity, Pennsylvania has been faced with 50 to 70 new natural gas power plants. One of them right here in the Peach Bottom area. Now, these power plants, first of all, just the one here at Peach Bottom would be at least half as large as the reactors that are already here.

So half the capacity could, theoretically, if they build this plant, be shut down. But that is not being talked about.

Now, on PJM's website they are talking about adding well over 10,000 megawatts each year, in 2003, 2004, 2005. Now, just the -- and this is almost all natural gas. Just the natural gas power plants that are already built, within the recent few years,

or under construction, or likely got built.

And a lot of them have been fought off, withdrawn, or defeated, and I have helped with some of those, I know this pretty well. But even the ones that are likely to go through is more than 10,000 megawatts.

Meaning we can not only shut down Peach Bottom, both units, we can shut down all the nukes in Pennsylvania, and no one's lights are going to go out, no one is even going to notice. We already have such a glut that even with a California style games happening here, by PPL, just like Enron did in California, PPL is being investigated for the same type of wholesale price manipulation.

But the lights aren't going to go out here, because we produce so damn much. And one of the things mentioned in this report, actually let me give another reference for how much extra energy capacity. This is from, and I have extra copies of this.

This is an Energy Industry Conference held in Pennsylvania this past October. I have multiple copies of this. This is the best presentation given by Dave Costello of the Department of Energy, and Exelon is aware of this, because one of the keynote speakers was the head of Exelon.

1 The mid-Atlantic region generating 2 capacity in 2001 through '3, you have approximately 3 20,000 megawatts, maybe a little less than that, being 4 added, according to this. 5 Now, PJM has a lot more than that. even in the lower end of these two estimates you have 6 7 twice as much of all the nuclear capacity Pennsylvania being filled, mostly by natural gas, in 8 9 the next few years. 10 So the no-action alternative already says 11 that this power is getting replaced, whether you like 12 it or not. I don't like the technology, but that is the way it is. 13 14 Sorry, I'm reading my really tiny notes to 15 myself, here. Okay, how the 12 year advance permit are needed, in this report -- actually no, not in this 16 17 report. Earlier in the presentation today it was 18 19 explained that the reason that is being done twelve 20 advance is to give Exelon time years in 21 replacement power. Now, that is ridiculous because it 22 is already getting replaced, so that is not a 23 legitimate argument. 24 The replacement power time frame that is

needed, even if there was a need for replacing this

1 specific reactors power, could be done within two to 2 three years, because that is the time frame for 3 establishing wind, and/or natural gas, both power 4 plant technologies take only a few years. 5 in this report, under wind, that ridge lines 6 mentioned are unsuitable for 7 winterize. Now, that is the most ridiculous thing I 8 have ever heard. Ι just came from an energy conference in New Jersey, plenty of folks from DOE and 9 other wind energy people that were there. 10 11 I saw the newer data on this, and hope you 12 are not trying to get me to shut up, because I have a few more points here. There is plenty of wind along 13 14 the ridge lines, and Exelon knows this, because 15 community energy is going ahead and building large wind farms in Pennsylvania, some of them on ridge 16 lines. 17 Yes, they are deforesting some of them, 18 19 and there are impacts. However, Exelon knows this 20 because they are funding them. There is a 60 megawatt 21 wind farm going on line in Northeast Pennsylvania. 22 Exelon is underwriting that. There are already two in 23 Southwest Pennsylvania, Exelon underwrote those as

There is another one going in, in West

well.

24

1 Virginia, in the Backbone mountain, another 60 2 megawatts. That is also Exelon money behind that. Exelon is not unaware of this. 3 4 And if you are unaware of this it is 5 because you are not talking to your licensee, because these are their projects, for the most part. 6 7 And so the wind part of this report is woefully inadequate, it is scientifically inaccurate, 8 9 it is just wrong, you need to do your homework. I've seen college reports, bachelor's degree college 10 11 reports, that are much better documented than this, 12 much better researched. The head of the Department of 13 14 Environmental Protection in Pennsylvania, David Hess, 15 was actually quoted at the Energy Conference where that natural gas presentation was given, saying that 16 17 using just the decent wind speed sites in can supply 30 percent of 18 Pennsylvania, we 19 electricity needs in this state. Now, what he is quoting is from the 20 21 American Wind Energy Association, which is using 22 Department of Energy data, which is working on being 23 revised, it is not really that optimistic. However, 24 30 percent is pretty high.

And even if it turns out to be 10 percent,

that is very significant, and that needs to be addressed in this report. So you are obviously misgauging the impacts of wind.

And also, a lot of this is addressing section E, on A-48 you mention over 50 competitive suppliers in Pennsylvania. This report, again, needs to be updated. There were close to 50 when deregulation first hit Pennsylvania, that is before we had PPL doing the Enron-like games here.

Since then competitors have fled as quickly as they can, we have very few suppliers that are left in this state right now, especially for the residential sector. For the business sector we have some, but it is still not looking that good.

And also on that same page, on page 8-48, there is basically no incentive for Exelon to be pushing conservation in a competitive market. Well, yes, that is a problem, that is a problem with the whole system of having a competitive market for things, when the logic in this report is saying, Exelon is not going to do it, that is not going to happen.

And that is, basically, the assumption that I saw in here because, otherwise, we can easily talk about methods of conserving enough electricity,

1 and without just looking back at their failed attempts 2 as a utility to work as against their own economic 3 interest. 4 And, finally, page 8-49, the very first few lines it says, therefore it is not clear whether 5 Exelon or another competitor supplier will construct 6 7 new generating units to replace Peach Bottom units 2 and 3 if the license were not renewed. 8 9 Again, you are getting at this idea that you have no idea what is going on currently, or if you 10 do, you are not writing it into this report. 11 This 12 power is already being replaced. So the whole no-action alternative, the 13 14 wind, the solar estimates, the conservation efficiency 15 estimates completely need to be rewritten. I've already submitted testimony on this, and it hasn't 16 been incorporated. 17 And to work off something Amy just said, 18 19 she mentioned there is 50 billion dollars a year in 20 federal subsidies to fossil and nuclear power, and 21 that is about ten years ago. Only slightly less than 22 one billion dollars, 600 million dollars, 60 million dollars according to a report by KPMG. 23 24 That is the cost it would take to build a

large scale solar panel production facility, where

1 every year you can crank out the production of 500 2 megawatts worth of power. So in four years just one factory can replace Peach Bottom and then keep making 3 4 more Peach Bottom's worth of electricity, but in the 5 form of solar panels. Now, for that cost, and building it down 6 7 to economy of scale, actually the question that I wrote for was what size would it take to make solar 8 9 power affordable? That is the problem with it, and you mention this in the report, that solar panels are 10 11 not affordable right now. 12 Well, building on the economy of scale that would be less than a billion dollars, 6 to 700 13 14 million dollars, will bring the cost of solar panel 15 production down by four to five times, so that is cost effective with other forms of electricity generation. 16 17 And when I say cost effective I'm talking about cost effective with the subsidized, and not real 18 19 cost that nuclear reactors are currently getting, 20 because nuclear reactors aren't cost competitive 21 either, that is why they are so heavily subsidized. 22 So that ought to be addressed. 23 FACILITATOR CAMERON: Okay, thank you for 24 those specific comments, Mike. We are over our time

and since Judy Johnsreud graciously gave up her spot

1 earlier, I promised that she would have at least a 2 couple of minutes. 3 And Judy could you -- well, do you want 4 If you would please just try to keep it brief 5 for us? Dr. Judy Johnsreud. DR. JOHNSREUD: Thank you, Chip. My name 6 7 is Judy Johnsreud, I did my doctoral work in the field of the geography of nuclear energy, and I have a sort 8 9 of a unique position here today. 10 I represent the Environmental Coalition on Nuclear Power, founded in 1970, here in Pennsylvania. 11 12 And Sierra Club, technical advisor to their national waste committee, currently. 13 14 But I was -- we were original intervenors 15 in the licensing of units 2 and 3 of Peach Bottom. And so it's been a long 30 years for me, to have to 16 come back here now and find that the agency personnel 17 either haven't learned, haven't come to understand the 18 19 nature of radiation injury, or they are not allowed to 20 do their job. 21 There are three sets of people here that 22 I really wanted to be able to address. Those of you who live here, and those who have come because they 23 24 don't live here, but they care about here; the NRC

Staff, and those who, I assume, are the majority here

of Exelon company.

And I think that what so many of us, including those associated with the industry, perhaps haven't really grasped is what is driving the force to relicense an aging plant with a less than sterling record.

When, indeed, there are available other much cleaner, much cheaper, much more durable sources to generate the electricity, the energy that we need. We are beginning to hear, in Pennsylvania, about distributive energy, taken seriously, where in a community is concerned to supply for itself.

But what is driving this, why do you folks in the agency, who very frankly ought to know better, if you are reading the literature in your own field, if you were attending conferences that the NRC has not seen fit to bother to attend, concerning the impacts of low level radiation.

What is driving it? It is the law. How many of you have heard me read the law to you? Read the law. How many of you have read the National Nuclear Energy Policy Statement? Anybody in the room? Right, and you heard what they had to say.

You who work for the Agency? It is chapter 1, section 1, and you better listen, it is why

1 we have the problem facing us, of 50 percent more high 2 level radioactive waste, and far more radioactive waste and materials that will be deregulated, that are 3 4 already being deregulated, to be recycled into the 5 consumer products of all of us. The law says, Atomic Energy is capable of 6 7 application for peaceful as well as military purposes. It is, therefore, declared to be the policy of the 8 9 United States that the development, use, and control of atomic energy shall be directed so as to make the 10 11 maximum contribution to the general welfare, which is 12 not defined in the law. Subject at all times to the paramount 13 14 objective of making the maximum contribution to the 15 common defense and security, and the development, use, and control of atomic energy shall be directed so as 16 17 to promote world peace, improve the general welfare, improve the standard of living, and strengthen free 18 19 competition in private enterprise. 20 Now, there are two things not mentioned 21 here. Did you catch them? There is not a word about 22 protection of the public health and safety, or of the 23 quality of the environment. 24 You have to read down several sections

and, even then, those factors which are surely the

paramount objective in our society, are subordinated by being equated with national security and the free enterprise factor.

I am appalled at the unwillingness of the Nuclear Regulatory Commission, and EPA, and DOE, to consider the information that is now becoming available concerning the impacts of ionizing radiation on the well being of living creatures, organisms of all kinds.

You fellows up here are well beyond being that healthy, young, standard man. So you ought to listen carefully. Because those standards that were mentioned to us by Dr. -- those standards were, in fact, developed based upon standard man, using weighting factors for organs, divorced from the reality of the variabilities in human susceptibilities to disease, to exposures, to the synergies between and among the sources of contamination that are with us, throughout our environment.

And the comments that you have heard today that are very significant, concerning health impacts, are based upon essentially an epidemiological approach, and that is really all we've had in the past, on which to base our understanding of health impacts.

1 But whenever a community has requested a 2 health study, and the health study has shown that, 3 indeed, there are excesses of certain cancers, or 4 leukemia, the response has been, but that is too small 5 a sample to have statistical significance. And I think we are at the point where we 6 7 need to think about how many such insignificant studies add up to very substantial significance to be 8 9 taken seriously. 10 But the situation with regard to the 11 health impact of the uses of ionizing radiation that 12 increase within our society, within our environment, those today are being looked at in a very different 13 14 way. 15 And that way is through molecular and cellular radiation biology, that is really beginning 16 to get us an understanding of the mechanisms of the 17 18 damage. 19 And I don't see that that is being 20 factored into this study, anymore than the totalities, 21 the systemic approaches that are necessary in order to 22 have a valid environmental impact statement. 23 Having promised you that I was going to 24 make it very short, I'm not going to say many of the

things that I think also need to be said.

25

But I

1 commend to you the comments, reasoned, careful, 2 thoughtful, and correct comments that you have heard today, from many people who care about the well being 3 4 of this area of southern Pennsylvania. 5 I urge, really a total reworking of this 6 EIS, of the environmental review necessary. 7 would strongly, strongly urge the NRC to set a precedent of denying a license extension. 8 9 FACILITATOR CAMERON: Thank you, Judy, and thank all of you for coming out and sharing your 10 11 concerns, and your comments with us. We are going to 12 be back at 7 o'clock for another meeting, open house at 6 before that. 13 14 Thank you, and we are adjourned. 15 (Whereupon, at 5:00 p.m. the aboveentitled matter was concluded.) 16 17 18 19 20 21 22 23 24 25
