Conversation: public comment on Bisphenol A

Subject: public comment on Bisphenol A

It seems to me that the entire philosophy behind the continued use of BPA in food products and containers is flawed. Evidence seems to suggest that there is a potential danger to BPA's use, however the public is told to wait until the evidence is confirmed. Normal I would think that since there is evidence of a danger to public health government and industry should act on the side of caution and restrict BPA's use or at the very least require labeling to allow the public to make an informed decision. Given the amount of concern and the prolific use of BPA it seems to me that NTA should act as soon as possible with a recommendation and government control of the use of this industrial chemical in food containers.

Sincerely,

Scott Winter
