Bleed

**The words on the front of this card are other names for methamphetamine.**

Methamphetamine is a powerfully addictive drug that can produce rapid heart rate, irregular heartbeat, increased blood pressure, and irreversible, stroke-producing damage to small blood vessels in the brain. High body temperature and convulsions occur with overdoses and, if not treated immediately, can result in death.

For more facts, in English and Spanish, on the health effects of methamphetamine or other drugs, visit [www.drugabuse.gov](http://www.drugabuse.gov).
