

Scientific Evaluation of the Clinical Validity and Utility of Genetic and Genomic Risk Factor Information

**Geoffrey S Ginsburg, MD, PhD
Director, Center for Genomic Medicine
Duke Institute for Genome Sciences & Policy**

**Personal Genomics
December 17-18, 2008**

The 'Translational Continuum' for Biomarkers

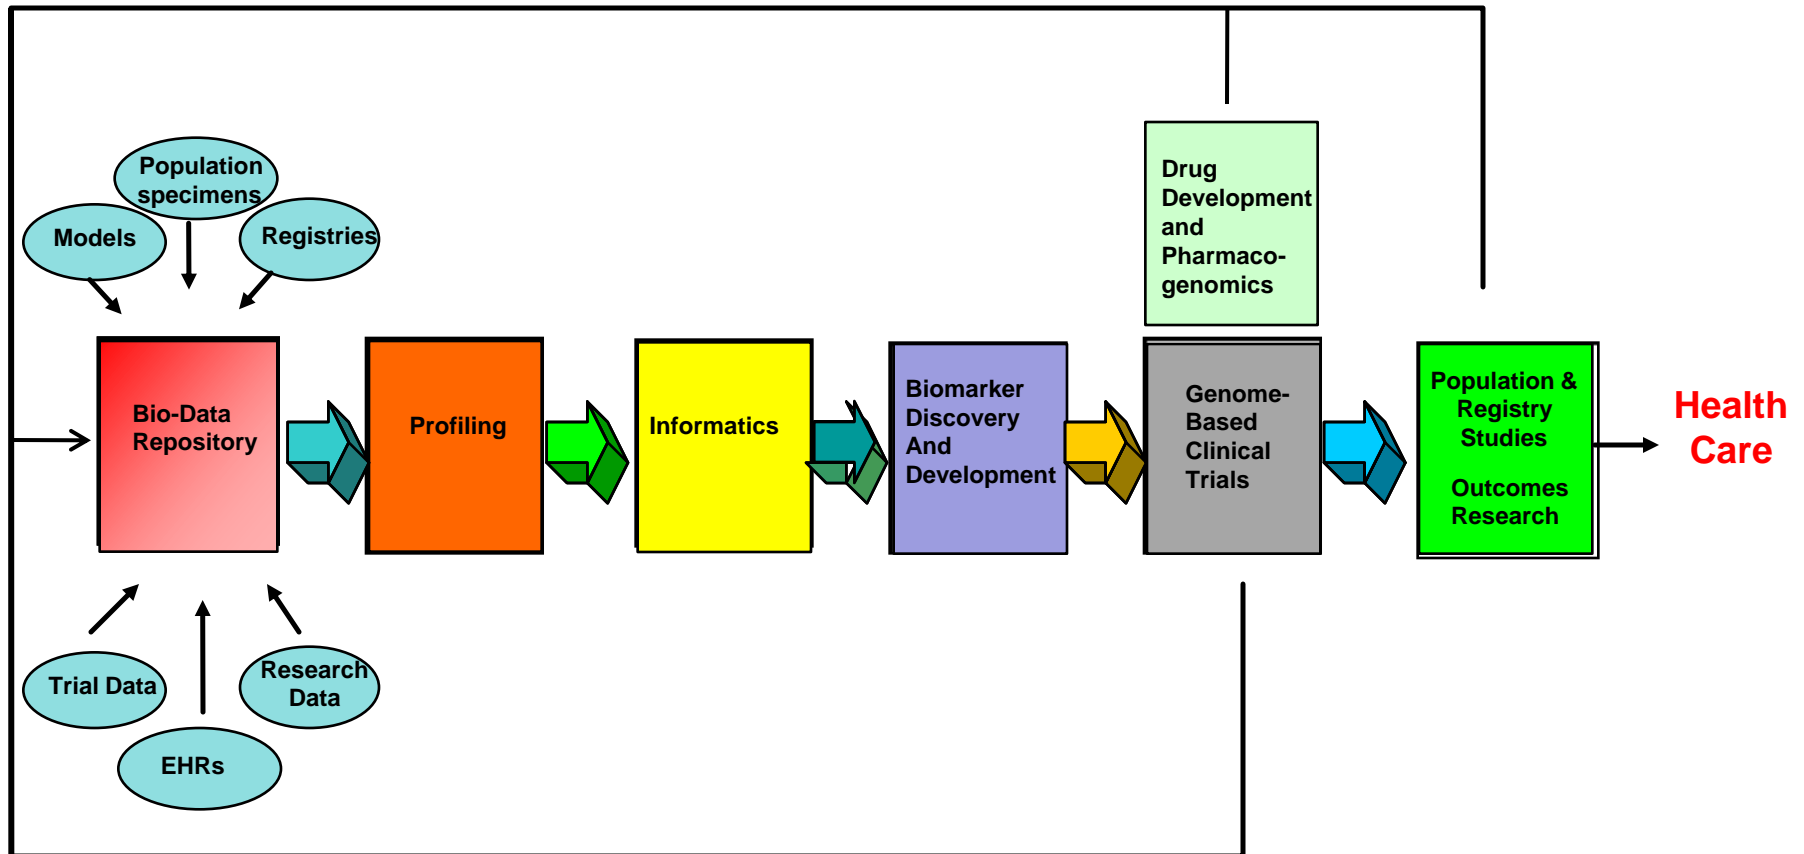

8 -20+ years

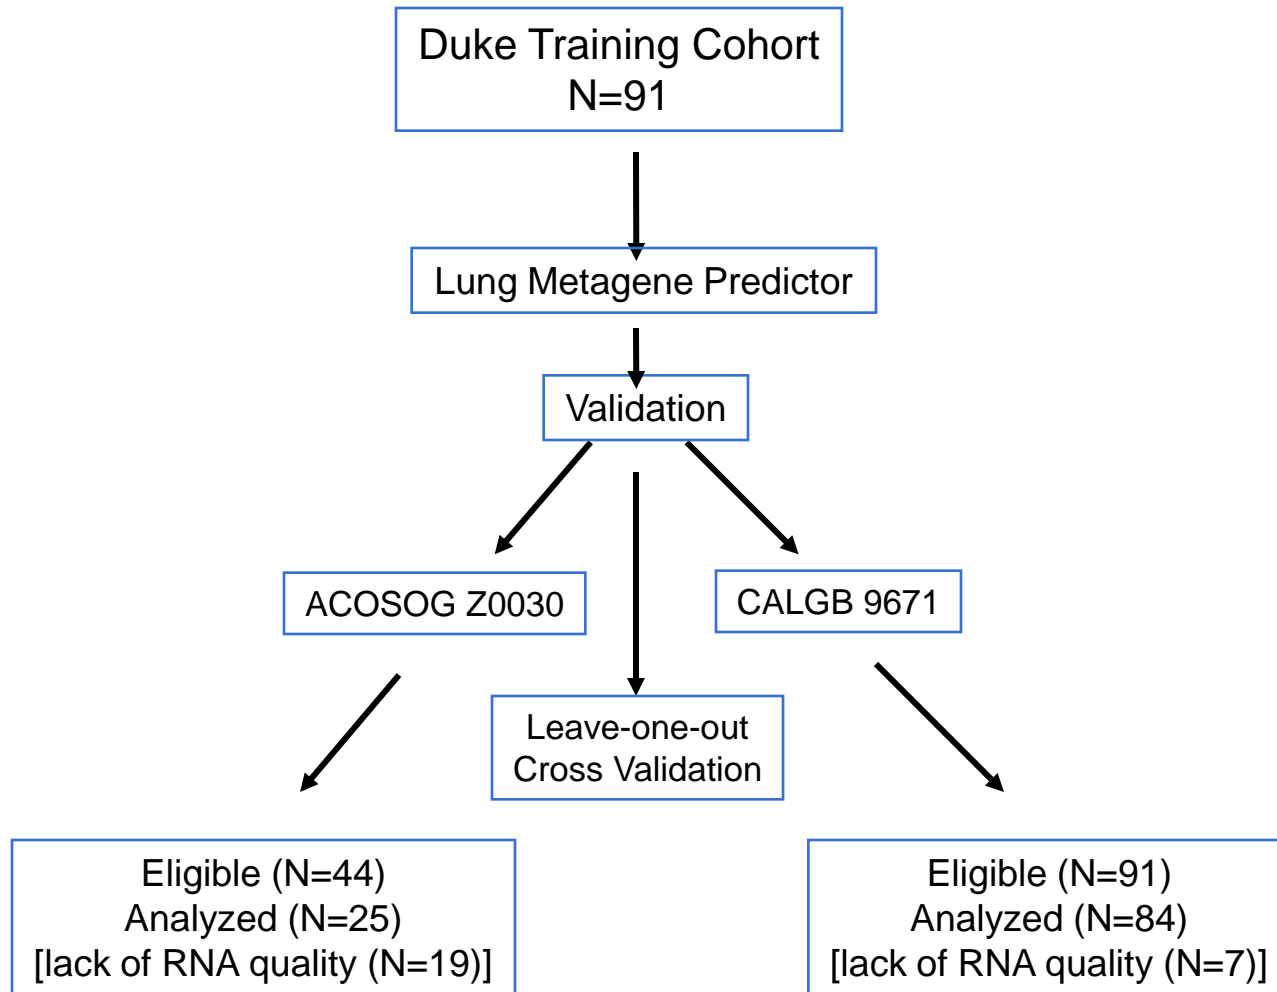

Building the Infrastructure to Make this Work

- Biobanking
 - Coordinated efforts
 - Operational and informatics support
 - Standards
- Genomic Technologies
 - Core laboratories
 - Economies of scale
- Informatics
 - Reliable, interoperable EHRs
 - Integration of research, clinical, molecular data
- Biostatistics
 - Critical shortage must be addressed
 - Physician training in quantitative skills
- Decision Making
 - Understanding of human decision making
 - Biological, psychological and social factors
 - Education of health care professionals

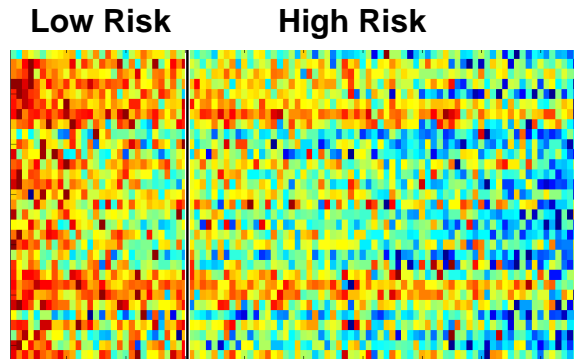

Enabling Genomics From Discovery to Health Applications

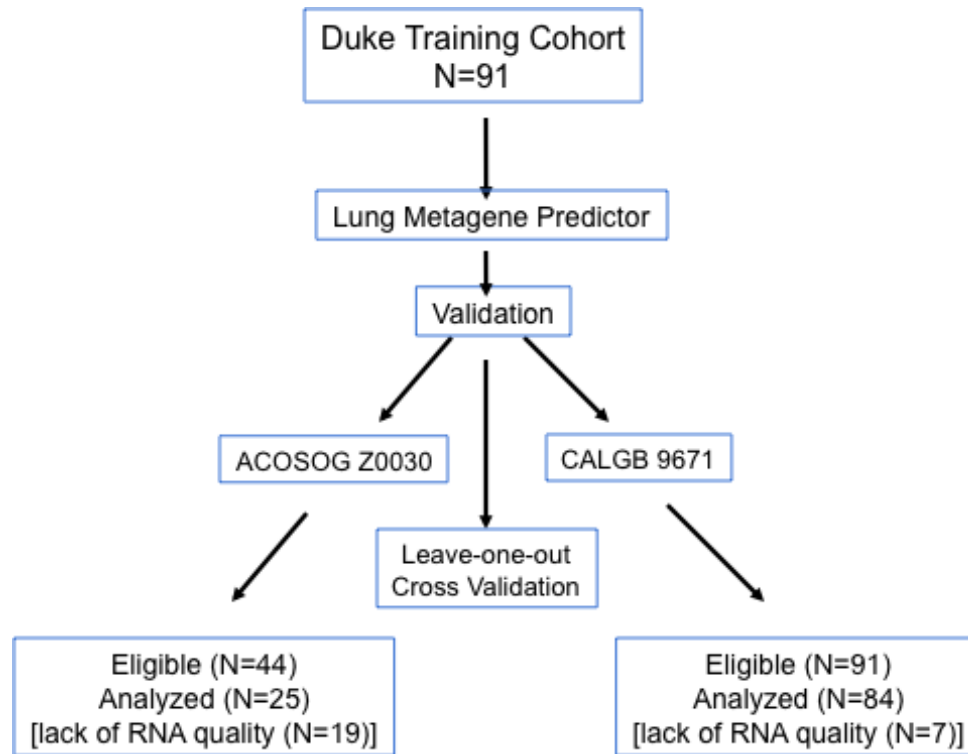

Lung Cancer *Prognosis* Genomic Signatures: The General Approach

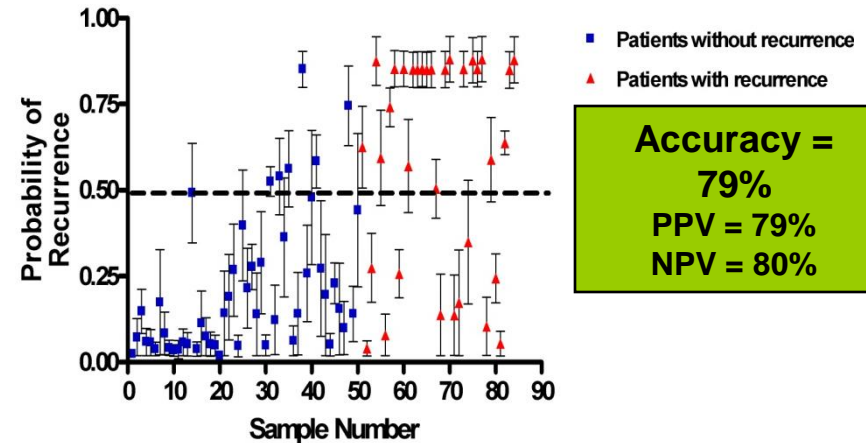

A Metagene Predictor of Recurrence

Independent Validation

Validation Set CALGB (n = 84)

Accuracy = 79%
PPV = 79%
NPV = 80%

An Opportunity to Improve Prognosis in Lung Cancer

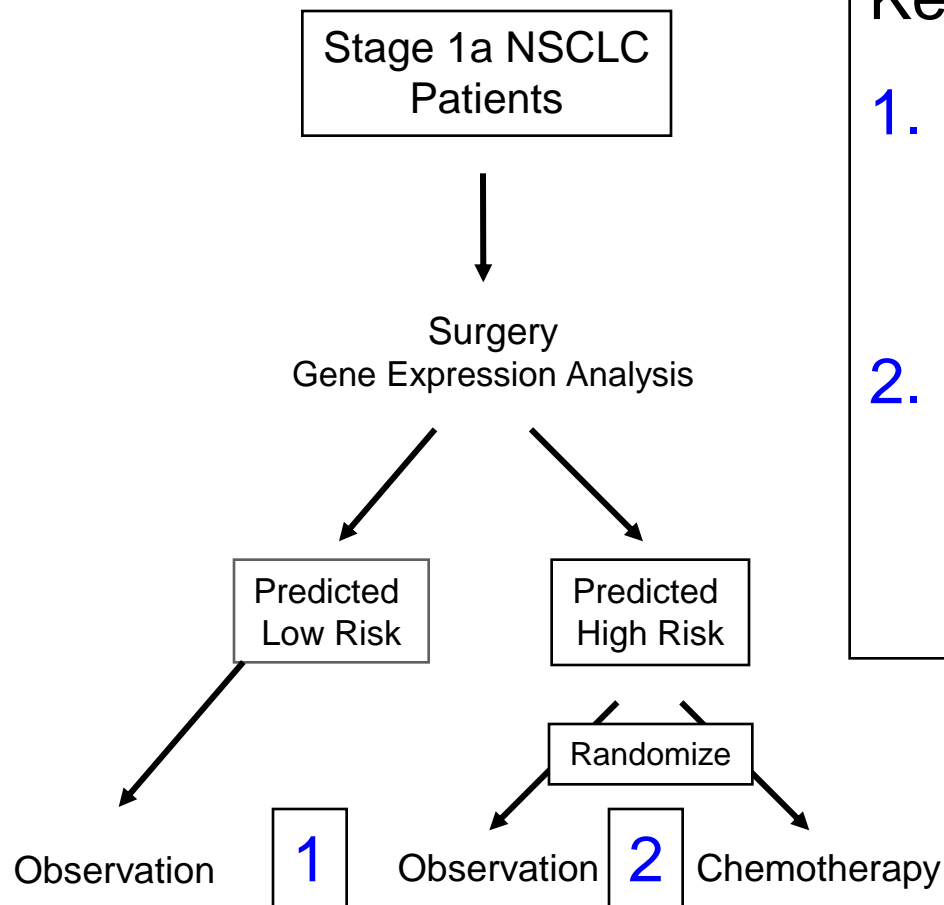

Stage Ia: Observation

Stage Ib-III: Adjuvant Therapy

CALGB 30506 - A Phase III Trial to Evaluate Genomic Prognosis

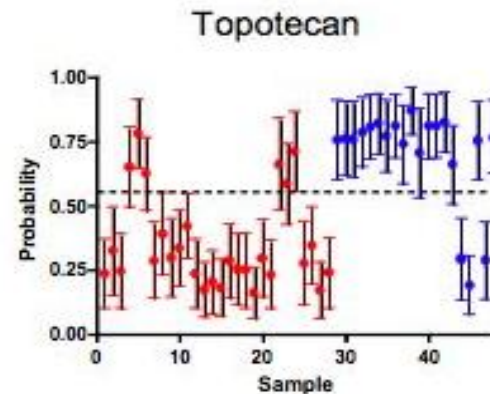

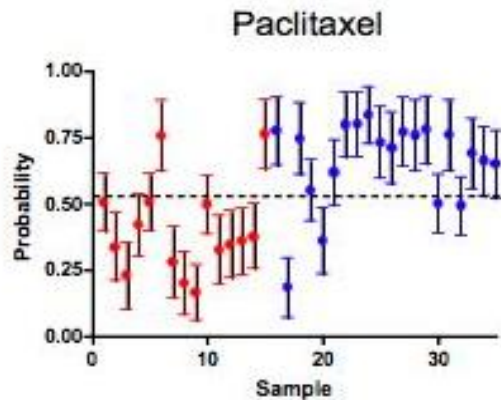

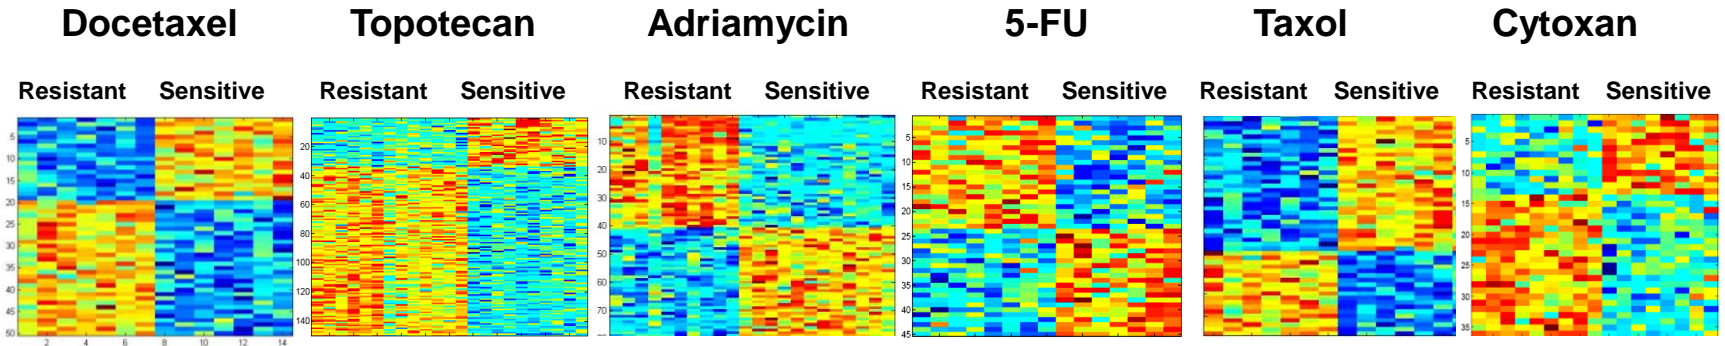

Key Points:

1. Does the genomic assay accurately predict low vs high risk?
2. Do patients predicted to be at high risk for recurrence benefit from chemotherapy?

Approved by NIH/NCI/CTEP

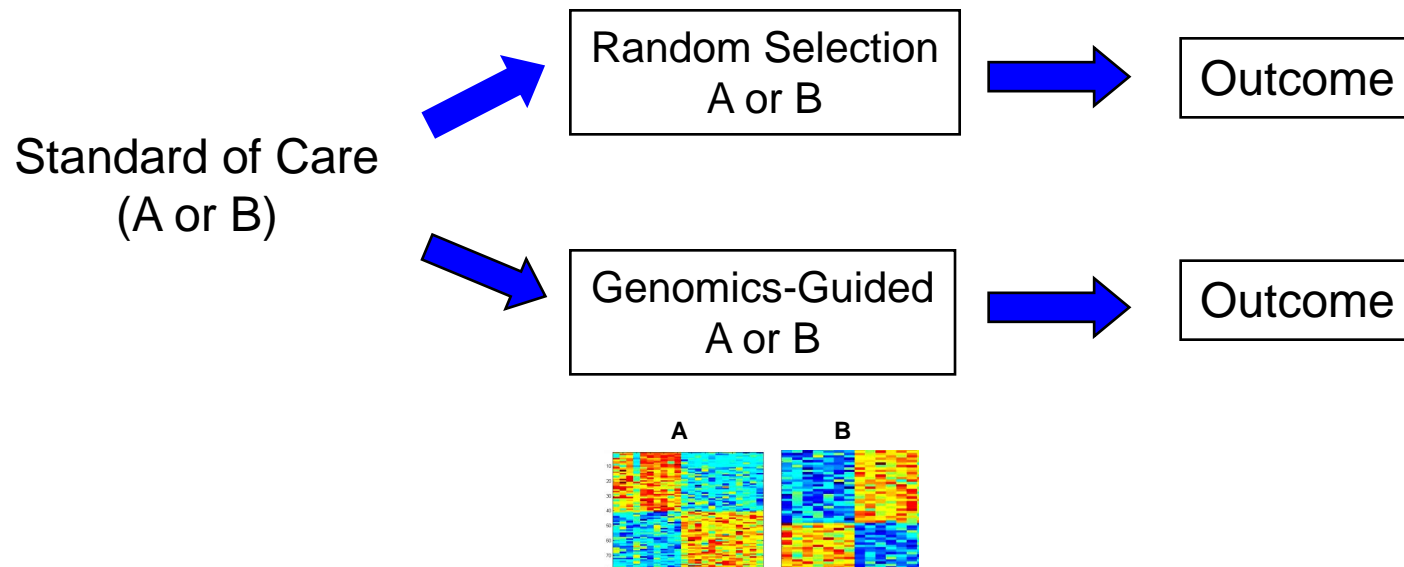

Initiates in early 2009

A Panel of Signatures to Guide the Use of Cytotoxic Chemotherapies

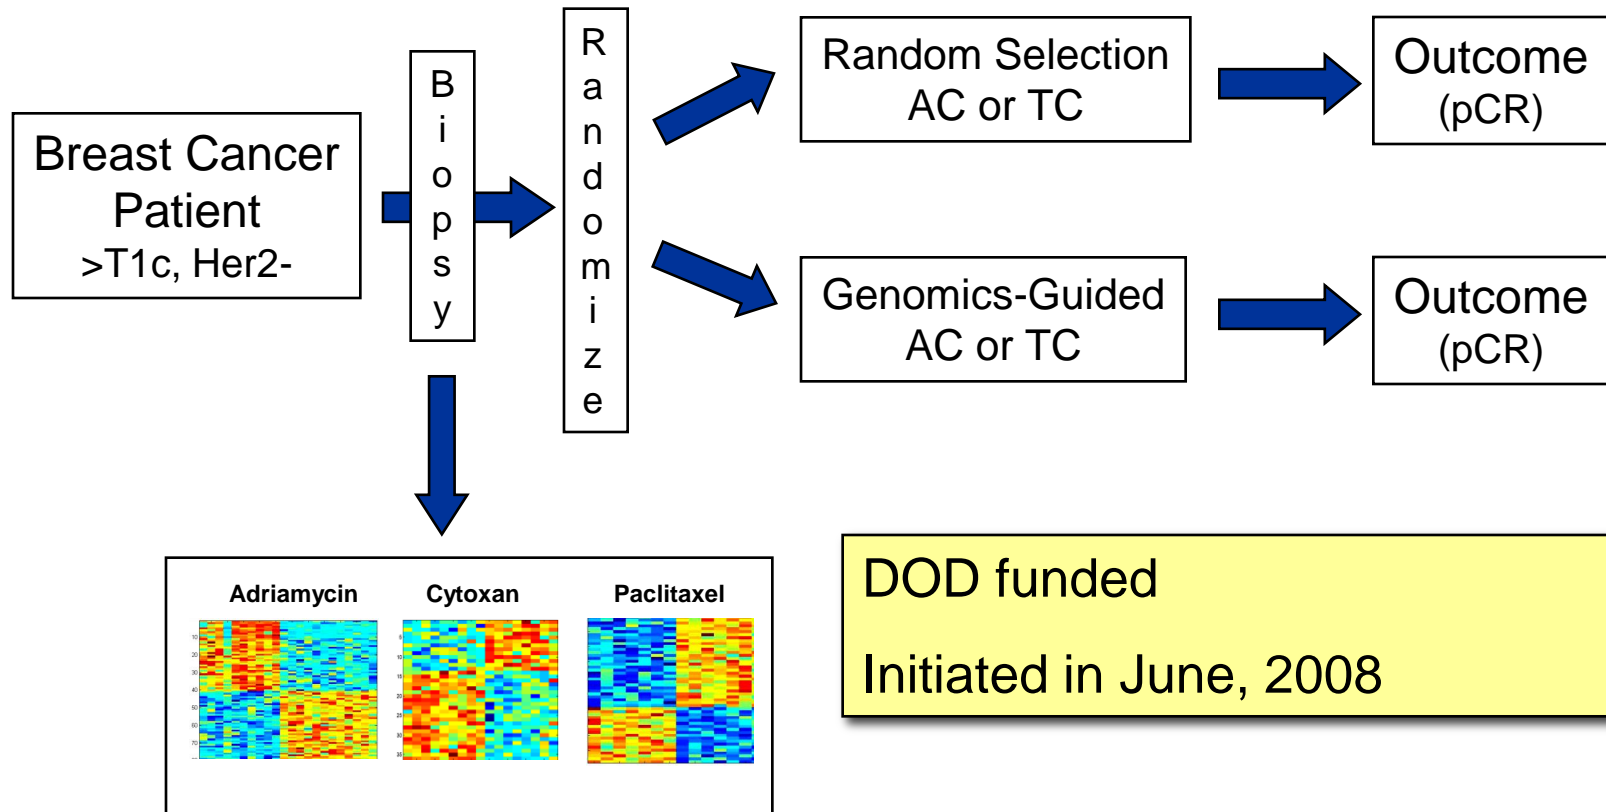

> 600 In vivo validations were performed for adriamycin, paclitaxel, gemcitabine, cyclophosphamide and topotecan
(Nature Medicine, 2006)

A Prototype for Clinical Utility Studies: Guiding *Standard of Care* Therapies

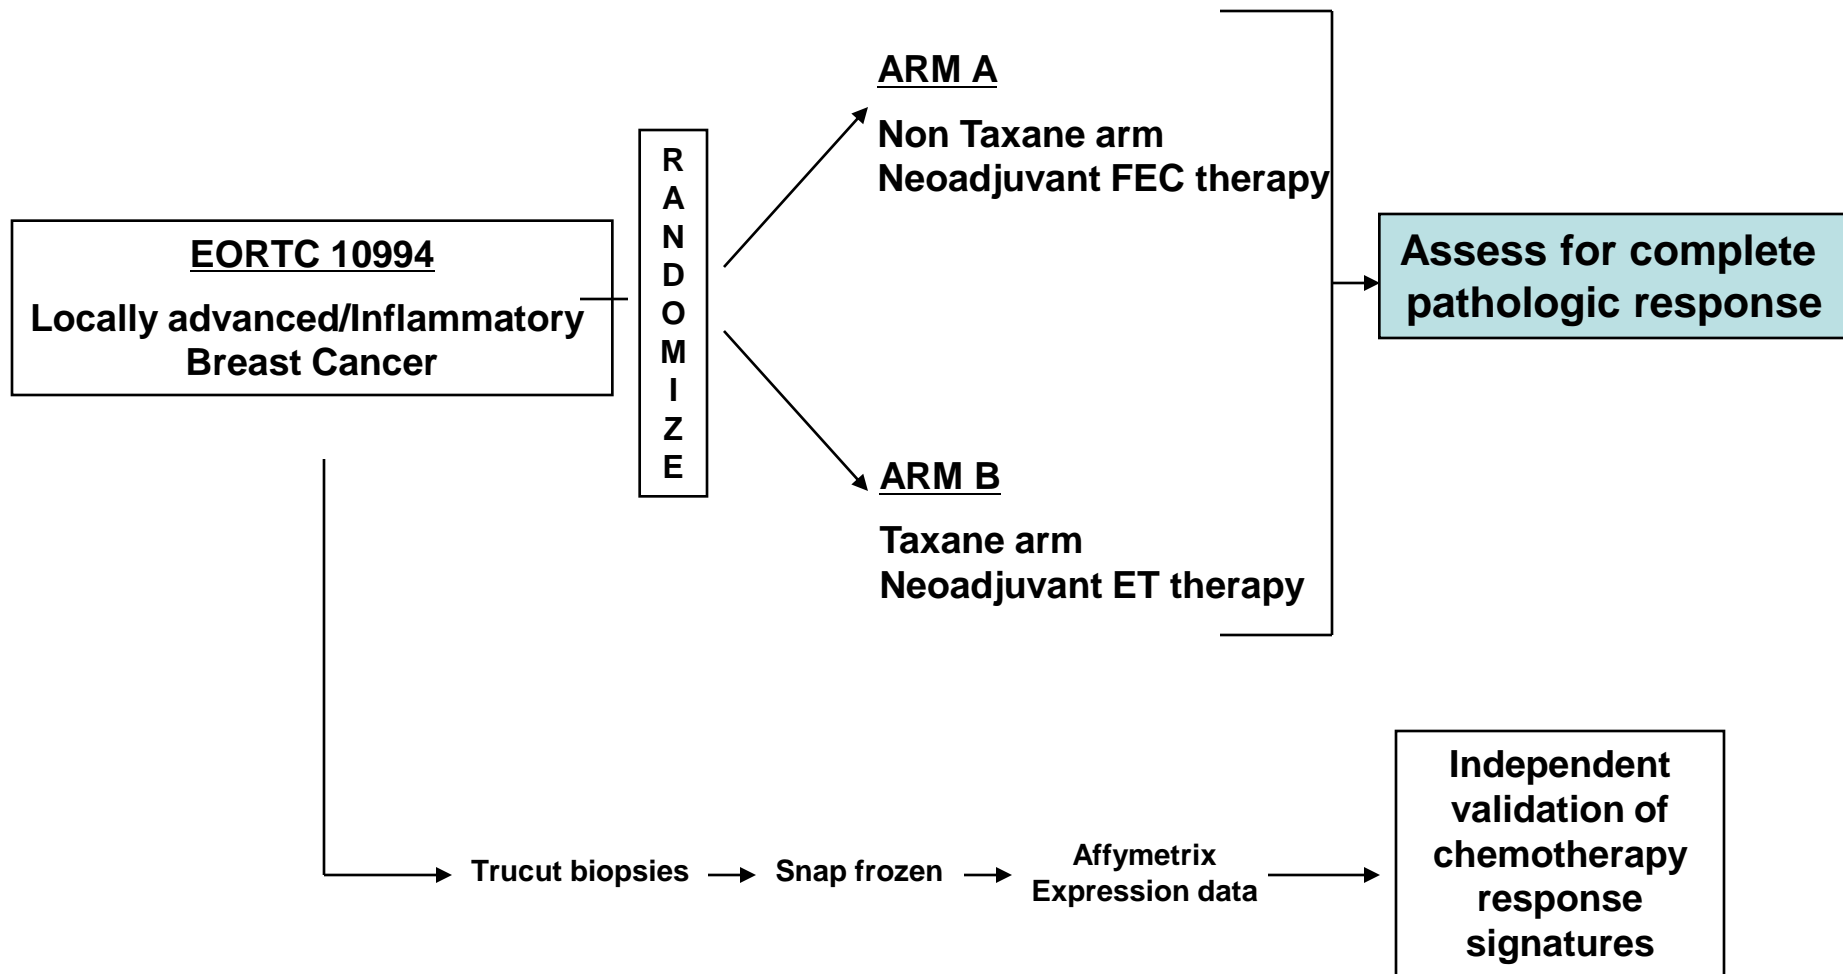

Health and Economic Outcomes

A Breast Cancer Neoadjuvant Trial

EORTC10994 Multicenter Prospective Neoadjuvant Phase III Breast Cancer Trial BLINDED VALIDATION (n = 162)

EORTC10994 Multicenter Prospective Neoadjuvant Phase III Breast Cancer Trial BLINDED VALIDATION (n = 162)

ARM A
Neoadjuvant FEC

FEC predictor

ARM B
Neoadjuvant ET

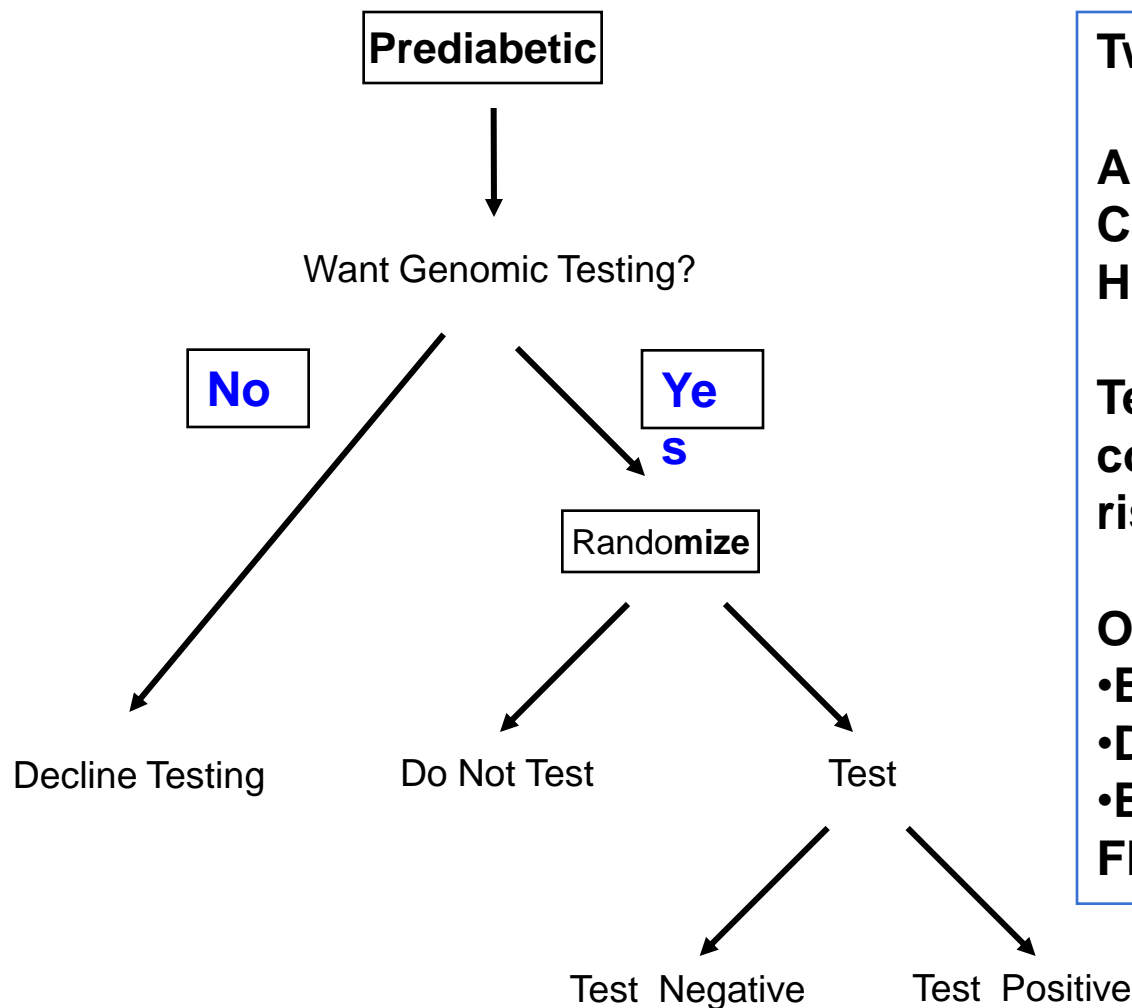

ET predictor

A Primary Care Based RCT for Clinical Utility of TCF7L2 in Diabetes

- Primary objective: to assess the ability of a genetic test for Type 2 diabetes risk to alter behavior and health measures in a general clinic population
 - HOmeostasis Model Assessment of Insulin Resistance (HOMA-IR)
 - waist circumference
 - weight loss
 - serum glucose
 - diet and energy expenditure
- Secondary goals :
 - to measure whether changes in perceived risk, and beliefs about genetics correlate with behavior change following genetic testing for Type 2 diabetes risk
 - To determine whether a genetic-guided clinical trial will change primary care MDs' beliefs and understanding of genetics and its role in their practice

A Primary Care Based RCT for Clinical Utility of TCF7L2 in Diabetes

Two Primary Care Practices

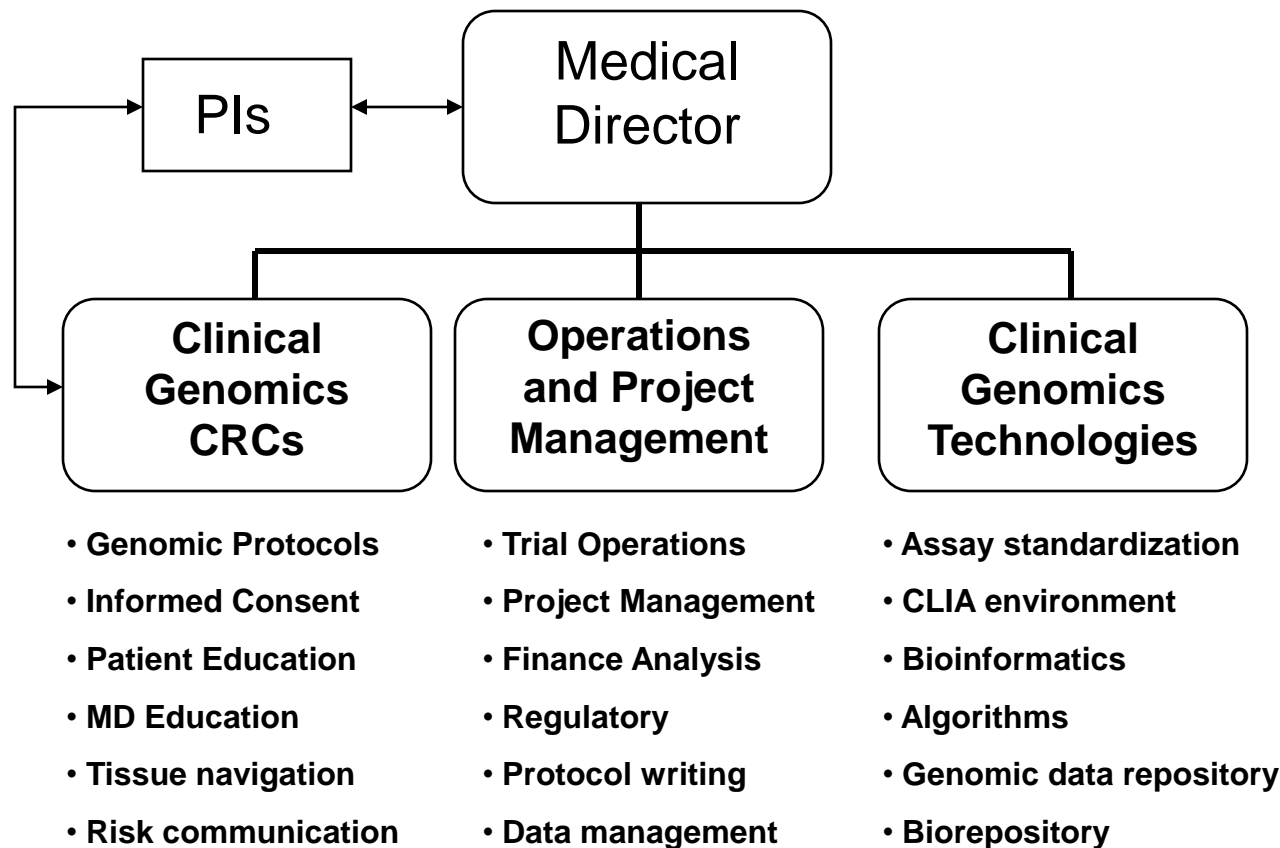

All Participants Receive Counseling based on Family History, BMI, FPG results

Test group also receives counsel based on genomic risk factors

Outcomes at 3 and 12 mos:

- Behaviors
- Diet/Exercise
- BMI, Waist circumference, FPG, HOMA IR

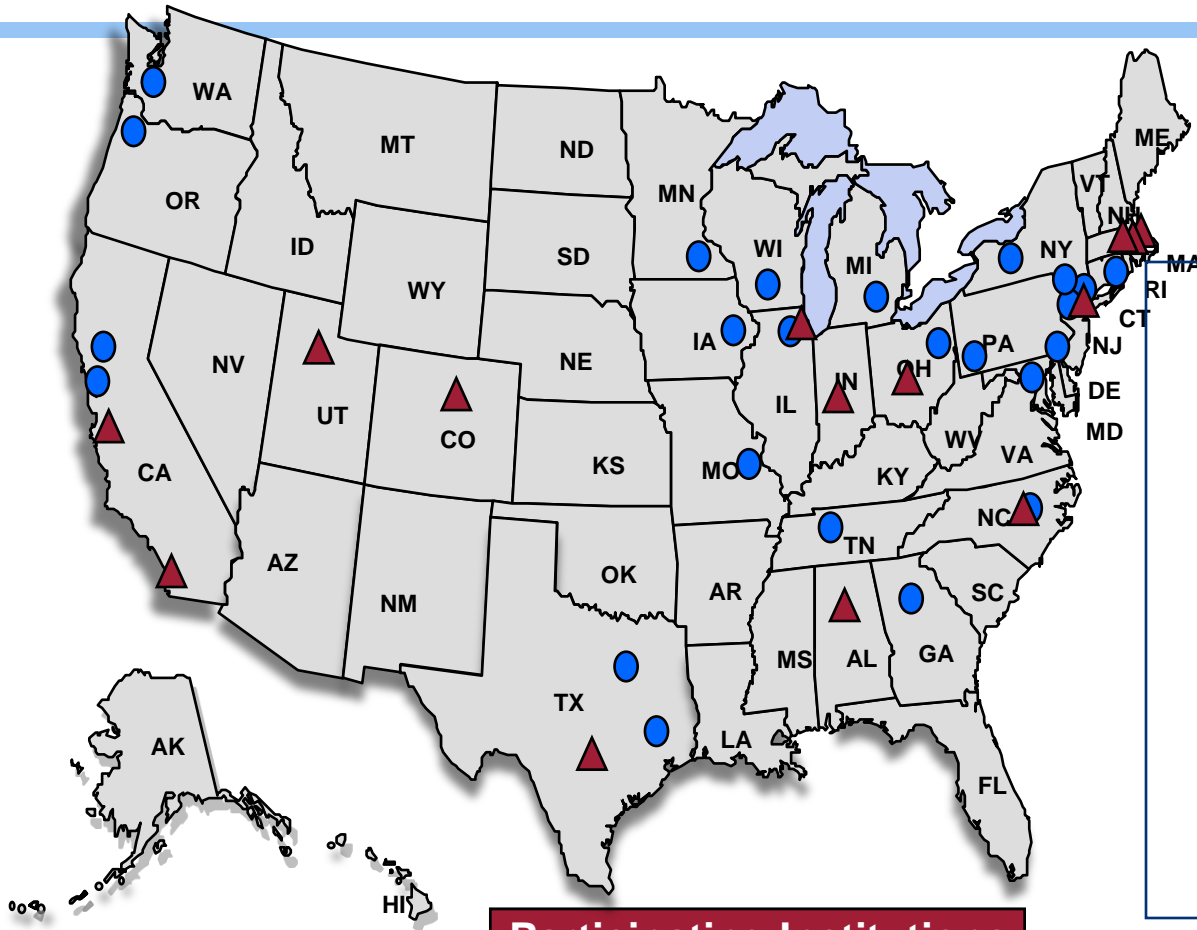

An Interdisciplinary Unit Driving Translational Genomics

Opportunities to Enable Scientific and Clinical Evaluation of Genomic Markers

- Patient registries (common and rare diseases)
 - Longitudinal follow up
 - Robust phenotypes
- Population studies linked to EHRs
- Prospective clinical trials
 - “Genomics Trials Cooperative Group”
- Industry
 - Public-private partnerships
 - Sample collection in phase II-IV trials
- A national virtual sample biorepository linked to research and clinical data

Building a National CTSA Consortium

Participating Institutions

- ▲ New members 2008
- Members 2006 & 2007

Enhancing national clinical and translational research capability

- clinical research management
- research infrastructure
- phenotyping - human and preclinical models
- Data sharing
- Community engagement
