1 [The proposal to bury waste from nuclear power production is flawed re safety.

First and foremost, it is ramified with fault lines, making leakage of high level radioactivity not just probable but inevitable during the 10,000 years that the material remains lethal to all life.

Second, it is folly as well to presume there will not be transport accidents that directly impact human health or contaminate groundwater to indirectly do so by poisoning drinking water downstream of a spill.

We suggest other hazards and points of opposition pale by comparison to the dangers implicit in the above two.]

Ken & Ethel Kipen, Ashfield, MA
