Towards the bottom of this forwarded email is a description of some possible scandalous MS activities. Please let me know if this is or is not pertinent info.

Keep up the great work and go get em.

To: justin@netscape.com

Hi Justin,

We keep missing each other although I didn't really expect you in the office on MLK day.

I do have a few things I'd like to discuss with you about my ISP affiliation and some related issues.

- As I understand it, my purchases of Netscape ISP kits entitled my customers to subscriptions for any release version. Will my customers be able to upgrade to 4.0 when it's released? (And what is the eta for the release or at least a revised beta. I love the program but it's buggy as shit in the preview version.)

- When I first set up my ISP affiliation and my rep was John O'Shaunessey he basically made some allowances for my situation as a very small ISP in a very sparsely populated area. Basically I bought 200 units, prepaid, with the understanding that any unused product at the end of my "year" would be pro-rated into the next year. Is this your understanding of my arrangement?

Something only marginally related to my ISP affiliation:

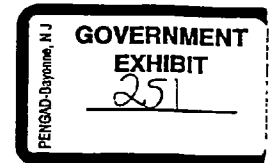

- I've noticed that the WIN95 version of Nav3 has an idle timeout setting built in; however I do not know where the setting is for this to change it to a longer period. Any clues?

And, finally, MS net cops!

- I recently revised my home page with frames per the structure given on the Netscape web site. They look and work fine. A couple of days after doing so I was talking to one of my customers and they asked me, "What's with this big 'WARNING' on your home page now?" I had no idea but found they were using MSIE and, sure enough, when I viewed my page with MSIE there was a big "warning" right at the very top of the page in Headline 2

HIGHLY CONFIDENTIAL

font saying:

"WARNING: this page is using an obsolete frame syntax.

For information on the original frame syntax please [click here](#)." (with the 'click here' being a link to..... www.microsoft.com!)

Boy that pissed me off! Apparently MSIE is hard-coded to read the meta tags generated by NavGold and kick up such "Warnings" when it finds them. I took out the meta tags and it was still there. Only after I opened the document in Front Page and then saved it (no changes to the html) did they disappear. I find this very disturbing and would think Netscape would as well. Just FYI, and if you know of any way to get rid of these short of doing what I did please let me know.

I hope to actually talk to you soon,
Todd Jagger
