Day 19	22.15	91.58	65.68	2.83	6.14	4.43	0.11	2.38	0.76	1.18	0.82	0.65	0.99	1.06	
Average dv	23.52														
	1996 Observed values at an IMPROVE site (10 Mm-1 is added to each total bext value to account for Rayleigh scattering)								Relative Reduction Factors are calculated from REMSAD for each species based on the model predicted % reduction for each day. RRFs represent the predicted reduction from the 2001 base case to the 2020 Clear Skies control case. An RRF of 0.85 indicates a 15% reduction.						

H-2

2020c SO4 bext	2020c NO3 bext	2020c OMC bext	2020c EC bext	2020c soil bext	2020c coarse bext	2020c Total bext	2020c Deciviews

34.51	1.62	4.82	3.73	0.15	3.05	57.87	17.56
49.62	3.34	5.05	2.87	0.10	2.52	73.50	19.95
Average dv 2020c							20.80
Reduction in dv from 2001-2020 control							-2.72
The RRFs are multiplied by the base year bext values to get the 2020 control bext predictions. The daily total bext values are converted to deciviews and then the deciview values are averaged across all days. The resultant average dv value for 2020c is subtracted from the observed value to get the predicted visibility improvement on the 20% worst days (-2.72 dv).
