

Dry Edible Beans

Caution Rules Dry Bean Market

As is the case for many other commodity markets, dry bean markets will end the calendar year on a very quiet note with the majority of product movement occurring under contract. Because open market sales volume has been very limited, price discovery in the U.S. dry bean market has been challenging. Few grower bids or dealer prices have been established for most bean classes since harvest was completed. Combined with the traditionally sluggish movement over the holiday period in December, little additional price information will likely be forthcoming until early 2009. Given the wide fluctuations experienced in commodity and world economic markets over the past year, market participants have become very conservative, waiting for the dust to settle. As light is shed on some of the unknowns (South American crop potential, production by class in the U.S., commodity price trends, world economic well being, etc.) in U.S. and world markets over the next few months, dry bean markets should begin to thaw as participants slowly gain confidence in the changing market environment.

Record High Yield in 2008

The U.S. dry edible bean crop was estimated to be 25.7 million cwt—up 1 percent from a year earlier (table 11). Although harvested area was down 2 percent, ideal weather in most major growing areas aided crop development and yield potential. As a result, the preliminary national per-acre yield averaged 17.75 cwt, up 3 percent from a year earlier and 9 percent above the average of the previous 5 years. If realized, this would also exceed the previous U.S. record-high yield set in 1991. Production declined 5 percent in North Dakota, which remained the top producing State, with 39 percent of the 2008 crop. Crop conditions in Michigan, which remained the second leading State in 2008, were favorable until heavy late season rain, with State yield rising 16 percent to 18.5 cwt per acre—the third highest on record. In Nebraska, the third leading producer, dry bean yields set a new standard for the second consecutive year, rising 4 percent to 23.5 cwt. This was the highest dry bean yield in the Nation, reflecting the use of irrigation (used on over 90 percent of the crop) in this relatively dry State.

Navy and Great Northern Crops Up, Pinto and Garbanzo Down

The first estimate of dry bean production by class was released by USDA on December 11. Production of 11 of the 15 identified bean classes increased or remained even with a year earlier, with the biggest percentage gains for Great Northern, small red, and dark red kidney beans (table 11). Output of garbanzo beans (chickpeas) fell 29 percent in 2008 as area harvested fell 30 percent and a cool spring combined with a dry summer kept yields about steady. With lagging prices relative to alternative crops discouraging planted area in several States, the garbanzo bean (small and large chickpeas) crop was the smallest since 2005. Large kabuli chickpeas accounted for 87 percent of the total garbanzo crop. Given a smaller crop, prices in the large chickpea/garbanzo market remain relatively strong, with early December grower bids 25 percent above year-earlier levels.

Although the total dry bean crop was little changed from a year ago, most classes of dry beans experienced production gains in 2008. Production of navy beans, the second-leading dry bean class, increased 21 percent as output was higher in both North Dakota (up 30 percent), Minnesota (up 17 percent), and Michigan (up 17 percent). Output of black beans was marginally higher as good yields in the 2 leading states, Michigan and North Dakota, offset reduced acreage.

Pinto bean production declined 11 percent from a year earlier as a reduction in harvested area combined with a slight drop in yield. Pinto beans easily remain the top bean class with 40 percent of the 2008 crop—down from 46 percent a year earlier. Pinto bean harvested area was down 10 percent to 605,300 acres, while average yield fell just 1 percent from last year's favorable level, with good yields in places such as North Dakota, Nebraska, and Colorado. Pinto bean output was down in 9 of the 14 producing States. Output in North Dakota, the leading producer, fell 12 percent from the state's record-large 2007 crop. Output of pinto beans fell 5 percent in Nebraska, the second-leading producer, largely because of a 4-percent drop in harvested area. Growers in Colorado produced 6 percent more pintos thanks to a 12-percent increase in yield.

Grower prices (ND/MN) for pinto beans began the marketing year in September at \$32.50 per cwt, up 39 percent from a year earlier and 84 percent higher than 2 years

Figure 5

earlier. With limited open market activity and considerable uncertainty in commodity markets, grower bids in North Dakota-Minnesota had slipped to \$27.00 by mid-December, which was still 13 percent above the favorable levels of a year earlier.

Outlook for 2009/10

With stocks of several dry bean classes likely to be low again by next summer, reduced supplies and strong prices (relative to historical trend) over the coming marketing year will backstop the need for increased acreage next spring. However, dry bean acreage has declined for three consecutive years, the general economic outlook is weak, and the industry continues to face a substantial (although weakened) challenge from traditional rotational crops such as corn, soybeans, barley, and wheat. Although prices for these grains have declined substantially in recent months, they remain above longrun trends. However, dry bean prices are also well above their longrun averages and have proven much stickier on their way down as the industry resists price reductions. As a result, potential dry bean returns are currently very competitive with virtually all alternative crops. This suggests that in the absence of major changes to these commodity price relationships this winter, U.S. dry bean acreage could increase 5 to 10 percent (or more) in 2009. If dry bean yields return to either trend or the longrun average in 2009, lower yields would result (the three-year average would be down 5 percent from 2008, while the five-year average would be 7 percent lower). Thus, a portion of any acreage increase in 2009 could be partly offset by lower yields, blunting any gain in output.

September-October Exports Up

U.S. dry edible bean export volume for the initial two months of the 2008/09 marketing year increased 13 percent from a year earlier (table 13). While the majority of dry beans experienced reduced export volume, sharply higher volume was experienced by light red kidney beans, navy beans, and black beans. The top destinations (in rank order) were Mexico (up 16 percent), Canada (up 111 percent), and the United Kingdom (up 101 percent). In 2007/08, navy bean exports were the highest since 2000/01, reaching 1.53 million cwt. This strength has carried over into the first two months of 2008/09, with navy volume more than double that of the same time a year ago. Strong movement into Canada and the United Kingdom

account for most all of the gain. In 2009, with the effects of strong food aid demand and lower prices offset by a stronger dollar and weak commercial demand, U.S. dry bean export volume is expected to remain near year-earlier levels in 2008/09.

U.S. dry bean imports (including garbanzo) during September-October were up 4 percent from a year earlier, led by pinto, garbanzo, and mung beans. While dry bean import volume from Canada (up 3 percent) and Peru (up 84 percent) was up, it was down for the other two major suppliers, Mexico (down 25 percent) and China (down 41 percent). The small gain in volume was likely driven by dwindling preharvest supplies and strong wholesale prices. During September-October, the producer price index (PPI) for canned dry beans was up 5 percent from a year earlier, while the PPI for dry pinto beans was 34 percent above a year earlier.

f = ERS forecast. Totals may not sum due to rounding. 1/ Per capita disappearance reflects domestic production, net trade, and estimated change in stocks.

2/ Includes small white and all other dry edible beans after 1979.
