# ADA-ES Hg Control Program

---

- **Full-scale field testing of sorbent-based mercury control on coal-fired boilers.**
- **Primary funding from DOE National Energy Technology Laboratory (NETL).**
- **Cofunding provided by:**
  - **Southern Company;**
  - **We Energies;**
  - **PG&E NEG;**
  - **EPRI;**
  - **Ontario Power Generation;**
  - **TVA;**
  - **First Energy;**
  - **Hamon Research Cottrell**
  - **Kennecott Energy; and**
  - **Arch Coal.**

# DOE/NETL Test Sites

---

<b>Test Site</b>	<b>Coal</b>	<b>APC</b>	<b>Variables</b>
Alabama Power Gaston	Bit	HS ESP COHPAC FF	
We Energies Pleasant Prairie	PRB	CS-ESP	T, Sorbent, Rate
PG&E NEG Brayton Point	Bit	CS-ESP	Sorbent, Rate, Lance, In-flight
PG&E NEG Salem Harbor	Bit	CS-ESP SNCR	T, Rate, SNCR

# Outline

---

**Support preliminary conclusions from four full-scale field tests with supplemental data from other field tests on the following issues:**

- **Mercury species**
- **Residence time**
- **ESP Performance**
- **Temperature**
- **Injector Design**
- **Effect of Chlorine**
- **Sorbent Characteristics**
- **Effect of SNCR**
- **Ash Issues**

# Issue

---

**Conclusion\*:**

**Questions?**

- ***\*“What we believe to be most likely to be true based upon what we know today about mercury. This is the opinion of ADA-ES and not that of DOE, NETL, EPRI or any of the co-funding power companies.”***

# Mercury Speciation

---

## Conclusion\*:

- Powdered activated carbon is effective on both bituminous and subbituminous coals and captures both elemental and oxidized mercury.

## Questions?

- Documented performance on a wider variety of sites.

# Removal of Mercury Species with PAC on Bituminous and Subbituminous Coal

## Bituminous with FF

	PARTICULATE	OXIDIZED	ELEMENTAL	TOTAL
PAC Injection	$\mu\text{g}/\text{m}^3$	$\mu\text{g}/\text{m}^3$	$\mu\text{g}/\text{m}^3$	$\mu\text{g}/\text{m}^3$
COHPAC Inlet	0.23	6.37	4.59	11.19
COHPAC Outlet	0.12	0.91	0.03	1.05
Removal Efficiency	45.6%	<b>85.7%</b>	<b>99.3%</b>	<b>90.6%</b>

## Subbituminous with ESP

	PARTICULATE	OXIDIZED	ELEMENTAL	TOTAL
PAC Injection	$\mu\text{g}/\text{m}^3$	$\mu\text{g}/\text{m}^3$	$\mu\text{g}/\text{m}^3$	$\mu\text{g}/\text{m}^3$
ESP Inlet	0.98	1.73	14.73	17.44
ESP Outlet	0.00	0.44	4.27	4.71
Removal Efficiency	100.0%	<b>74.5%</b>	<b>71.0%</b>	<b>73.0%</b>

# Residence Time

---

## Conclusion\* :

1. The in-flight sorption of oxidized mercury is faster than predicted by current models.
2. There should be sufficient residence time in most power plants for ACI to be effective.

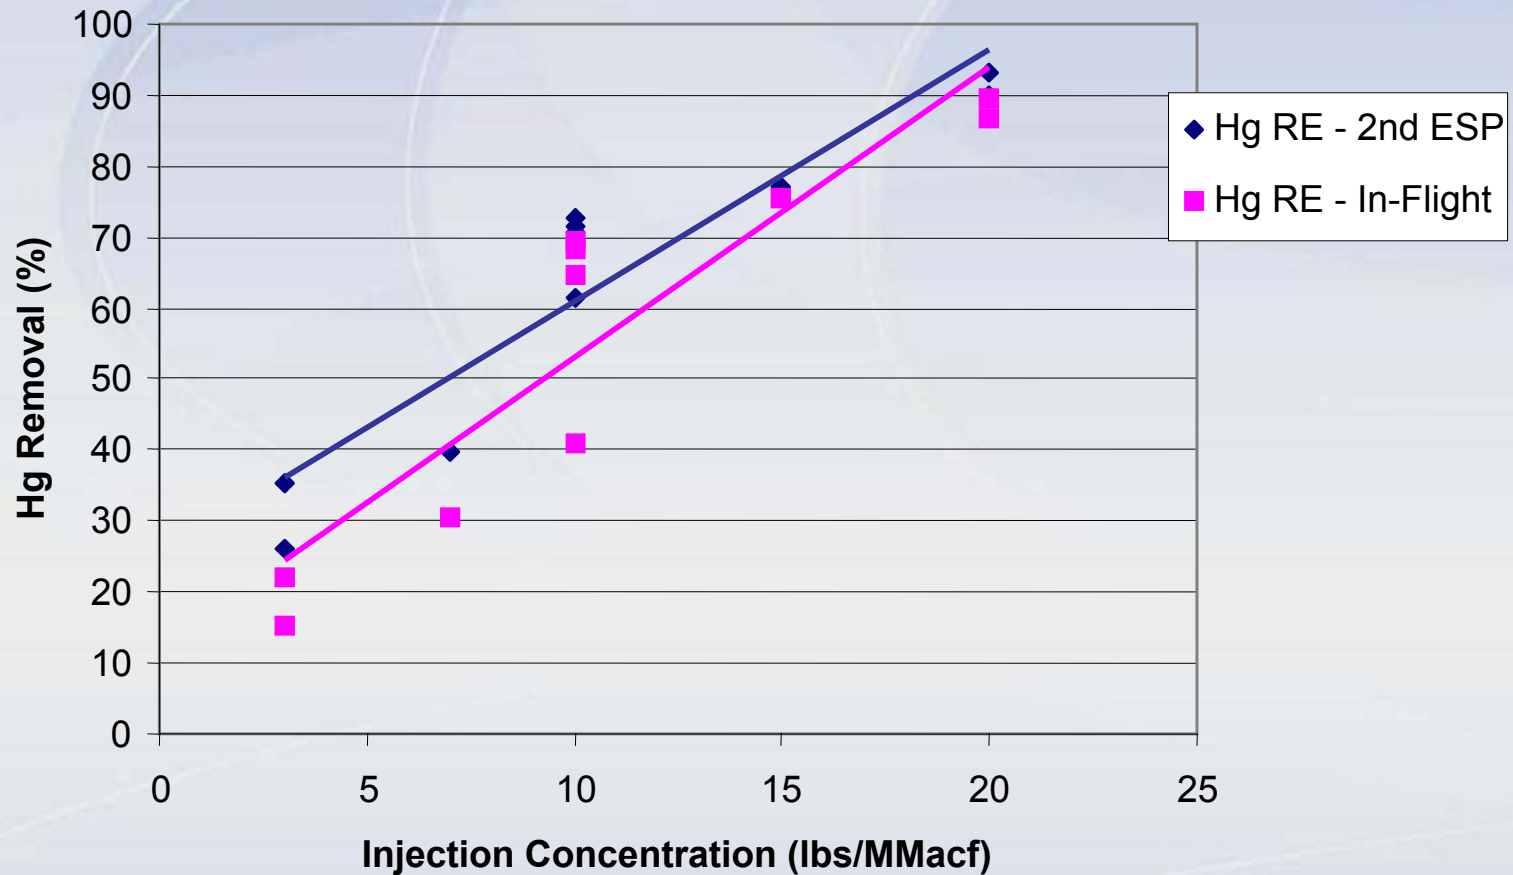

## Questions?

- Is the rate for in-flight sorption of elemental mercury comparable to that of oxidized mercury?

# Brayton Point Configuration

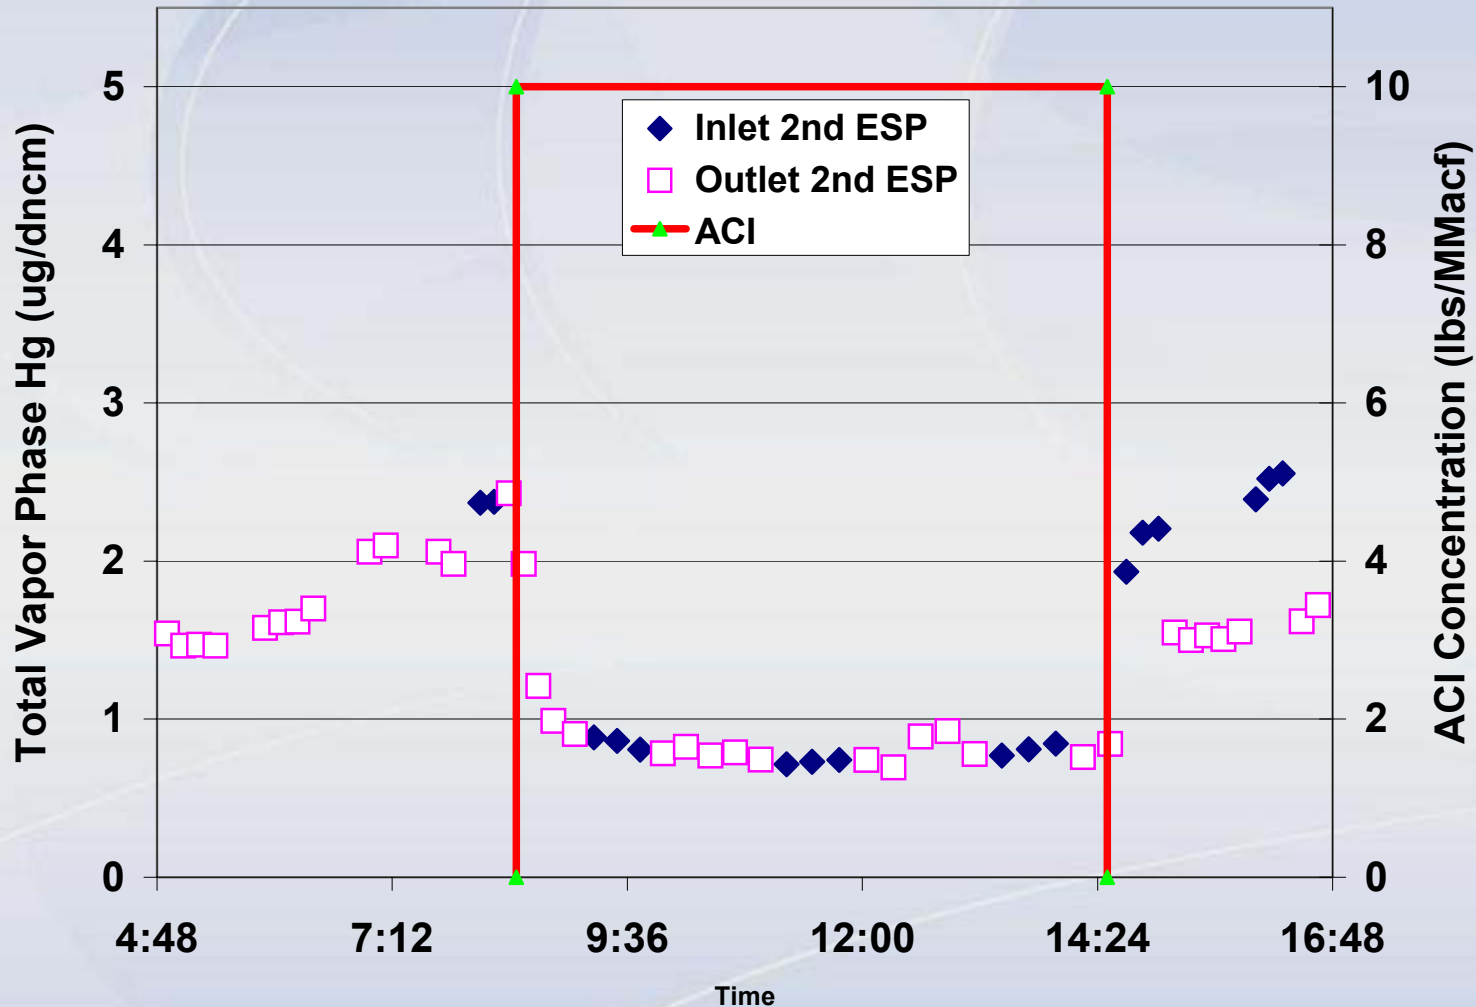

# In-Flight Sorption of Vapor Phase Mercury

# In-Flight Mercury Sorption

# In-Flight Mercury Sorption

# Residence Time Estimates

---

<b>Plant</b>	<b>In-Duct (Sec.)</b>	<b>ESP Cone (Sec.)</b>	<b>ESP Box (Sec.)</b>
<b>Brayton Point</b>	<b>0.54</b>	<b>1.5</b>	<b>12</b>
<b>Salem Harbor</b>	<b>0.9</b>	<b>1.6</b>	<b>18</b>
<b>Pleasant Prairie</b>	<b>0.75</b>	<b>3.1</b>	<b>14.7</b>

# ESP Performance

---

## Conclusion\*:

1. ACI does not impact the fundamental performance of an ESP
2. A large ESP ( $SCA > 400 \text{ ft}^2/\text{kacfm}$ ) should be able to effectively capture injected sorbents

## Questions?

- Will a smaller ESP ( $SCA < 250 \text{ ft}^2/\text{kacfm}$ ) be able to adequately capture injected sorbents

# ESP Performance – Brayton Point

# SCA at Test Sites

---

<b>Plant Site</b>	<b>SCA (ft<sup>2</sup>/1000 ACFM)</b>
<b>Pleasant Prairie</b>	<b>468</b>
<b>Brayton Point</b>	<b>403</b>
<b>Salem Harbor</b>	<b>474</b>

# Temperature

---

## Conclusion\*:

- At temperatures below 350 °F, spray cooling will provide no benefit to ACl.
- At temperatures above 350 °F, on a flue gas stream with predominately oxidized mercury, some form of cooling will be required for ACl to be effective.

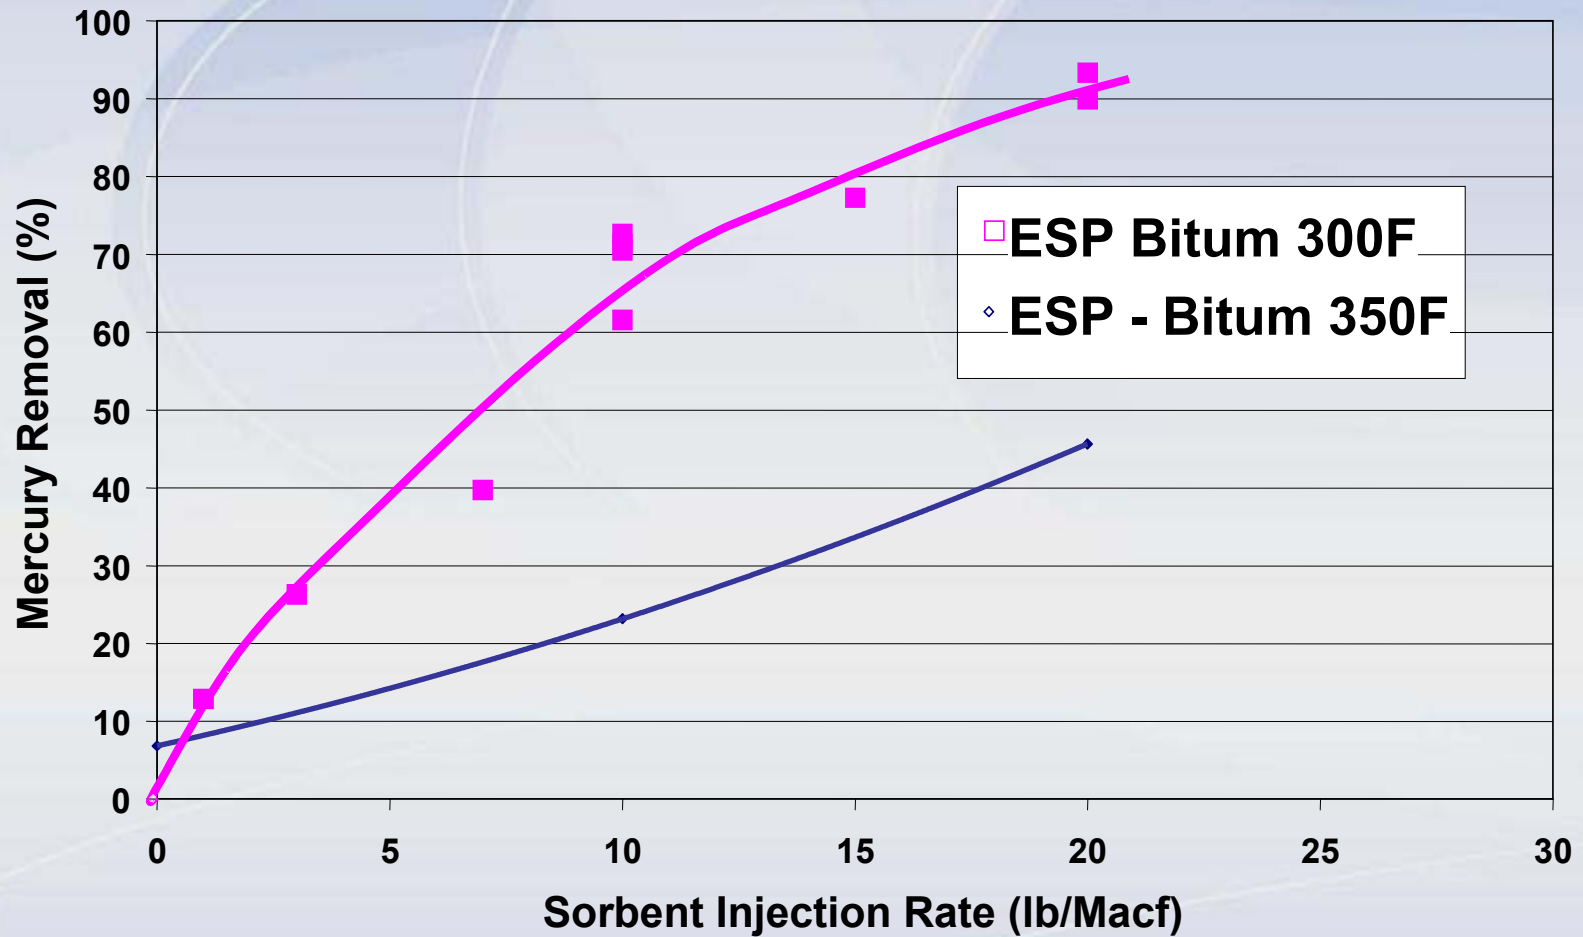

## Questions?

- Maximum temperatures for ACl on a flue gas with predominately elemental mercury .

# Adsorption Capacity vs. Temperature

# Hg Capture vs. Temperature (w/ ACI)

# Adsorption Capacity of LOI Carbon

# Hg Capture vs. Temperature (No ACI)

# Injection Equipment

---

## Conclusion\* :

- Sorbent injection equipment capable of treating power plant sized gas streams was demonstrated in this program.
- Distribution of sorbent in the system is adequate as evidenced by > 90% removal.

## Questions?

- Long-term reliability

# Activated Carbon Storage and Feed System

---

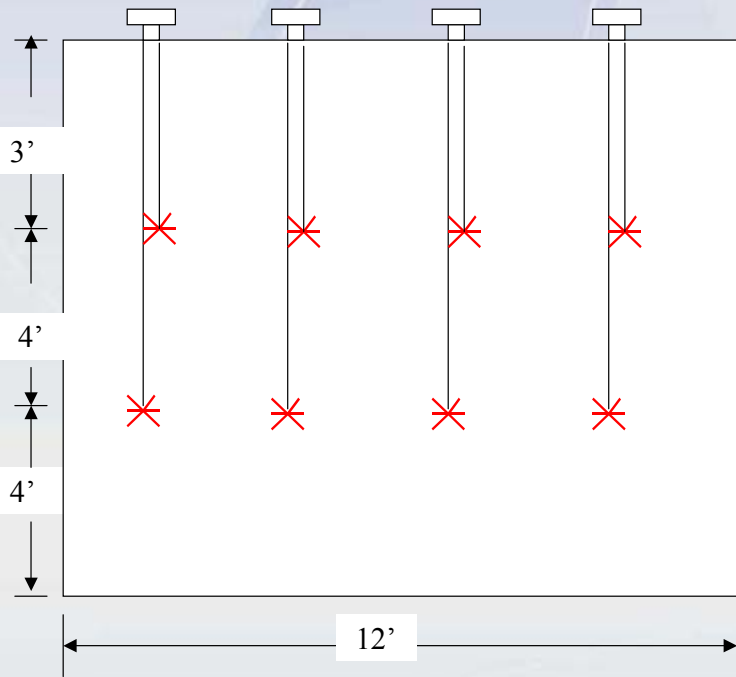

# Powdered Activated Carbon Injection System

---

# Lance Designs

**No difference in performance  
with the two lance configurations**

# Effect of Chlorine

---

## Conclusion\*:

- Chlorine plays a significant role in the performance of PAC

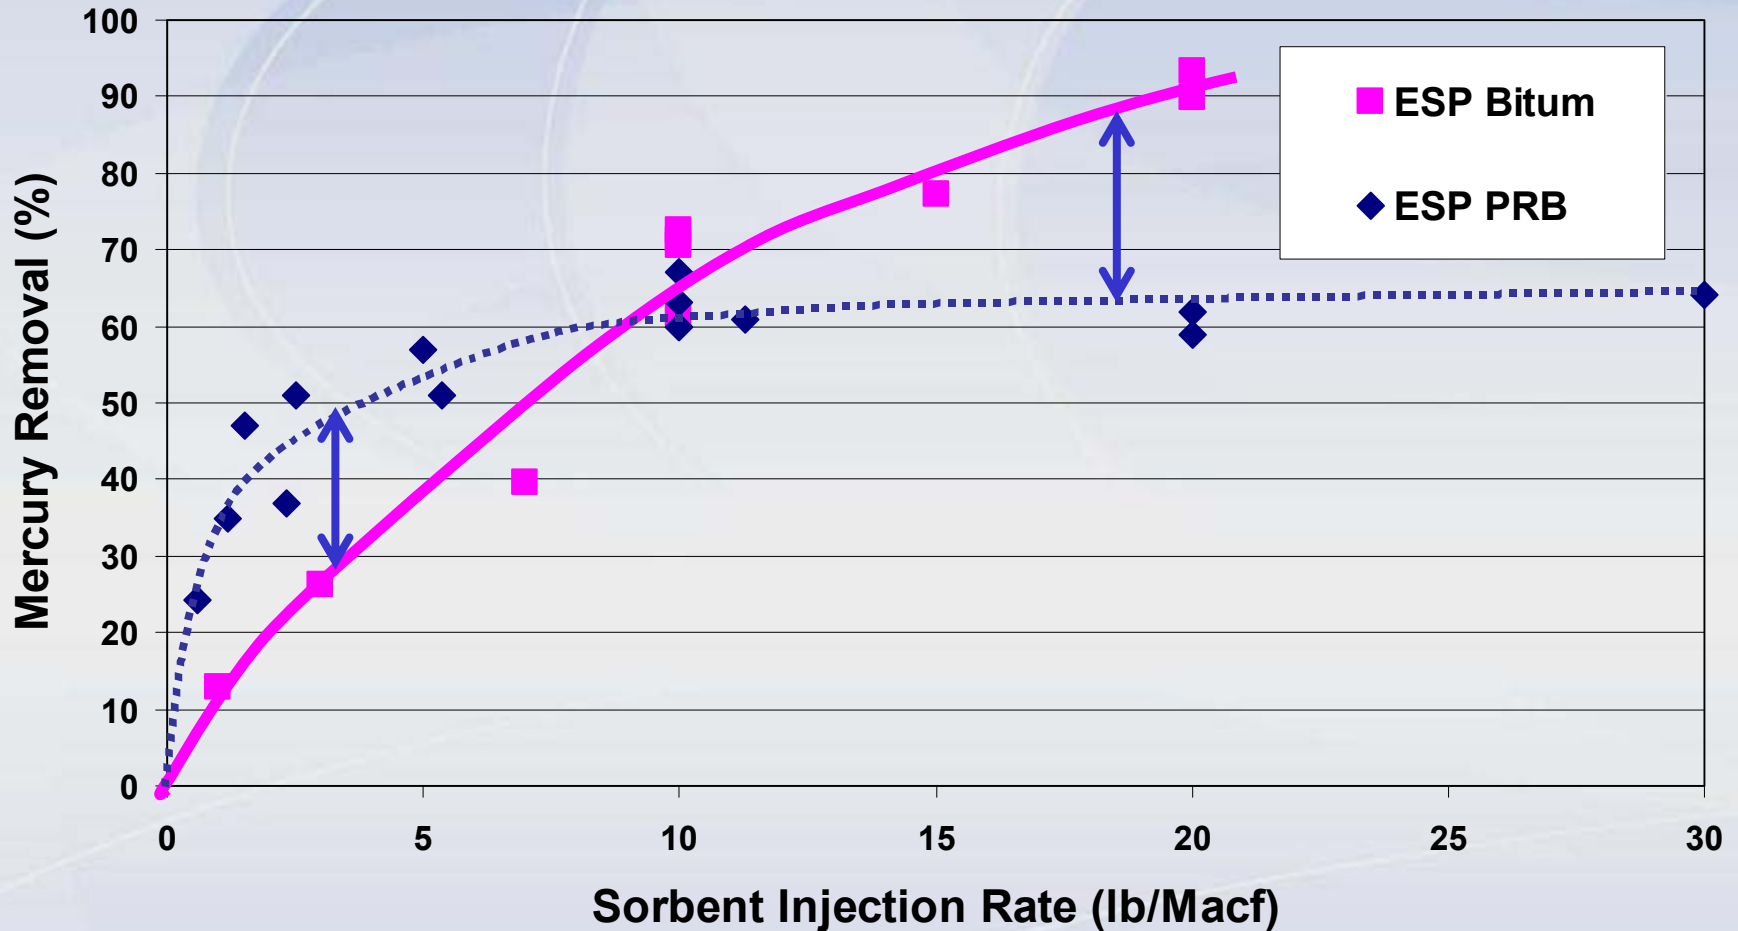

## Questions?

- Can halogenated sorbents (other than iodated carbon) produce acceptable performance in an HCl deficient gas stream.

# Differences in Coal and Flue Gas Characteristics for the Four DOE Sites

<b>Plant</b>	<b>Coal</b>	<b>Hg (ppm)</b>	<b>Chlorine (ppm)</b>
<b>Alabama Power Gaston</b>	<b>Washed Eastern Bit</b>	<b>0.14</b>	<b>169</b>
<b>We Energies Pleasant Prairie</b>	<b>PRB</b>	<b>0.11</b>	<b>8</b>
<b>PG&amp;E NEG Brayton Point</b>	<b>Eastern Bit</b>	<b>0.03</b>	<b>2000-4000</b>
<b>PG&amp;E NEG Salem Harbor</b>	<b>South Amer. Bituminous</b>	<b>0.03-0.08</b>	<b>206</b>

# PAC Performance with ESPs: Bituminous vs. PRB

# Native Mercury Removal for Western Coals

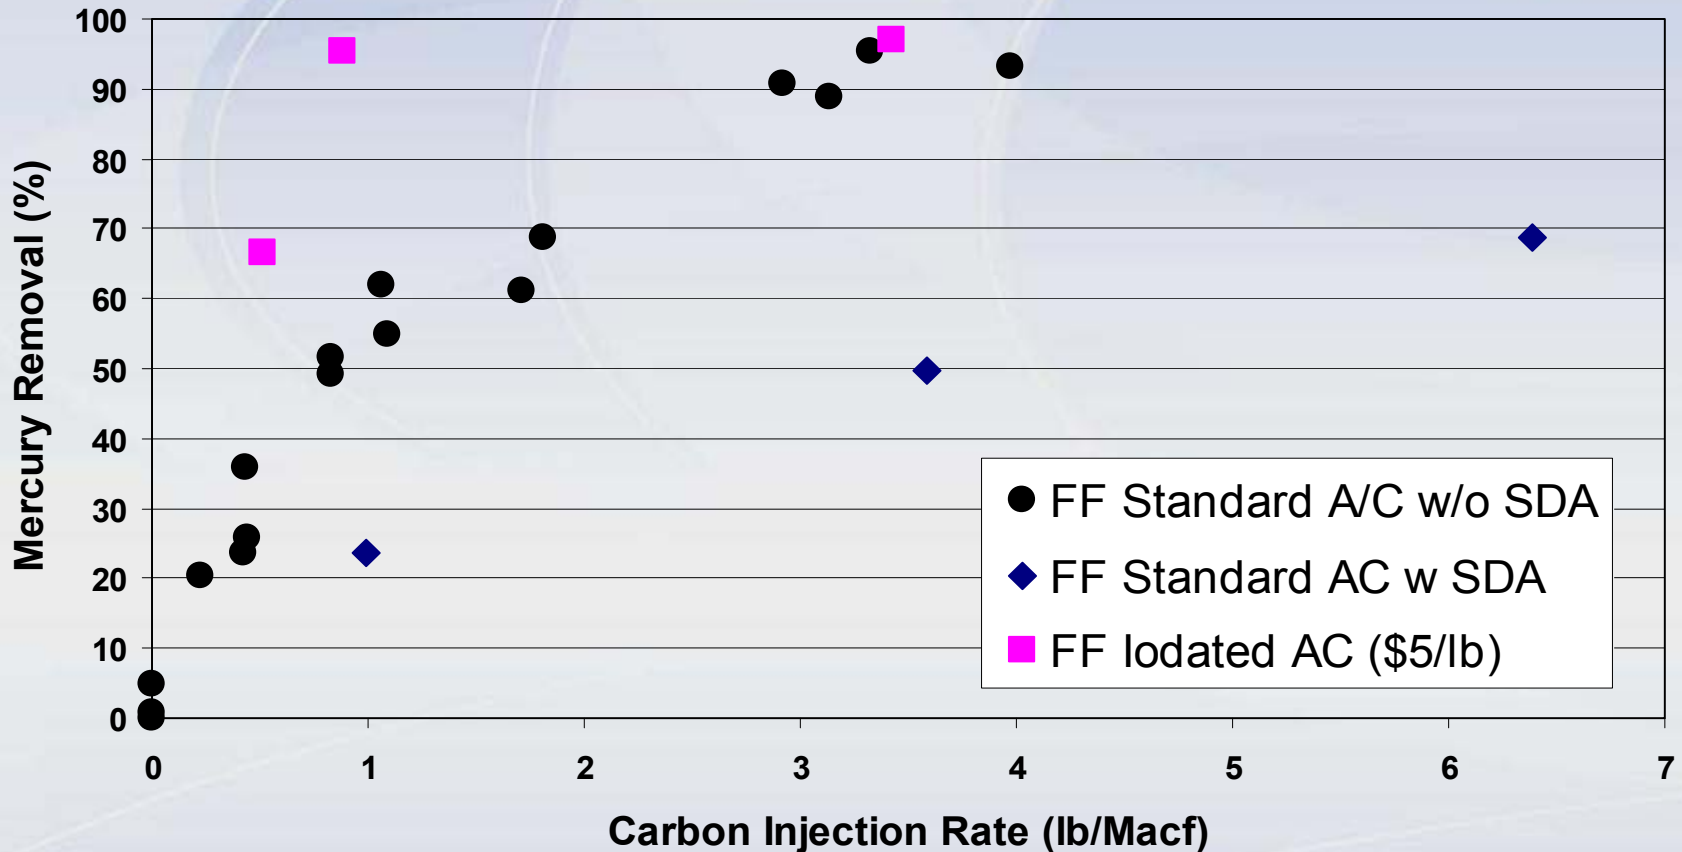

---

<u>Plant</u>	<u>ESP/FF</u>	<u>Coal</u>	<u>Carbon in Ash</u>	<u>Mercury Removal</u>
Comanche 2	FF	PRB <sup>1</sup>	0.4	61%
Arapahoe 4	FF	PRB <sup>1</sup>	14.4	62%
Cherokee 3	FF	Colowyo <sup>2</sup>	7.6	98%
Valmont	FF	20 Mile <sup>2</sup>		86%

1: < 50 ppm Cl

2: 400 ppm Cl

# Hg Removal with Spray Dryers on Western Coals (EPRI Data)

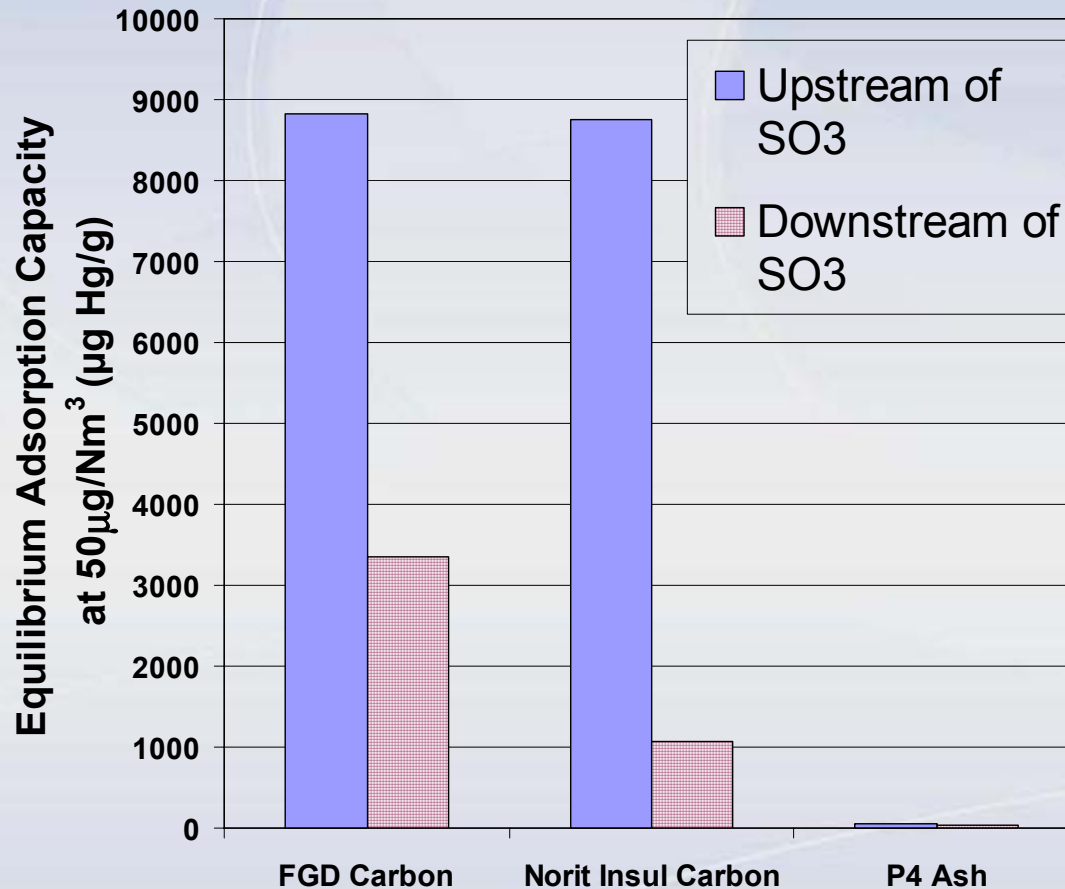

# PAC Performance with ESPs: Bituminous vs. PRB

# Equilibrium Adsorption Capacities at 250°F Upstream and Downstream of SO<sub>3</sub> Injection

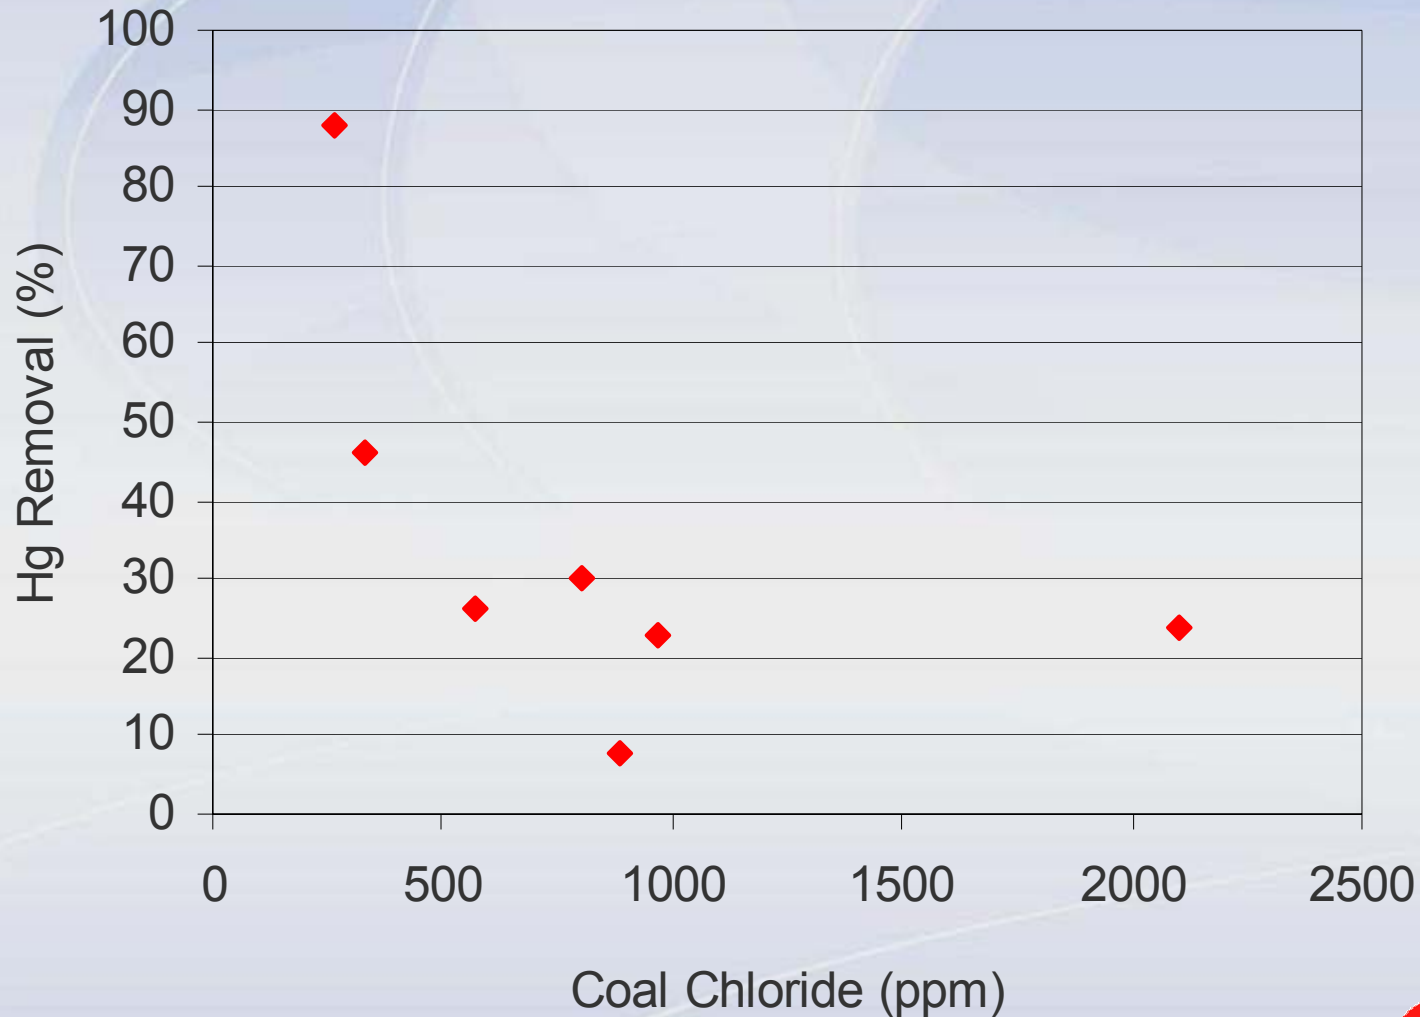

# Impact of Ca Injection on PAC Performance on a High HCl Flue Gas: EPRI COHPAC Testing at Hudson

# ICR Data on Chlorine in Bituminous Coals

## Impact on Mercury Removal in ESP

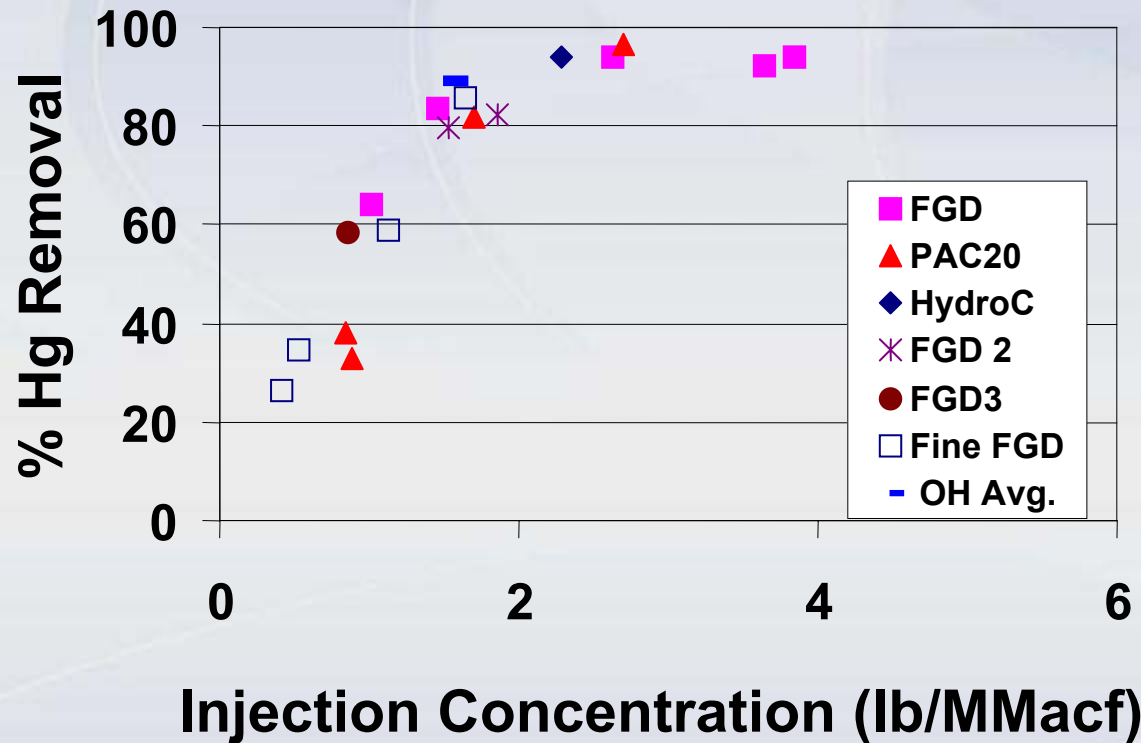

# Sorbent Characteristics

---

## Conclusion\*:

- **Similar performance from several high-capacity carbons**
- **R&D to improve sorbents should be directed toward lower-capacity, cheaper products**
- **Questions?**
- **Can performance be improved by reducing particle size?**

# Mercury Removal with Different NORIT PACs (Gaston)

# Mercury Removal with Different NORIT PACs (Pleasant Prairie)

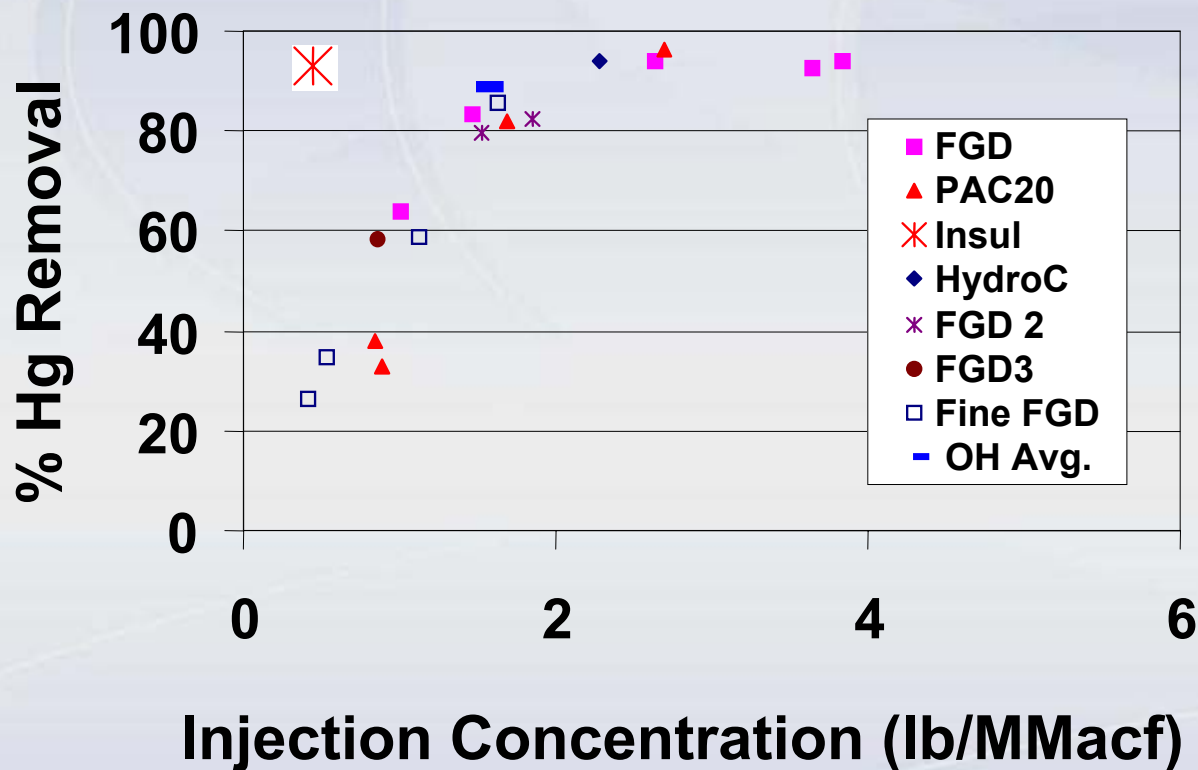

# Mercury Removal with PAC from Different Suppliers (Brayton Point)

# Improved Performance with Reduced Particle Size

Results could not be repeated with two additional tests. In both cases, there was difficulty feeding the finer material.

# Effect of SNCR

---

## Conclusion\*:

- **SNCR was not the reason for the high native mercury removal at Salem Harbor.**

## Questions?

- **Does SNCR impact the performance of PAC?**

# SNCR On/Off Results

# Ash Issues

---

## Conclusion\*:

- The mercury captured by PAC, LOI, and ash appears to be very stable and unlikely to reenter the environment.
- The presence of PAC will most likely prevent the sale of ash for use in concrete.

## Questions?

- How effective will new technologies be in addressing the ash reuse issue?

# Carbon-in-Fly Ash Issues

---

- **Even small amounts of carbon in fly ash can limit use as a cement admixture.**
- **If currently selling fly ash, must address loss of sales and disposal.**
- **Several developing technologies to address the problem:**
  - **Separation;**
  - **Combustion;**
  - **Chemical treatment;**
  - **Non-carbon sorbents; and**
  - **Configuration solutions such as EPRI TOXECON**
