Jane E. Henney, M.D.
Commissioner
U.S. Food & Drug Administration
5600 Fishers Lane
Rockville, MD 20857-0001

Dear Dr. Henney:

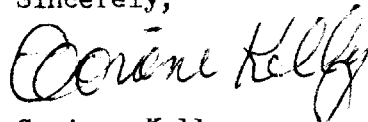

I have been reading for some time now about food producers feeding antibiotics to cows, pigs and chickens. I don't know why, unless it makes them grow faster or bigger, or to keep them from catching something???

It is just common sense to figure out that this is not good for people eating the meat! What people won't do to make more money! It's obvious that the germs, or bacteria, whatever, will become resistant to these antibiotics! I care a lot about this for the children--our grandchildren in particular!

I think the USFDA should launch a campaign to find out how much antibiotics is being fed to the animals and to publish it extensively so that people will know what they are eating!

I hope it can be started quickly, because the Bush people will probably never do it!

Sincerely,

Coriene Kelly
