# **Agent-Based Modeling: Population Health from the Bottom Up**

---

**Dr. Joshua M. Epstein**  
**Senior Fellow, Economic Studies and**  
**Director, Center on Social and Economic Dynamics**  
**The Brookings Institution**

**External Faculty, Santa Fe Institute**

**National Institutes of Health, July 13, 2007**

---

# Outline

- **Agent-Based Models**
  - **Public Health Applications**
-

---

# Features of Agent-Based Computational Models

- **Heterogeneity**
    - No representative agent; no homogeneous pools, no aggregation
    - Every agent explicitly represented, and differ by:
      - Wealth, network, immunocompetence, memory, genetics, culture, ...
  - **Autonomy**
  - **Bounded Rationality**
    - **Bounded Information**
    - **Bounded Computing**
  - **Explicit Space**
  - **Local Interactions**
  - **Non-Equilibrium Dynamics**
    - **Tipping Phenomena**
-

---

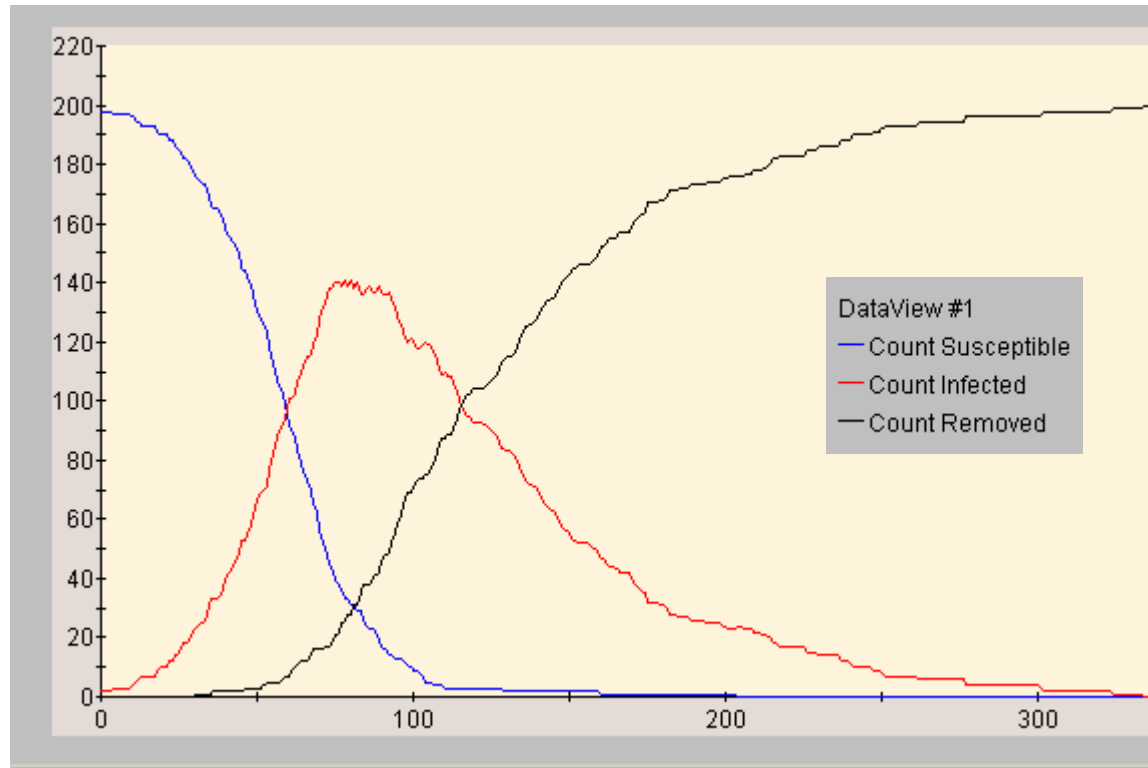

# Today's Examples

- **Playground (warm-up)**
  - **Town Scale**
    - **Smallpox**
  - **City Scale**
    - **New Orleans Toxic Chemical)**
  - **National Scale**
    - **U.S. smallpox**
  - **Global Scale**
    - **MIDAS Pandemic Flu**
  - **Network**
    - **Teen Smoking**
    - **Obesity**
-

# Toy Warm-Up. SIR. Playground Interactions ( $r=.15, b=.02$ ).

Two.qt

# Influenza Epidemic Data, 1978

## English Boarding School

Influenza epidemic, boys boarding school. *British Medical Journal*, 4 March, 1978. Of 763 boys, 512 were confined to bed, 22 January-4 February, 1978.

- 
- OK for very small-scale
  - Well-mixed setting
  - Simple bug
  - Let's add some complexity...
-

---

# Example 1. Smallpox Model

- Developed with Donald Burke JHSPH for The Smallpox Working Group, Secretary's Council on Public Health Preparedness, HHS, founded and chaired by D. A. Henderson.
  - Intensive regular meetings to arrive at reasoned assumptions about all biomedical and critical behavioral aspects
-

---

# Basic Question

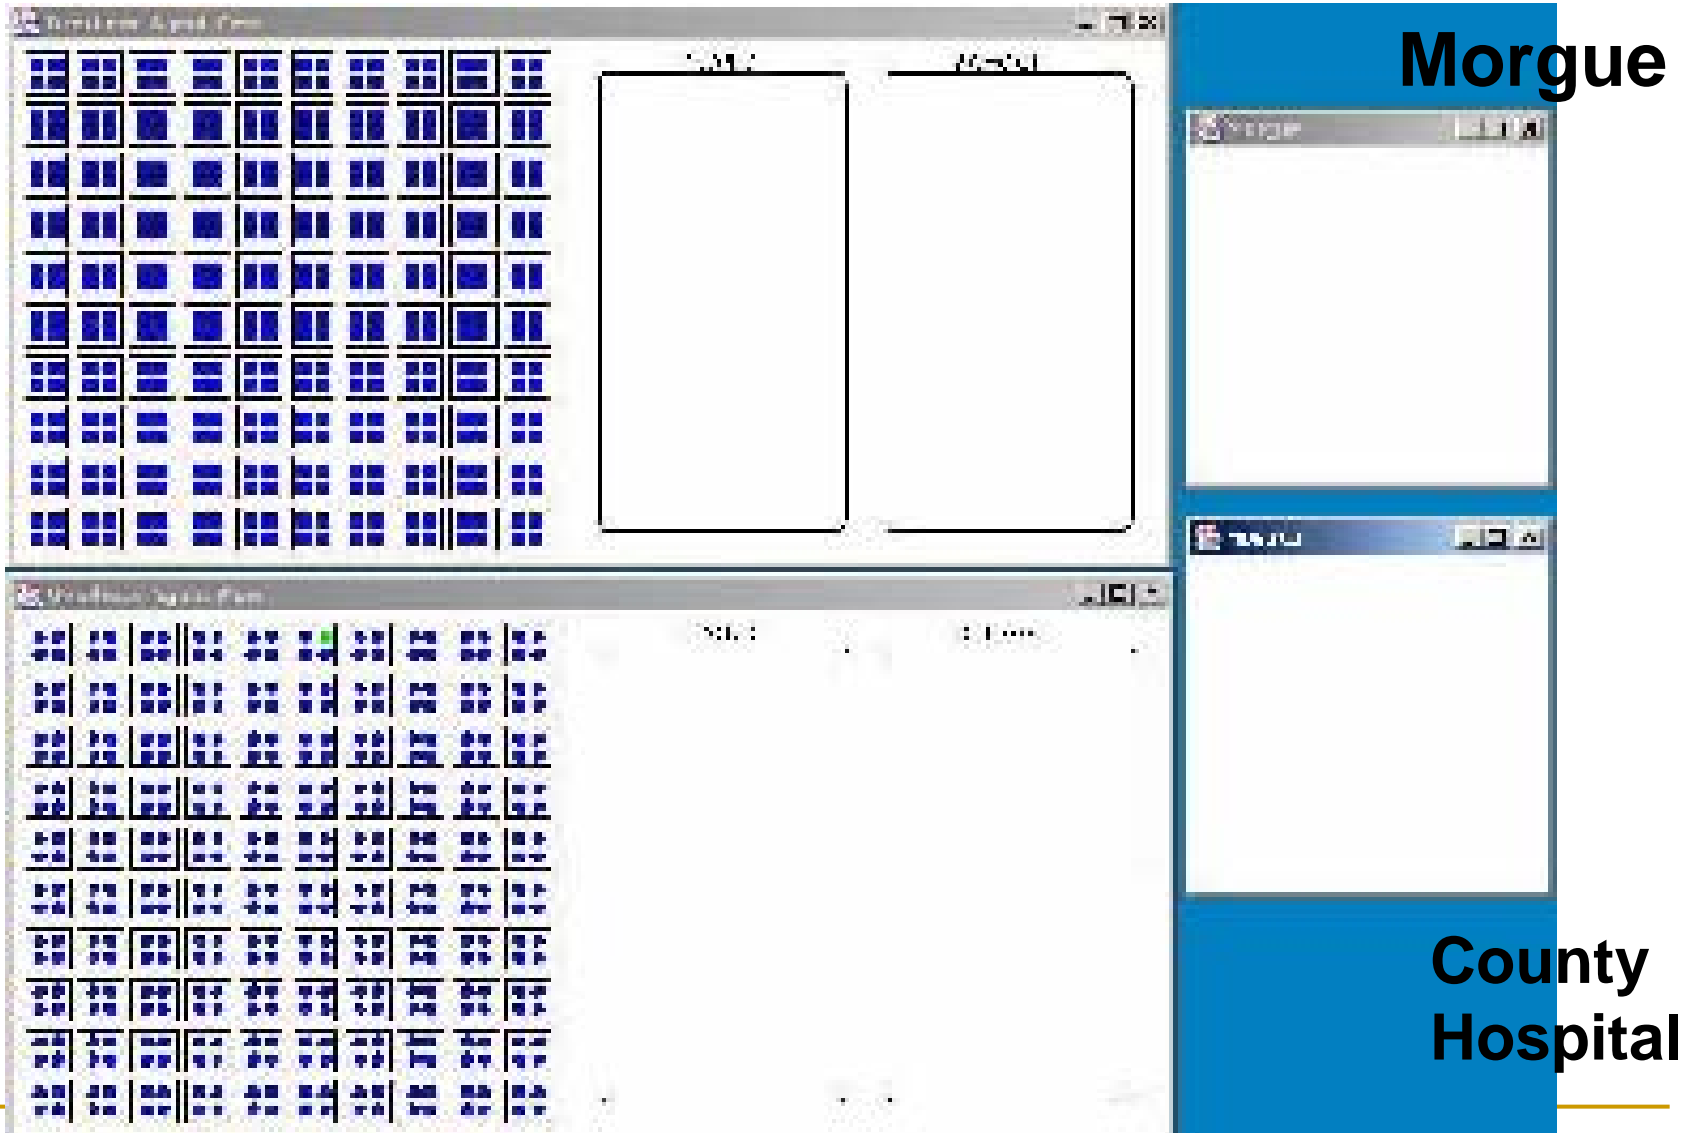

- What Resolution?
  - Include Social Units the Loom Largest in Data:
    - Homes
    - Schools
    - Workplaces
    - Hospitals
-

---

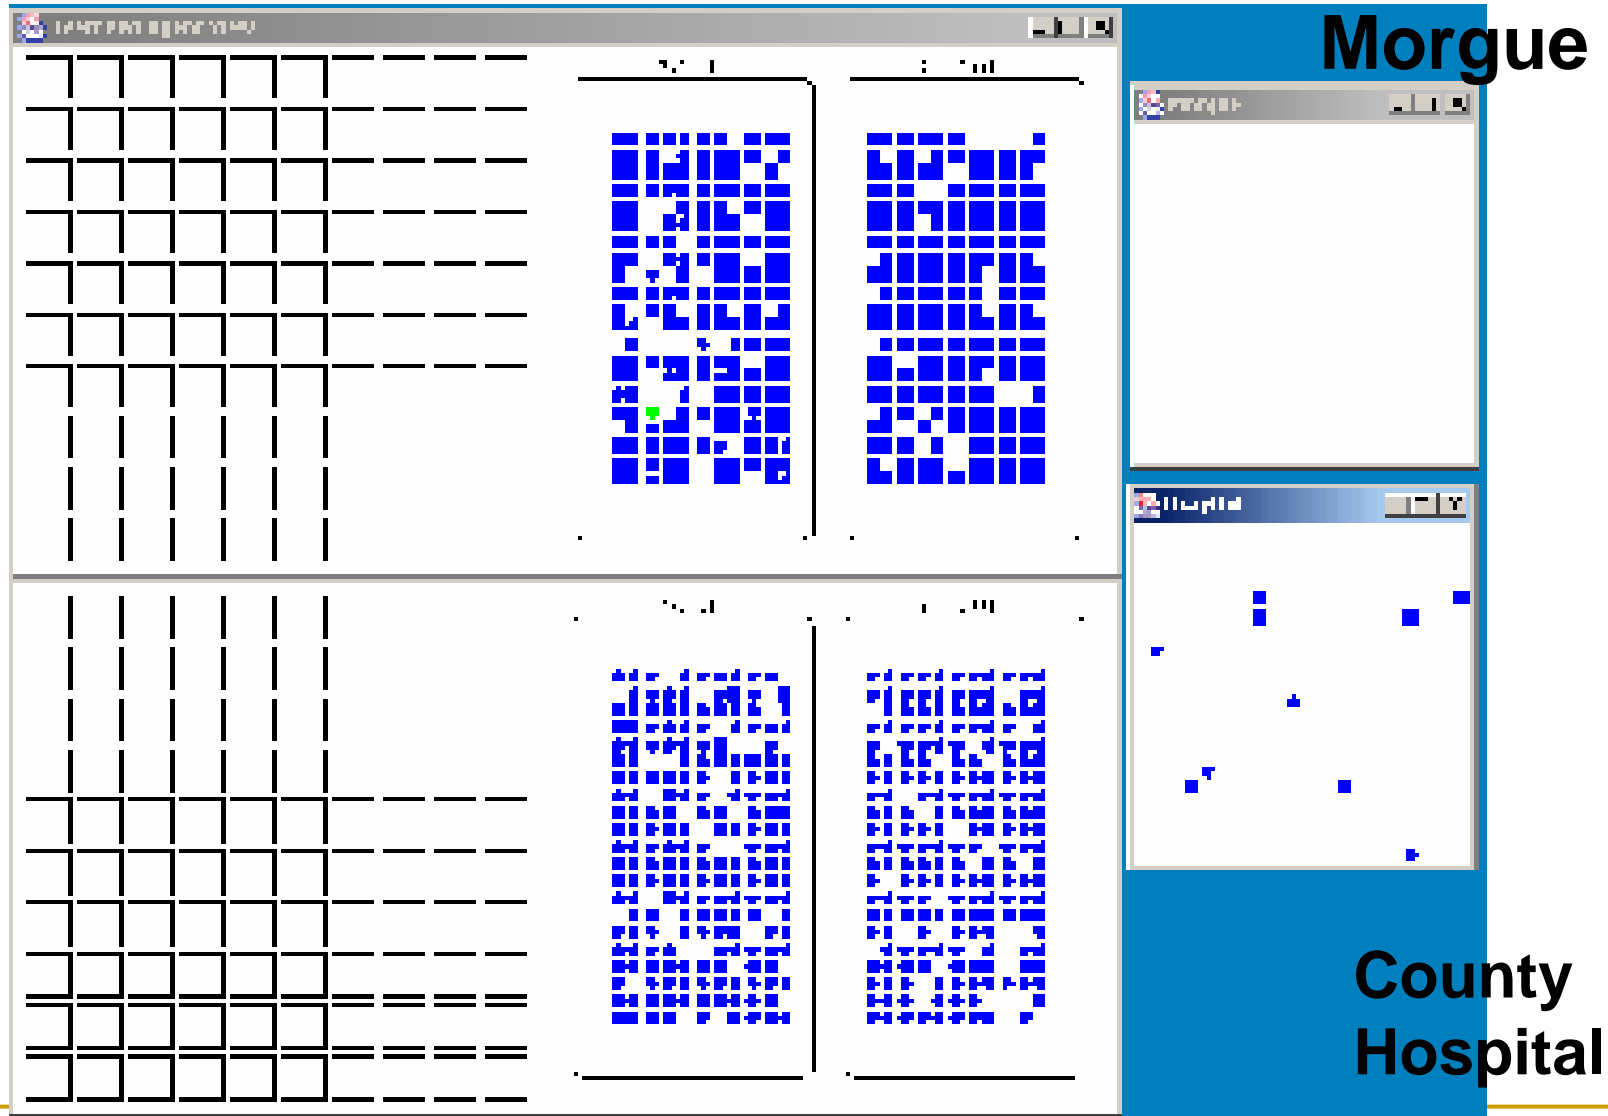

# County-Level Model

- **2 Towns**
  - **Per Town Assumptions**
    - **400 people comprised of**
    - **100 Households, each with 2 adults and 2 kids**
    - **Non-commuting adults work at the town workplace**
    - **10% adults of commute to the other town's workplace**
    - **5 adult hospital workers**
    - **Kids go to school in the town school**
    - **1 workplace**
    - **1 school**
  - **1 Common Hospital**
    - **10 adult hospital workers**
  - **1 Common Morgue**
  - **Day = Night = 10 Rounds**
  - **Contacts Per Day: Home=3 , Work=10.**
-

“Night-Time” = All individuals at home, not at work or school

“Day-time” = All individuals are at work or school

All individuals go home at night, and the cycle repeats every “day”

# Ordinary Smallpox Natural History

## Ordinary Smallpox

Mean: 11.40 days

Distribution of Incubation Period (Onset of Fever)

## Disease recognition

Latent Period

## Incubation period

One day after onset of fever

One day before onset

## Behavior

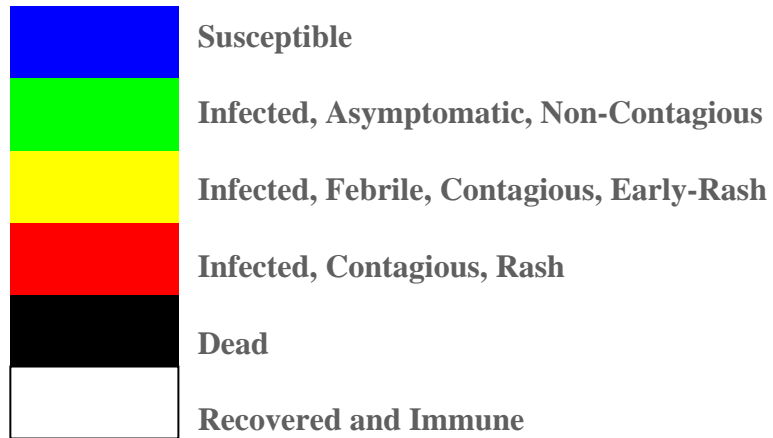

In the end of the 1<sup>st</sup> day of fever 17.5% withdraw to the home 17.5% go to the hospital

At the end of the 3<sup>rd</sup> day of fever (beginning of 1<sup>st</sup>): 10% go to the hospital + 10% withdraw to the home

1<sup>st</sup> recognized case in hospital 2 hours later, withdrawal

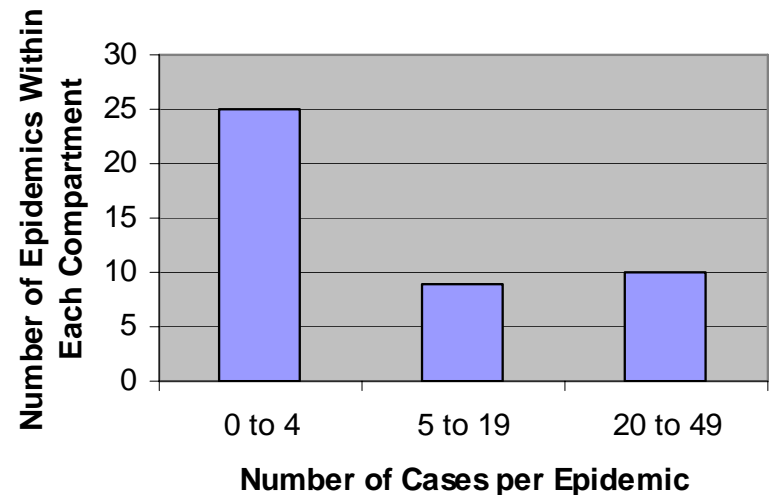

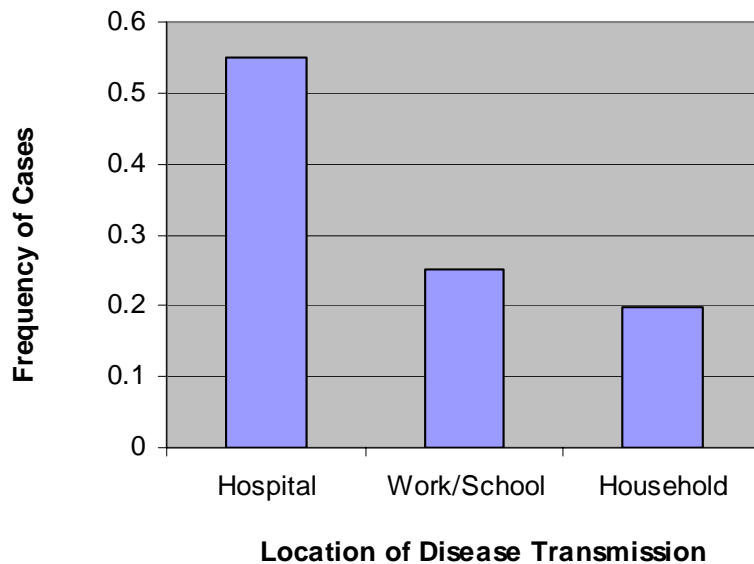

# Simplified Progression of Smallpox

# Calibration of smallpox model

- European data of 49 epidemics occurring between 1949-1971
- Two distributions

---

# Base Case Run

- No Policy Interventions
  - No Background Immunity
  - One commuter index case starts the epidemic in Circletown; it spreads to Squaretown
-

# Smallpox Base Case

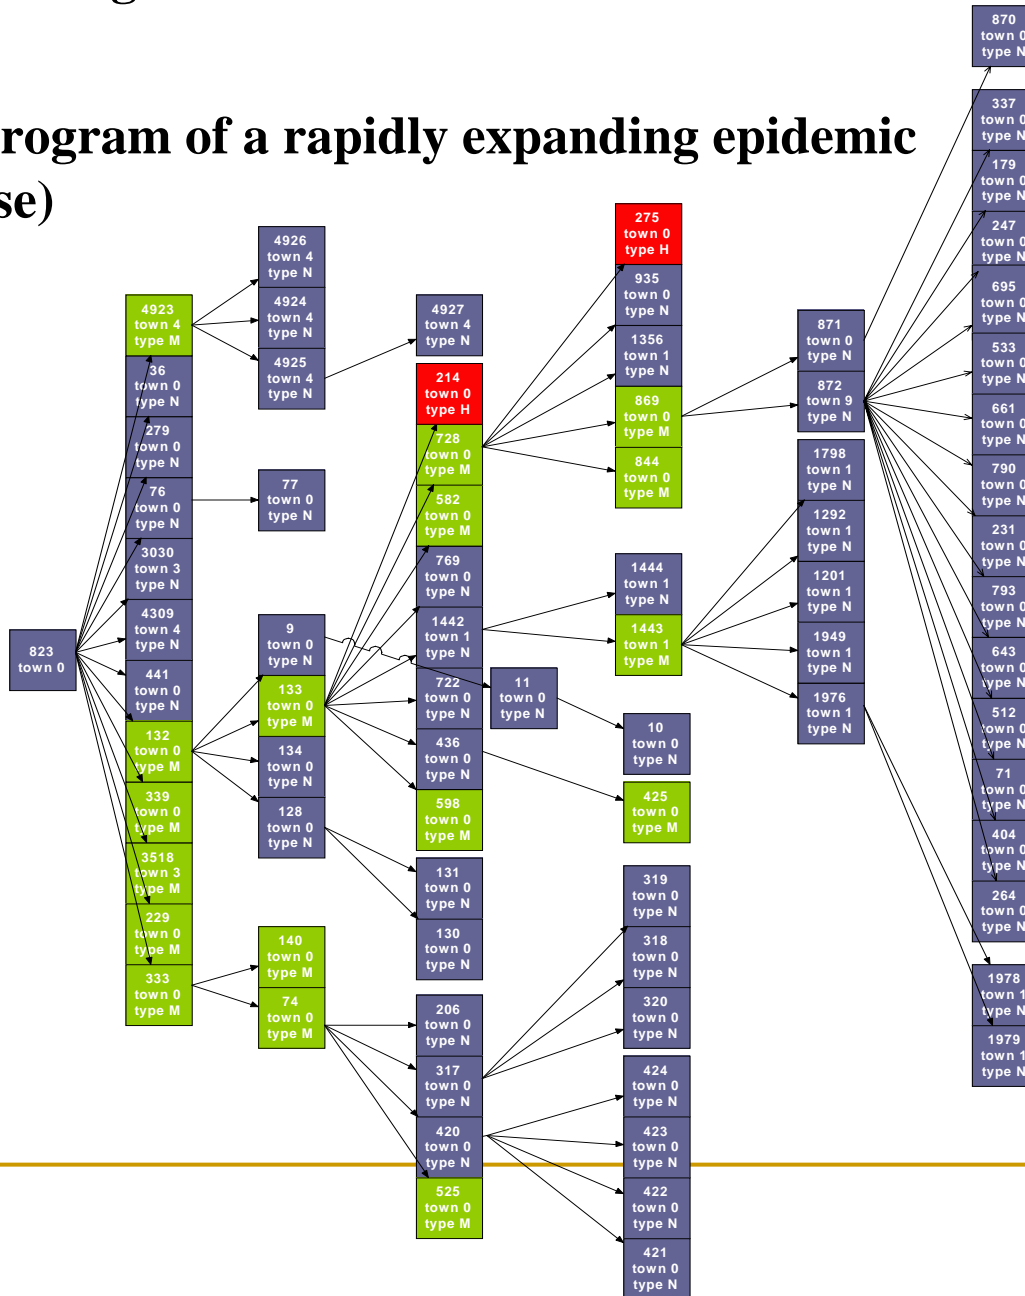

**Typical Results for Base Case Run: Incidents per Day and Time Series of Cumulative Infected. 800 infected. 255 dead. As in pre-vaccine Europe.**

# Superspreaders: Agent model tracks every contact.

## Contact dendrogram of a rapidly expanding epidemic (one index case)

---

# Policy Interventions

- **Trace vaccination**
  - **Mass vaccination**
  - **Hybrid strategies**
-

---

# Intervention 1: Contact Tracing

**“Persons who had...close proximity contact (<2 meters=6.5 feet) with a confirmed or suspected smallpox patient after the patient developed fever and until all scabs have separated (no longer infectious.)”**

**Problem: Perfect contact tracing is difficult if you were...**

---

# Here

# ... Or Here

## TWA NORTH AMERICA DESTINATIONS

- 
- Conventional wisdom (bolstered by well-mixed ODE models) was that we'd lose "the race to trace," leaving only...
-

---

# Intervention 2. Mass Vaccination

- **Problem 1: Vaccine may be fatal if you are immune suppressed**
    - **AIDS**
    - **Chemotherapy**
    - **Other (e.g., Infant)**
-

## Intervention 2. Mass Vaccination

- **Problem 2: Serious vaccine side effects**

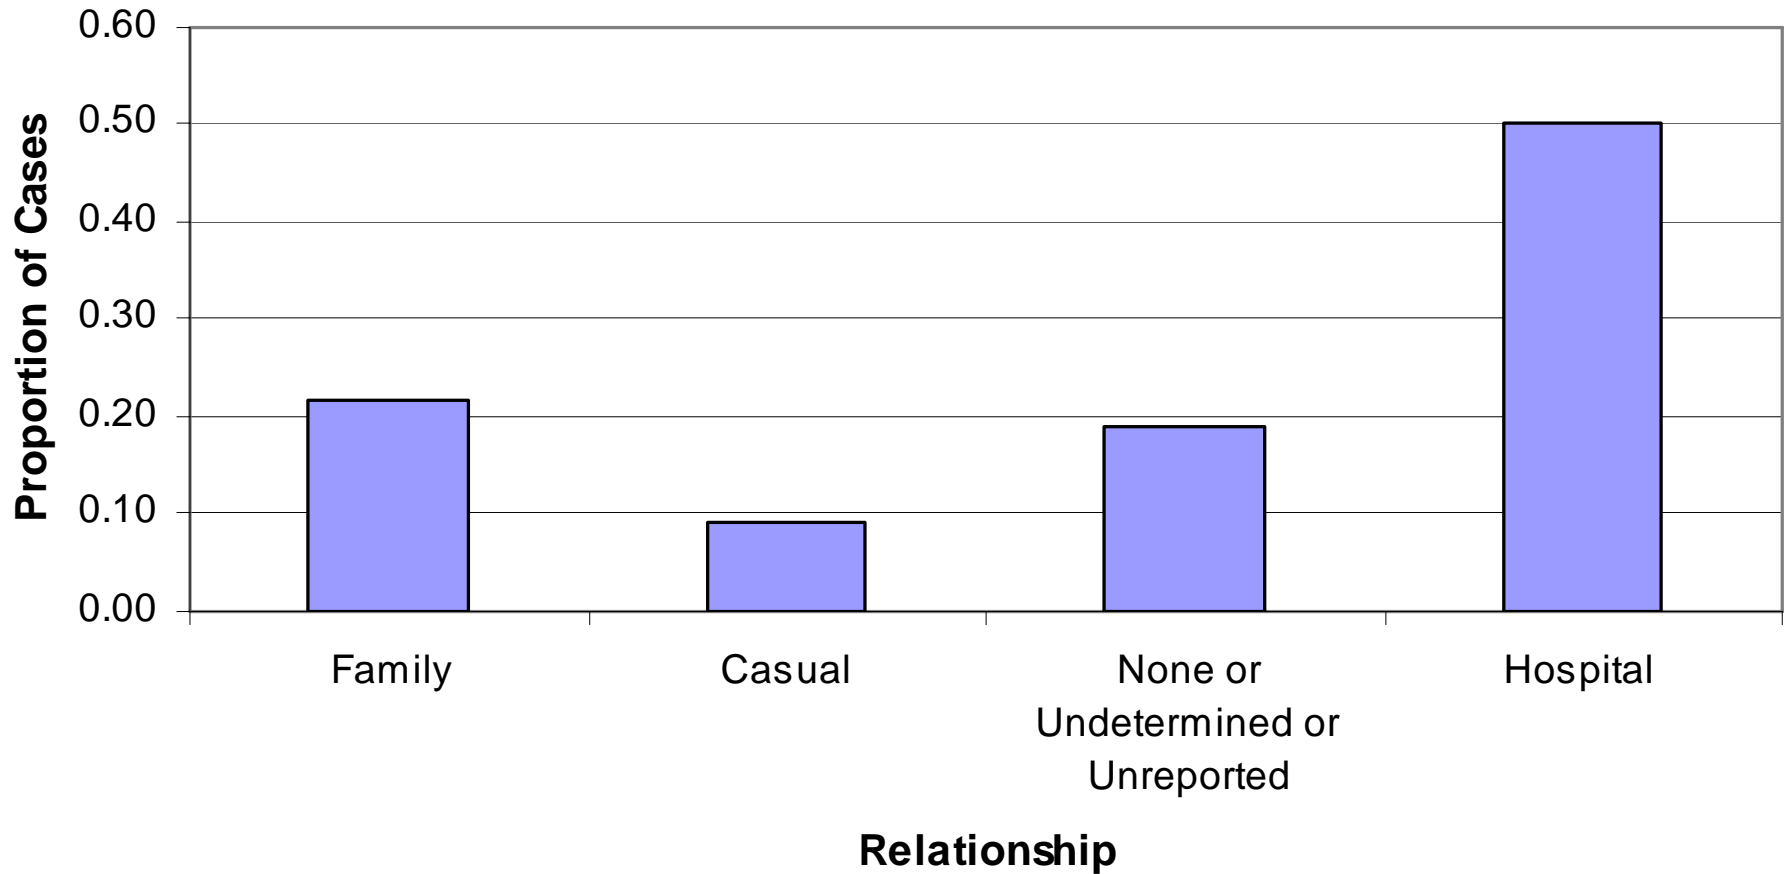

---

# Policy Challenge

*Design a policy that is more feasible than perfect trace vaccination, less risky than mass vaccination, and is highly effective in minimizing a smallpox epidemic.*

---

# Smallpox Cases by Relationship to Transmitting Case for 680 Cases Occurring in Europe 1950-1971 (Mack, 1972)

**Our model retrodicts this data, which suggests that vaccinating hospital + family would be effective. Is it?**

# Results of Hospital and Family Only (280 Dead vs. 45 Dead)

---

# Extensions (PACER, NIH/MIDAS)

- **Vastly Increased Scale**
    - 50k Longini, et al; Burke et al
    - 1.2m (Portland) Eubank et al
    - 300m Parker et al
  - **Increased Biomedical Realism**
    - Ordinary, Modified, Hemorrhagic variants
  - **Range of Social Structures**
  - **Human Behavioral Responses (e.g., distancing)**
  - **Support The Basic Result (Epstein, et al, Brookings, 2004; Longini, et al, *IJID*, 2006; Burke, et.al, *AEM* 2006)**
-

---

# Main Conclusion

- Mass vaccination unnecessary (and unduly risky)
  - Close contact vaccination (S&C) can succeed
  - Pre-attack vaccination of health care workers amplifies effect.
-

---

## Example 2. City Level Toxic Chemical

- Collaborators: Dr. Bharat Soni. Chair, Dept of Mechanical Engineering, UAB.
  - Highly realistic fluid dynamics
  - Plausible human behavior
    - Mass psychology
    - Non-compliance
    - Flight
    - Congestion
  - Design optimal response
-

---

# New Orleans Model

---

# Novelty

- The combination of high fidelity fluid dynamics and
  - Behaviorally rich agent layer.
  - Design optimal preparedness and response
-

---

# Example 3. US National Model

- Lead Developer: J. Parker, CSED
    - PACER
    - MIDAS agent global
  - 300 million individual agents
  - Displayed on US map, resolved at the level of ZIP code
  - Movement from zip  $I$  to zip  $j$  governed by a 4,000 x 4,000 travel matrix encoding a gravity model
  - Demo with Smallpox
    - Susceptible: Black
    - Infected/Contagious: Red
    - Recovered or Dead: Blue
-

---

# National: 300 million Agents

---

# Applications

- National scale optimized containment strategy
    - Smallpox
    - TB
    - Flu...
  - Linkage to Global Model...
-

---

# Example 4. Global Pandemic Flu

- NIH Global Pandemic Flu Model
  - Director Dr. Joshua M. Epstein
  - Dr. Georgiy Bobashev, Dr. Michael Goedecke, Dr. Feng Yu, Dr. Diane Wagener RTI/MIDAS
  - Epstein, et al. May 2, 2007 *PLoS One*
-

---

# Plan of Attack

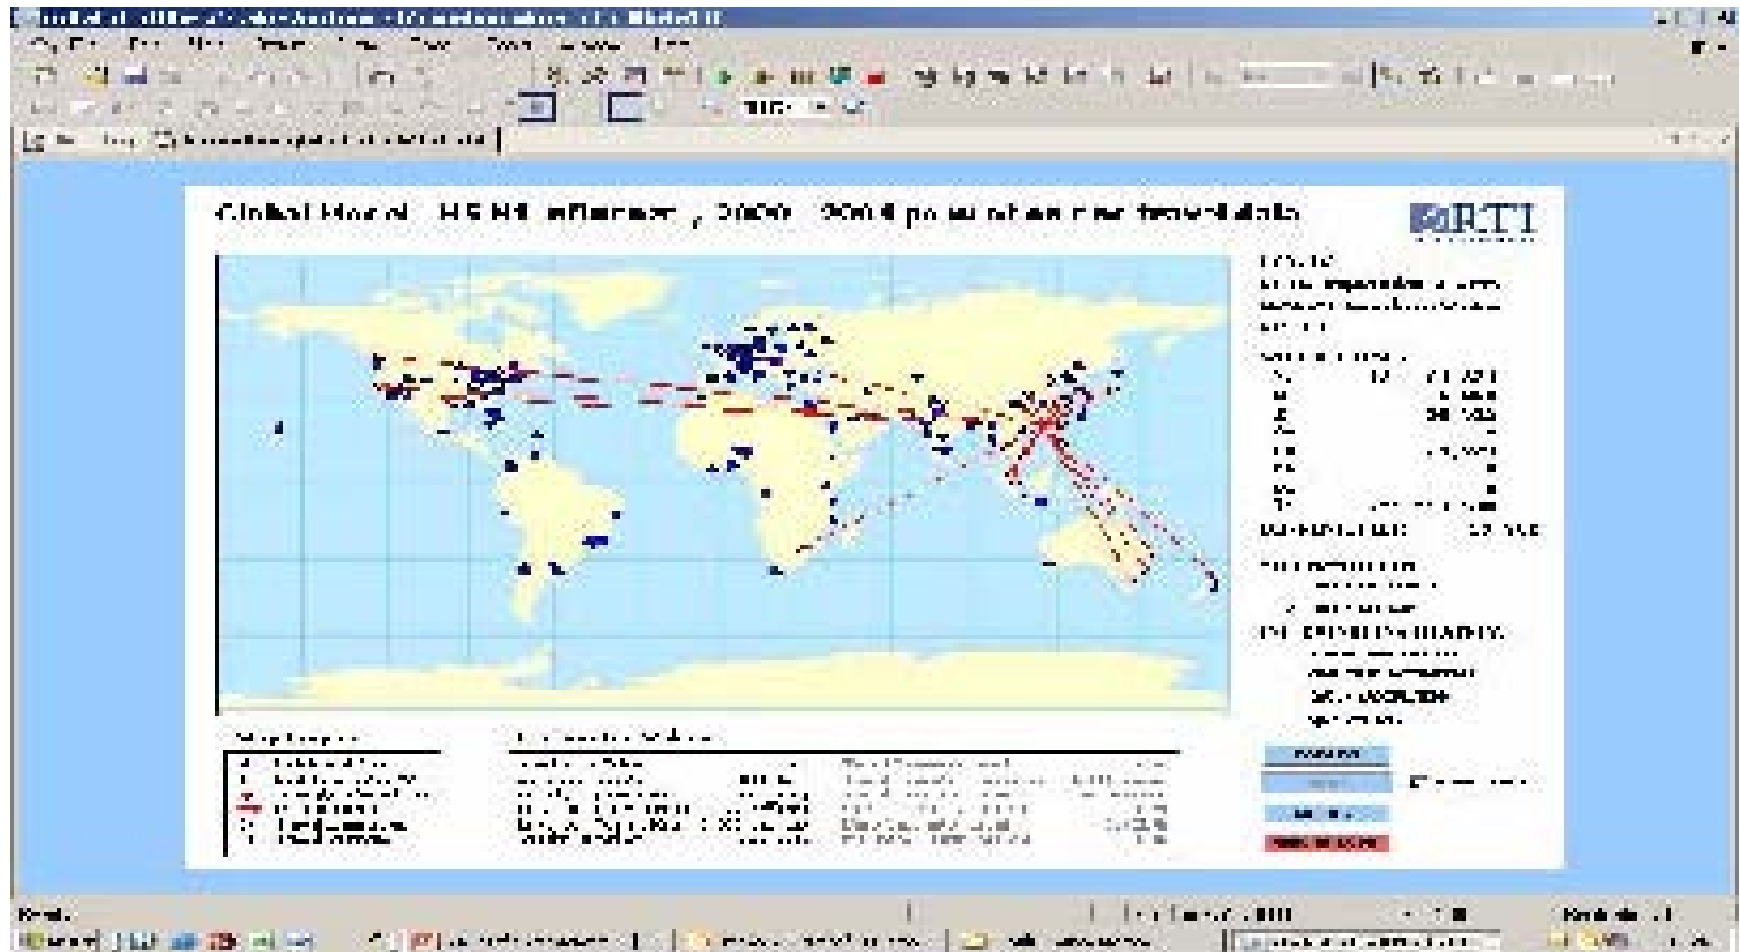

- 1968 Flu/1968 Pop and Trans.
  - 1968 Flu/2000 Pop and Trans.
  - Pandemic Flu/2000 Pop and Trans.
  - So, we end up with...
-

# Global Model : 155 Largest Cities

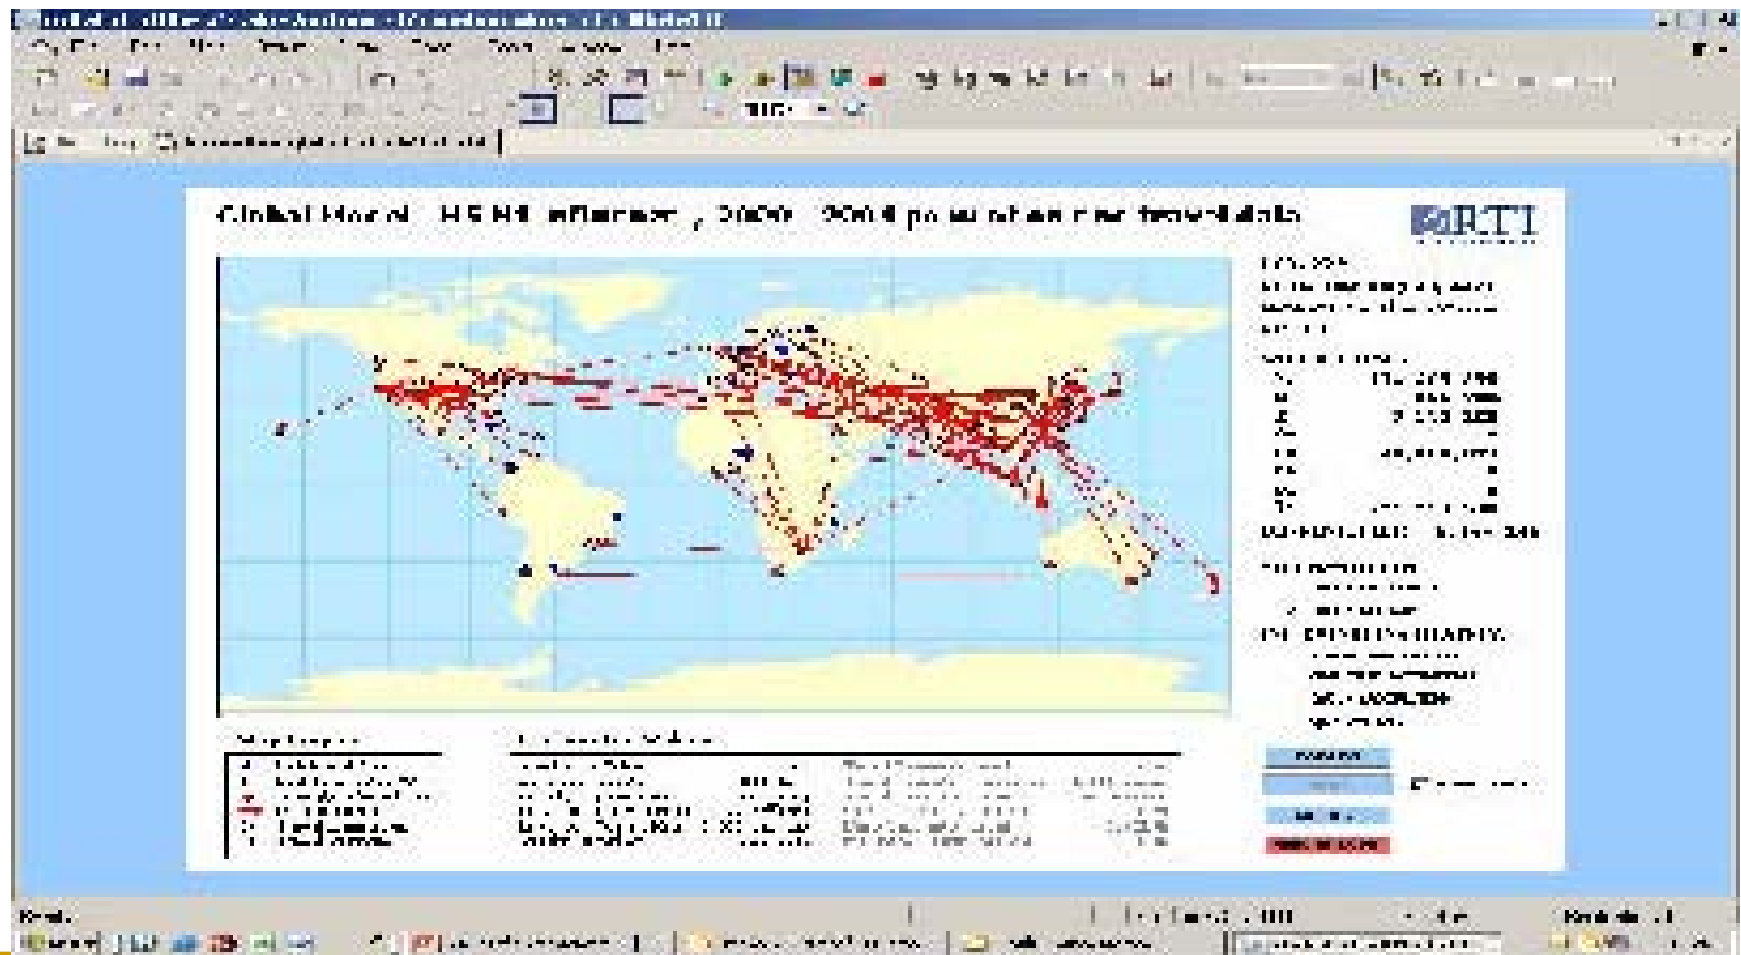

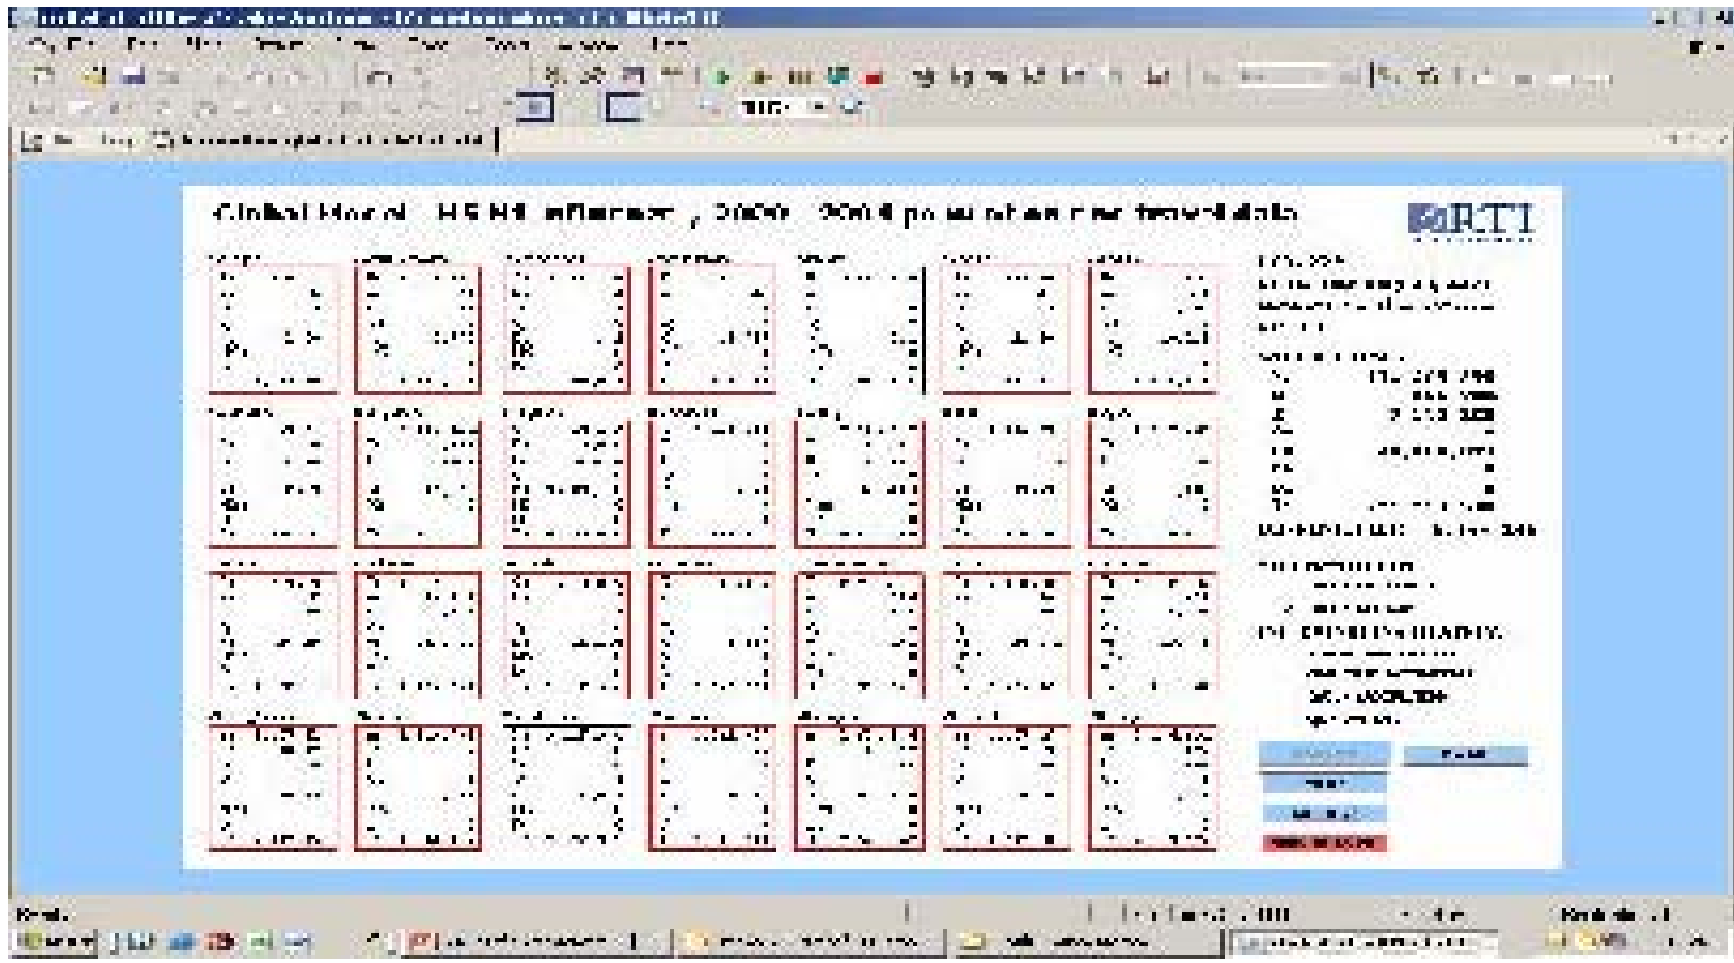

# Geographic Spread

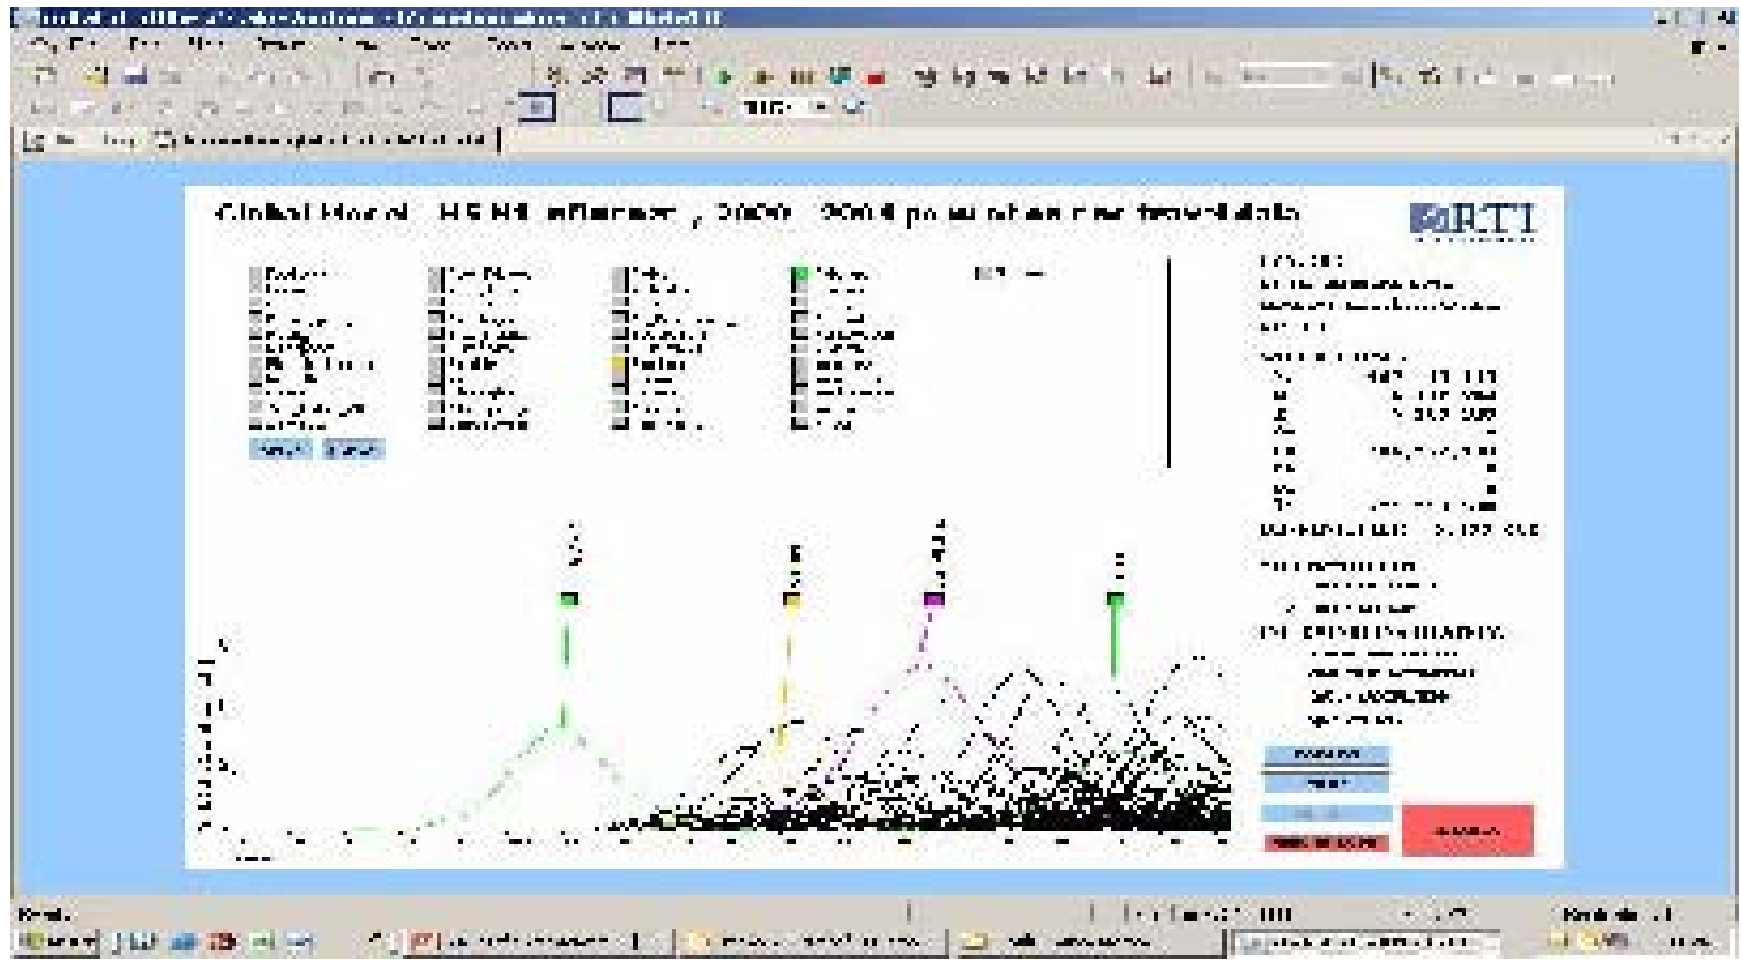

# Geographic Spread (continued)

# City-Specific Analyses

# Global Time Series

- 
- Two Scenarios:
    - Hong Kong Start
    - London Start
-

# Hong Kong Start
