### RATE TABLE

Table I.—Crude death rates (number of deaths per 100,000 provisional estimated midyear population) for selected causes of death, by place of residence: United States and each State, 1939-----			18
---	--	--	----

### GENERAL NATALITY AND MORTALITY TABLES

Table 1.—Live births by sex of child, age of mother, race, and parent nativity of white: United States and each State, 1939-----			23
Table 2.—Live births by age of mother, population groups, and race: United States and each State, 1939-----			36
Table 3.—Live births by age of mother, race, and number of child: United States and each State, 1939-----			55
Table 4.—Live births by number of child and by race, and for white by nativity of mother: United States and each State, 1939-----			70
Table 5.—Live births by age of parents: United States and each State, 1939-----			76
Table 6.—Live births of residents, by place of occurrence: each State, 1939-----			82
Table 7.—Live births of residents of each State, county, and city, and live births occurring in each State, county, and city, by person in attendance: 1939-----			85
Table 8.—Births and deaths by place of occurrence and by place of residence: each State, county, and city, 1939-----			139
Table 9.—Deaths of residents, by place of occurrence: each State, 1939-----			167
Table 10.—Deaths from selected causes, by sex, race, and population groups: United States and each State, 1939-----			170
Table 11.—Deaths from selected causes, by race, and by individual cities of 10,000 or more in 1930: 1939-----			210
Table 12.—Deaths of residents of each State, county, and city, and deaths occurring in each State, county, and city, by institution: 1939			246
Table 13.—Deaths under 1 year of age from selected causes, by population groups, and for all causes by race: United States and each State: 1939-----			274

# VITAL STATISTICS OF THE UNITED STATES

## PART II. GEOGRAPHIC CLASSIFICATION BY PLACE OF RESIDENCE

### Introduction

This volume—Vital Statistics of the United States, Part II—contains additional official statistical tabulations of natality and mortality data for the calendar year 1939. In part II, the tables consist of tabulations of births and deaths classified according to the place of residence of the mother of the child, or the place of residence of the decedent. The natality data are classified by geographic area; race, nativity, and age of parents; sex; number of child; and type of attendance. The mortality data are classified by geographic area; cause of death; sex; race; and institution. These tabulations are compiled from the same source material as the tables published in part I, both being derived from transcripts of original birth and death certificates received from registration officials of States, cities, and outlying possessions of the United States.

This volume was prepared under the direction of Dr. Halbert L. Dunn, Chief Statistician for Vital Statistics, Dr. John Collinson, Assistant Chief Statistician for Vital Statistics, and Dr. Forrest E. Linder, Technical Expert for Vital Statistics. The tabulations and introductory material were prepared under the immediate supervision of Dr. Robert D. Grove, Associate Social Science Analyst.

#### REVISION OF ANNUAL VITAL STATISTICS VOLUMES

The present volume continues the new series of annual publications begun in 1937. It presents natality and mortality data based upon the place of residence of the mother of the child or the place of residence of the decedent. Data compiled on a place-of-occurrence basis are published in a volume entitled "Vital Statistics of the United States, Part I."

The publication in 1937 of a combined volume of natality and mortality data tabulated by place of residence marked an important change in the compilation of vital statistics by the Bureau of the Census. The tabulations by place of residence have been expanded considerably for 1939. This volume presents, for the first time on a place-of-residence basis, detailed Nation-wide statistics of births by age of mother and number of child. Similarly, detailed data on deaths by cause by place of residence are given for the first time. In succeeding years, more of the tabulations will be made according to place of residence. The published resident tables will be expanded and revised from time to time to meet the needs of users of vital statistics.

The tables given in part II should be interpreted with some caution since several factors enter into the determination of the place of residence. The place of birth or death, in most cases, is clear-cut and definitely determinable. The place of residence is much more difficult to determine and is dependent upon the definitions of residence and the completeness of the information given on the certificate. It has, therefore, been necessary to adopt a set of arbitrary rules that indicate the proper coding in each instance. The data obtained by a reallocation of nonresidents are obviously dependent upon these rules and cannot be correctly interpreted unless the rules are exactly and clearly stated.

#### THE VALUE OF VITAL STATISTICS TABULATED BY PLACE OF RESIDENCE

Tabulated vital statistics may be used for many purposes, each requiring data classified by different groupings or according to different definitions. Many of these uses relate to public-health work, such as an assay of the problems confronting public-health agencies or the measurement of the results of public-health programs. Other uses relate to maternal and infant-welfare activities, problems of population

research, analysis of fertility trends, actuarial investigations, medical research, et cetera. For some purposes, such as a study of the hospital load carried by a given community, the proportion of births attended by physicians, or the simple ranking of causes of death, it is possible to use tabulated natality and mortality data without relating them to other statistical data. But for the most part, vital statistics take on their full value only when related to population figures by the computation of birth or death rates. For deaths, these rates, in their simplest form, consist of ratios of the number of deaths occurring in a specified place during a specified time to the number of persons exposed to the risk of death at that place and time. It is obvious that such a rate can be correctly computed and interpreted only when the population figure in the denominator and the mortality figure in the numerator are compiled on a comparable basis. In other words, the population figures must represent a certain group that is exposed to the risk of death, and the death figure must include all of this group that died. Although the birth rate is interpreted in a different manner, similar considerations apply to it.

For the United States, as a unit, there is little difficulty in securing adequate comparability between vital statistics and population figures. For individual cities or counties or for population-size groups, there are several disturbing factors. In the population census each person is counted as a part of the population of the geographic unit in which he has his "usual place of abode." Therefore, the enumerated population of a city is a count of all the persons who usually live in that city, excluding persons who are temporarily in the city at the time of the census and including residents of the city who are at some other place during the time of the census enumeration.

The crude death rate for the residents of any area must be based on the total resident population of that area and the total number of deaths occurring in this total resident population. It is essential to include the deaths of residents no matter where the death occurred, and to exclude deaths of nonresidents occurring in that area.

The occurrence of a large number of births and deaths "away from home" results from the movement of the people, facilitated by convenient and unrestricted methods of transportation, and from the increasing use of hospitals during confinement and illness. Seasonal movement to and from resort States, seasonal migration in search of employment, and the movement of people to some other area for hospital facilities not available in their usual place of residence, are several of the factors that contribute to the number of nonresident births and deaths.

Inasmuch as the registration laws of each State specify that births and deaths be registered at the place of birth or death, the compilation of vital statistics according to place of occurrence is the most direct and usual method. Rates computed on this basis may be called recorded rates, since all the births or deaths recorded in each area are included in the computation. The compilation of natality and mortality data on the same geographic basis as the population census requires a complete reallocation to the place of residence. When this reallocation has been made, it is then possible to compute resident rates. Since resident death rates are ratios of the number of deaths to the number of persons exposed to the risk of death, they indicate more accurately the force of mortality affecting a given population and can therefore be interpreted in terms of relative health conditions. Resident birth rates are interpreted somewhat differently, but similar considerations apply to them. Of course, in such interpretations cognizance must be taken of other factors, such as the age distributions of the exposed populations.

From some points of view it may seem incorrect to allocate deaths purely on a place-of-residence basis without taking account of the city or county responsible for the causes resulting in death. For example, a resident of one city may be killed in an automobile accident in another city. In such a case it may seem unreasonable to allocate that death to the city of residence if the accident was caused by traffic hazards in the city where the death occurred. However, even if desirable, the reallocation of deaths to the area responsible for the causes resulting in death would be a highly speculative and difficult task. Furthermore, admitting the possibility of making such an assignment of death, it then becomes necessary to devise an "exposed-to-risk" figure quite different from an enumerated population.

Tabulations of vital statistics by place of occurrence are valuable and necessary for certain purposes. Tabulations by place of residence and the computation of resident birth and death rates provide data of greater value and meaning for many uses. However, resident data cannot be directly interpreted for every purpose. No single method of tabulation could be devised that would provide statistics compiled in the manner necessary for all possible problems.

#### PREVIOUS TABULATIONS BY PLACE OF RESIDENCE<sup>1</sup>

The first nonresident tabulations made by the Bureau of the Census were published in the volume of "Mortality Statistics" for 1914. These tabulations included deaths, but not births, and consisted merely of a separation of the nonresident deaths from the total deaths for each area. However, discovery of serious deficiencies in the residence information given on the death certificate resulted in the omission of nonresident tabulations from the published volumes from 1915 to 1918. By 1918 it was believed that sufficient progress had been made with the basic data to resume publication of nonresident statistics.

In 1918 the nonresident mortality tabulations were revised so as to provide a complete allocation of deaths by place of residence within the limits of the then incomplete registration area. A decedent in the registration area whose place of residence was outside the registration area could not be reallocated to his place of residence. Similarly, deaths of residents of the registration area could not be included in the figures for this area if the deaths had occurred outside the registration area.

Tables showing the number of deaths by place of residence were published for each year from 1918 to 1930. The rules for residence allocation remained essentially unchanged during this period. In 1931, the tabulation of nonresident deaths was discontinued as an economy measure and for the years 1931 to 1934 no data on this important subject are available.

The completion of the birth and death registration areas in 1933 made possible, for the first time, a Nation-wide reallocation of nonresidents to the place of residence. When nonresident reallocation was resumed in 1935, the definition of a nonresident was revised and more detailed rules for allocation were formulated. In addition, compilation by place of residence was extended to birth statistics. Previous to 1935, no reallocation of births to place of residence of the child's mother had been made by the Bureau of the Census.

Since 1935, the natality and mortality tabulations by place of residence have been gradually developed and extended. Eventually, most of the major tabulations for individual cities and counties and for the population-size groups will be transferred to this basis.

Resident tabulations for 1935 and 1936 were not published in the annual volumes—"Birth, Stillbirth, and Infant Mortality Statistics" or "Mortality Statistics"—but have been released in the series of "Vital Statistics—Special Reports."<sup>2</sup>

#### NONRESIDENT TABULATIONS BY STATE OFFICES

Since vital-statistics tabulations by place of residence are important in public-health administration, many State departments of health compile natality and mortality data on

this basis. A survey by the Bureau of the Census in 1935 revealed that 11 States made rather complete resident reallocations and 8 States published tables showing the number of deaths for cities and counties including and excluding deaths of nonresidents. A survey was made in 1938 by a Committee on Residence Allocation under the auspices of the Vital Statistics Section of the American Public Health Association. This survey indicated that 24 States were making regular tabulations involving the reallocation of nonresidents.

Answers to a questionnaire sent to the States by the Bureau of the Census in 1941 indicate that 35 States and the District of Columbia are making some resident tabulations, while 13 States are making no resident tabulations. In 4 States, these tabulations are limited to the separation of residents and nonresidents with no allocation to place of residence. In 13 States, the tabulations exclude nonresidents from other areas within the State and include residents who are born or who die elsewhere; however, the tabulations in these States do not exclude nonresidents from other States or include residents of the State who are born or who die in another State. Nineteen States make complete place-of-residence tabulations excluding all nonresidents and including all residents within and outside the State.

In many States the resident tabulations are based solely on a reallocation of nonresidents within the State. In other words, these States do not include in their tabulations the deaths (or births) of residents of that State occurring in other States. For State totals, the allocation of interstate nonresidents is, in most cases, numerically unimportant. However, for areas near a State border, interstate reallocation may be very important since many deaths (or births) to residents of the area may occur in the adjacent State.

To assist the States in obtaining records of births or deaths of their residents in other States, the Vital Statistics Section of the American Public Health Association adopted, in 1931, a resolution requesting the Bureau of the Census to act as a clearing house in the exchange of such records. Since 1933, most States have sent to the Bureau of the Census copies of birth and death certificates for out-of-State nonresidents and these have been forwarded to the State of residence. Although this interstate exchange has been of considerable value to the individual States, it has not solved all of the difficulties met by State agencies in making a complete reallocation.

Differences of opinion exist regarding the principles on which the definition of a nonresident and the rules used in coding should be based. For this reason the interstate transfer is not on a strictly uniform basis for all States. While State tabulations fulfill an important need, it is obviously desirable for some central agency, operating with a uniform although arbitrary set of rules, to make Nation-wide tabulations.

One significant comment should be made regarding the differences between resident tabulations made by State agencies and those made by the Bureau of the Census. Because of the large number of transcripts involved in national tabulations, the coding rules used by the Bureau of the Census must be designed and simplified to facilitate mass production. Furthermore, the Bureau of the Census does not have access to the detailed local information necessary for certain types of allocation. For these reasons, it is not possible to introduce all possible coding refinements or to use different sets of rules for various causes of death. Many State offices, having special local problems or interests to meet, wish to use special coding rules for certain groups of data. For example, some States either allocate deaths in custodial institutions to the place of prior residence or consider these institutions as separate tabulation areas. Some States prefer to allocate deaths from infectious diseases to the area where the infection presumably originated; deaths from accidents, to the place of accident; deaths from homicide, to the place of homicide; et cetera.

The desirability of these special types of tabulation should be emphasized, but they often require detailed information available only in local offices and involve operating rules feasible only for a relatively small volume of work. Therefore, while it is desirable for a central agency to make national tabulations, these national uniform tabulations do not replace those made by the separate State agencies.

<sup>1</sup>For a more detailed account of previous resident tabulations, see "Vital Statistics of the United States, Part II," p. 2, 1937.

<sup>2</sup>For a list of these reports containing resident tabulations for 1935 and 1936, see "Vital Statistics of the United States, Part II," p. 2, 1937.

**DEFINITIONS OF NONRESIDENTS AND RULES FOR CODING**

The reallocation of birth and death certificates to place of residence is based on information somewhat different and collected in a manner different from that obtained in the enumerated population census. It is obviously not possible to use identical rules for both compilations. The tabulation of vital statistics on a place-of-residence basis requires that the information given on the certificate be interpreted in such a way as to result in classifications comparable to the census figures. The necessity for such interpretation introduces arbitrary and controversial factors into the procedure of allocation. It can hardly be expected that the geographic classification by place of residence can be as direct and simple as the classification by place of occurrence.

In addition to difficulties in the definition of residence, there are several factors in the original collection of birth and death information that may produce errors or discrepancies in resident tabulations. The place of birth or death is usually obvious or easily learned by the person filling out the original certificate. On the other hand, the original informant or the State office may have to make an inquiry to determine the place of residence, particularly in the case of non-resident births or deaths. Since it is sometimes difficult to ascertain the precise geographic location of the place of residence, errors may be made occasionally. Due to these difficulties of residence designation and to incomplete understanding of the importance of residence data, the residence information has been omitted or incompletely reported on birth and death certificates for certain areas. In addition, the residence data on the original certificates may, in some cases, be incompletely transcribed in the State office.

In view of these considerations, errors in the residence tabulations for certain areas may be expected. It is believed that errors of a significant size are restricted to a small number of areas and will decrease as the meaning and importance of residence data become more widely understood.

Nation-wide adoption of the new standard birth, stillbirth, and death certificates recommended by the Bureau of the Census will greatly facilitate the collection of accurate residence information. The part of the new standard death certificate devoted to information concerning place of death and place of residence is reproduced below.

State of _____	
1. PLACE OF DEATH:	2. USUAL RESIDENCE OF DECEASED:
(a) County _____	(a) State _____ (b) County _____
(b) City or town _____	(c) City or town _____
(c) Name of hospital or institution: _____	(d) Street No. _____
(d) Length of stay in hospital or institution: _____	(e) If foreign born, how long in U.S.A? _____ years.

The new standard birth and stillbirth certificates are essentially the same with respect to these items. The item of residence has been given much greater prominence and more space. Separate lines are allowed for each part of the geographic location—State, county, city or town, and street. The specific request for county of residence is perhaps the most important new information on residence made available by the new certificates.

The new certificates were used by a few States during the latter part of 1939. In 1940, a large majority of births and deaths throughout the country were reported on the new forms. Therefore, it may be expected that tabulations by place of residence for 1940 and succeeding years will be more complete and accurate than for earlier years.

**Relation of geographic code to the identification of nonresidents.**— Whether or not a person is classified as a nonresident depends somewhat upon the size of the area under consideration. A resident of Maine may die in California, yet this fact may be ignored when only totals for the United States are concerned. For State totals, only those persons who cross State lines need be considered in a reallocation of place of residence, since any movement within the State is irrelevant. On the other hand, for the study of mortality conditions within a city (for individual census tracts or wards), it is necessary to use a much finer definition of a nonresident. In such cases it may be necessary, for example, to define as a nonresident a person who lived on one side of a street and died in a hospital on the other side of the same street.

In whatever way the place of residence may be defined, the size of the tabulation or coding unit will partially determine the number of identified nonresidents. If the coding unit—assuming the use of a punch-card system in which geographic areas are given numerical codes—is a whole county, obviously it is impossible to determine, from a tabulation of the cards, the number of persons who moved about within the county. If the coding unit is a single registration district, it will be possible to identify persons moving from one district to another within the county, but it will not be possible to measure the movement within districts.

The tabulations given in this volume are based on a geographic code that identifies each city having a population of over 10,000 in 1930 and each county excluding these cities. The code for the county (exclusive of the cities of 10,000 or more) is subdivided into two codes, one for all incorporated places of 2,500 to 10,000 as a group, and another for all villages under 2,500 and rural areas as a group. In coding for residence, movement from an incorporated place or city of 2,500 population or more to another place or city of 2,500 or more, in the same or a different county, is identified. Similarly, any movement from one county to another is identified, including movement to or from rural areas in different counties. However, movement from a village under 2,500 or from a rural area to another village under 2,500 or rural area within the same county is not identified.

Another limitation should be mentioned. If, for example, the nonresident deaths for each city and county within a State are tabulated, it is not possible to add these figures together and obtain the number of nonresidents of the whole State. Such addition will give the number of persons in the State who died in a tabulation-unit area other than the area of their residence, but it will not give the number of nonresidents of the State since a nonresident in a city may be a resident of some rural area or some other city in the same State. Therefore, the term "nonresident" may have one of two meanings. In reference to the smallest unit of tabulation (in this report, a city or county), a nonresident is a person who died within that unit but whose usual place of residence was in some other unit. In reference to a consolidation of separate geographic units (for example, a whole State), the term refers to the number of persons dying therein who are nonresidents of the particular place of death but are not necessarily nonresidents of the consolidated area. Furthermore, since the nonresidents of one area are necessarily residents of some other area, it is necessary to apply both terms to the same data when considered in different aspects. In order to avoid confusion, the tables given in this volume include headnotes or footnotes when additional explanation seems necessary.

**Rules for the allocation of deaths.**— The allocation of deaths to the place of residence is based on the following main rules:

1. General principle: Mortality data should be compiled so as to correspond with enumerated populations on which rates are to be based. Each death should be assigned to the area in which the decedent had his "usual place of abode."
2. With certain exceptions and qualifications, a decedent is defined as a nonresident if the place of residence stated on the certificate is different from the place of death.
3. Decedents who at the time of death had been living more than 1 year in a community are considered residents of that community even though some other place of residence is stated.
4. Decedents in general hospitals, tuberculosis sanatoriums, et cetera, are reallocated to the place of residence.
5. Decedents in mental institutions, et cetera, are not reallocated to the place of prior residence.

For the purpose of coding mortality transcripts, these rules have been expanded into definite coding instructions that state the procedure followed in each case. These coding instructions have been printed in the Official Instruction Manual of the Division of Vital Statistics and are reprinted below.

## VITAL STATISTICS OF THE UNITED STATES

**Rules for determining place of residence for deaths.—**

The following statements define the meaning of residence:

1. If no entry is made for place of residence, the transcript is a resident transcript.

2. If the place of residence is stated as unknown, the transcript is a resident transcript.

3. If the place of residence is given as a foreign country, or as a United States possession outside the continental United States, the transcript is a resident transcript. In such cases, a copy is made of the transcript.

4. In any case in which a place of residence is stated but the coder is unable to determine the complete correct code for the stated place of residence, query for additional information. If the necessary information is not obtained, the transcript is considered to be a resident transcript.

5. Whenever "R.F.D." follows the place of residence, the place of residence is coded as the county in which the R.F.D. post office is located, unless another county is given as place of residence. If the place of residence is a city that is coextensive with a county, then consult the supervisor and query for additional information.

6. Whenever the place of residence is a city that is listed as a postal substation of another city and also as an individual city, the code for the individual city is to be given.

7. Deaths are coded according to the place of residence of the deceased except in case of death of a newborn infant. When infants are born at other than the place of residence of the mother, and die before return to mother's residence, the residence of the mother is considered the residence of the child.

8. If the place of residence is stated to be different from the place of death, and if the "length of stay" is less than 1 year, the place of residence as stated is coded. If the "length of stay" is not stated, code place of residence as given. If the "length of stay" is more than 1 year, the decedent is coded as a resident of the place of death. This rule applies in all cases except those provided for in the following rule.

9. The inmates of penitentiaries; prisons; reformatories; hospitals for the insane, epileptic, and feeble-minded; orphanages, homes for the blind, the deaf, the indigent or aged; are considered residents of the city, town, or county in which the institution is located. This rule applies even when some other place of residence is stated, and applies regardless of the "length of stay." The rule applies to inmates of institutions coded 8 or 9 for type of institution.

10. Patients or inmates of surgical or medical hospitals, tuberculosis sanatoriums, and jails, are usually only temporary inmates and are considered non-residents of the place in which the institution is located, if residence at some other city, town, or county is stated. No exception to rule 8 is made for these cases. This rule applies to inmates of institutions coded 1, 2, 3, 4, 6, and 7 for type of institution.

11. In general, a transcript is a nonresident transcript if the geographic code for place of residence differs in any respect from the geographic code for place of death. Under this definition:

(a) A transcript for a death occurring in a city of 10,000 or more is a nonresident transcript if the place of residence is in any other city, any other county, or any other part of the same county.

(b) A transcript for a death occurring in a rural city (2,500 to 10,000) is a nonresident transcript if the place of residence is in any other city, any other county, any other rural city, or the rural part of the same county.

(c) A transcript for a death occurring in the rural part (under 2,500) of a county is a nonresident transcript if the place of residence is in any city, any rural city, or in the rural part of any other county.

In addition, if a death occurs in one rural city, and the place of residence is another rural city of the same county, the transcript is to be coded as a nonresident even though the geographic code is the same for both place of death and place of residence.

**Rules for the allocation of births.—** The allocation of births is made according to the same general principles as the allocation of deaths. In the case of births, however, the residence of the child is defined as the residence of the mother. The following rules have been used in coding place of residence for births.

**Rules for determining place of residence for births.—** The following statements define the meaning of residence:

1. The residence of the mother (item 19) is considered the residence of the child.

2. If no entry is made for place of residence, the transcript is a resident transcript.

3. If the place of residence is stated as unknown, the transcript is a resident transcript.

4. If the place of residence is given as a foreign country, or as a United States possession outside the continental United States, the transcript is a resident transcript. In such instances, a copy is made of the transcript.

5. In any case in which the place of residence is stated, but the coder is unable to determine the complete correct code for the stated place of residence, query for additional information. If the necessary information is not obtained, the transcript is considered to be a resident transcript.

6. Whenever "R.F.D." follows the place of residence, the place of residence is coded as the county in which the R.F.D. post office is located, unless another county is given as place of residence. If the place of residence is a city coextensive with a county, consult the supervisor and query for additional information.

7. Whenever the place of residence is a city that is listed as a postal substation of another city and also as an individual city, the code for the individual city is to be given.

8. In general, a transcript is a nonresident transcript if the geographic code for place of residence differs in any respect from the geographic code for place of birth. Under this definition:

(a) A transcript for a birth occurring in a city of 10,000 or more is a nonresident transcript if the place of residence is in any other city, any other county, or any other part of the same county.

(b) A transcript for a birth occurring in a rural city (2,500 to 10,000) is a nonresident transcript if the place of residence is in any other city, any other county, any other rural city, or the rural part of the same county.

(c) A transcript for a birth occurring in the rural part (under 2,500) of a county is a nonresident transcript if the place of residence is in any city, any rural city, or in the rural part of any other county.

In addition, if a birth occurs in one rural city and the place of residence is another rural city of the same county, the transcript is to be coded as a nonresident even though the geographic code is the same for both place of birth and place of residence.

**Change in nonresident coding.—** One very important change was made in 1939 in the rules for coding nonresidents for births and deaths. In preceding years, movement from a rural city (2,500 to 10,000) to another rural city in the same county was coded as resident, although the place of residence differed from the place of birth or death. In order to secure more complete information on the volume and direction of the nonresident movement, the coding rules for 1939 were changed so as to identify as nonresident any movement from one rural city to another within the same county.

This revision of the rules for nonresident coding affects significantly statistics of residents and nonresidents for cities of 2,500 to 10,000 and for rural areas. Therefore, resident statistics for these areas in 1939 are not strictly comparable with those for preceding years.

RELATION OF INSTITUTIONS TO NONRESIDENT CODING

An important feature of the rules used in coding nonresident transcripts for deaths is the distinction between two types of institutions. The first type of institution consists of surgical and medical hospitals and other institutions in which the length of stay is usually not long. These institutions are referred to as "nonresident institutions" since decedents here are considered as nonresidents of the place in which the institution is located, if residence in some other city, town, or county is stated. The second type consists of those institutions in which the length of stay is usually long and includes penitentiaries, hospitals for the insane, homes for the indigent and aged, et cetera. These institutions are referred to as "resident institutions" because decedents here are considered residents of the place in which the institution is located, even though some other place of residence may be stated on the death certificate.

The practice of the Bureau of the Census, in considering all decedents in "resident" institutions to be residents of the area in which the institution is located, is not consistent with the practice of some individual State agencies. Some States prefer to allocate these deaths to the place of prior residence. The reallocation of these deaths has the effect of reducing the total death rate of the areas that contain institutions since it is not always possible to distribute the population of the institution in a comparable manner before computing rates.

While the tabulations in this volume have been based on reallocation according to usual place of abode, regardless of previous residence, it is desirable to have, for some purposes, mortality figures for cities and counties exclusive of deaths in resident institutions. Table 12 gives, with other data on institutional deaths, the number of deaths in resident institutions for each geographic area. These figures may be subtracted from city and county "Total deaths of residents" given in the same table, to obtain the number of deaths of residents of each area exclusive of all deaths occurring in this type of institution.

Since only the name of the hospital or institution is given on the death certificate, it is not possible to determine directly the type of institution. To facilitate the work of coding, an institution index has been developed that lists the name and type of each known institution. This institution index has been developed by the Bureau of the Census with the assistance and cooperation of the American Medical Association. While the primary purpose of the index is to classify institutions for the purpose of coding place of residence, each institution is also classified according to "Type of institution (service)" and "Type of control." These classifications are consistent with those used by the American Medical Association in the list of registered hospitals published in the annual hospital number of the Journal of the American Medical Association.

INSTITUTION CODE: TYPE OF INSTITUTION

NONRESIDENT INSTITUTIONS			NONRESIDENT INSTITUTIONS			RESIDENT INSTITUTIONS		
Extended code	Abbreviated code		Extended code	Abbreviated code		Extended code	Abbreviated code	
		General hospitals and combinations (except with resident institutions)	41	4	Tuberculosis and convalescent and rest	90	9	Other resident institutions
		General and cancer	42	4	Tuberculosis and isolation	91	9	Blind and deaf
00	0		43	4	Tuberculosis and orthopedic	92	9	Incurable
01	0		44	4		93	9	Prisons, reformatories, and industrial homes (some are classified by the American Medical Association as institutional)
02	0	General and isolation	45	4				
03	0		46	4	Other combinations (except with general)	94	9	Homes for aged and poor, county homes, farms and infirmaries, homes for soldiers and sailors
04	0	General and orthopedic	47	4	Unspecified	95	9	
05	0	General and tuberculosis	48	4	Other types of hospitals of non-resident type			
06	0		49	4				
07	0	General and other combinations

		Specialized hospitals	77	7				Proprietary
30	3	Eye, ear, nose, and throat	78	7		80	8	Individual
31	3		79	7	Miscellaneous	81	8	Partnership
32	3					82	8	Corporation
33	3	Isolation				83	8	Independent
34	3	Isolation venereal, syphilis, and gonorrhea				84	8	Industrial
35	3	Isolation miscellaneous types, smallpox, trachoma				85	8	Association
36	3				Insane institutions			Others and combinations of main types
37	3	Orthopedic, orthopedic and neurological	80	8	Epileptic	90	9	Government—Federal and local
38	3	Surgical and emergency, surgical and eye, ear, nose, and throat	81	8	Feeble-minded	91	9	Government—Federal with nonprofit
39	3	Miscellaneous	82	8	Mental defective or mental	92	9	Government—Federal with proprietary
			83	8	Neurological and mental or nervous and mental	93	9	Local with nonprofit
			84	8		94	9	Local with proprietary
			85	8		95	9	Nonprofit with proprietary
		Tuberculosis hospitals and sanatoriums	86	8		96	9	Unknown
40	4	Tuberculosis and cancer	87	8		97	9	Miscellaneous
			88	8		98	9	
			89	8	Nervous, miscellaneous	99	9	

VITAL STATISTICS OF THE UNITED STATES

There are certain problems involved in the correct location and classification of hospitals and other institutions named on death certificates. Several different names may be given at different times for the same hospital, or the name may be abbreviated so as to cast doubt upon its identity. Also, errors in location may occur where the hospital is just inside or outside the limits of an incorporated town or city. In addition, it is possible that in a few areas the name of the hospital may be omitted from some of the certificates. Significant errors of these types are believed to be few and not to vitiate the value of the institutional statistics presented for the large majority of areas.

The preceding outline shows the system of classifying institutions and gives an extended and an abbreviated code symbol.

DEATHS ALLOCATED TO PLACE OF RESIDENCE

**Summary for deaths.**— In 1939 there were 1,387,897 deaths registered in the United States, of which 195,612 (14.1 percent) were of nonresidents of the city or county in which death occurred. Most of the nonresidents in any State are residents of some other part of the same State and do not, therefore, represent movement between States. In the United States there were 27,223 interstate nonresident deaths. These comprise 13.9 percent of all nonresident deaths and only 2.0 percent of all deaths.

TABLE A.—DEATHS OF NONRESIDENTS IN EACH STATE AND DEATHS OF RESIDENTS IN OTHER STATES: 1939  
(Exclusive of stillbirths. Deaths in South Dakota of nonresidents from other States were incompletely reported)

<sup>1</sup>The place of residence of persons dying in areas other than their place of residence was incompletely reported for Kentucky in 1939, resulting in an understatement of the total number of nonresident deaths in the State.

A summary of the reallocation of deaths to place of residence is given in table A. This table shows the total number of deaths occurring in each State, the number of these that were of nonresidents, the number of deaths of residents occurring in other areas, and the total number of deaths of residents wherever occurring. For example, 77,130 deaths were recorded in California in 1939. Of this total number of recorded deaths, 17,462 occurred in a city or county of which the decedent was not a resident. In 16,014 instances the decedent was a resident of some other area of California, and in 1,448 instances the decedent was a resident of some other State. Considering next the deaths of residents of California, the table shows that 16,688 residents of California died in some city or county other than their residence. Of these, 16,014 died in some other area of California, and 674 California residents died in some other State. Altogether, a total of 76,356 residents of California died in 1939, irrespective of the place of death.

An inspection of table A shows relatively small differences between the total number of deaths occurring in a State and the total number of deaths of residents of the State. This indicates that interstate nonresident deaths are a small proportion of the total deaths and that in most cases the number of residents leaving a State and dying in other States approximately balances the number of residents of other States dying within the State. Even in States where a large number of out-of-State nonresidents are to be expected, reallocation does not greatly change the State totals. In Florida the difference between the number of recorded deaths and the number of resident deaths is 5.4 percent of the number of resident deaths; in New Mexico, 2.9 percent; in Arizona, 2.1 percent; and in California, only 1.0 percent. These figures demonstrate that for State totals it is unnecessary in most cases to reallocate deaths to the place of residence. It is only for individual areas within the State that reallocation is important. However, to obtain correct figures for areas near State borders, it is probably necessary that this reallocation be on an interstate as well as an intrastate basis.

<sup>1</sup>The place of residence of persons dying in areas other than their place of residence was incompletely reported for Kentucky in 1939, resulting in an understatement of the total number of nonresident deaths in the State.

**Number of nonresident deaths.**—The proportion of nonresident deaths for each State is given in table B. This table shows the total number of deaths occurring in each State and the number and percent of these that are of nonresidents of

the particular area in which death occurred. For the entire United States the nonresident deaths constitute 14.1 percent of all deaths, but in individual States, excluding Kentucky, this proportion ranges from 2.6 percent in Alabama to 30.5 percent in Nevada. A frequency distribution of States showing the percent of total recorded deaths that are of nonresidents is given in table C.

TABLE C.—FREQUENCY DISTRIBUTION OF STATES BY PERCENT OF NONRESIDENTS AMONG TOTAL RECORDED DEATHS: 1939

(Exclusive of stillbirths)

PERCENT NONRESIDENTS	NUMBER OF STATES
0-4	5
5-9	2
10-14	16
15-19	22
20-24	5
30-34	1

Since the movement to cities for hospitalization is an important contributing factor to the number of nonresident deaths, it is reasonable to suppose that the proportion of nonresident deaths will be greater in cities than in rural areas. A study of table D reveals several interesting features of the urban-rural distribution of nonresident deaths. The percent of nonresident deaths in large cities of 100,000 or more and in rural areas and very small cities (2,500 to 10,000) is below the percent (14.1) for the United States. In cities of 10,000 to 25,000 and 25,000 to 100,000 the proportion of nonresident deaths is greater than for the other population groups shown in table D. More than 22 and 20 percent, respectively, of all deaths occurring in cities of these two population groups are of residents of some area other than the place of death.

TABLE D.—PERCENT OF NONRESIDENTS AMONG TOTAL RECORDED DEATHS BY POPULATION GROUPS: 1939

(Exclusive of stillbirths)

POPULATION GROUP	PERCENT NONRESIDENTS
UNITED STATES	14.1
Cities of 100,000 or more	10.8
Cities of 25,000 to 100,000	20.7
Cities of 10,000 to 25,000	22.8
Rural <sup>1</sup>	12.9

<sup>1</sup> Includes cities of 2,500 to 10,000.

A frequency distribution of cities showing the variation of the percent of nonresident deaths is given in table E. Eighteen cities have less than 10 percent nonresident deaths, and 60 cities have between 10 and 20 percent. The number and proportion of nonresident deaths for individual cities having populations of 100,000 or more are given in table F. Small proportions of nonresidents are noted for New York, N. Y. (2.6 percent); South Bend, Ind. (3.1 percent); and Birmingham, Ala. (3.3 percent). Among the cities having a large proportion of nonresident deaths are Camden, N. J. (28.4 percent); Hartford, Conn. (26.7 percent); Kansas City, Kans. (26.1 percent); Salt Lake City, Utah (25.6 percent); and Memphis, Tenn. (24.5 percent).

TABLE E.—FREQUENCY DISTRIBUTION OF CITIES OF 100,000 OR MORE BY PERCENT OF NONRESIDENTS AMONG TOTAL RECORDED DEATHS: 1939

(Exclusive of stillbirths)

PERCENT NONRESIDENTS	NUMBER OF CITIES
0-4	6
5-9	12
10-14	37
15-19	23
20-24	11
25-29	4

<sup>1</sup> The place of residence of persons dying in areas other than their place of residence was incompletely reported for Kentucky in 1939, resulting in an understatement of the total number of nonresident deaths in the State.

CHANGES IN DEATH STATISTICS FOR POPULATION-SIZE GROUPS

The effect of the resident reallocation on data for population-size groups is summarized in table G. This table shows for each population group the total number of deaths of residents wherever occurring and the total number of deaths occurring in each area. The ratios in the last column are the ratios of the recorded deaths to the resident deaths. For all cities over 2,500 as grouped, the number of recorded deaths exceeds the number of resident deaths, whereas for rural areas the recorded deaths are fewer than the resident deaths. Cities of 25,000 to 100,000 are most affected by reallocation since for this group the number of deaths recorded is 110.9 percent of the number of resident deaths.

The number of resident deaths, recorded deaths, and ratios similar to those given in table G for population groups are indicated in table H for individual cities having populations of 100,000 or more. The ratio of recorded deaths to resident deaths varies from 85.8 percent for Somerville, Mass., to 126.8 percent for Salt Lake City, Utah. In general, the deviation of this ratio from 100 percent is greater for small cities than for large cities.

## VITAL STATISTICS OF THE UNITED STATES

TABLE G.—DEATHS OF RESIDENTS AND DEATHS OCCURRING IN POPULATION-SIZE GROUPS: UNITED STATES, 1939

(Exclusive of stillbirths)			
POPULATION-SIZE GROUP	Total deaths of residents	Total deaths in area	Ratio of recorded deaths to resident deaths
Cities of 100,000 or more	419,927	441,017	105.0
Cities of 25,000 to 100,000	153,683	170,448	110.9
Cities of 10,000 to 25,000	112,245	122,493	109.1
Cities of 2,500 to 10,000	145,453	152,950	105.2
Rural	556,589	500,989	90.0

TABLE H.—RATIO OF RECORDED DEATHS TO RESIDENT DEATHS: CITIES OF 100,000 OR MORE, 1939

**Residence allocation of deaths by cause.**—Death rates in 1939 for selected causes of death based on data allocated to place of residence are given for each State in table I, on p. 18. These rates may be compared with rates for the same causes and for each State computed on a place-of-occurrence basis, as given in table XII of Vital Statistics of the United States, 1939, Part I.

For a large majority of the States, the difference between the recorded and resident death rates is not great for any of the causes. However, substantial differences for a few causes may be noted for certain States. For example, the death rate for tuberculosis of the respiratory system in Arizona in 1939 was 170.5 per 100,000 estimated population when computed on a place-of-occurrence basis and 150.3 on a place-of-residence basis. The death rate for motor-vehicle accidents in Nevada was 71.7 by place of occurrence compared with 56.1 by place of residence.

Table J shows for five population-size groups in the United States the number of deaths, from selected causes, of residents of each area, the number of deaths occurring in each area, and the ratio of recorded deaths to resident deaths. The effect of residence allocation of deaths differs greatly between causes. For example, the ratio of recorded deaths to resident deaths from typhoid and paratyphoid fever is 147.7 for cities of 100,000 or more; 181.3 for cities of 25,000 to 100,000; 139.3 for cities of 10,000 to 25,000; 117.9 for cities of 2,500 to 10,000; and 75.9 for places below 2,500 and rural areas. However, the corresponding ratios for deaths from tuberculosis of the respiratory system are 88.4, 81.9, 79.6, 90.6, and 120.7, respectively.

The nonresident movement resulting from illness is preponderantly to urban areas, as indicated by the fact that for cities of 10,000 or more, the ratio of recorded to resident deaths is over 100.0 for every cause except tuberculosis of the respiratory system. For cities of 2,500 to 10,000 population the ratio exceeds 100.0 for a large majority of the causes. For rural areas, however, the ratio is less than 100.0 for every cause except tuberculosis of the respiratory system; for illness involving the latter cause, the movement is predominantly from urban to rural places. More detailed data on deaths by cause allocated to place of residence are given in tables 10 and 11.

# INTRODUCTION

TABLE J.—RATIO OF RECORDED DEATHS TO RESIDENT DEATHS FOR SELECTED CAUSES AND POPULATION GROUPS: UNITED STATES, 1939

(Numbers after causes of death are those of the 1938 revision of the detailed International List)

CAUSE OF DEATH	CITIES OF 100,000 OR MORE			CITIES OF 25,000 TO 100,000			CITIES OF 10,000 TO 25,000			CITIES OF 2,500 TO 10,000			RURAL		
	Deaths of residents	Deaths re-recorded in area	Ratio of recorded deaths to resident deaths	Deaths of residents	Deaths re-recorded in area	Ratio of recorded deaths to resident deaths	Deaths of residents	Deaths re-recorded in area	Ratio of recorded deaths to resident deaths	Deaths of residents	Deaths re-recorded in area	Ratio of recorded deaths to resident deaths	Deaths of residents	Deaths re-recorded in area	Ratio of recorded deaths to resident deaths

## INFANT MORTALITY BY POPULATION-SIZE GROUPS

Table K shows the infant mortality rates by population-size groups and by race for the United States on a place-of-residence basis. The rate in 1939 ranged from 41.2 deaths under 1 year per 1,000 live births for cities of 100,000 or more to 53.2 for cities of 2,500 to 10,000. The differences between areas are much greater for persons of "all other races" than for white persons.

TABLE K.—INFANT MORTALITY BY RACE AND POPULATION GROUPS: UNITED STATES, 1939

AREA	DEATHS UNDER 1 YEAR <sup>1</sup>					
	Total		White		All other races	
	Number	Rate per 1,000 live births	Number	Rate per 1,000 live births	Number	Rate per 1,000 live births
UNITED STATES	108,846	48.0	87,841	44.5	21,005	74.2
Cities of 100,000 or more	23,691	41.2	19,393	38.0	4,298	56.9
Cities of 10,000 to 100,000	19,121	48.8	16,500	45.4	2,621	85.2
Cities of 2,500 to 10,000	12,201	53.2	10,602	50.1	1,599	92.1
Rural	53,833	50.3	41,546	46.1	12,287	73.0

## DEATHS IN HOSPITALS AND OTHER INSTITUTIONS

The connection between nonresident deaths and institutional deaths is indicated by table L. This table shows for each State the proportion of all recorded deaths and the proportion of nonresident deaths that occurred in hospitals or other institutions.

For the entire United States, 37.7 percent of all deaths occurred in institutions, but for individual States the proportion varies from 15.6 percent for Mississippi to 52.1 percent for California. The District of Columbia shows the relatively high figure of 60.3 percent.

For the nonresident deaths, the proportion of deaths in institutions is much greater. Of the 195,612 nonresident deaths in the United States for 1939, 77.7 percent occurred in hospitals or institutions. The large proportion of hospital deaths for nonresidents is to be expected, since a hospital usually serves a larger area than just the city or county in which it is located. However, it should not be forgotten that many nonresident deaths (22.3 percent) did not occur in institutions, and this would seem to indicate that the desire for hospital services was not the only factor in the nonresident movement. Table L shows that in every State the proportion of nonresident deaths in institutions is definitely greater than the proportion of all recorded deaths in institutions.

Because so many nonresident deaths occur in institutions, the use of hospital facilities by the inhabitants of other States or other specified areas is more correctly indicated by

## VITAL STATISTICS OF THE UNITED STATES

data reallocated to place of residence than by data based on deaths as recorded in each area. Table M shows the proportion of deaths of residents of each State that occurred in institutions and the comparable proportion for all deaths occurring in each State irrespective of place of residence. The table also gives these proportions for cities of 10,000 or more and for cities of 2,500 to 10,000 and rural.

For State totals, the proportion of recorded deaths occurring in institutions corresponds closely with the proportion of deaths of residents occurring in institutions. This statement does not apply, however, for urban or rural population groups. Considering deaths on the basis of place of occurrence, 51.4 percent of deaths in cities of 10,000 or more occurred in institutions but only 22.4 percent of the deaths in areas under 10,000 were institutional. Reallocating the data to place of residence, the corresponding figures become 47.6 for urban places and 28.1 for areas under 10,000. For some States, the differences are much greater. For example, in North Dakota, 69.4 percent of all deaths in cities of 10,000 or more occurred in hospitals or other institutions, but this figure is not indicative of the utilization of hospital facilities by urban residents of North Dakota since only 57.5 percent of the deaths of residents of such cities occurred in institutions. The opposite change is observed for the small cities and rural areas.

Table N gives a frequency distribution of States according to the percent of resident deaths that occurred in institutions in 1939. In two States less than 20 percent of all resident deaths occurred in institutions, and in two States and the District of Columbia 50 percent or more of these deaths occurred in institutions.

TABLE N.—FREQUENCY DISTRIBUTION OF STATES BY PERCENT OF RESIDENT DEATHS IN INSTITUTIONS: 1939

(Exclusive of stillbirths)

PERCENT OF DEATHS IN INSTITUTIONS	NUMBER OF STATES
10-19	2
20-29	12
30-39	17
40-49	15
50-59	5

The "institutional" grouping in tables L, M, and N is based on the institution index, and all types of hospitals, et cetera, are included under the broad term "institution." For deaths, the institutions are, for the most part, general hospitals. Table O shows for 1939 the number of deaths and the percent of these deaths occurring in each broad class of institution. Of the total number of deaths, 62.3 percent did not occur in an institution, 29.0 percent occurred in general hospitals, and 8.7 percent occurred in other types of hospitals and institutions. Reference should be made to the code outline on page 5 for the classification of specific types of institutions.

TABLE O.—RECORDED DEATHS IN INSTITUTIONS: UNITED STATES, 1939

(Exclusive of stillbirths)

TYPE OF INSTITUTION	Total deaths	Percent of total deaths
Total deaths	1,587,897	100.0
No institution	865,969	62.5
Total institution	525,928	37.7
Type of service:		
General	401,805	29.0
Maternal and infant	4,556	0.3
Tuberculosis	15,770	1.0
Other nonresident hospitals	26,154	1.9
Nonresident institutions	15,814	1.0
Mental institutions	41,203	3.0
Other resident institutions	22,626	1.6

BIRTHS ALLOCATED TO PLACE OF RESIDENCE

Summary for births.—Of a total of 2,265,588 births registered in the United States for 1939, 1,826,596 occurred in the city or county in which the mother of the child usually resided, and 438,992 (19.4 percent) were nonresident births. The proportion of total births that were of nonresidents is slightly greater than the proportion of nonresident deaths (14.1 percent). A large proportion of these nonresident births were to mothers who lived in rural areas or small cities and gave birth in more populous areas. Classified in broad population groups (as shown in table V), 304,286 (69.3 percent) of the nonresident births represent the movement to larger population groups; 73,869 (16.8 percent) represent the movement between areas in the same population-size group; and 60,837 (13.9 percent) represent the movement to smaller population-size groups. As might be expected, this movement from rural areas or small cities to larger urban places is largely an intrastate movement as only 28,027 (6.4 percent) of all nonresident mothers crossed State lines. However, in the case of deaths, a greater number of long-distant movements occurred and 27,223 (13.9 percent) of all nonresidents crossed State lines.

A summary of births by place of occurrence and by place of residence is given for States in table P. This table shows, for each State, the number of births registered as occurring

VITAL STATISTICS OF THE UNITED STATES

within the State; the total number of nonresident births within the State, that is, the number of births occurring in cities or counties of which the mother is not a resident; the number of these occurring to nonresident mothers who live in some other part of the same State; and the number to mothers living in other States. This table also shows the number of births of residents of each State occurring in other areas, and the total births of residents wherever occurring. For all States the total number of births occurring within the State is approximately equal to the total number of births of residents wherever occurring. In the District of Columbia the number of births occurring in the area is substantially greater than the number of births to residents of the area.

TABLE P.—BIRTHS OF NONRESIDENTS IN EACH STATE AND BIRTHS OF RESIDENTS IN OTHER STATES: 1939

(Exclusive of stillbirths. Deaths in South Dakota of nonresidents from other States were incompletely reported)

**Number of nonresident births.**—Although for the entire United States the nonresident births are 19.4 percent of all births, this proportion varies widely among States. In some States the percent of all births that are nonresident is less than 10 percent (West Virginia, 9.2, Kentucky, 7.8, and Alabama, 1.4), whereas in other States the percentage is above 35 percent (New Jersey, 42.8 and Nevada, 37.6). Table Q gives the total number of births occurring in each State and the number and percent that occurred in a city or county of which the mother was not a resident. The frequency distribution of this

percentage for States is given in table R. Three States had less than 10 percent of nonresident births and 19 States had more than 25 percent.

TABLE Q.—BIRTHS OF NONRESIDENTS AND PERCENT OF TOTAL RECORDED BIRTHS: EACH STATE, 1939

TABLE R.—FREQUENCY DISTRIBUTION OF STATES BY PERCENT OF NONRESIDENTS AMONG TOTAL RECORDED BIRTHS: 1939

(Exclusive of stillbirths)

PERCENT NONRESIDENTS	NUMBER OF STATES
0-4	1
5-9	2
10-14	10
15-19	11
20-24	6
25-29	11
30-34	6
35-39	1
40-44	1

The proportion of nonresident births varies greatly for different population-size groups. Since many births are nonresident because of the use of urban hospitals by residents of rural areas, it is to be expected that there will be a high proportion of nonresident births in cities. Table S, which gives the proportion of nonresident births for each population-size group, indicates that the proportion of nonresident births is greatest for cities having populations below 100,000. Large cities having populations of over 100,000 have practically the same proportion of nonresident births as the total United States, whereas rural areas have a much smaller proportion.

TABLE S.—PERCENT OF NONRESIDENTS AMONG TOTAL RECORDED BIRTHS BY POPULATION GROUPS: 1939

(Exclusive of stillbirths)

POPULATION GROUP	PERCENT NONRESIDENTS
UNITED STATES	19.4
Cities of 100,000 or more	16.2
Cities of 25,000 to 100,000	30.5
Cities of 10,000 to 25,000	35.9
Cities of 2,500 to 10,000	35.9
Rural	9.8

# INTRODUCTION

Table T gives the total number of births occurring in each city of 100,000 or more, and the number and percent that were of nonresidents of the city. The variation for individual cities is greater than that for States. New York, N. Y., has the smallest percent (2.8) of nonresident births, and Camden, N. J., has the highest percent (47.5). For most of the 93 cities, between 10 and 20 percent of the births are of nonresidents. In only 9 cities are there less than 10 percent, while 23 cities have more than 25 percent. The frequency distribution of cities with reference to the percent of nonresident births is given in table U. Since many factors contribute to the number of nonresident births occurring in a community, a careful study of local conditions is necessary to explain such large differences as are noted. Important factors are: the number and location of hospitals in suburbs surrounding a given city; the density of population in adjacent rural areas and the distance to other cities; the extent to which hospital facilities are available or utilized by inhabitants of the area; et cetera.

**Changes in birth statistics for population-size groups.**—The effect of the reallocation of births to place of residence upon data classified by population-size groups is shown in table V. This table shows the complete reallocation from place of birth to place of residence for these groups. The designations in the table stub refer to the place of birth, and reading horizontally the table gives the total number of births occurring in each population group, the number of these that were of residents of the place of birth, and the number that were of nonresidents. The nonresidents are subdivided according to their place of residence. Reading vertically, the table gives the total number of births of residents in each population group. This number is divided into births of residents who were born at the place of residence and of residents born elsewhere. The births of residents born elsewhere are classified according to the area in which birth occurred.

The structure of this table may be clarified by an illustration. In cities having populations of 100,000 or more there were 653,583 births recorded for 1939. A large majority (547,865) of these births were to residents of the city in which birth occurred. A smaller number (105,718) were to persons not resident of the city in which the birth occurred. Of these 105,718 births to nonresidents in cities of 100,000 or more, 4,574 were to residents of other cities of 100,000 or more; 15,944, residents of cities of 25,000 to 100,000; 15,122, residents of cities of 10,000 to 25,000; 18,201, residents of cities of 2,500 to 10,000; and 51,877, residents of rural areas.

TABLE V.—ALLOCATION OF BIRTHS TO PLACE OF RESIDENCE, BY POPULATION GROUPS: UNITED STATES, 1939

(Exclusive of stillbirths)

PLACE OF OCCURRENCE	Total births	Births of residents in area	Total births of non-residents	PLACE OF RESIDENCE IN ANY STATE BY—

VITAL STATISTICS OF THE UNITED STATES

The data given in a column of the table refer to the distribution of residents of a population-size group classified according to the place of birth. For example, there were 574,502 births to residents of cities having populations of 100,000 or more. Of these, 547,865 occurred in the cities in which the mothers were residents, and 26,637 occurred in other areas. The 26,637 births occurred in the following places: 4,574, in cities of 100,000, but not in the specific cities of which the mothers were residents; 7,425, in cities of 25,000 to 100,000; 2,971, in cities of 10,000 to 25,000; 3,998, in cities of 2,500 to 10,000; and 7,669, in rural areas.

A careful study of table V reveals general information concerning the areas from which nonresident mothers came and the areas to which they went. More specific details regarding the nonresident movement for individual States, cities, and counties can be obtained from the general tables.

The data given in table V are summarized in table W, which shows the number of births to residents of each population-size group and the number of births occurring in each size group. The ratio in the final column of table W indicates the importance of the difference between data classified by place of occurrence and by place of residence. When the birth data for 1939 were classified by place of occurrence, the number of births for cities of 25,000 to 100,000 was 122.2 percent of the number of births to residents of those areas. For rural areas, the births classified by place of occurrence were only 82.5 percent of the total number of births to rural residents. All of the urban groups show a much larger number of births by place of occurrence than by place of residence.

TABLE W.—BIRTHS OF RESIDENTS AND BIRTHS OCCURRING IN POPULATION-SIZE GROUPS: UNITED STATES, 1939

POPULATION-SIZE GROUP	(Exclusive of stillbirths)		
	Total births of residents	Total births in area	Ratio of recorded births to resident births
Cities of 100,000 or more	574,502	655,585	113.8
Cities of 25,000 to 100,000	223,511	273,186	122.2
Cities of 10,000 to 25,000	168,666	200,634	119.0
Cities of 2,500 to 10,000	229,139	255,106	111.3
Rural	1,069,770	883,079	82.5

Similar ratios are given in table X for individual cities of 100,000 or more. Although there are a few exceptions, most cities of this size have more recorded births than resident births. Exceptions to this general rule are Birmingham, Ala.; Chicago, Ill.; Grand Rapids, Mich.; Los Angeles, Calif.; Miami, Fla.; Reading, Pa.; Somerville, Mass., and Tampa, Fla. The ratio of recorded births to resident births ranges from 79.6 percent for Somerville, Mass., to 183.4 percent for Camden, N. J.

BIRTHS IN HOSPITALS

Table Y shows for each State the proportion of all recorded births and the proportion of nonresident births occurring in hospitals. In Alabama, Arkansas, Kentucky, Mississippi, South Carolina, and West Virginia, less than 20 percent of all recorded births occurred in hospitals. In certain other States, the proportion of recorded births occurring in hospitals is very high. In Connecticut, the percentage was 87.9; in New York, 84.6; in Washington, 83.0; in California, 82.8; in Massachusetts, 81.5; and in New Jersey, 80.4. In the United States 51.1 percent of all births recorded in 1939 were hospital births.

For nonresident births the table shows a much higher proportion of hospital cases. In the United States, 85.1 percent of all nonresident births occurred in hospitals, and in 16 States and the District of Columbia this percentage was over 90. Some of the States having the highest percentages are: Connecticut and Massachusetts, 98.6; New York and Rhode Island, 98.3; and New Jersey, 98.0. The District of Columbia had a percentage of 99.8.

The use of hospitals for confinements by the inhabitants of any area is more correctly indicated by data reallocated to place of residence than by data based on place of birth. This information for States and certain population-size groups is given in table Z, which shows the proportion of resident births of each area occurring in hospitals and the proportion of the recorded births in each area occurring in hospitals. For State totals, reallocation to place of residence does not greatly change the proportions, but for cities of 10,000 or more as a group and for cities of 2,500 to 10,000 and rural areas as a group, as shown in table Z, there are marked changes. Although much greater changes can be observed for certain States, the general effect of reallocation can be seen from the national figures. Tabulated by place of occurrence, 80.7 percent of the births in cities of 10,000 or more and 21.8 percent of births in cities of 2,500 to 10,000 and rural places, were hospital births. When the data are reallocated to place of residence, 77.6 percent of the births to residents of cities of 10,000 or more and 31.5 percent of the births to residents of cities of 2,500 to 10,000 and rural areas, occurred in hospitals.

Table AA gives a frequency distribution of the States according to the proportion of resident births occurring in hospitals. In six States less than 20 percent of the resident births occurred in hospitals, while in seven States resident births in hospitals were 80 percent or more of all resident births.

The hospital coding and classification for birth statistics is not based on the institution code used for mortality. The births are coded with a simple code that indicates only whether or not the birth took place in a hospital or other institution.

Detailed statistics of births by type of attendance are given in table 7. The total number of births by place of occurrence and by place of residence are shown for each city and county of each State. Four types of attendants are distinguished in these tabulations: physician not in a hospital, physician in a hospital, midwife, and other or unspecified attendant.

TABLE AA.—FREQUENCY DISTRIBUTION OF STATES BY PERCENT OF RESIDENT BIRTHS IN HOSPITALS: 1939

PERCENT OF BIRTHS IN HOSPITALS	NUMBER OF STATES
10-19	6
20-29	5
30-39	4
40-49	5
50-59	13

NOTE.—Certain cities listed in this table are located in more than one county. In these cases, figures for the county include only the figures for that part of the city in the county. Total figures for each of these cities are shown under the county containing the larger proportion of the city's population. Totals for Amarillo, Tex., are shown under Potter County; Atlanta, Ga., under Fulton County; Bethlehem, Pa., under Northampton County; Centralia, Ill., under Marion County; Elgin, Ill., under Kane County; Ellwood City, Pa., under Lawrence County; Fostoria, Ohio, under Seneca County; Huntington, W. Va., under Cabell County; Joplin, Mo., under Jasper County; Rocky Mount, N. C., under Nash County; St. Cloud, Minn., under Stearns County; Watertown, Wis., under Jefferson County; and Youngstown, Ohio, under Mahoning County.

<sup>1</sup> Inasmuch as nonresidents of one city or county in the State may be residents of some other city or county in the same State, the State totals indicate the number of persons born within the State who were not residents of the particular place of birth, but do not indicate the number of nonresidents of the entire State.

<sup>2</sup> See note 1; the same explanation applies to deaths.

<sup>3</sup> Inasmuch as nonresidents of a city may be residents of the county in which the city is located and vice versa, it is not possible to add the rural and city figures to obtain the total for the county.

<sup>4</sup> Includes data for Texarkana, Ark., only.

<sup>5</sup> The place of residence of persons dying in areas within the State other than their place of residence was incompletely reported for Kentucky in 1939, resulting in an understatement of the total number of nonresident deaths within the State.

<sup>6</sup> Beginning with 1939, data are not available for Bronx, Kings, New York, Queens, and Richmond Counties, which are coextensive with the boroughs comprising New York (city).

<sup>7</sup> The allocations of the number of births and deaths between Oklahoma City and the rural part of Oklahoma County in 1939 are inconsistent with those of preceding years. However, total figures for the county are consistent.

<sup>8</sup> Includes data for Bristol, Tenn., only.

<sup>9</sup> Includes data for Texarkana, Tex., only.

<sup>10</sup> Cities of Virginia are independent, each having the same status as a county. Cities of 10,000 inhabitants or more include: Charlottesville, Alexandria, Staunton, Lynchburg, Petersburg, Winchester, Richmond, Suffolk, Norfolk, Portsmouth, Danville, Hopewell, Roanoke, and Newport News.

<sup>11</sup> Includes data for Bristol, Va., only.

<sup>12</sup> Includes data for Bluefield, W. Va., only.

NOTE.—Certain cities listed in this table are located in more than one county. In these cases, figures for the county include only the figures for that part of the city in the county. Total figures for each of these cities are shown under the county containing the larger proportion of the city's population. Totals for Amarillo, Tex., are shown under Potter County; Atlanta, Ga., under Fulton County; Bethlehem, Pa., under Northampton County; Centralia, Ill., under Marion County; Elgin, Ill., under Kane County; Ellwood City, Pa., under Lawrence County; Fostoria, Ohio, under Seneca County; Huntington, W. Va., under Cabell County; Joplin, Mo., under Jasper County; Rocky Mount, N. C., under Nash County; St. Cloud, Minn., under Stearns County; Watertown, Wis., under Jefferson County; and Youngstown, Ohio, under Mahoning County.

NOTE.—Certain cities listed in this table are located in more than one county. In these cases, figures for the county include only the figures for that part of the city in the county. Total figures for each of these cities are shown under the county containing the larger proportion of the city's population. Totals for Amarillo, Tex., are shown under Potter County; Atlanta, Ga., under Fulton County; Bethlehem, Pa., under Northampton County; Centralia, Ill., under Marion County; Elgin, Ill., under Kane County; Ellwood City, Pa., under Lawrence County; Fostoria, Ohio, under Seneca County; Huntington, W. Va., under Cabell County; Joplin, Mo., under Jasper County; Rocky Mount, N. C., under Nash County; St. Cloud, Minn., under Stearns County; Watertown, Wis., under Jefferson County; and Youngstown, Ohio, under Mahoning County.

## VITAL STATISTICS OF THE UNITED STATES

TABLE 13.—DEATHS UNDER 1 YEAR OF AGE FROM SELECTED CAUSES, BY POPULATION GROUPS, AND FOR ALL CAUSES BY RACE: UNITED STATES AND EACH STATE, 1939
