Power Plants Face a Complex Set of Requirements Under The Current Clean Air Act

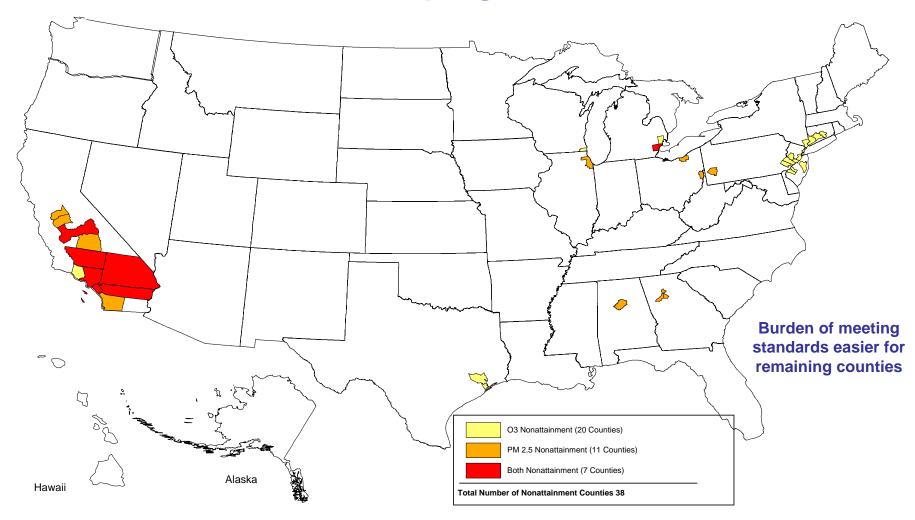

NSR Permits for new sources & modifications that increase emissions

350 Monitored Counties must meet New Air Quality Standards for Ozone and Fine Particles.*

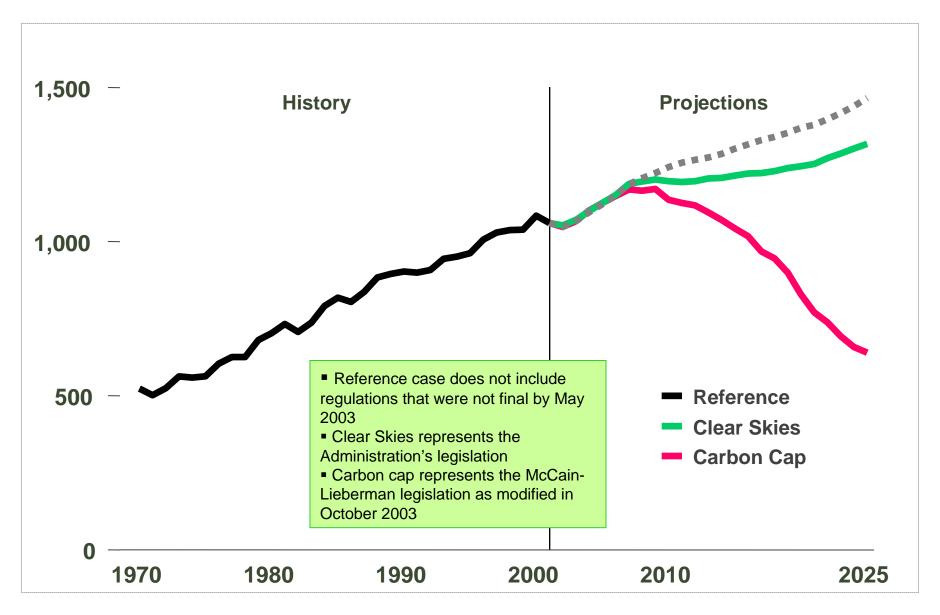

In 2020, 312 Monitored Counties will meet Standards with Clear Skies, New Diesel rules, and existing Clean Air Act programs

^{*}For relative comparison purposes only. Based on 2003 EPA modeling conducted on CSA, 1999-2001 AQ data.

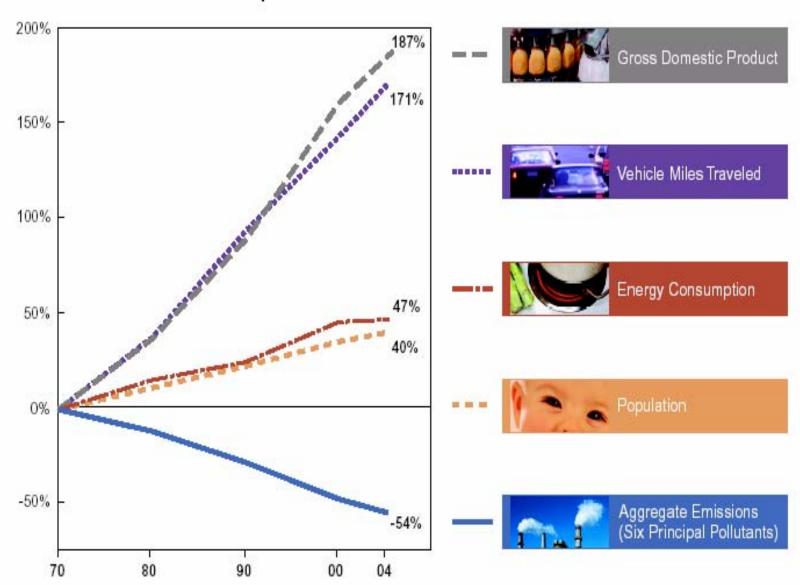

Coal Consumption 1970-2025

Economic Growth and Emissions Decline

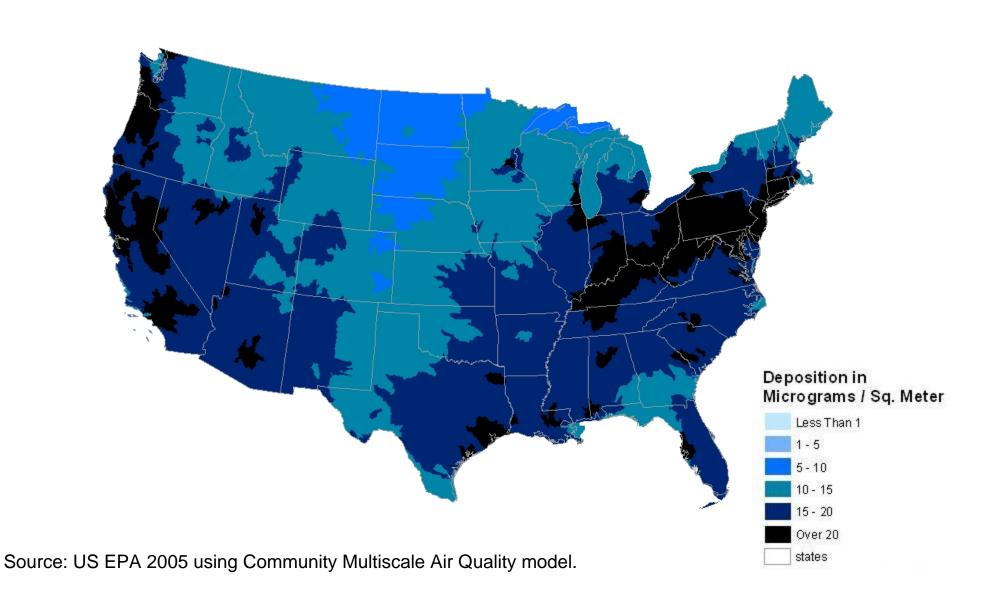

Comparison of Growth Areas and Emissions

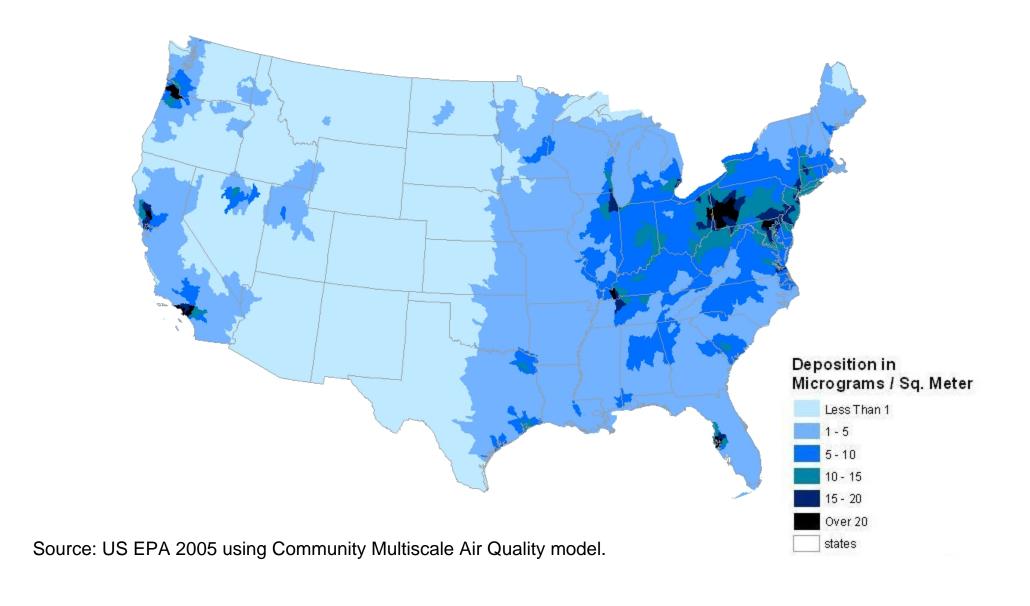

Power Generation Emission Reductions

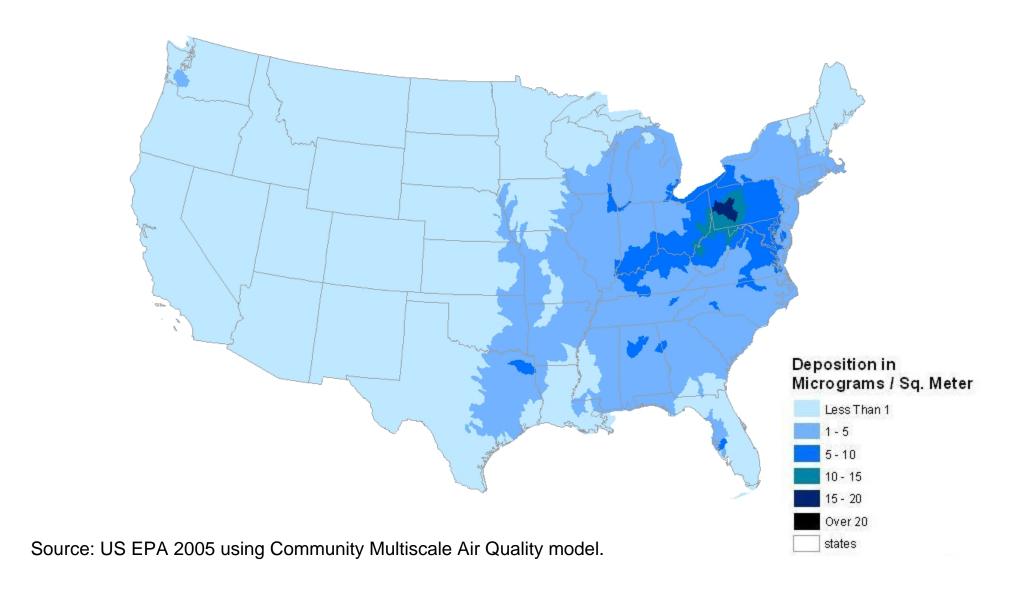

Mercury Deposition From All Sources in 2001

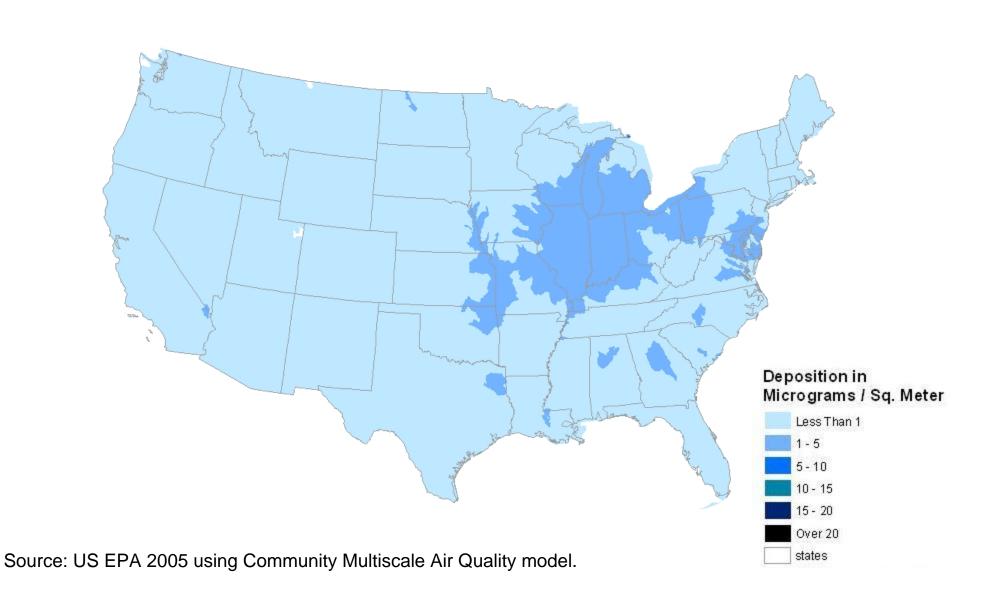

Mercury Deposition from All US and Canadian Sources in 2001

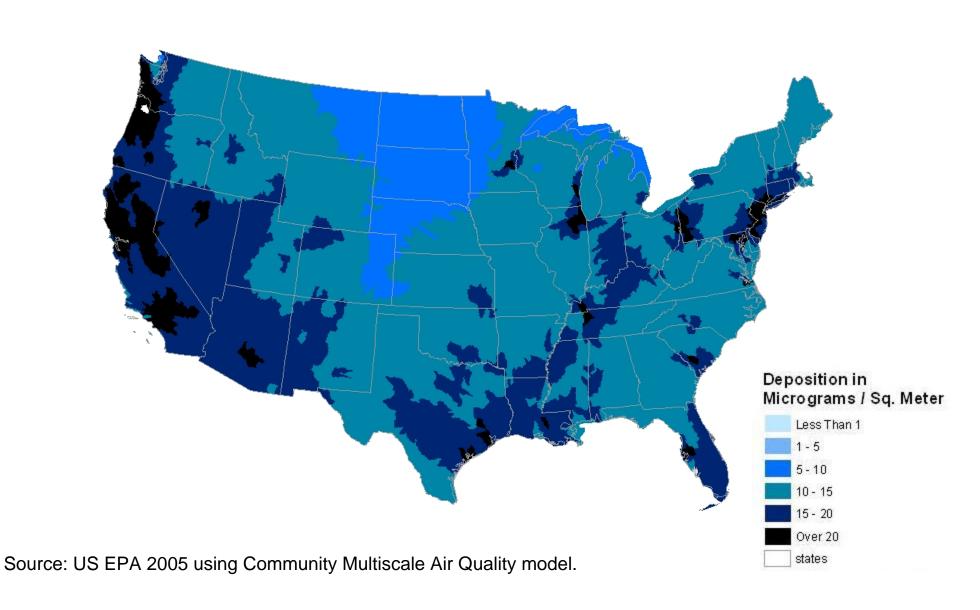

Mercury Deposition From US Power Plants in 2001

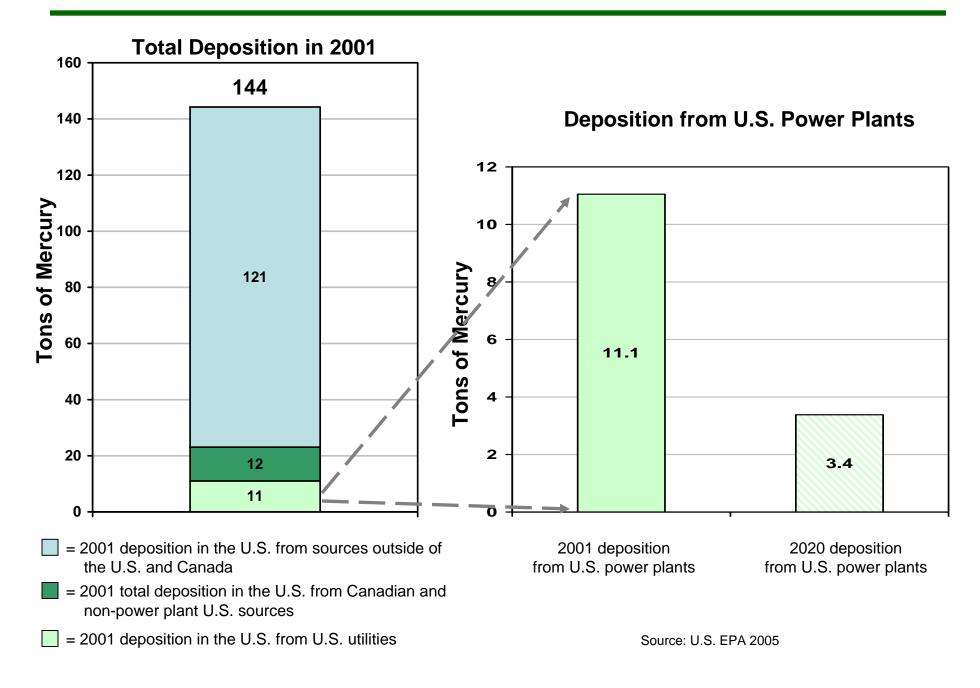

Mercury Deposition From US Power Plants in 2020 with CAIR and CAMR

Mercury Deposition from Non-Power Plant Sources in 2020

Mercury Deposition in the U.S.

Achieving the Clean Coal Vision

	Today's Fleet Average	Today's Modern PC w/ Scrubbers Clean Coal Technology	First Generation IGCC Advanced Clean Coal	Second Generation IGCC CCPI Technology	Future Plants FutureGen Technology
SO ₂ (% removal)	35%	98%	>98%	>99%	>99%
NO _x (% control)	50%	85%	93%	99%	>99%
Hg (% removal)	35%	20 – 90% depending on coal type and plant configuration	90%	95%	99%
CO ₂ (% reduction)	0%	~ 5-17% efficiency based	~17% efficiency based	~20-25% efficiency based	>90% with sequestration

Note: The emissions shown are representative of the technologies listed. Greater emission reductions can be achieved for all technologies shown, but there would be a significant increase in cost. The reductions shown for PC plant requires add-on environmental control technologies. The reductions shown for IGCC systems are largely inherent to the technology.
