SCIENCE MANAGEMENT USING ORGANIZATIONAL KNOWLEDGE: The Wisdom of Crowds*

Science of Science Management Conference
National Institutes of Health

Mary Kane, President
Concept Systems, Incorporated

Focus on Knowledge for Management

- “Knowledge management concepts and systems are both an opportunity for science managers to improve planning and management, and a tool for science research that requires increased expertise in the management process.”
- We need *prospective* thinking on what is required for science advancement, as well as retrospective analysis research data
- Independent contribution and consideration of knowledge by individuals in groups can yield higher quality decisions than those of selected experts only: the *wisdom of crowds*

Knowledge Development to Support Research Programs Management

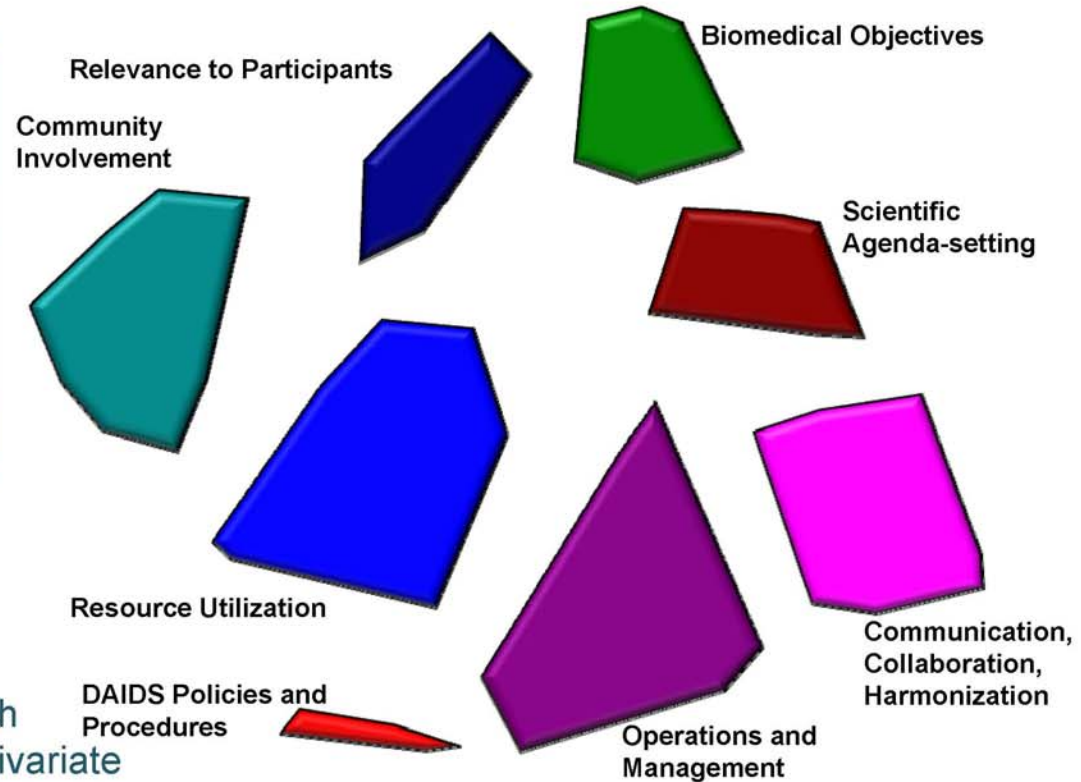

- Our emphasis: the *management* of science initiatives and the organizations that support them, to:
 - Establish commonly understood, purposeful research agenda
 - Accumulate organize and apply knowledge from those who know
 - Identify and reduce gaps in knowledge to improve use and results
 - Enable focused resources and assessment of results based on scientific priorities
- *Collaborative* construction of emergent concepts to
 - Tackle thorny issues (from defining what we mean by science management to systematic support of discoveries)
 - Get agreement on research and operational priorities
 - Align operations to support framework priorities

“Coordinated Clinic Trials Research Networks Will Be Successful If...”

Relative Importance, All Participants

statistical applications
Systematic, structured and broadly
applicable

Kane and Trochim (2007) Concept Mapping for Planning and Evaluation.

“Coordinated Clinic Trials Research Networks Will Be Successful If...”

Utility

- Questions like: *What will or should a system to manage science contain, support, achieve?*
- “Wisdom of crowds:” each here is expert; as a group we are new at this
- Link knowledge and positional priorities to create “common sense”
- Use agreed-upon knowledge framework rooted in scientific objectives and methods
- Result: greater than the sum of its parts

“Features that distinguish science from pseudoscience are repeatability, economy, menuration, heuristics, and consilience.”
E. O. Wilson in Consilience: The Unity of Knowledge (1998)

Studying the Emerging Global Brain: Analyzing and Visualizing the Impact of Co-Authorship Teams

Börner, Dall'Asta, Ke & Vespignani (2005) *Complexity*, 10(4):58-67.

Research question:

- Is science driven by prolific single experts or by high-impact co-authorship teams?

Contributions:

- New approach to allocate citational credit.
- Novel weighted graph representation.
- Visualization of the growth of weighted co-author network.
- Centrality measures to identify author impact.
- Global statistical analysis of paper production and citations in correlation with co-authorship team size over time.
- Local, author-centered entropy measure.

Spatio-Temporal Information Production and Consumption of Major U.S.

Research Institutions

Börner, Katy, Penumathy, Shashikant, Meiss, Mark and Ke, Weimao. (2006)

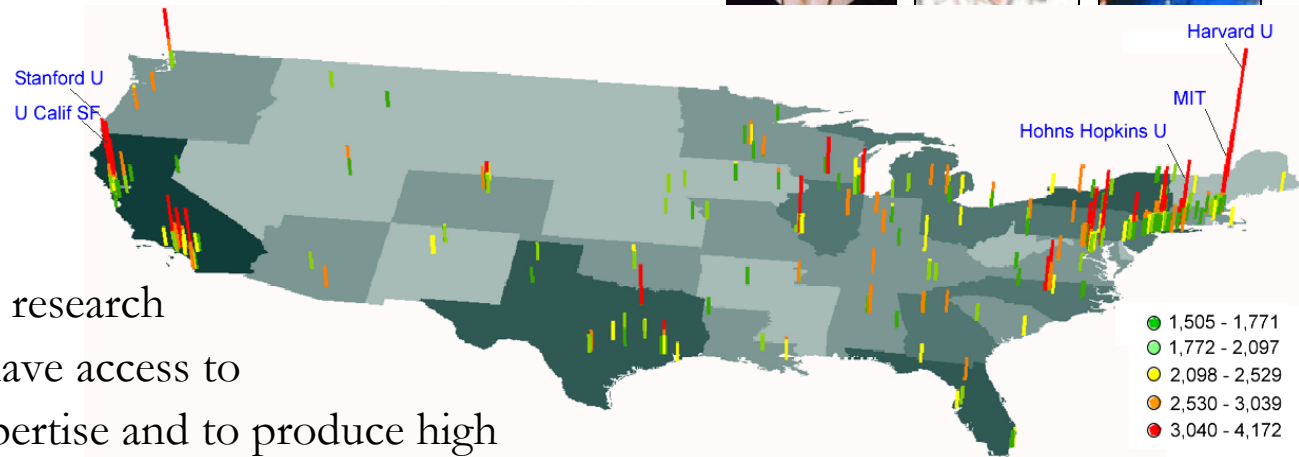

Mapping the Diffusion of Scholarly Knowledge Among Major U.S. Research

Institutions. Scientometrics. 68(3), pp. 415-426.

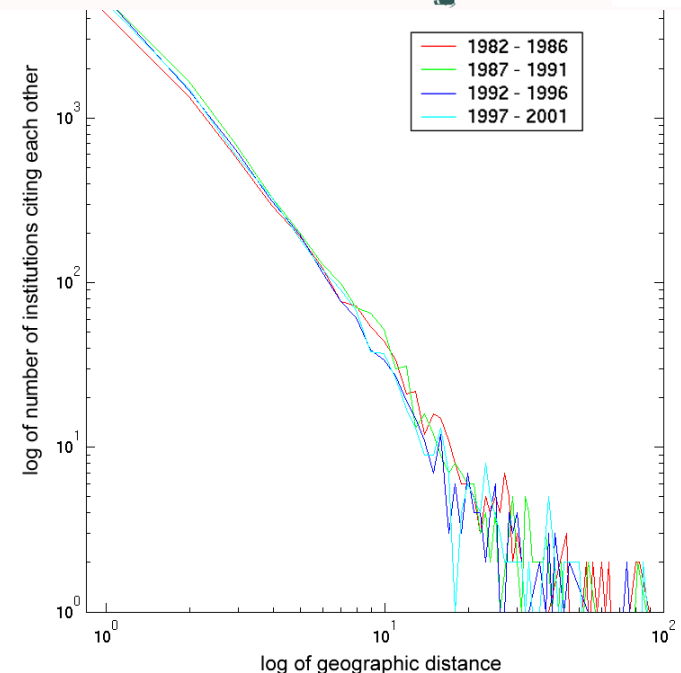

Research questions:

1. Does space still matter in the Internet age?
2. Does one still have to study and work at major research institutions in order to have access to high quality data and expertise and to produce high quality research?
3. Does the Internet lead to more global citation patterns, i.e., more citation links between papers produced at geographically distant research institutions?

Contributions:

- Answer to Qs 1 + 2 is YES.
- Answer to Qs 3 is NO.
- Novel approach to analyzing the dual role of institutions as information producers and consumers and to study and visualize the diffusion of information among them.

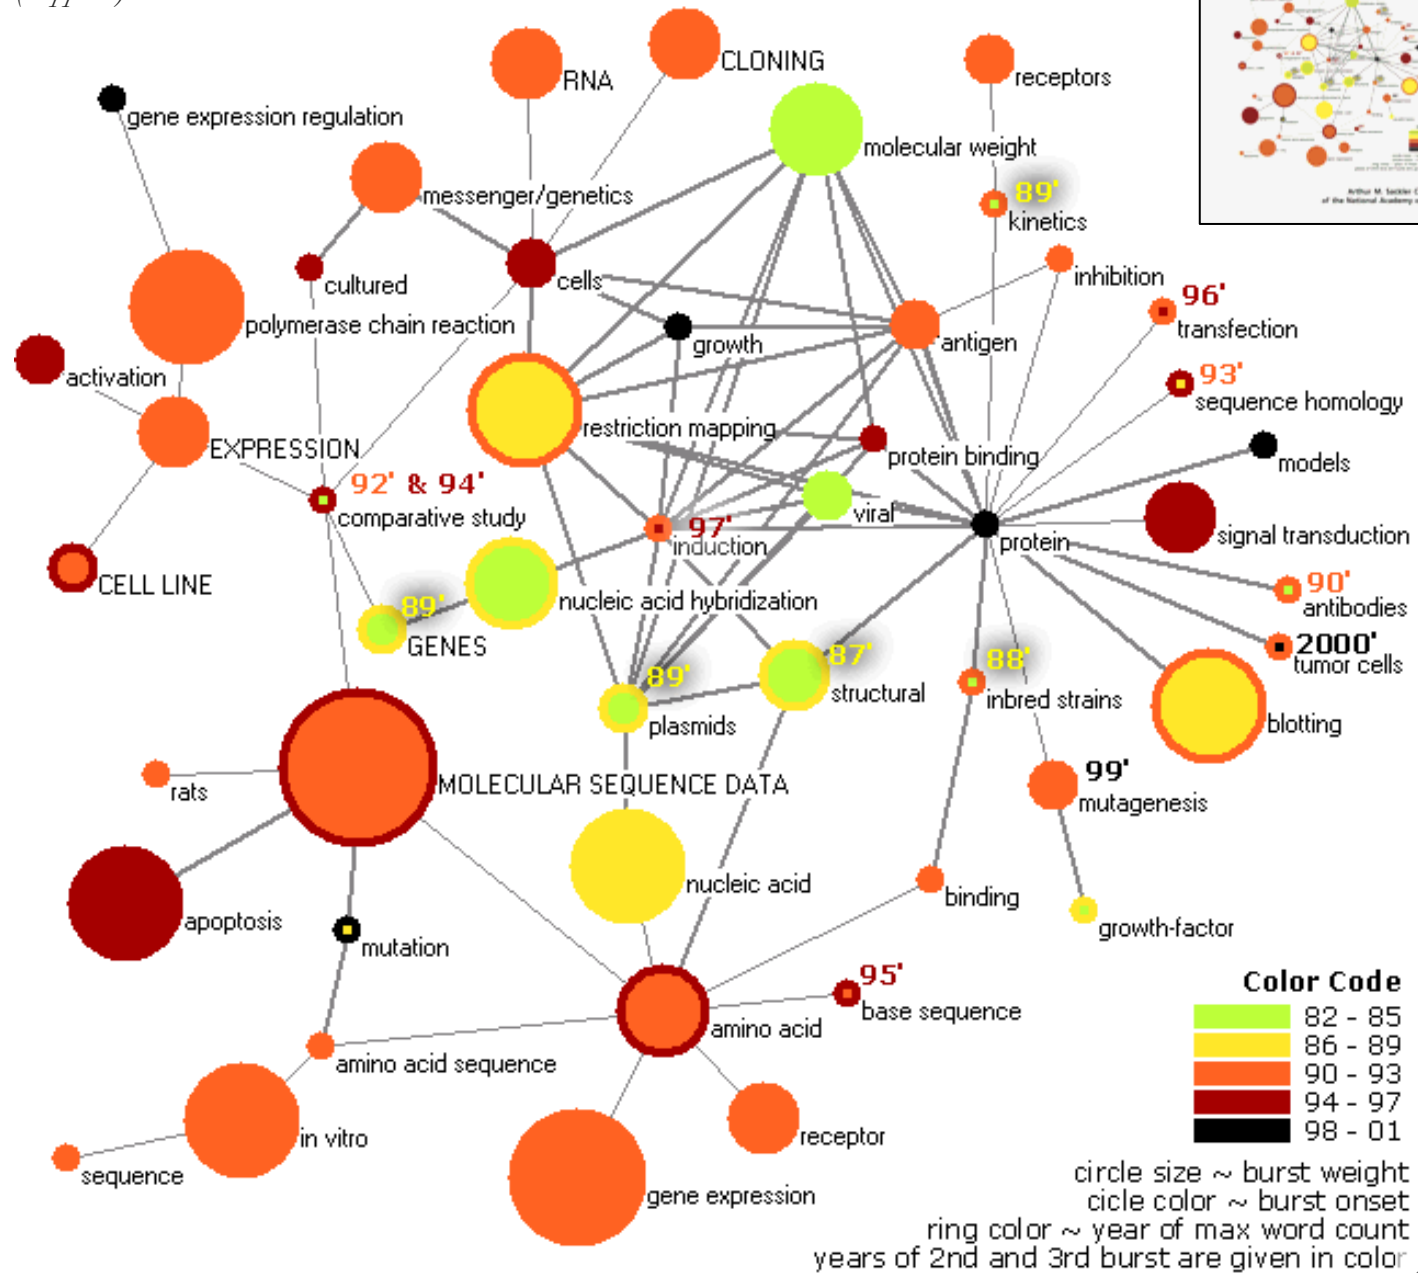

Mapping Topic Bursts

Mane & Börner. (2004) PNAS, 101(Suppl. 1): 5287-5290.

Co-word space of the top 50 highly frequent and bursty words used in the top 10% most highly cited PNAS publications in 1982-2001.

Insight gained:

Most bursts occur before words experience widespread usage.

- National Research Council in Ottawa, Canada, April 3-Aug. 29, 2008.
- Chinese Academy of Sciences, China, May 17-Nov. 15, 2008.

Illuminated Diagram Display

W. Bradford Paley, Kevin W. Boyack, Richard Kalvans, and Katy Börner (2007)

Mapping, Illuminating, and Interacting with Science. SIGGRAPH 2007.

Large-scale, high resolution prints illuminated via projector or screen.

Questions:

- Who is doing research on what topic and where?
- What is the 'footprint' of interdisciplinary research fields?
- What impact have scientists?

Interactive touch panel.

Contributions:

- Interactive, high resolution interface to access and make sense of data about scholarly activity.

学科分布图: 科学学科是怎样相互关联的

世界地图: 科学研究在哪里进行着

你可以透过触摸屏在地图上随意点击来改变你所见到的光亮强度。当你触摸世界地图的某一点时, 在那个地理位置上的所有研究机构会被点亮, 同时在这些研究机构工作的学者的论文所属的学科会在学科分布图上被点亮, 而当您触摸学科分布图的某一点时, 在那个位置上的科学学科会被点亮, 同时从这些学科研究的研究机构在世界地图上的分布会被点亮。

纳米技术

这里显示所有和纳米技术相关的科学学科, 纳米技术和科学研究人类在无形的空间里改造世界的的能力。这些空间存在于极其微小以至半个原子的结构中。目前大部分有关纳米的研究主要集中在物理、化学和材料科学领域。它们主要位于学科分布图上中部分的位置。不过, 纳米技术在生物学和医药学中的应用也越来越多。生物学和医药学位于学科分布图下半部分的位置。

探索科学学科的相互关联性

所有科学学科	纳米技术	弗朗西·科里克	阿尔伯特·爱因斯坦	迈克尔·贾普尔	苏珊·贾斯克
显示所有776科学学科	有关微观粒子的科学	DNA双螺旋结构的发现者之一	用相对论重新激活了物理学	发现了物质转变式的物质步骤	研究人的认知是如何产生偏见的
可持续性	化学和生物	约舒亚·雷德伯格	德里克·德索拉·普里克斯	理查德·扎尔	关于本次展览
一些与人类学长期希望相关的科学	化学和生物科学的交叉部分	细菌遗传机制研究的先驱	著名的“科学计量学之父”	采用激光化学技术研究分子动态分布	与此展览相关人员和机构

探索某个学者的科学著作的影响力传播

显示用通过切面来展示各个学者对科学文献以及影响力的传播。首先, 显示用英文高被引学者发表的论文所属的学科在学科分布图上的位置以及被引用次数。第二步, 显示用研究时所在的研究机构在世界地图上的位置。到第三步, 所有这些论文的引用率仍然很高。第四步, 显示用高被引论文在学科分布图上的位置以及它们在世界地图上的位置。第五步, 显示用高被引论文的学科在学科分布图上的位置以及它们在世界地图上的位置。第六步, 显示用高被引论文的学科在学科分布图上的位置以及它们在世界地图上的位置。

Mapping Knowledge Domains

Arthur M. Sackler Colloquium
of the National Academy of Sciences

Science of Science Studies Challenges

- (Different) user groups and their needs and priorities have to be identified.
- Major terms, e.g., ‘impact’ or ‘interdisciplinary’, need to be defined and operationalized.
- (Standard) datasets have to be federated and made available so that science of science studies can be replicated.
- A common science of science cyberinfrastructure is desirable.
- There is a need for well documented case studies and evaluation.
- Major results, good practices, and new datasets/tools have to be communicated widely.

Note that

- Science of science studies can augment but not replace human judgment.
- Incomplete, low coverage data typically leads to low quality results.
- Studies performed using proprietary tools and/or proprietary data are hard to replicate.

Networks & Institutions in the Utilization of Science

Jason Owen-Smith

University of Michigan

Boston and Bay Area Networks, 1988, 1994, 1999

Networks

Definition: Concrete patterns of interaction among participants in a recognizable field of endeavor

Mechanisms of Action: Status Signaling (Podolny 1993; Phillips & Zuckerman 2001), Resource/Information Transfer (Granovetter 1985; Burt 1992), Social Influence (Coleman et al 1966; Mizruchi 1992)

Life Science Examples: Flows of research materials among scientists, flows of students/post-docs across labs, Co-authorship, overlapping membership on study section panels

Key Idea: Much of what accounts for the success of a new discovery is the networks in place at the time of its diffusion

Institutions define rules, roles and incentives

Institutions

Definition: Shared expectations that define goals, rewards, and standards of appropriate behavior in a recognizable field of endeavor.

Mechanisms of Action: assumptions (Zucker 1977), norms (Meyer & Rowan 1977), regulations (DiMaggio & Powell 1983)

Life Science Examples: Peer Review, Authorship standards v. Inventorship rules, record keeping practices (lab notebooks), COI/COC policies

Key Idea: Institutions are the formal and informal rules of the game. What makes different stakeholders distinct is their orientation toward disparate institutions.

Institutions help determine why people want information on new discoveries

Networks help determine how they access and understand that information

Understanding knowledge utilization and diffusion requires that we understand the joint effects of networks and institutions.

Induced Pluripotent Stem Cell Lines Derived from Human Somatic Cells

Junying Yu,^{1,2*} Maxim A. Vodyanik,² Kim Smuga-Otto,^{1,2} Jessica Antosiewicz-Bourget,^{1,2} Jennifer L. Franke,¹ Shulan Tian,³ Jeff Nie,³ Gudrun A. Jonsdottir,³ Victor Ruotti,³ Ron Stewart,³ Igor I. Slukvin,^{2,4} James A. Thomson^{1,2,5*}

Somatic cell nuclear transfer allows trans-acting factors present in the mammalian oocyte to reprogram somatic cell nuclei to an undifferentiated state. We show that four factors (*OCT4*, *SOX2*, *NANOG*, and *LIN28*) are sufficient to reprogram human somatic cells to pluripotent stem cells that exhibit the essential characteristics of embryonic stem (ES) cells. These induced pluripotent human stem cells have normal karyotypes, express telomerase activity, express cell surface markers and genes that characterize human ES cells, and maintain the developmental potential to differentiate into advanced derivatives of all three primary germ layers. Such induced pluripotent human cell lines should be useful in the production of new disease models and in drug development, as well as for applications in transplantation medicine, once technical limitations (for example, mutation through viral integration) are eliminated.

Mammalian embryogenesis elaborates distinct developmental stages in a strict temporal order. Nonetheless, because development is dictated by epigenetic rather than genetic events, differentiation is, in principle, reversible. The cloning of Dolly demonstrated that nuclei from mammalian differentiated cells can be reprogrammed to an undifferentiated state by trans-acting factors present in the oocyte (1), and this discovery led to a search for factors that could mediate similar reprogramming without somatic cell nuclear transfer (2).

SOX2, *NANOG*, and *LIN28* are sufficient to reprogram human somatic cells.

Human ES cells can reprogram myeloid precursors through cell fusion (7). To identify candidate reprogramming factors, we compiled a list of genes with enriched expression in human ES cells relative to that of myeloid precursors and prioritized the list based on known involvement in the establishment or maintenance of pluripotency (table S1). We then cloned these genes into a lentiviral vector (fig. S1) to screen for combi-

ES cell-derived CD45⁺ hematopoietic cells (7, 9), to geneticin-resistant (*OCT4*^r) colonies with an ES cell morphology (fig. S2A) (10). These geneticin-resistant colonies expressed typical human ES cell-specific cell surface markers (fig. S2B) and formed teratomas when injected into immunocompromised severe combined immunodeficient-beige mice (fig. S2C).

By testing subsets of the 14 initial genes, we identified a core set of 4 genes, *OCT4*, *SOX2*, *NANOG*, and *LIN28*, that were capable of reprogramming human ES cell-derived somatic cells with a mesenchymal phenotype (Fig. 1A and fig. S3). Removal of either *OCT4* or *SOX2* from the reprogramming mixture eliminated the appearance of geneticin-resistant (*OCT4*^r) reprogrammed mesenchymal clones (Fig. 1A). *NANOG* showed a beneficial effect in clone recovery from human ES cell-derived mesenchymal cells but was not required for the initial appearance of such clones (Fig. 1A). These results are consistent with cell fusion-mediated reprogramming experiments, where overexpression of Nanog in mouse ES cells resulted in over a 200-fold increase in reprogramming efficiency (11). The expression of *NANOG* also improves the cloning efficiency of human ES cells (12) and thus could increase the survival rate of early reprogrammed cells. *LIN28* had a consistent but more modest effect on reprogrammed mesenchymal cell clone recovery (Fig. 1A).

We next tested whether *OCT4*, *SOX2*, and *NANOG* were sufficient to reprogram human somatic cells.

OCT4 promoter, a gene that is highly expressed in pluripotent cells but not in differentiated cells. Thus, reprogramming events reactivating the *OCT4* promoter can be recovered by geneticin selection. The first combination of 14 genes that we selected (table S2) directed the reprogramming of adherent cells, which were derived from human

SUMMARY

Successful reprogramming of differentiated human somatic cells into a pluripotent state would allow creation of patient- and disease-specific stem cells. We previously reported generation of induced pluripotent stem (iPS) cells, capable of germline transmission, from mouse somatic cells by transduction of four defined transcription factors. Here, we demonstrate the generation of iPS cells from adult human dermal fibroblasts with the same four factors: Oct3/4.

issues is to induce pluripotent status in somatic cells by direct reprogramming (Yamanaka, 2007).

We showed that induced pluripotent stem (iPS) cells can be generated from mouse embryonic fibroblasts (MEF) and adult mouse tail-tip fibroblasts by the retrovirus-mediated transfection of four transcription factors, namely Oct3/4, Sox2, c-Myc, and Klf4 (Takahashi and Yamanaka, 2006). Mouse iPS cells are indistinguishable from ES cells in morphology, proliferation, gene expression, and teratoma formation. Furthermore, when transplanted into blastocysts, mouse iPS cells can give rise to adult chimeras, which are competent for germline transmission (Maharani et al. 2007; Okabe et al. 2007; Wernig et al.

Takahashi et al. 2007. *Cell* 131, 861

tent cell-specific genes, and telomerase activity. Furthermore, these cells could differentiate into cell types of the three germ layers in vitro and in teratomas. These findings demonstrate that iPS cells can be generated from adult human fibroblasts.

with adult human somatic cells by specifying retroviral transduction in human fibroblasts and subsequent culture conditions. These efforts have enabled us to generate iPS cells from adult human dermal fibroblasts and other human somatic cells, which are comparable to human ES cells in their differentiation potential in vitro and in teratomas.

Yu et al. 2007. *Science* 318, 1917

An Example: Induced Pluripotent Stem Cells

Stakeholder	Question/Motivation	Access/Network
Academic Scientist	Should I shift bodies and bench space?	Colleagues, co-authors, etc.
Physician	What do I tell my patients?	Medline, news media
Patient	When will there be a cure?	News media, rumor, physicians
Legislator	How should I vote on stem cell funding?	Briefings, news media, staff
Biotech CEO	What does this mean for my IP position?	Scientific advisory board, legal counsel

We know too little about how different stakeholders access and understand new discoveries

Involving diverse stakeholders directly in scientific networks may speed utilization but could shift the dynamics of discovery

Keeping stakeholders separate from discovery may protect science but widen the gap between bench and bedside

Ideas for Moving Forward...

Gaps

- Fragmented, diffuse public health information
- Engineered systems but not incentives
- Scattered understanding of intervention prospects
- Limited understanding of ecosystem dynamics
- Insufficient attention to strategic flexibility

Possible Responsive Research Avenues

- Integrated public health observatories
- Information technology fostering incentives
- Knowledge/prediction markets
- Dynamic ecosystem models
- Real options

Ideas for Moving Forward...

Gaps

- Fragmented, diffuse public health information
- Engineered systems but not incentives
- Scattered understanding of intervention prospects
- Limited understanding of ecosystem dynamics
- Insufficient attention to strategic flexibility

Possible Responsive Research Avenues

- ★ **Integrated public health observatories**
- Information technology fostering incentives
- Knowledge/prediction markets
- Dynamic ecosystem models
- Real options

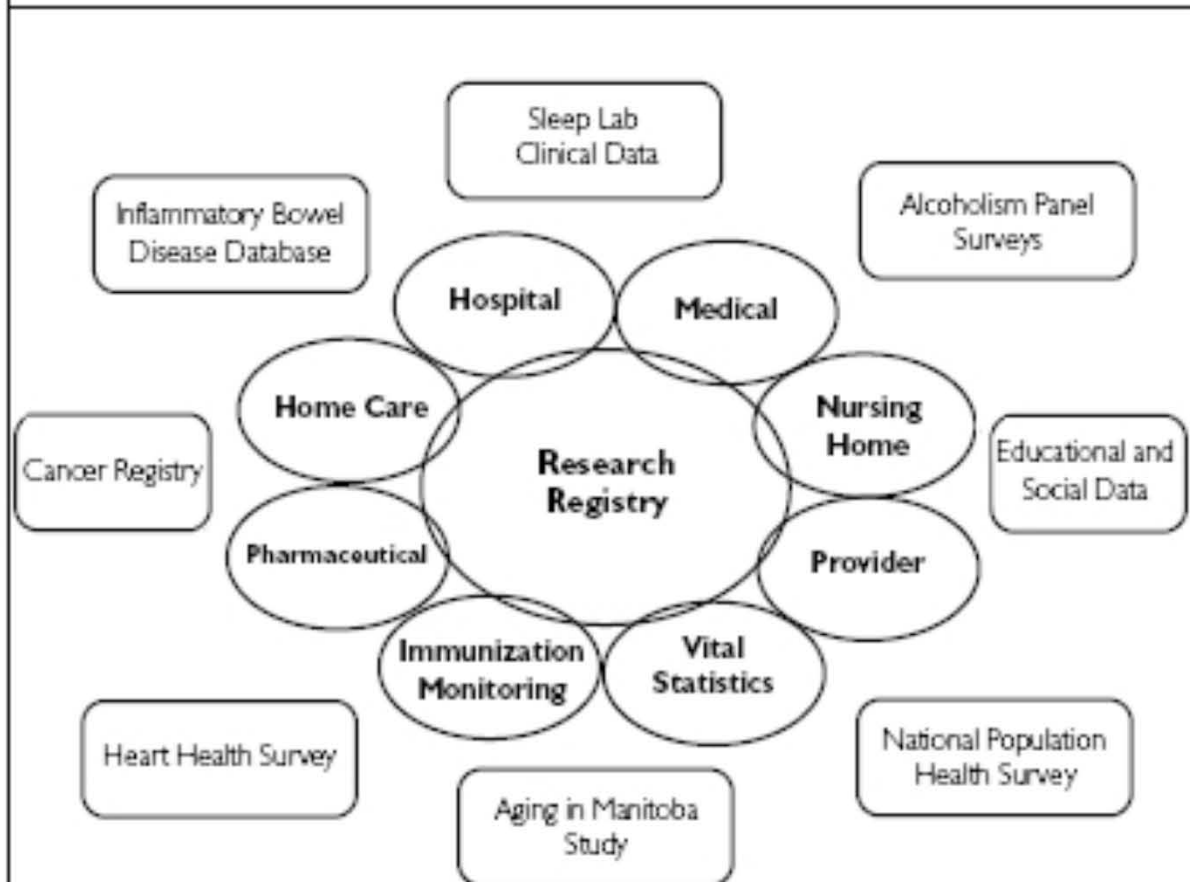

Public Health Observatories

- Cross-linking & annotating multi-level data
 - Multiple cross-sectional & longitudinal survey instruments (health status, risk factors)
 - Administrative data (e.g. diagnostic codes, pharmaceutical & healthcare utilization, vital statistics, cost & resource use, education, justice, housing, ...)
 - Critical components
 - Confidentiality
 - Federated data access at different levels of resolution & authority
 - Rich & consistent metadata
 - Case ascertainment algorithms
 - Data cleaning
 - Strongly empowers
 - Systems modeling efforts
 - Derivation of surrogate measures for conditions
 - Context-rich cross-sectional & longitudinal analysis
- ## Priorities
- Incorporation of
 - Contextual information
 - (De-identified) & cross-linked social/family network data
 - Determinants of health (e.g. Socio-economic status)
 - Intervention history
 - Transparent systems models
 - Data cleaning & analysis algorithms
 - EMA data
 - Community-contributed metadata
 - Rewarding contributions
 - Operational support
 - Voluntary privacy waivers?

Ideas for Moving Forward...

Gaps

- Fragmented, diffuse public health information
- Engineered systems but not incentives
- Scattered understanding of intervention prospects
- Limited understanding of ecosystem dynamics
- Insufficient attention to strategic flexibility

Possible Responsive Research Avenues

- Integrated public health observatories
- **★ Information technology fostering incentives**
- Knowledge/prediction markets
- Dynamic ecosystem models
- Real options

Learning from Management of Learning Communities

- Issue: IT infrastructure for sharing not matched by incentive structures
 - Enhancing research incentives may improve contributions
 - Reviews, sharing negative results, result sharing & reproduction...
- Example: Comptella (J. Vassisleva)
- High sensitivity to even simplest incentive schemes
 - Non-monetary incentives highly effective in promoting “culture change” towards sharing
 - Incentives for reviews helps highlight quality contributions
 - Gaming of incentives common
- Overcoming local optima: Injection of stochastics can help reduce lock-in to local minima

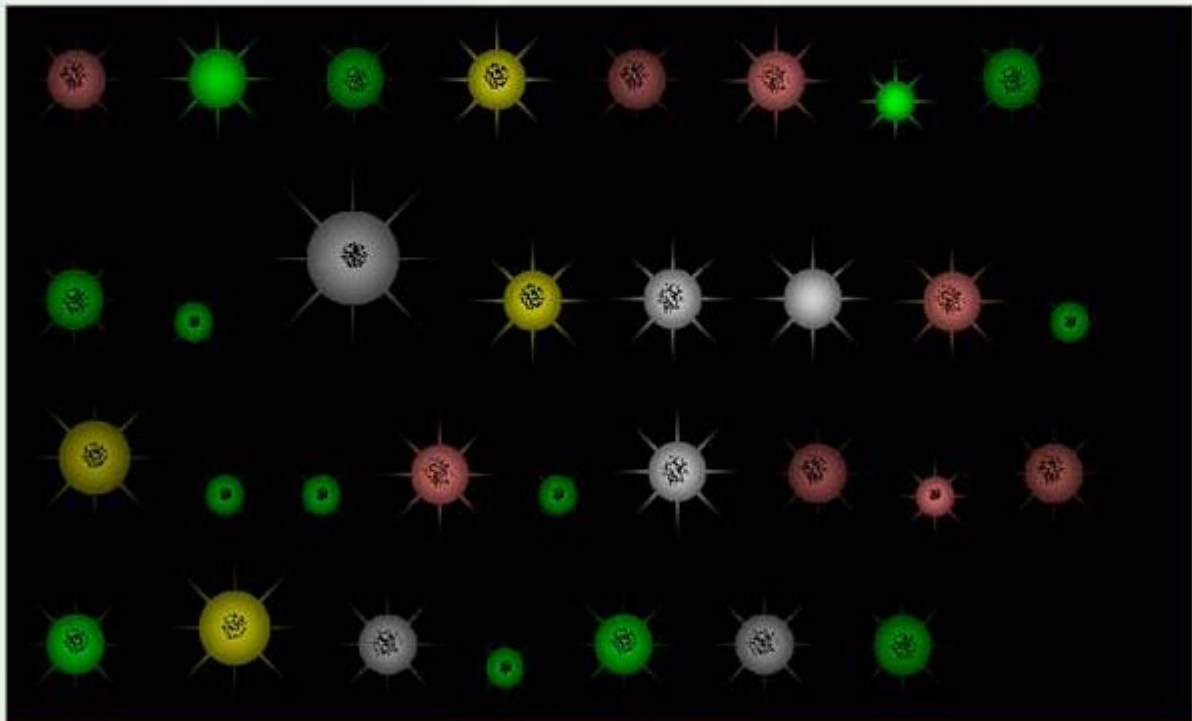

Example Learning Community

Comtella

J. Vassisleva

Example: Bioinformatics Community

- Enormously rich annotated cross-linked databases
 - Federal support (e.g. PDB, SwissProt, EBI, GENBANK, ...)
 - Cross-linking key to use & realized value
- Cultural norms & incentives value shared contributions
 - Reputation accrues through sharing
 - Sharing encouraged/required through
 - Funding guidelines
 - Publication policy
 - Society guidelines & consensus statements
 - Shared data fairly standard
 - Shared code encouraged
- Programmatic data access & services (via web services)

Ideas for Moving Forward...

Gaps

- Fragmented, diffuse public health information
- Engineered systems but not incentives
- Scattered understanding of intervention prospects
- Limited understanding of ecosystem dynamics
- Insufficient attention to strategic flexibility

Possible Responsive Research Avenues

- Integrated public health observatories
- Information technology fostering incentives
- ★ **Knowledge/prediction markets**
- Dynamic ecosystem models
- Real options

Knowledge Markets

- Prediction markets for lines of research, with added sharing incentives
- Exploit market information
 - Aggregation
 - Dissemination
- Components
 - Market incentives can help overcome vested interests in statements of likely outcome
 - Market signals reflect confidence of beliefs
 - Reward exchange of information for trades
- Challenges: Market design, market gaming & insider trading, adequate market size
