Data Dictionary for the Natural History Database

Purpose

The purpose of this document is to give an outline and understanding of the data structure of the Natural History Database. The data structure represents data elements that are captured on the Case Reporting Forms (CRFs). Familiarization with these forms will facilitate a better understanding of what data is being captured as well as where it is stored.

Data Storage

The Natural History data is stored in an Oracle® relational database. A relational database is built on the storage of data in tables that are related to each other. Each table in a relational database contains columns that help to define these relationships. Often columns are referred to as "fields".

Each week, data are converted, processed and exported out into this relational database. Thus, the data in the tables is updated weekly with new and corrected information. This is an important point when developing queries against this dataset.

Table Types

The Natural History database has several categories of data tables:

- general information tables
- code table;
- CRF-based tables
- "extra" data tables
- post-processed tables
- static tables

The first three groups of these tables are automatically generated as part of a dynamic process that takes information from the data entry module of RSS to a flat data structure. "Extra" data tables provide additional information from other data sources (for example, from other research protocols) as approved by the Principal Investigator. Post-processed tables are created by additional processing that is performed to facilitate easier querying and summarizing of data for research questions for the Natural History Study. A list of these tables can be found at the end of this document. Static tables are special tables of data used for a variety of reasons (for example, for grouping drugs into drug categories) and are updated only when needed.

General Informational Tables

There are two general informational tables: EXPORT_INFO and MASTER_ENROLLMENT. EXPORT INFO has two rows. One row is for Protocol1 (Recipe = 0) while the other is for Protocol2 (Recipe = 1). To see the last export and conversion process times, query the columns EXPORT_STARTED and EXPORT_COMPLETED. The dates and times in these columns are refreshed each week as new data is loading into the Natural History database.

MASTER_ENROLLMENT will show the latest enrollment information, by PIN, in each protocol that is in the Research Support System (RSS). If a participant has transferred enrollment between sites, only the last enrollment is shown in this table. Protocol1 enrollments are NOT included in this table as of this time. An effort may be made in the future to load that information into this table. Information about Protocol1 enrollments can be derived from the ENROLLMENT CRF-based table as described below.

Code Tables

Since data are stored in a relational database, codes are often used to increase storage capacity, enforce integrity of data and provide a concise way of viewing data. However, many times codes can be arbitrary or cryptic to those who are not familiar with the dataset. A series of automated code tables will be produced each time the data is exported from the RSS application. This will provide the most recently included or modified code listings.

All of the code tables that are automatically created begin with the prefix: "PROTOCOL_". Below is a listing of code tables:

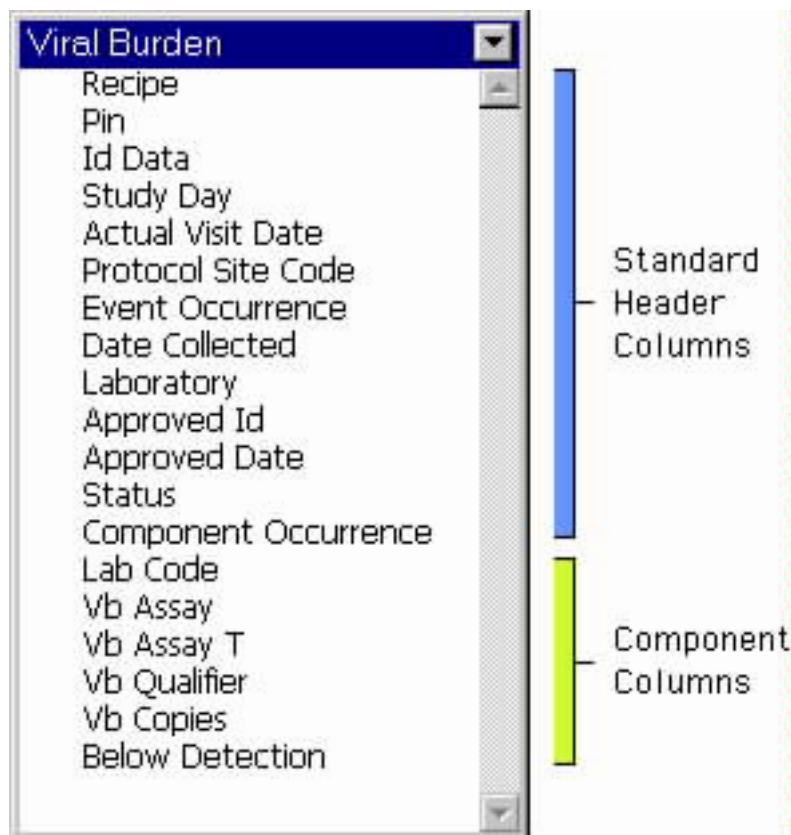

PROTOCOL_CLEANLINESS	This table gives the meaning to the cleanliness column in the CRF-based tables. Mostly, it can be ignored. It is used to track the quality of the data and used internally.
PROTOCOL_LABORATORY	This is a code table for applicable laboratories. This table can be ignored since it only contains the code (-2) for 'N/A'. Laboratories have been recorded using a different field in this study.
PROTOCOL_LOOKUP_CODES	This is one of the most useful codes tables. It contains each coded column and its meaning. Using the EVENT_NAME (Table) and COMPONENT_NAME (Column), several descriptions are provided. Use this table to help format reports and translate codes.
PROTOCOL_PERSON	This code table contains specific links to determine the Research Coordinator/Investigator who submitted a CRF. Join the PERSON_ID field to the APPROVED_BY field any of the CRF based tables to find the full name of the person.

PROTOCOL_SITE	This code table makes several links between the field PROTOCOL_SITE_CODE and its descriptions. Join the PROTOCOL_SITE_CODE field to this table to find the Formal Site Name for reporting. Protocol Site Codes are alphanumeric, so you must use the full 2 digit code, for example, '01' instead of '1'.
PROTOCOL_STATUS	This table gives the meaning to the status column in the CRF-based tables. Mostly, it can be ignored. It is used to track whether the required data was supplied.
PROTOCOL_USER	This is actually not a true code table. However, it reflects all the people who have access to the dataset.

CRF-based Tables

There are twenty-two CRF-based tables that available in the Natural History Database. In addition there is a table called VISIT1. This table contains research visit information for each participant. With these twenty-three tables, it is easy to perform quality assurance in matching the data with CRFs used in Protocol2.

The CRF-based tables have a common structure. The first thirteen columns of each of these tables (excluding VISIT1) are called "Standard Header Columns". The remaining columns, called "Component Columns" reflect the individual fields on the CRF. Many of the Standard Header Columns are not used or applicable in the Natural History Protocol. In other protocols, these columns have specific meanings. An explanation of the standard header columns follows.

Standard Header Columns Information

RECIPE	This corresponds to the recipe that is found within a protocol and phase. It is a way to stratify the database. <u>In our case, Protocol1 will be Recipe 0 and Protocol2 will be Recipe 1.</u>
PIN	This is the unique identifier for each participant.
ID_DATA	This is an alternate identifier for each participant.
STUDY_DAY	This is the sequential time element to the protocols. It indicates the day of the participant's visit. <u>For Protocol1, since there was no true visit number, this field is calculated based on the participant's Miscellaneous Exam visit. For Protocol2 data, this corresponds with the actual visit number that is in the header of the CRF.</u>
ACTUAL_VISIT_DATE	This is the date on which the study visit took place. <u>This corresponds with the actual visit date that is in the header of the CRF.</u>
PROTOCOL_SITE_CODE	This is the code that is used for the site where the visit occurred. Note that it is an alphanumeric character, so if there is a leading

	zero, the zero cannot be dropped or ignored. The translation for this code can be found in a table called PROTOCOL_SITE.
EVENT_OCCURRENCE	This represents the occurrence number of the event during a visit. For example, if there are three sets of viral burden results recorded on the same visit, there will be three event occurrences numbered one to three in the database for the participant on this particular STUDY_DAY (Visit Number). <u>For most uses, this column can be ignored.</u>
DATE_COLLECTED	This represents the date that all the components of this table were recorded, captured or tested as defined on the CRFs. <u>This is an important column for joining data between tables.</u>
LABORATORY	This represents the physical laboratory where the results were obtained. <u>In most cases, this field is unused;</u> rather a component column called "Lab Code" is set aside to define the physical laboratory location.
APPROVED_ID	This represents the person who signed, authorized or reviewed the data on this event. This is a numerically coded column. The codes can be found in the table called PROTOCOL_PERSON.
APPROVED_DATE	This represents the data on which the data of this event was signed, authorized, or reviewed.
STATUS	This represents the status of the event as a whole. These statuses are codes that are defined for each protocol. The codes for these statuses can be found in a table called PROTOCOL_STATUS. <u>For most uses, this column can be ignored.</u>
COMPONENT_OCCURRENCE	This represents the occurrence of each of the components below during this event. It can be thought of as the line numbers of a particular event. <u>For most uses, this column can be ignored.</u>

Component Columns vary from table to table. However, there are some general rules that apply to these columns.

_T Columns that end in '_T' represent associated text with the base component. This normally reflects comments or fields that require information on the CRF to be specified as a short text.

Example:

In the figure of the Viral Burden table there are two component columns VB_ASSAY and VB_ASSAY_T. They differ only by the "_T". In this case, VB_ASSAY is the coded viral burden assay type. However, if code 99 ("Other") is entered, the name of the viral burden assay type will be stored in the VB_ASSAY_T column.

_S Columns that end in '_S' represent the status of the base component. To date, no individual component statuses have been set to export, so this should not be seen in any CRF-based tables in the Natural History Database.

Extra Tables

These tables are derived from their original source. At present, the only table in this category is EXTRA_CERT_VB. This table provides all CERT viral burdens for participants enrolled in both protocols, excluding those collected in the preceding two weeks, which is the CERT blackout period. These CERT viral burdens may have also been reported in the Natural History Lymphocyte Profile table, because the research coordinators have been instructed to report the CERT viral burdens on the Lymphocyte Profile case report form.

Post-processed Tables

Derived from the CRF-based tables, the post-processed tables may have the most usage when developing complex queries. These types of tables are used to summarize, group and join the data together in a way to more easily facilitate research and reporting. Many of the pre-built Standardized Natural History Queries are in fact built off some of these underlying tables. The tables hide the complexity of some advance querying techniques by providing the data in a pre-assembled format.

All the tables in this category are prefixed by the "POST_" name. This makes it easy to distinguish the tables from the actual data submitted via the CRF (in the CRF-based tables).

The following list of post-processed tables may not be complete, as additional tables are designed and implemented.

POST_ALL_AF_STAGE	This tables combines the Armed Forces staging data from the STAGING_HISTORY and MISC_EXAM CRF tables.
POST_ALL_BLOOD_CHEM_IMM	This data combines the data from the BLOOD_CHEMISTRY and CHEMISTRY_IMMUNOLOGY CRF tables.
POST_BIO_CHILDREN	This table contains the dates of birth of biological children as given in the DEMOGRAPHY table. This table can be used with the POST_CURRENT_DEMOGRAPHY table to get complete demographic information. If the participant has no biological children, there will be no rows for that PIN.
POST_CLINICAL_RESULTS	This table combines viral burden, CD4 counts and Armed Forces staging data from three tables. Not every row will have data for all three measures, since viral burdens, CD4 counts and staging assessments may have been done on different dates.

POST_CURRENT_DEMOGRAPHY	This table gives the most recently reported information for each variable on the DEMOGRAPHY CRF. This means that variables might come from several different study days (visits). There is 1 row per participant. The PROTOCOL_SITE_CODE and STUDY_DAY information comes from the most recently reported DEMOGRAPHY information, which may not be the most recent visit.
POST_DEMOGRAPHY	In this table, variables are “filled in” from previous values if they are missing. Recall that the DEMOGRAPHY CRF is filled out only for those variables which are different since the last report. Thus, for example, marital status might be reported on the initial CRF, and subsequently only if it changes. Looking at CRFs from dates between these two would show marital status as missing. In the POST_DEMOGRAPHY table, the initial marital status will be shown for all the CRFs from the initial one until it changes, or if it never does, until the most recent CRF.
POST_DIAGNOSIS_CODE	This table provides a method of categorizing diagnoses by diagnoses type and the recipe under which they were collected.
POST_DRUG_CODE	This table provides a method of categorizing drugs by drug type and the recipe under which they were collected.
POST_DRUG_REGIMEN	In this table, distinct episodes of combinations of antiviral drugs are summarized with a start date and a stop date. Each row summarizes the distinct combination of selected antiviral drugs that occurred during a single time period, and is marked by a sequential “regimen number”. If a participant has never been on antiviral therapy, there is only 1 row for that PIN, with REGIMEN_NUMBER=0. The individual drugs that are summarized in this table are also shown as variables that take on the value ‘Y’ or ‘N’ to show whether the participant was on that drug during that regimen number. There are also three summary variables: ON_PI_YN, ON_NRTI_YN, and ON_NNRTI_YN. A null stop date means the regimen is ongoing as of the last reported research visit.
POST_MEDICAL_HISTORY	The table has the columns LOCUS and METHOD updated with the method and locus values sorted alphanumerically. In addition, the column DX_CODE_T contains a description of the diagnosis either from the definition of the code or, in the case of “Other Specify” diagnoses, the comments provided.
POST_MEDICAL_HIST_SUMMARY	This table “collapses” information about a diagnosis episode from more than one row in the MEDICAL_HISTORY table into a single row with a start date and an end date. Multiple reports of a diagnosis with the same start date are combined into one row to provide a unique start and end date. In some cases there may be more than 1 row if there are different locus or method codes.

POST_MEDICATION	This table has medication data with the column DRUG_CODE_T populated with the medication name, when it is not already provided on the CRF.
POST_MEDICATION_SUMMARY	This table “collapses” information about a medication episode from more than one row in the MEDICATION table into a single row. Multiple reports of a medication with the same start date are combined into one row to provide a unique start and stop date. In some cases there may be more than 1 row if there are different indication codes or routes.
POST_SKIN_TEST_SUMMARY	This table summarizes distinct periods of normal, partial and complete skin test reactivity with a start date and an end date. Each row summarizes a period when reactivity was consistent, and is marked by a sequential “skin test number” for purposes of distinguishing and ordering the periods.

The list below gives an itemization of tables within each category of tables.

Extra Data Tables

EXTRA_CERT_VB

Static Tables of Interest

STATIC_100_MILE_ZIPS

These tables give a list of ZIP codes within 100 miles of a given clinical site and their actual distance to the center of the ZIP code where the clinical site is located. This data was downloaded from the Internet.

STATIC_SPECIMEN_CRF

Matches submitted for specimens. This table forms the basis for the Outstanding CRFs report.

STATIC_DRUG_SCORE

Based on the POST_DRUG_REGIMEN table. It also includes lifetime cumulative days on a particular drug or class of drugs as of the start of this drug regimen. This attempts to measure intensity of treatment. For example, the column SCORE_AZT gives the lifetime number of days on AZT for this participant as of the start of the current drug regimen. Similarly, the SCORE_PI gives the combined lifetime days on protease inhibitors at the start of this

drug regimen. For example, 10 days on Indinavir prior to the beginning of this regimen, plus 30 days on Nelfinavir prior to the beginning of this regimen, would give a SCORE_PI=40 for this regimen. By definition, all scores=0 for regimen 1 and regimen 0.

STATIC_DRUG_SYNONYM

This table contains a list of drug codes used and various synonyms such as generic or trade names corresponding to these codes.
