GOALS of Liver Disease Effects Lecture

- Estimation of **Hepatic Clearance**
- Effect of **Liver Disease** on Elimination:
 - *RESTRICTIVELY* Eliminated Drugs
 - *NON-RESTRICTIVELY* Eliminated Drugs
- **Other Effects** of Liver Disease:
 - Renal Function
 - Drug Distribution
 - Drug Response
- **Modification of Drug Therapy** in Patients with Liver Disease

ADDITIVITY of Clearances

$$CL_E = CL_R + CL_{NR}$$

ESTIMATED FROM
PLASMA LEVEL-
VS.-TIME CURVE

ESTIMATED FROM
RECOVERY OF
DRUG IN URINE

ESTIMATED
AS $CL_E - CL_R$

CALCULATION OF CL_H

$$CL_H = CL_E - CL_R$$

ASSUMES $CL_H = CL_{NR}$

FICK EQUATION

$$Cl = Q \left[\frac{A - V}{A} \right]$$

$$E = \left[\frac{A - V}{A} \right]$$

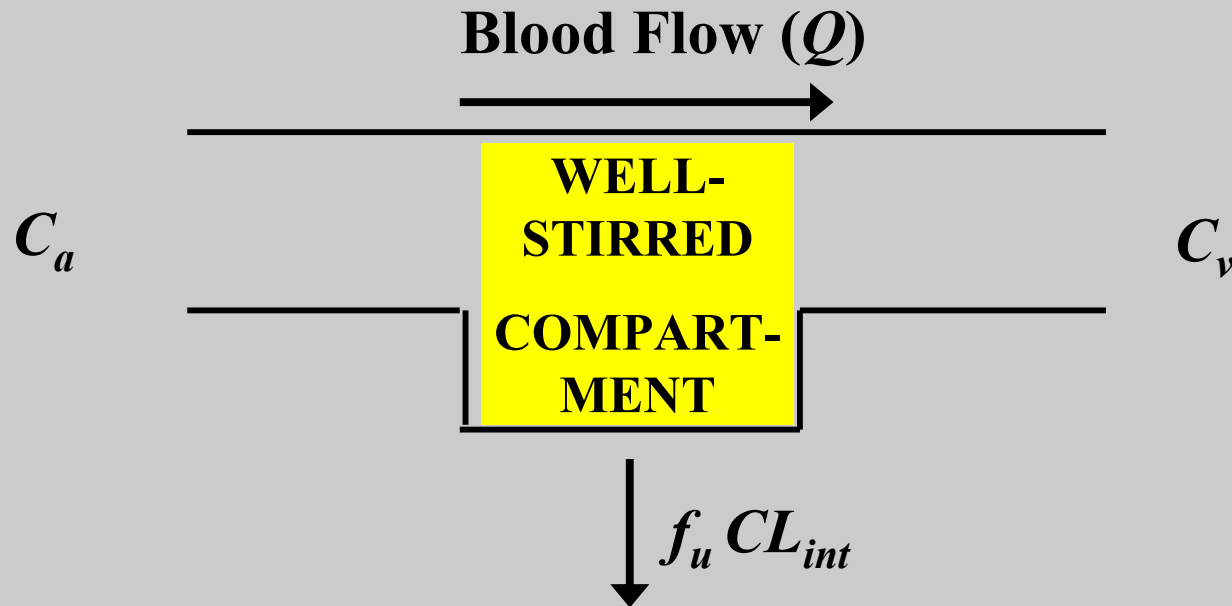

$$\text{So } Cl = Q \bullet E$$

A = CONCENTRATION ENTERING LIVER

V = CONCENTRATION LEAVING LIVER

Q = HEPATIC BLOOD FLOW

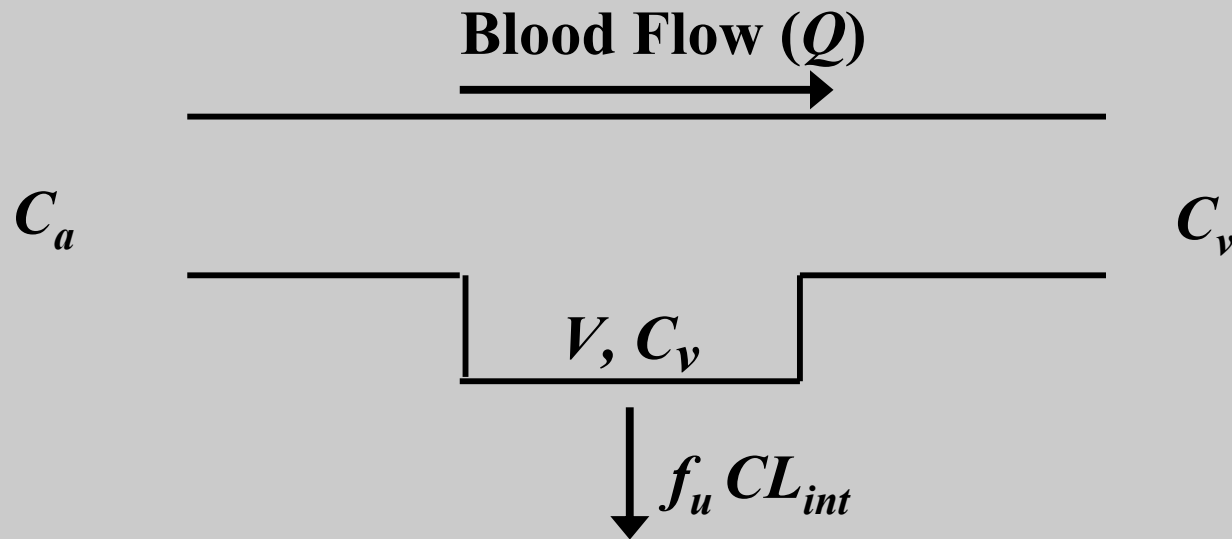

Derivation of *ROWLAND EQUATION (I)*

f_u = FRACTION OF DRUG THAT IS UNBOUND

CL_{int} = HEPATIC CLEARANCE IN ABSENCE
OF BINDING RESTRICTION

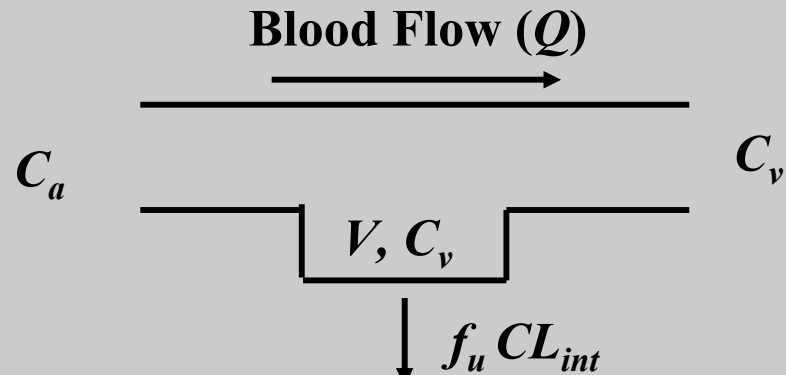

Derivation of *ROWLAND EQUATION (II)*

MASS BALANCE EQUATION :

$$V \frac{dC_v}{dt} = QC_a - QC_v - f_u CL_{int} C_v$$

Derivation of *ROWLAND EQUATION (III)*

at steady state :

$$QC_a - QC_v - f_u CL_{int} C_v = 0$$

so :

$$Q(C_a - C_v) = f_u CL_{int} C_v$$

$$QC_a = (Q + f_u CL_{int}) C_v$$

therefore :

$$ER = \frac{C_a - C_v}{C_a} = \frac{f_u CL_{int}}{Q + f_u CL_{int}}$$

ROWLAND EQUATION *WELL-STIRRED COMPARTMENT*

$$CL_H = Q \cdot E = Q \cdot \left[\frac{f_u CL_{int}}{Q + f_u CL_{int}} \right]$$

TWO LIMITING CASES:

RESTRICTIVELY METABOLIZED DRUGS ($Q \gg f_u CL_{int}$):

$$CL_H = f_u CL_{int}$$

NON-RESTRICTIVELY METABOLIZED DRUGS ($f_u CL_{int} \gg Q$):

$$CL_H = Q$$

•
•
•

RESTRICTIVELY and NON-RESTRICTIVELY Eliminated Drugs

RESTRICTIVELY METABOLIZED DRUGS:

Phenytoin

Warfarin

Theophylline

NON-RESTRICTIVELY METABOLIZED DRUGS:

Lidocaine

Propranolol

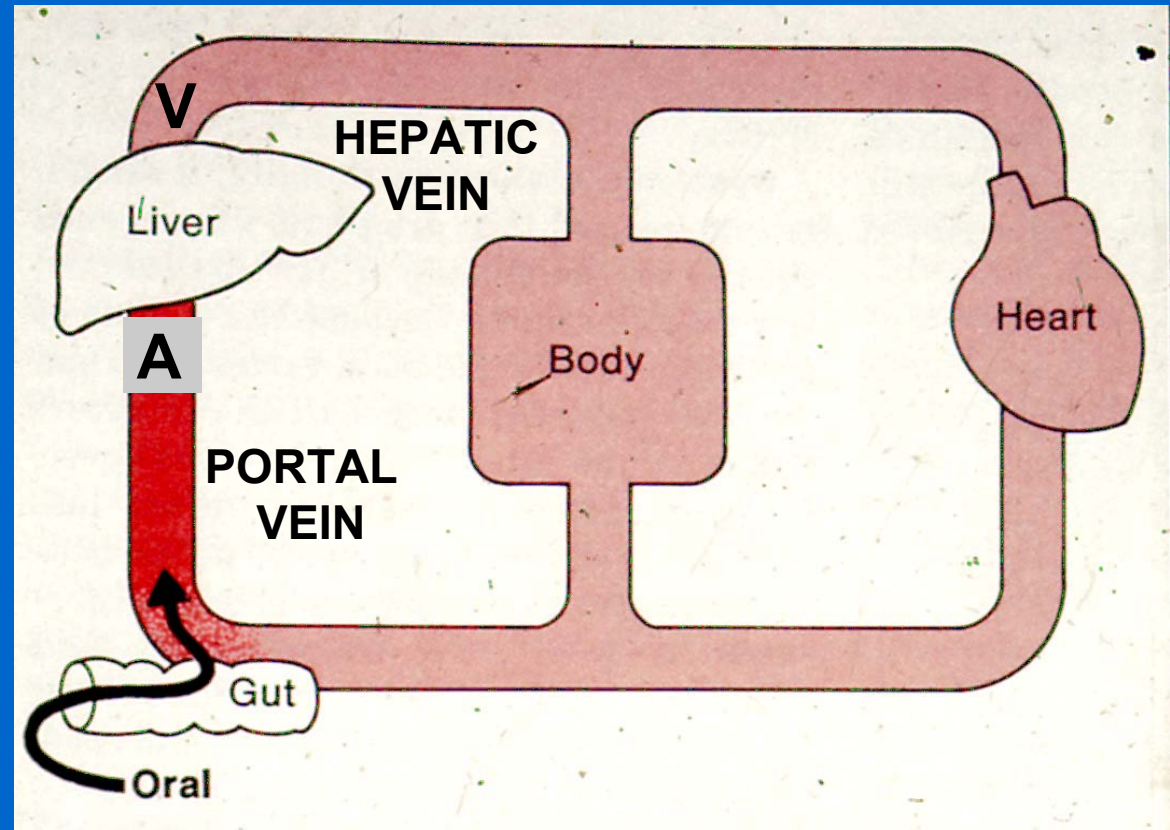

Morphine

HEPATIC *FIRST-PASS* METABOLISM

$$E = \frac{A - V}{A}$$

IF $E = 1$: $V = 0$

IF $E = 0$: $V = A$

•
•
•

NON-RESTRICTIVELY Eliminated Drugs

$$Cl_H = Q = Q \cdot ER$$

$$\text{FOR : } ER = \left[\frac{A - V}{A} \right] \Rightarrow 1, V \Rightarrow 0$$

$$\text{BUT : } F = 1 - ER, \text{ So } F \Rightarrow 0$$

THESE DRUGS HAVE EXTENSIVE FIRST-PASS METABOLISM

ACUTE VIRAL HEPATITIS

- Acute inflammatory condition
- Mild and ***transient changes*** related to extent of disease in most cases. Infrequently severe and fulminant
- *May become chronic* and severe
- Changes in drug disposition less than in chronic disease
- ***Hepatic elimination returns to normal*** as disease resolves

CHRONIC LIVER DISEASE

- Usually related to **chronic alcohol use** or **viral hepatitis**
- *Irreversible* hepatocyte damage
 - Decrease in *SERUM ALBUMIN* concentration
 - Decrease in *INTRINSIC CLEARANCE* of drugs
 - Intrahepatic and extrahepatic *shunting* of blood from functioning hepatocytes
 - *FIBROSIS* disrupts normal hepatic architecture
 - *NODULES* of regenerated hepatocytes form

RESTRICTIVELY Metabolized Drugs:

Effects of **LIVER DISEASE**

$$CL_H = f_u CL_{int}$$

| | CL_H | FREE CONC. |
|------------------------|--------|------------|
| ↓ ALBUMIN | ↑ | NO CHANGE |
| ↓ CL_{int} | ↓ | ↑ |
| PORTOSYSTEMIC SHUNTING | ↓ | ↑ |

•
•
•

***RESTRICTIVELY* Metabolized Drugs: Effect of PROTEIN BINDING Changes**

$$\bar{C}_{ss} = \frac{\text{DOSE} / \tau}{CL_H}$$

FOR RESTRICTIVELY ELIMINATED DRUGS :

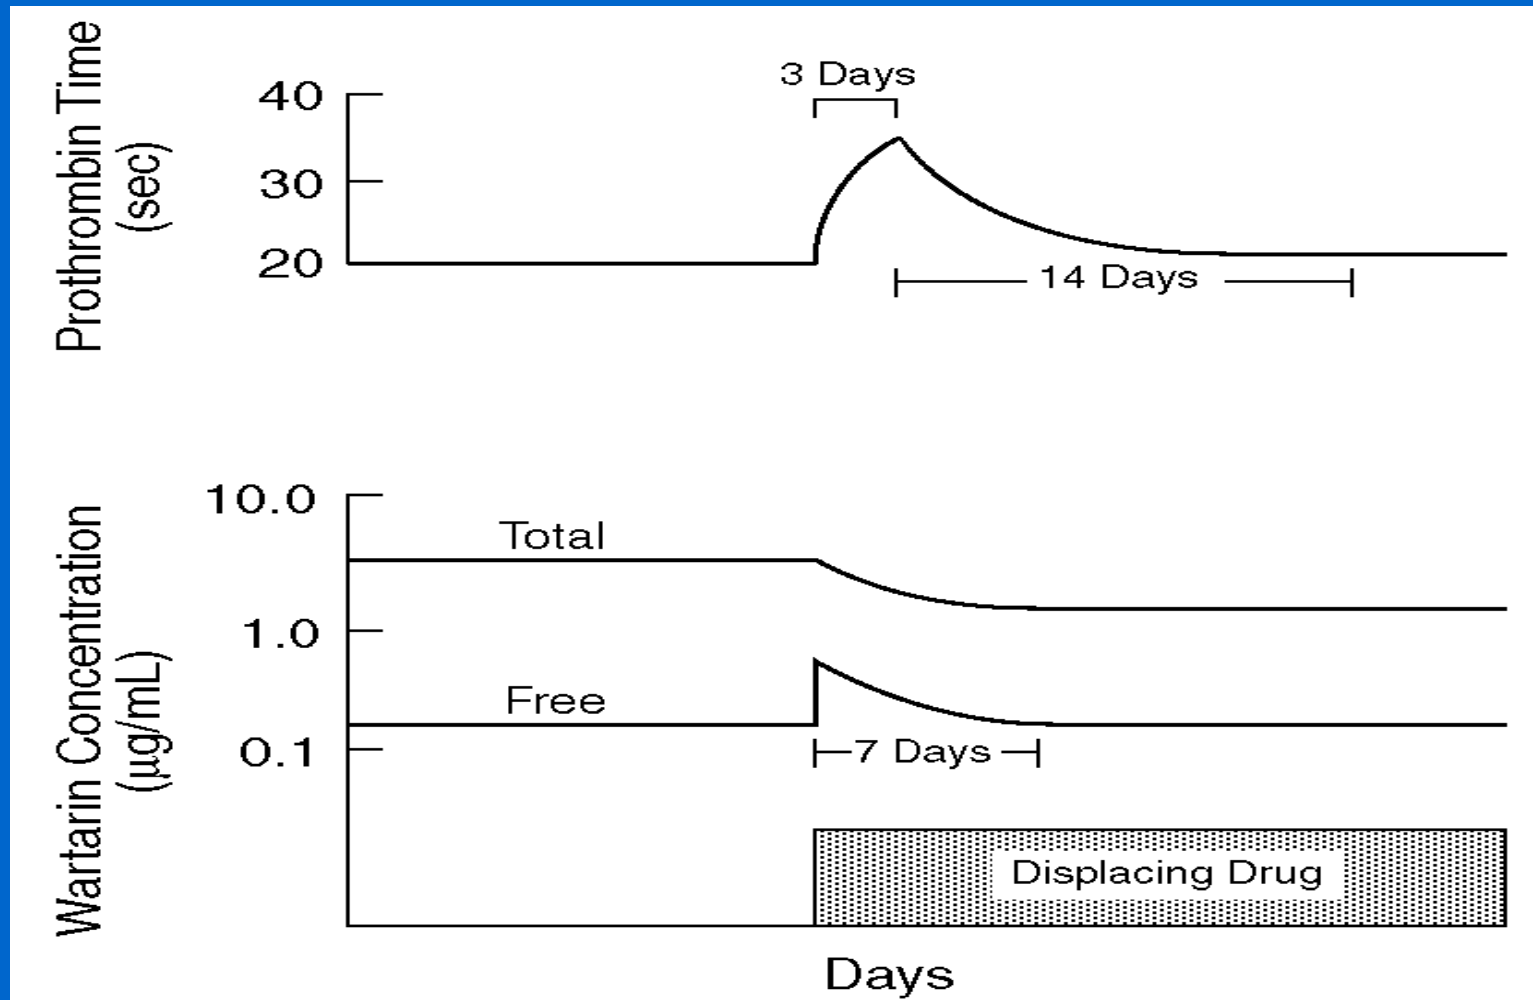

$$CL_H = f_u CL_{int}$$

$$\text{FREE CONC.} = \bar{C}_{ss} \cdot f_u = \frac{f_u \text{DOSE} / \tau}{f_u CL_{int}}$$

FREE and *TOTAL* PHENYTOIN Levels (DOSE = 300 MG/DAY)
