The Project

Land Grant Universities, Water Research Institutes, and EPA Region 10 have formed a partnership to provide research and education to communities about protecting or restoring the quality of water resources. This partnership is being supported in part by the USDA's Cooperative State Research, Education, and Extension System (CSREES).

Our Goal and Approach

The goal of this Project is to provide leadership for water resources research, education, and outreach to help people, industry, and governments to prevent and solve current and emerging water quality and quantity problems. The approach to achieving this goal is for the Partners to develop a coordinated water quality effort based on, and strengthening, individual state programs.

Our Strengths

The Project promotes regional collaboration by acknowledging existing programs and successful efforts; assisting program gaps; identifying potential issues for cross-agency and private sector collaboration; and developing a clearinghouse of expertise and programs. In addition, the Project establishes or enhances partnerships with federal, state, and local environmental and water resource management agencies, such as by placing a University Liaison within the offices of EPA Region 10.

National Water Quality Program Areas

The four land grant universities in the Pacific Northwest have aligned our water resource extension and research efforts with eight themes of the USDA's Cooperative State Research, Education and Extension System.

1. Animal Waste Management
2. Drinking Water and Human Health
3. Environmental Restoration
4. Nutrient and Pesticide Management
5. Pollution Assessment and Prevention
6. Watershed Management
7. Water Conservation and Management
8. Water Policy and Economics

CSREES is the Cooperative States Research, Education, and Extension Service, a sub-agency of the United States Department of Agriculture, and is the federal partner in this water quality program.

Applying knowledge to improve water quality

Pacific Northwest Regional Water Program

A Partnership of USDA CSREES & Land Grant Colleges and Universities

Water Conservation and Agricultural Water Management

Overview

Pacific Northwest and Alaska rivers, lakes and groundwater sources provide water for industry, agriculture, residential uses and recreation, as well as support a diversity of ecosystems. Increased demands from an expanding population, industrial growth, increases in agricultural production and ecosystem management have resulted in localized, temporal shortages of available water. Agriculture is the single largest water user. However, inefficient irrigation methods are being replaced by modern science-based water saving techniques. Additionally, efficient water management reduces soil erosion. Land grant universities in the Pacific Northwest are engaged in research and educational outreach in water conservation techniques for agricultural operations. Regionally, there are also ongoing, community watershed planning efforts in which many local Cooperative Extension faculty are actively engaged. Members of the Pacific Northwest Water Quality Coordination Program have a broad range of research activities, educational materials and outreach programs to assist agriculturists and others to manage water quality and quantity.

Desired Outcomes

- Agricultural water users implement water-saving irrigation methods
- Individuals employ water conservation techniques
- Water conservation mitigates the need for increased numbers of water storage systems
- Water resources are better managed
- Soil erosion is reduced to sustainable levels

Pacific Northwest Conservation Tillage Handbook

Much of the effort in the Pacific Northwest to control soil erosion and effectively manage water in agriculture promotes the use of conservation tillage. This technology developed by scientists associated with the Solutions to Environmental and Economic Problems (STEEP) program is summarized in the *Pacific Northwest Conservation Tillage Handbook*. This handbook contains chapters covering soil erosion, conservation tillage systems and equipment, residue management, plant diseases, weeds, fertility and fertilizers, plant development and ground cover, wheat variety development and alternate crops, erosion control on irrigated cropland, economics, and application of new technology. This handbook can be ordered from publication offices at Oregon State University, Washington State University or the University of Idaho.

Pacific Northwest Regional Publications (note: these publications can be obtained from publication offices at Oregon State University, Washington State University and the University of Idaho):

- PNW 0286 Offsets for Stationary Sprinkler Systems
