COLVILLE NATIONAL FOREST  
LITTLE PEND OREILLE NATIONAL WILDLIFE REFUGE  
AND OTHER PUBLIC WILDLANDS  
2001

### INTRODUCTION

The Colville National Forest (CNF) covers about 1,096,000 acres (443,545 ha) in Ferry, Stevens and Pend Oreille counties. From the Canadian border, the CNF extends southward for up to 60 miles (97 km), although west of the Columbia River, the CNF shares its southern boundary with the Colville Confederated Tribes Indian Reservation. Elevations range from about 1,800 feet (549 m) to Gypsy Peak's summit at 7,309 feet (2,229 m). The CNF is divided into 4 Ranger Districts and has offices in Colville, Kettle Falls, Newport, Republic and Sullivan Lake. One wilderness, the Salmo-Priest, lies in the northeast corner of the CNF.

The Little Pend Oreille National Wildlife Refuge takes its name from the river that flows through its northern portion. It was established in 1939 as one of the early game refuges, and now covers about 40,000 acres (16,200 ha). Elevations range from 1,800 feet (549 m) on the western lowlands of the Little Pend Oreille River Valley to Olson Peak's 5,610-foot (1,710 m) summit on the eastern boundary.

The State of Washington and the Bureau of Land Management also manage several thousand acres of public land in the area. Many of these parcels are nestled among the private lands in the valleys and towards the southeastern end of the area. Much of the private land can be viewed from the roads or after obtaining a landowner's permission. Most of the industrial timber companies also allow public access.

### DESCRIPTION

The area contains 2 mountain ranges, oriented north-south: the Kettle Range and the Selkirk Crest. Numerous glacial valleys cut the main ridges and diversify the topography, which ranges from rounded mountain slopes at lower elevations to high peaks and basins at about 7,300 feet (2,225 m). Streams, rivers, bogs, marshes, and small and large lakes are found throughout the area. Three distinctly different zones, each with its own unique climate, topography, and vegetation are found in the major river watersheds. These zones are the Sanpoil/Curlew River Valleys, the Kettle/Colville/Columbia River Valleys, and the Pend Oreille River Valley. Precipitation and density of vegetation increase with altitude and lie on a southwest-to-northeast gradient. Habitats grade from the ponderosa pine and Douglas-fir forests that occupy the drier, western portion, to western red-cedar and hemlock forests on the moister east side. Agricultural fields and grasslands cover most valley bottoms.

### WILDLIFE

The great biodiversity of the State of Washington makes compiling a local checklist difficult. Though none of the area is a desert, dry-land species common farther west, such as the least chipmunk, might be found. On the other end of the habitat spectrum, species that occupy the moist, boreal forests, such as boreal owl and woodland caribou, are included.

THANKS to Maurice Vial, without whose help neither the drawings nor the list would have been possible. CL 10/2001.

# MAMMALS

## SHREWS

- MASKED SHREW
- MERRIAM'S SHREW
- DUSKY SHREW

## LYNX

LONG-LEGGED, GANGLY LOOK  
 BIG, FURRY FEET  
 PALE COLOR, FAINT SPOTTING  
 TAIL UNIFORM, WITH BLACK TIP TAIL BARRED, WITH WHITISH UNDERSIDE

## BOBCAT

SLIGHTLY SMALLER THAN LYNX  
 MORE BROWN; WHITISH BELLY  
 DISTINCT SPOTTING ON LEGS

## OCCURRENCE STATUS

This checklist estimates populations based on available information. Rating systems based on chance of observation favor highly visible species and thus distort reality for nocturnal or secretive species that could be equally common. Chance for observation is entrusted to luck and skill as an observer! Ratings in the checklist apply to during the right season and in the proper habitat.

C Common: from fairly common to abundant  
 U Uncommon: local and not present in all suitable habitats

R Rare: widely spaced or not always present  
 XR Extremely rare: seldom present but fair number of records

(REC) Recorded: few accepted records

**Bat note:** The abundance of bats cannot be accurately rated. Studies rely on capture and radio-tracking, but some bat species are very adept at eluding capture. Bats are also difficult to identify unless found at a roost or captured. Therefore, for bats other than those we know to be common, we only use the rating "P" for "present."

**Fish note:** Fish are not easy to observe, and their populations have not been studied well. The list included here is based on State information and knowledge of local fish and wildlife biologists.

## SEASONAL STATUS (Applies to birds and some bats)

- R Resident: sedentary, or altitudinal migrant within the area. Breeds here or nearby. Always present, but not necessarily the same individuals or populations.
- M Migrant: non-breeding species or extralimital breeders in transit between summer and winter ranges.
- SB Summer breeder: breeding species present only in summer.
- W Winter: non-breeding species on its winter range. In some species, arrival may be as early as September and departure as late as April. This also refers to individuals that wander out of their range in winter.

## HABITATS

- AG Agriculture: human-managed habitat, farmlands and open rangelands.
- UB Urban: towns and small communities.
- WL Wetlands: wide streams, marshes, rivers and lakes.
- BS Bogs and streams: mainly in mountainous forests.
- FL Forested lands: low to medium elevation.
- SA Subalpine: near timberline and above.
- TR Transition: dry hillsides, open forests; mainly in the western part of the region.
- AH All habitats: species that can be expected anywhere.
- LK Lake: applies only to fish.
