David L. Azuma is a research forester, **Larry F. Bednar** was a mathematical statistician, **Bruce A. Hiserote** is a forester, and **Charles F. Veneklase** is a computer specialist, Forestry Sciences Laboratory, P.O. Box 3890, Portland, OR 97208-3890. Bednar is now a consultant, Portland, OR.

Abstract

Azuma, David L.; Bednar, Larry F.; Hiserote, Bruce A.; Veneklase, Charles F.

2004. Timber resource statistics for western Oregon, 1997. Rev. Resour. Bull. PNW-RB-237. Portland, OR: U.S. Department of Agriculture, Forest Service, Pacific Northwest Research Station. 120 p.

This report is a summary of timber resource statistics for western Oregon, which includes Benton, Clackamas, Clatsop, Columbia, Coos, Curry, Douglas, Hood River, Jackson, Josephine, Lane, Lincoln, Linn, Marion, Multnomah, Polk, Tillamook, Washington, and Yamhill Counties. Data were collected as part of a statewide multiresource inventory. The inventory sampled all private and public lands except those administered by the National Forest System and the Bureau of Land Management (BLM). The National Forest System and BLM provided data from regional inventories. Area information for parks and other reserves was obtained directly from the organizations managing these areas. Statistical tables provide estimates of land area, timber volume, growth, mortality, and harvest for individual survey units and at the half-state level.

Keywords: Forest surveys, forest inventory, statistics (forest), timber resources, resources (forest), western Oregon.

Summary

Western Oregon has an estimated 19 million acres of land. About 80 percent of this land is forested with 71 percent being timberland. Lands administered by the U.S. Department of Agriculture, Forest Service, National Forest System (NFS) and U.S. Department of the Interior, Bureau of Land Management (BLM) make up about 48 percent of the timberland. Within the nonfederal timberland area, net volume of growing stock is estimated as 23.5 billion cubic feet. About 58 percent of the volume is administered by forest industry, 20 percent by other public owners, and 21 percent by other private owners. About 82 percent of the total growing stock volume is in coniferous species, with Douglas-fir accounting for 74 percent of the conifer volume. Estimated net annual growth of growing stock for nonfederal lands is 0.77 billion cubic feet, and average annual mortality for this timber is an estimated 0.1 billion cubic feet.

Preface

Forest Inventory and Analysis (FIA) is a nationwide program of the USDA Forest Service authorized by the Forest and Rangeland Renewable Resources Research Act of 1978. Work units at Forest Service research and experiment stations conduct forest resource inventories throughout the 50 states. The FIA Program of the Pacific Northwest Research Station in Portland, Oregon, is responsible for forest inventories in Alaska, California, Hawaii, Oregon, and Washington.

Western Oregon Survey Units and Counties

Northwest Oregon

West-Central Oregon

Southwest Oregon

Introduction

The Forest Inventory and Analysis (FIA) unit of the USDA Forest Service, Pacific Northwest Research Station conducted a multiresource inventory in western Oregon's forests between 1994 and 1998. This inventory included all lands except those administered by the Forest Service and the U.S. Department of the Interior, Bureau of Land Management (BLM). This report summarizes the timber resource statistics for western Oregon's forests. Some statistical tables include inventory data provided by the Forest Service and the BLM for area on their lands. Other resources sampled but not included in this report are understory vegetation, crown cover, coarse woody debris, and snags. These data will lead to further analysis of the status of western Oregon's forests.

This FIA unit has been reporting statistics for western Oregon since the 1930s. Hazard and Metcalf (1964, 1965), Metcalf and Hazard (1964), Bassett (1977), Jacobs (1978), Mei (1979), and Gedney and others (1986a, 1986b, 1987) reported inventory statistics in the 1960s, 1970s, and 1980s. The current grid system was a systematic sample implemented in the early 1960s; before this grid, a type map system was used for inventory statistics. McKay and others (1998) used an updated 1994 data set to report the latest forest statistics for western Oregon.

This report contains statistical tables that provide current estimates of forest land area, change estimates for nonfederal lands, number of trees, timber volume, growth, mortality, and harvest. In several tables, area data supplied to the 1997 Resources Planning Act (RPA) by the National Forest System are incorporated. The national forest statistics include areas that are withdrawn from full production but still meet the FIA definition of timberland. National forest lands are not equally available for timber production because management must consider policies such as the Northwest Forest Plan and riparian reserves in decisionmaking.

Highlights

About 80 percent of western Oregon's land is forested with about 71 percent being timberland. Federal agencies—the National Forest System and the Bureau of Land Management—administer about 48 percent of the timberland. Owners classed as forest industry administer about 31 percent of the timberland; nonindustrial and other public owners administer about 13 and 6 percent of timberland, respectively.

The production of timber has shifted away from federal lands to state and privately owned lands. In the 1980s, federal lands produced an average of 2.66 billion board feet per year. In the 1990s, that number dropped to 0.79 billion board feet per year, with a 0.19 billion average between 1995 and 1997. Other public and private lands averaged 3.0 billion board feet in the 1980s and decreased 5 percent to 2.85 billion in the 1990s. The 70-percent reduction from federal lands does not represent a change in land class, but is evidence of changing availability of land for timber production based on new management decisions. Federal land areas with reduced availability include, but are not limited to, riparian reserves, wildlife reserves, and access-limited areas.

The stand size for nonfederal owners in western Oregon tends to be skewed to the small size classes. About 5 percent of the nonfederal lands have an average stand diameter of 21 inches or greater, and 43 percent have an average stand diameter between 5 and 11 inches. Public owners such as state, county, and other federal owners have about 10 percent of their lands with an average diameter of 21 inches or greater. Forest industry and nonindustrial private owners have about 4 percent of their land in the larger diameters. Forty-eight percent of all nonfederal lands have stand diameters between 11 and 21 inches.

Inventory Procedures (Nonfederal Lands)

Nonfederal timberlands in western Oregon show an increase in standing volume from 20.1 to 23.3 billion cubic feet based on plots measured during the previous and present inventories. Growth is 33 percent greater than removals plus mortality for nonfederal lands in western Oregon. The growth greater than removals plus mortality differs by survey unit with the southwest unit having the lowest percentage at 16 percent, followed by the west-central unit at 21 percent, and the northwest unit at 63 percent.

A minor net loss of timberland—51,000 of 6.9 million acres—is due to land use change. Most of the losses in timberland came from previous timberland being reclassified as roads. The 189,000-acre loss in timberland to urban, agriculture, and other nonforest uses is offset by the 138,000-acre gain from nonforest and other forest becoming timberland. Reclassification of lands from the previous inventory accounts for an additional 184,000 acres of timberland.

Western Oregon was inventoried by using a double sampling for stratification scheme (Cochran 1977). The sampling is implemented on a permanent systematic grid and produces an even geographic distribution of both secondary (field) and primary (photo) plots across the state. Photo plots are placed at random inside each square of the grid.

The primary sample for western Oregon consists of a grid of about 24,000 points established in 1994 by using aerial photographs taken in 1994. Data collected on each point included amount of tree cover by species group, average conifer height, disturbance codes, owner, and stage of development.

The secondary sample consisted of 1,478 forest and nonforest field locations established in previous inventories and remeasured or reclassified in the 1994-98 period. This sample represents about a 1-in-16 subsample of the primary sample. The ratio of 1 field to 16 photo plots provides a sufficient number of plots to meet the required sampling precision for estimates of forest area and volume.

The national forest and BLM plots were based on a similar grid system with a different plot design (Max and others 1996). The data were collected for these inventories between 1993 and 1996 and are in the 1997 RPA database.

In 1984-86 a cluster of five subplots was installed at timberland grid locations. At that time, the subplots sampled a single homogeneous condition, by moving subplots into the condition if necessary. Variable-radius sampling was used to select trees over 5 inches diameter at breast height (d.b.h.), and a smaller fixed-radius plot was used to sample seedlings and saplings.

In 1994, the sampling design was modified to remove potential bias inherent in the 1984-86 procedures. The term “condition class” was defined for the modified design to identify different situations that could occur on a plot. A condition class, or “condition,” refers to an area with a distinct land class (timberland, woodland, nonforest, etc.) and vegetative condition (forest type, stand age, etc.). The modified design requires that the field plots maintain fixed locations for all subplots in the cluster. Plots that straddle two or more conditions sample all conditions by establishing each subplot in the designated position and mapping the boundaries around each condition. The information pertinent to each condition is recorded as condition-class attributes. When multiple conditions exist on a plot, all data in one condition are processed together. This can impact the amount of information present to classify stand characteristics such as forest type, stand size, and stand age. On 1,478 field plots in the 1995-97 inventory, 2,754 condition classes were sampled, of which 1,403 were timberland conditions. Roads accounted for most nonforest conditions existing on plots.

Land and Water Area Updated

The U.S. Department of Commerce, Bureau of the Census compiles and publishes the acreage of land and water in the United States every 10 years. These area figures, available by state and county, are accepted and used by FIA in Portland, Oregon, as the gross number of acres to be inventoried in each county. The previous inventory was based on 1980 census data, and the current inventory uses 1990 census figures. Raster-scanned topographic maps from the U.S. Department of the Interior, Geological Survey and a geographic information system are now used by the Bureau of the Census to identify water bodies and landforms and to determine the size of much smaller areas than previously possible. As a result, the definition of inland water was changed to reflect the finer resolution. Streams with a minimum width of 200 feet are now recognized, compared to 660 feet in 1980; small water bodies are now at least 4.5 acres, compared to 40 acres in the past.

Change in Ownership Definitions

Analysis of Change Between Inventories for Nonfederal Lands

Reliability of Inventory Data

Land owned by Native Americans is now classified as "other private." In the 1986-87 inventory, these lands were defined as "other public." Forest industry was divided into the two categories of "forest industry with mills" and "forest industry without mills"; both are now classed as "forest industry."

To analyze change in forest statistics, the 1986-87 data were recompiled to account for technical changes in the 1995-97 inventory. The summaries presented in tables 27a through 29d have been developed from remeasured plots outside of federal lands and include recompiled data from the 1986-87 inventory. Caution should be used in comparing present statistics and those published by Gedney and others (1986a, 1986b, 1987) because of procedural changes, stratification differences, and plot changes. Comparing estimates from previous to current ones is like comparing independent estimates of the resource at different points in time; although both are valid estimates, they will not be equal.

Inventories conducted by FIA are designed to provide sampling errors consistent with national standards set by the Forest Service. The target error for total timberland area is 3 percent per million acres and 10 percent per billion cubic feet of growing-stock volume.

The sample design for this inventory provides the highest precision when estimates are aggregated for an entire survey unit such as the northwest, west-central, or southwest units in western Oregon. As the sample is divided into smaller units, the confidence intervals increase in relation to the size of the estimate. Confidence intervals are quantitative expressions of the variability inherent in the estimation procedures for area and volume. The tabulation below indicates, for instance, a 68-percent (one standard error) chance that the true timberland area for nonfederal owners in the northwest unit (2,369,000 acres) is within the range of 2,322,000 to 2,416,000 acres.

Standard errors for nonfederal timberland area, by owner class and survey unit, are displayed below:

Survey unit	Other public	Forest industry	Other private	All owners
<i>Thousand acres (\pm standard error)</i>				
Northwest	574 \pm 40	1,103 \pm 50	692 \pm 48	2,369 \pm 47
West-central	98 \pm 26	1,339 \pm 47	431 \pm 42	1,867 \pm 38
Southwest	179 \pm 32	1,736 \pm 55	759 \pm 48	2,809 \pm 48

Standard errors for growing-stock volume on nonfederal timberland area, by owner class and survey unit, are displayed below:

Survey unit	Other public	Forest industry	Other private	All owners
<i>Million cubic feet (\pm standard error)</i>				
Northwest	3,075 \pm 279	4,514 \pm 355	2,194 \pm 218	9,783 \pm 400
West-central	411 \pm 116	4,382 \pm 307	1,400 \pm 174	6,194 \pm 334
Southwest	900 \pm 182	4,625 \pm 301	2,014 \pm 185	7,538 \pm 348

Confidence intervals vary with the size of the estimate and the amount of variance associated with the estimate. The following is a set of approximate confidence intervals calculated by using a regression analysis between actual standard error and the estimate involved. These regressions have r-square values greater than 0.86, indicating that 86 percent of the variance in the relation can be explained by the equation. The actual error estimates for cells in tables can be obtained from the Portland FIA unit.

Timberland area			Growing-stock volume		
Estimate	Interval	Percent	Estimate	Interval	Percent

Terminology

Available other forest land—Forest land incapable of growing 20 cubic feet per acre per year (mean annual increment at culmination in fully stocked, natural stands) of industrial wood because of adverse conditions such as sterile soils, dry climate, poor drainage, subalpine sites, steepness, or rockiness.

Bureau of Land Management land—Land administered by the U.S. Department of the Interior, Bureau of Land Management.

Class of timber—A classification of trees as growing stock, cull, and salvable dead. Growing-stock trees are divided into poletimber and sawtimber trees.

Condition class—A mapped area on a plot with a distinct land class (for example, timberland, oak woodland, nonforest) or a distinct vegetative condition (for example, forest type, stand size). The first condition identified at plot center is the only condition that is remeasured and used for the analysis of periodic change.

County and municipal lands—Lands owned by county and other local public agencies.

Cull trees—Live trees of noncommercial species and live trees of commercial species that are more than 75-percent defective. Noncommercial species are apple, black locust, holly, junipers, Pacific yew, Pacific dogwood, white alder, and willow. Cull trees are not growing-stock trees.

Cull trees, rotten—Cull trees with defect caused primarily by rot.

Cull trees, sound—Trees of noncommercial species or cull trees of commercial species with defect caused primarily by poor form and roughness.

Diameter class—A classification of trees based on diameter outside the bark measured at breast height, 4½ feet above the ground. The common abbreviation for diameter at breast height is d.b.h. Trees are grouped into 2-inch classes up to 21 inches d.b.h., after which the class intervals become broader.

Even-aged stands—Stands where 70 percent or more of the tree stocking falls within three adjacent 10-year age classes.

Farmer-owned lands—Lands owned by the operators of farms.

Forest industry lands—Lands owned by companies that grow timber for industrial use. Includes companies both with and without wood processing plants.

Forest land—Land at least 10 percent stocked with live trees, or land that had this minimum tree stocking in the past and is not currently developed for nonforest use. The minimum area recognized is 1 acre; it must be 115 feet wide.

Forest types—Stands are assigned a pure softwood, pure hardwood, softwood-hardwood mix, or hardwood-softwood forest type. Stands with 70 percent or more of the stocking in live softwood trees are classified as pure softwood types and are assigned the type name of the softwood species with the greatest stocking among all softwoods on the condition class plot. Stands with 70 percent or more of the stocking in live hardwood trees are classified as pure hardwood types and are assigned the type name of the hardwood species with the greatest stocking among all hardwoods on the condition class plot. Mixed species types are assigned if softwood stocking is 31 to 69 percent total stocking on the plot; stands with 50 to 69 percent of the stocking in live softwood trees are classed as softwood-hardwood types and receive a type name that includes the softwood species with the greatest softwood stocking, followed by the hardwood species with the greatest hardwood stocking; stands with 51 to 69 percent of the stocking in live hardwood trees are classed as hardwood-softwood types and receive a type name that includes the hardwood species with the greatest hardwood stocking, followed by the softwood species with the greatest softwood stocking. For ease in reporting, the secondary forest type will be identified after a slash as “softwood” or “hardwood” in the summary tables

Growing-stock trees—All live trees growing on timberland except cull trees (see “cull trees”).

Growing-stock volume—Net volume in cubic feet of live sawtimber and poletimber growing-stock trees from the top of a stump 12 inches tall to a minimum 4-inch top (of central stem) inside the bark. Net volume is gross volume less deductions for rot and missing bole sections.

Growth, current net annual, growing stock—The increase in growing-stock volume on timberland during the last year of the period between the previous and current inventories. Components of current net annual growth for growing-stock volume include (a) the increment in net volume of poletimber and sawtimber growing-stock trees alive at the beginning of the year and surviving to year end; plus (b) ingrowth, the net volume of growing-stock trees reaching poletimber or sawtimber size during the year; minus (c) mortality, the net volume of poletimber and sawtimber growing-stock trees that died during the year.

Growth, current net annual, sawtimber—The increase in sawtimber volume on timberland during the last year of the period between the previous and current inventories. Components of current net annual growth for sawtimber volume include (a) the increment in net volume of sawtimber trees alive at the beginning of the year and surviving to year end; plus (b) ingrowth, the net volume of trees reaching sawtimber size during the year; minus (c) mortality, the net volume of sawtimber trees that died during the year.

Growth, periodic gross, growing stock—The increase in growing-stock volume between the previous and current inventories that is attributable to increasing tree size. Periodic gross growth includes (a) the increment in net volume of poletimber and sawtimber growing-stock trees alive at both the previous and current inventories; (b) the increment in net volume of poletimber and sawtimber growing-stock trees alive at the previous inventory and harvested between inventories; and (c) ingrowth, the net volume of growing-stock trees reaching poletimber or sawtimber size between inventories.

Growth, periodic gross, sawtimber—The increase in sawtimber volume between the previous and current inventories that is attributable to increasing tree size. Periodic gross growth includes (a) the increment in net volume of sawtimber trees alive at both the previous and current inventories; (b) the increment in net volume of sawtimber trees alive at the previous inventory and harvested between inventories; and (c) ingrowth, the net volume of trees reaching sawtimber size between inventories.

Hardwoods—Nonconiferous trees, usually broad-leaved. See “Names of Trees” for a list of hardwood species in this report.

Industrial wood—All commercial roundwood products except fuelwood. Roundwood includes logs or bolts that are in straight sections at least 8 feet long for hardwoods and 12 feet long for softwoods.

Land area—Area reported as land by the Bureau of the Census (U.S. Department of Commerce 1990). Total land area includes dry land and land temporarily or partially covered by water, such as marshes, swamps, and river flood plains; streams, sloughs, and canals less than 200 feet wide; and lakes, reservoirs, and ponds less than 4.5 acres in area.

Land class—A classification of land by major use. The minimum area for classification is 1 acre.

Mean annual increment (MAI) at culmination—A measure of the productivity of forest land expressed as the average increase in cubic-foot volume per acre per year. For a given species and site index, the mean is based on the age at which the mean annual increment culminates for fully stocked natural stands. The MAI is calculated from equations and is based on the site index of the plot.

Mortality, average annual, growing stock—The annual net volume of poletimber and sawtimber growing-stock trees that died between the previous and current inventories.

Mortality, average annual, sawtimber—The annual net volume of sawtimber trees that died between the previous and current inventories.

National forest lands—Federal lands that have been designated by Executive Order or statute as national forest or purchase units and other lands under the administration of the U.S. Department of Agriculture, Forest Service, including experimental areas and Bankhead-Jones Title III lands.

Native American lands—Tribal and allotted lands held in trust by the federal government. Native American lands are grouped with farmer and miscellaneous private lands as other private lands.

Net volume—Gross volume less deductions for sound and rotten defects. Growing-stock net volume is gross cubic-foot volume less deductions for rot and missing bole sections on poletimber and sawtimber growing-stock trees. Sawtimber net volume is gross board-foot volume less deductions for rot, sweep, crook, missing bole sections, and other defects that affect the use of sawtimber trees for lumber.

Noncommercial species—A tree species not suitable for industrial wood products: apple, black locust, holly, junipers, Pacific yew, Pacific dogwood, white alder, and willow. Noncommercial species will not be included in growing-stock volume tables; however, if one or more of these species dominate on a plot, the forest type might be classified as a noncommercial species.

Nonforest land—Land that has never supported forests or formerly was forested and currently is developed for nonforest uses. Included are lands used for agricultural crops, Christmas tree farms, cottonwood plantations, improved pasture, residential areas, city parks, constructed roads, operating railroads and their right-of-way clearings, powerline and pipeline clearings, streams more than 30 feet wide, and 1- to 40-acre areas of water classified by the U.S. Department of Commerce, Bureau of the Census, as land. If intermingled in forest areas, unimproved roads and other nonforest strips must be more than 120 feet wide, and clearings or other areas must be 1 acre or larger to qualify as nonforest land.

Nonstocked areas—Timberland less than 10 percent stocked with live trees. Recent clearcuts scheduled for planting are classified as nonstocked area.

Other private lands—Private lands not owned by forest industry. Native American lands, farmer-owned lands, and miscellaneous private lands are included.

Other public lands—Lands administered by public agencies other than the U.S. Department of Agriculture, Forest Service and U.S. Department of the Interior, Bureau of Land Management. Other public lands do not include Native American lands, which are included with other private lands.

Poletimber stands—Stands with a quadratic mean diameter (mean diameter weighted by basal area) from 5.0 to 9.0 inches at breast height if a softwood stand and from 5.0 to 11.0 inches at breast height if a hardwood stand.

Poletimber trees—Live growing-stock trees of commercial species that are 5.0 inches in d.b.h. or larger but smaller than sawtimber trees.

Reserved other forest—Forest land incapable of growing 20 cubic feet per acre per year (mean annual increment at culmination in fully stocked, natural stands) of industrial wood that has been dedicated to noncommodity use through statute, ordinance, or administrative order.

Reserved timberland—Forest land capable of growing 20 cubic feet or more per acre per year (mean annual increment at culmination in fully stocked, natural stands) of industrial wood that has been dedicated to noncommodity use through statute, ordinance, or administrative order.

Roundwood—Logs, bolts, or other round sections cut from trees.

Sapling and seedling stands—Stands with a quadratic mean diameter (mean diameter weighted by basal area) less than 5.0 inches at breast height.

Sapling and seedling trees—Live trees of commercial species that are less than 5.0 inches d.b.h. and have no diseases, defects, or deformities likely to prevent their becoming poletimber trees.

Saw-log portion—The bole of sawtimber trees between the stump and the saw-log top. Saw-log top is 7.0 inches in diameter outside bark on softwoods and 9.0 inches in diameter outside bark on hardwoods.

Sawtimber stands—Stands with a quadratic mean diameter (mean diameter weighted by basal area) larger than 9.0 inches at breast height if a softwood stand and larger than 11.0 inches at breast height if a hardwood stand. Small sawtimber stands are sawtimber stands with a mean diameter (weighted by basal area) less than 21.0 inches at breast height. Large sawtimber stands are sawtimber stands that have a mean diameter 21.0 inches or larger at breast height.

Sawtimber trees—Live softwood trees of commercial species at least 9.0 inches d.b.h. and live hardwood trees of commercial species at least 11.0 inches d.b.h. At least 25 percent of the board-foot volume in a sawtimber tree must be free from defect. Softwood trees must contain at least one 12-foot saw log with a top diameter of not less than 7 inches outside bark; hardwood trees must contain at least one 8-foot saw log with a top diameter of not less than 9 inches outside bark.

Sawtimber volume—Net volume of sawtimber trees measured in board feet. Softwood volume is estimated from the top of a stump 12 inches tall up to a minimum 6-inch top diameter, inside bark, and hardwood volume is estimated from the top of a stump 12 inches tall up to a minimum 8-inch top diameter, inside bark. Net sawtimber volume equals gross volume less deduction for rot, sweep, crook, and other defects that affect use for lumber.

Scribner rule—The common board-foot log rule used locally in western Oregon to determine sawtimber volume. Scribner volume is estimated in terms of 32-foot logs for softwoods and 16-foot logs for hardwoods. See “sawtimber volume” for utilization limits.

Site class—A classification of the potential productivity of forest land expressed as mean annual increment (MAI) at culmination in fully stocked natural stands. Six classes in this report are based on a range of MAI values that were calculated on every plot.

Site index—A measure of the productivity of forest land expressed as the average height of dominant and codominant trees at a specified age.

Softwoods—Coniferous trees, usually evergreen, with needles or scalelike leaves. See “Names of Trees” for a list of softwood species in this report.

Stand age—The 10-year age class that best characterizes the stand. See “even-aged stand” and “uneven-aged stand” for more details.

Stand-size class—A classification of stands based on tree size. Stand-size classes are sawtimber, poletimber, and sapling-seedling stands.

State lands—Lands owned by states or administered by state agencies.

Timber harvest—Volume of roundwood removed from forest land for products. Timber harvest statistics reported in tables 30a through 30d were collected by the Oregon Department of Forestry.

Timber volume—Includes the net volume in cubic feet of poletimber and sawtimber trees and salvable dead sawtimber trees, and the net volume in cubic feet of cull trees of commercial species. In tables 18a-18d, the volume of cull trees includes the gross volume of noncommercial species. Volume is measured from the top of a stump 12 inches tall to a minimum 4-inch top diameter, inside bark.

Timberland—Forest land capable of growing 20 cubic feet or more per acre per year (mean annual increment at culmination in fully stocked, natural stands) of industrial wood and not in a reserved status through removal of the area from timber utilization by statute, ordinance, or administrative order and not in a withdrawn status where it is pending consideration for reserved status.

Uneven-aged stands—Stands where less than 70 percent of the tree stocking falls in three adjacent 10-year age classes.

Upper stem portion—The bole of sawtimber trees above the saw-log top—7.0 inches diameter outside bark for softwoods and 9.0 inches diameter outside bark for hardwoods—to a minimum top diameter of 4.0 inches inside bark, or to the point where the central stem divides into limbs.

Names of Trees

Common name	Scientific name ¹
Softwoods:	
Alaska-cedar	<i>Chamaecyparis nootkatensis</i> (D. Don) Spach
Brewer spruce	<i>Picea breweriana</i> [breweriana] Wats.
Douglas-fir	<i>Pseudotsuga menziesii</i> (Mirb.) Franco
Engelmann spruce	<i>Picea engelmannii</i> Parry ex Engelm.
Giant sequoia	<i>Sequoiadendron giganteum</i> (Lindl.) Buchh.
Grand fir	<i>Abies grandis</i> (Dougl. ex D. Don) Lindl.
Incense-cedar	<i>Libocedrus decurrens</i> Torr.
Jeffrey pine	<i>Pinus jeffreyi</i> Grev. & Balf.
Knobcone pine	<i>Pinus attenuata</i> Lemm.
Lodgepole pine	<i>Pinus contorta</i> Dougl. ex Loud.
Mountain hemlock	<i>Tsuga mertensiana</i> (Bong.) Carr.
Noble fir	<i>Abies procera</i> Rehd.
Pacific silver fir	<i>Abies amabilis</i> Dougl. ex Forbes
Ponderosa pine	<i>Pinus ponderosa</i> Dougl. ex Laws.
Port-Orford-cedar	<i>Chamaecyparis lawsoniana</i> (A Murr.) Parl.
Redwood	<i>Sequoia sempervirens</i> (D. Don) Endl.
Scotch pine	<i>Pinus sylvestris</i> L.
Shasta red fir	<i>Abies shastensis</i> (Lemmon)
Sitka spruce	<i>Picea sitchensis</i> (Bong.) Carr.
Subalpine fir	<i>Abies lasiocarpa</i> (Hook.) Nutt.
Sugar pine	<i>Pinus lambertiana</i> Dougl.
Western hemlock	<i>Tsuga heterophylla</i> (Raf.) Sarg.
Western juniper	<i>Juniperus occidentalis</i> Hook.
Western redcedar	<i>Thuja plicata</i> Donn ex D. Don
Western white pine	<i>Pinus monticola</i> Dougl. ex D. Don
White fir	<i>Abies concolor</i> (Gord. & Glend.) Lindl. ex Hildebr.
Whitebark pine	<i>Pinus albicaulis</i> Engelm.
Hardwoods:	
Apple	<i>Malus</i> spp. Mill.
Bigleaf maple	<i>Acer macrophyllum</i> Pursh
Black cottonwood	<i>Populus trichocarpa</i> (Torr. & Gray)
Black locust	<i>Robinia pseudoacacia</i> L.
California black oak	<i>Quercus kelloggii</i> Newb.
California-laurel	<i>Umbellularia californica</i> (Hook. & Arn.) Nutt.
Canyon live oak	<i>Quercus chryssolepis</i> Liebm.
Cherry	<i>Prunus</i> spp.
Golden chinkapin	<i>Chrysolepis chrysophylla</i> (Dougl. ex Hook.) Hjelmqvist
Holly	<i>Ilex</i> spp.
Oregon ash	<i>Fraxinus latifolia</i> Benth.
Oregon white oak	<i>Quercus garryana</i> Dougl. ex Hook.
Quaking aspen	<i>Populus tremuloides</i> Michx.
Pacific madrone	<i>Arbutus menziesii</i> Pursh
Red alder	<i>Alnus rubra</i> Bong.
Tanoak	<i>Lithocarpus densiflorus</i> (Hook. & Arn.) Rehd.
White alder	<i>Alnus rhombifolia</i> Nutt.
Willow	<i>Salix</i> spp.

¹ Nomenclature per Little (1979).

Acknowledgments

Many people were involved in the collection of data and the design of the inventory. Thanks go to the data collection staff: Brett Anderson, Christina Anthony, Joy Archuleta, Dale Baer, Jennifer Baker, Del Barge, Adam Blackwood, Steve Bolon, Sarah Butler, Perry Colclasure, Shaun Curtis, Brian Daum, Sebastien DeLion, Peter DelZotto, Paul Dunham, Szilard Farkas, Perttu Finni, Andrei Fiodorov, Jennifer Gomoll, Walter Grabowiecki, Erica Hanson, Kalle Harkonen, Sarah Hedrich, Mike Hogan, Ellie Husk, Jari Jokinen, Dana Katz, Juha Kauppila, Kim Kuhne, J.D. Lloyd, Kitty McCovey, Tom Meade, Cecilia Meyers, Scott Nelson, Dominic Ortiz, Mikko Paivinen, Melissa Patterson, Aimee Porcaro, Bob Rhoads, Tony Rodriguez, Sam Solano, Julie Theil, Chuck Veneklase, Mark Weber, and Len Zeoli. Thanks go to Chuck Bolsinger, Gary Lettman, and Neil McKay who provided valuable reviews. Dale Weyermann provided the maps and Paul Dunham the cover photograph. A special thanks to the many land-owners who allowed field crews on their lands to visit plots and measure trees.

Metric Equivalents

- 1 acre = 0.405 hectare
- 1 acre = 4046.86 square meters
- 1,000 acres = 404.7 hectares
- 1,000 cubic feet = 28.3 cubic meters
- 1 cubic foot per acre = 0.07 cubic meter per hectare
- 1 foot = 0.3048 meter
- 1 inch = 2.54 centimeters
- 1 mile = 1.609 kilometers

The **Forest Service** of the U.S. Department of Agriculture is dedicated to the principle of multiple use management of the Nation's forest resources for sustained yields of wood, water, forage, wildlife, and recreation. Through forestry research, cooperation with the States and private forest owners, and management of the National Forests and National Grasslands, it strives—as directed by Congress—to provide increasingly greater service to a growing Nation.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, gender, religion, age, disability, political beliefs, sexual orientation, or marital or family status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD).

To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326-W, Whitten Building, 14th and Independence Avenue, SW, Washington, DC 20250-9410 or call (202) 720-5964 (voice and TDD). USDA is an equal opportunity provider and employer.
