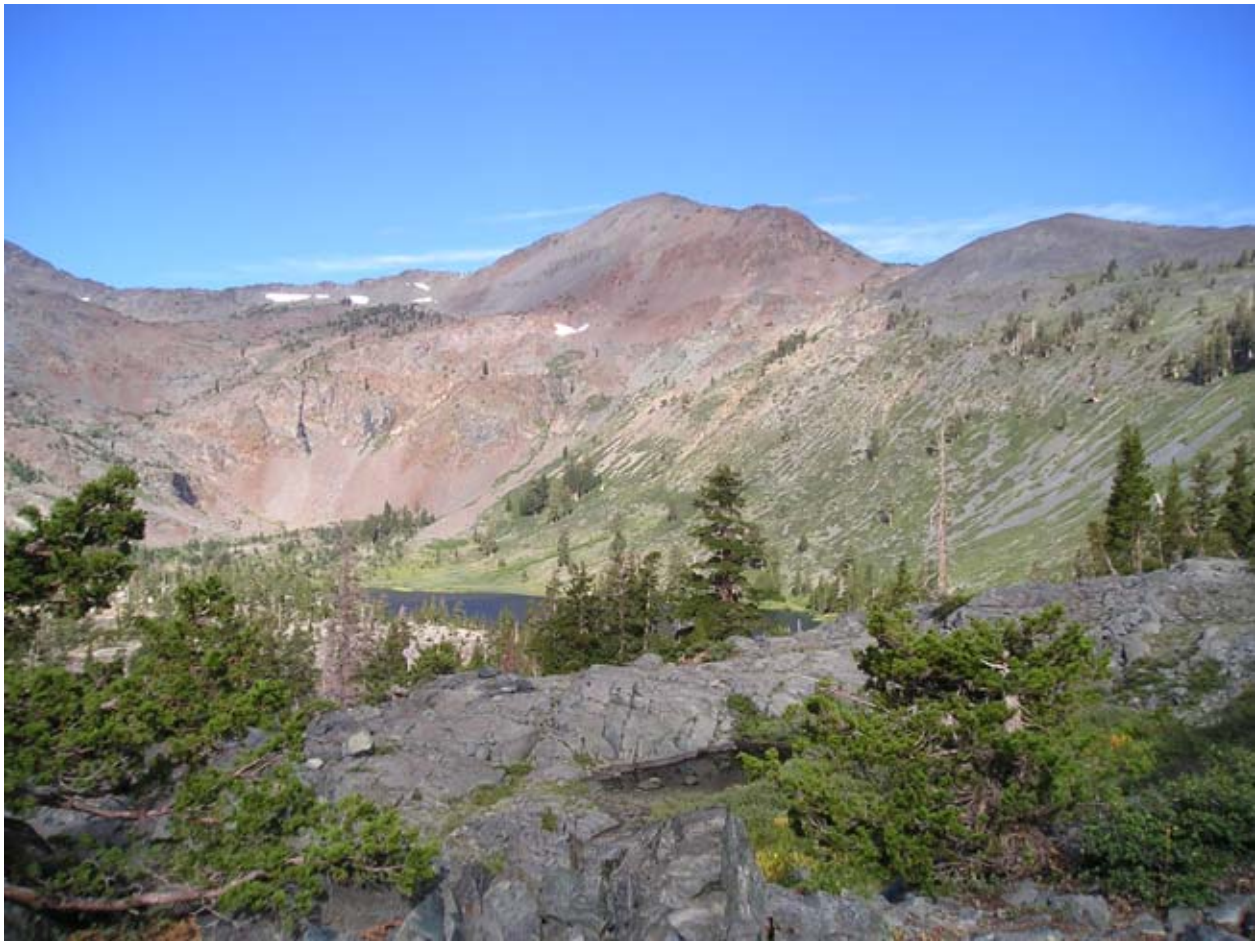
Soil Survey of the Tahoe Basin Area, California and Nevada



How To Use This Soil Survey

General Soil Map

The general soil map, which is a color map, shows the survey area divided into groups of associated soils called general soil map units. This map is useful in planning the use and management of large areas.

To find information about your area of interest, locate that area on the map, identify the name of the map unit in the area on the color-coded map legend, then refer to the section **General Soil Map Units** for a general description of the soils in your area.

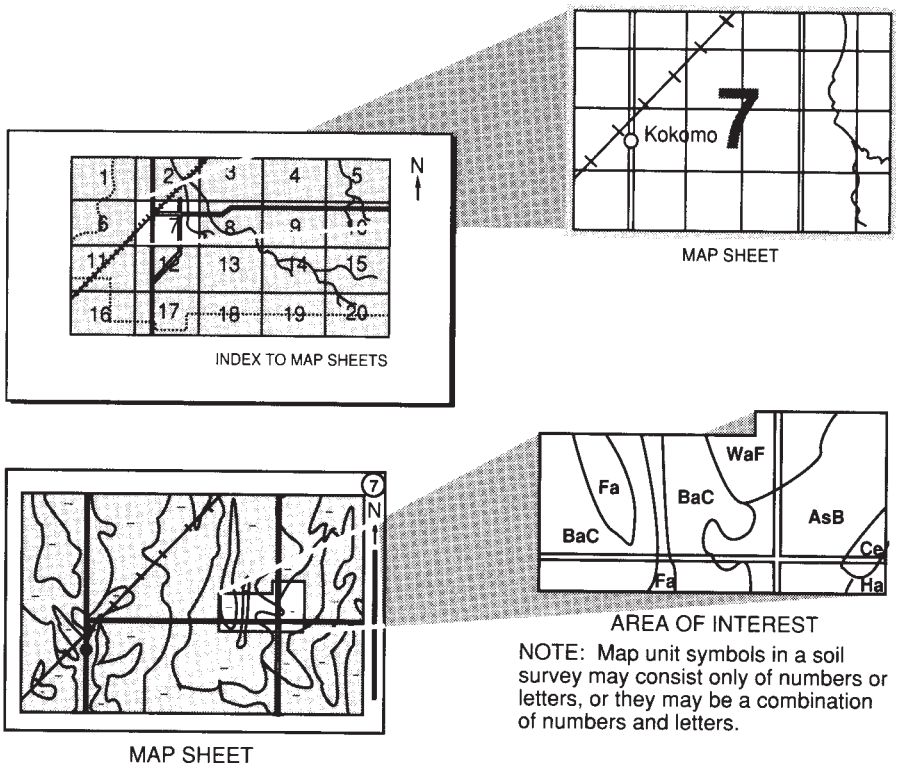
Detailed Soil Maps

The detailed soil maps can be useful in planning the use and management of small areas.

To find information about your area of interest, locate that area on the **Index to Map Sheets**. Note the number of the map sheet and turn to that sheet.

Locate your area of interest on the map sheet. Note the map unit symbols that are in that area. Turn to the **Contents**, which lists the map units by symbol and name and shows the page where each map unit is described.

The **Contents** shows which table has data on a specific land use for each detailed soil map unit. Also see the **Contents** for sections of this publication that may address your specific needs.



National Cooperative Soil Survey

This soil survey is a publication of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (formerly the Soil Conservation Service) has leadership for the Federal part of the National Cooperative Soil Survey. This survey was made cooperatively by the United States Department of Agriculture, Natural Resources Conservation Service and Forest Service; the California Department of Conservation; and the University of California, Agricultural Experiment Station. The survey is part of the technical assistance furnished to the Tahoe Resource Conservation District (in California) and to the Nevada Tahoe Resource Conservation District.

Major fieldwork for this soil survey was completed in 2005. Soil names and descriptions were approved in 2006. Unless otherwise indicated, statements in this publication refer to conditions in the survey area in 2006. The most current official data are available on the Internet.

Soil maps in this survey may be copied without permission. Enlargement of these maps, however, could cause misunderstanding of the detail of mapping. If enlarged, maps do not show the small areas of contrasting soils that could have been shown at a larger scale.

Nondiscrimination Statement

Contents

Issued 2007

Foreword

This soil survey contains information that affects land use planning in this survey area. It contains predictions of soil behavior for selected land uses. The survey also highlights soil limitations, improvements needed to overcome the limitations, and the impact of selected land uses on the environment.

This soil survey is designed for many different users. Farmers, ranchers, foresters, and agronomists can use it to evaluate the potential of the soil and the management needed for maximum food and fiber production. Planners, community officials, engineers, developers, builders, and home buyers can use the survey to plan land use, select sites for construction, and identify special practices needed to ensure proper performance. Conservationists, teachers, students, and specialists in recreation, wildlife management, waste disposal, and pollution control can use the survey to help them understand, protect, and enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. The information in this report is intended to identify soil properties that are used in making various land use or land treatment decisions. Statements made in this report are intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are shallow to bedrock. Some are too unstable to be used as a foundation for buildings or roads. A high water table makes a soil poorly suited to basements or underground installations.

These and many other soil properties that affect land use are described in this soil survey. Broad areas of soils are shown on the general soil map. The location of each map unit is shown on the detailed soil maps. Each soil in the survey area is described. Information on specific uses is given for each soil. Help in using this publication and additional information are available at the local office of the Natural Resources Conservation Service or the Cooperative Extension Service.

Soil Survey of
The Tahoe Basin Area, California and Nevada

By William R. Loftis, United States Department of Agriculture, Natural Resources Conservation Service

Fieldwork by William R. Loftis, Foster Fell, Paul Lake, Amy Hansen, Kevin Norwood, Alaina Frazier, and Andrew Conlin

Assistance with vegetation data provided by Marchel Munnecke

United States Department of Agriculture, Natural Resources Conservation Service and Forest Service,
in cooperation with
California Department of Conservation and University of California, Agricultural Experiment Station

General Nature of the Survey Area

Lake Tahoe Basin sits on the state line between California and Nevada. The survey area includes Alpine, El Dorado, and Placer Counties, California, and Carson City Rural Area and Douglas and Washoe Counties, Nevada. It has a total of 336,854 acres, of which roughly 126,500 acres is water. Lake Tahoe makes up about 123,000 acres. About 85 percent of the basin is National Forest. Also, several state parks are in the area. The basin is in the high mountains between the Sierra-Nevada and the Carson Range. Elevation ranges from about 6,200 to 11,000 feet. All of the survey area drains to Lake Tahoe, except for a small acreage at the outlet of the lake. The survey area is dominated by steep mountainsides. Small areas of less steep land occur in riparian corridors and meadows and on alluvial flats and outwash plains. The acreage of less steep land increases with proximity to the lake.

There are two main types of geology in the Tahoe Basin (fig. 1). These are igneous intrusive rocks (typically granodiorite) and igneous extrusive rocks (typically andesitic lahar). Small amounts of metamorphic rock occur in the Spooner Summit and Desolation Wilderness areas.

Climate

Prepared by the National Water and Climate Center, Natural Resources Conservation Service, Portland, Oregon.

Table 1a gives data on temperature and precipitation for the survey area as recorded at Tahoe City in the period 1971 to 2000. Table 1b gives similar data for representative SNOTEL sites for various periods of record. Table 2 shows probable dates of the first freeze in fall and the last freeze in spring. Table 3 provides data on the length of the growing season. The median number of frost-free days (0 degrees C) ranges from 21 days at Hagan's Meadow to 100 days at Echo Peak. The median

Figure 1.—An example of the dominant geology in the Tahoe Basin. Granodiorite is on the left, and volcanic material is on the right.

number of freeze-free days (-2 degrees C) ranges from 48 days at Hagan's Meadow to 141 days at Tahoe City.

In winter, the average temperature is 30.8 degrees F and the average daily minimum temperature is 20.4 degrees. The lowest temperature on record, which occurred at Tahoe City on December 11, 1972, is -16 degrees. In summer, the average temperature is 58.6 degrees and the average daily maximum temperature is 74.6 degrees. The highest recorded temperature, which occurred at Tahoe City on August 15, 1933, is 94 degrees.

Growing degree days are shown in table 1a. They are equivalent to "heat units." During the month, growing degree days accumulate by the amount that the average temperature each day exceeds a base temperature (50 degrees F). The normal monthly accumulation is used to schedule single or successive plantings of a crop between the last freeze in spring and the first freeze in fall.

The average annual total precipitation is 32.75 inches. Of this, about 2.46 inches, or about 8 percent, usually falls in June through September. The growing season for most crops falls within this period. The heaviest 1-day rainfall on record, which occurred at Tahoe City on December 23, 1964, is 6.77 inches. Thunderstorms occur on about 18 days each year, and most occur in April in the western part of the survey area and in July in the eastern part.

The average seasonal snowfall is 169.3 inches at Tahoe City. The greatest recorded snow depth, which occurred on February 27, 1969, at Lake Lucille, is 259 inches. On an average, 131 days per year have at least 1 inch of snow on the ground. The heaviest recorded 1-day snowfall, which occurred at Tahoe City on March 20, 1952, is 166 inches.

The average relative humidity in midafternoon is about 42 percent. Humidity is higher at night, and the average at dawn is about 81 percent. The sun shines 87 percent of the time possible in summer and 57 percent in winter. The prevailing wind is from the west-northwest. Average windspeed is highest, 8.0 miles per hour, in March.

How This Survey Was Made

This survey was made to provide information about the soils and miscellaneous areas in the survey area. The information includes a description of the soils and miscellaneous areas and their location and a discussion of their suitability, limitations, and management for specified uses. Soil scientists observed the steepness and shape of the slopes, the general pattern of drainage, the kinds of native plants, and the kinds of bedrock. They dug many holes to study the soil profile, which is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

The soils and miscellaneous areas in the survey area occur in orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept or model of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil

scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

This soil survey updates the survey of the Tahoe Basin area published in 1974 (USDA, 1974). In this update, the boundaries included in the original survey were used as a foundation for the concepts and extent of soil types. Additional fieldwork was performed to refine the boundaries. Also, GIS software was used to better conform the boundary lines to the slope, landform, vegetation, and climate.

Vegetation ecologists collected vegetation data in conjunction with the soil data. Data were collected from circular plots with the soil pit in the center. Species composition, heights, and cover were recorded. Site index data were collected for the dominant trees, and rangeland productivity data were collected for sites that are not forested. The vegetation plot data, along with the soil data, were used to distinguish ecological sites on the basis of potential natural vegetation and soil characteristics.

General Soil Map Units

The general soil map in this publication shows broad areas that have a distinctive pattern of soils, relief, and drainage. Each map unit on the general soil map is a unique natural landscape. Typically, it consists of one or more major soils or miscellaneous areas and some minor soils or miscellaneous areas. It is named for the major soils or miscellaneous areas. The components of one map unit can occur in another but in a different pattern.

The general soil map can be used to compare the suitability of large areas for general land uses. Areas of suitable soils can be identified on the map. Likewise, areas where the soils are not suitable can be identified.

Because of its small scale, the map is not suitable for planning the management of a farm or field or for selecting a site for a road or building or other structure. The soils in any one map unit differ from place to place in slope, depth, drainage, and other characteristics that affect management.

Areas of water, including Lake Tahoe, make up 38.20 percent of the survey area.

Soils That Formed in Alluvium and Organic Soil Materials

1. Tahoe-Watah

Very deep, nearly level and gently sloping, very poorly drained, frigid soils that formed in alluvium

Map unit setting

Landform: Flood plains
Slope: 0 to 5 percent

Map unit composition

Extent of the map unit:
1.37 percent of the survey area

Extent of the components in the map unit:
Tahoe soils—50 percent
Watah soils—16 percent
Minor components—34 percent

Soil properties and qualities

Tahoe
Depth class: Very deep
Drainage class: Very poorly drained
Landform: Flood plains
Parent material: Alluvium derived from mixed sources
Texture of the surface layer: Mucky silt loam

Watah
Depth class: Very deep
Drainage class: Very poorly drained
Landform: Flood plains
Parent material: Organic material over alluvium derived from mixed sources
Texture of the surface layer: Peat

Minor components

- Marla soils on the perimeter of the flood plains
- Bidart soils in cold meadows at high elevations
- Water in small pockets and depressions
- Beach areas around the edge of the lake

Use and management

Major uses: Wildlife habitat, recreation, grazing, and watershed
Management concerns: High water table and subsidence

2. Hellhole

Very deep, nearly level, very poorly drained, frigid soils that formed in organic soil materials

Map unit setting

Landform: Fens
Slope: 0 to 2 percent

Map unit composition

Extent of the map unit:
0.07 percent of the survey area

Extent of the components in the map unit:
Hellhole soils—79 percent
Minor components—21 percent

Soil properties and qualities

Hellhole
Depth class: Very deep
Drainage class: Very poorly drained
Landform: Fens
Parent material: Mossy organic material
Texture of the surface layer: Peat

Minor components

- Bidart and Watah soils on the edge of the fens
- Water in depressions and pockets

Use and management

Major uses: Wildlife habitat and recreation
Management concerns: High water table and subsidence

Anthropogenic Soils and Landforms

3. Oxyaquic Xerorthents-Urban Land-Water

Very deep, well drained, nearly level and gently sloping soils and areas dominated by urban development, fill materials, and human-made water features

Map unit setting

Landform: Areas of fill deposits, human-created coves, and developed areas
Slope: 0 to 5 percent

Map unit composition

Extent of the map unit:
0.25 percent of the survey area

Extent of the components in the map unit:
Oxyaquic Xerorthents—39 percent
Urban land—34 percent
Water—26 percent
Minor components—1 percent

Soil properties and qualities

Oxyaquic Xerorthents
Depth class: Very deep
Drainage class: Well drained
Landform: Filled marshland
Parent material: Earthy fill derived from granodiorite
Texture of the surface layer: Very gravelly coarse sand

Use and management

Major use: Urban development
Management concern: Permeability

Soils on Glacial Outwash Terraces

4. Christopher-Jabu-Gefo-Inville

Very deep, gently sloping to moderately steep, somewhat excessively drained and well drained, frigid soils that formed in glacial outwash and alluvium

Map unit setting

Landform: Outwash plains
Slope: 2 to 30 percent

Map unit composition

Extent of the map unit:
3.58 percent of the survey area

Extent of the components in the map unit:
Christopher soils—26 percent
Jabu soils—22 percent
Gefo soils—17 percent
Inville soils—17 percent
Minor components—18 percent

Soil properties and qualities

Christopher
Depth class: Very deep
Drainage class: Somewhat excessively drained
Landform: Outwash plains
Parent material: Glacial outwash derived from granodiorite
Texture of the surface layer: Loamy coarse sand

Jabu
Depth class: Very deep
Drainage class: Well drained
Landform: Outwash plains
Parent material: Glacial outwash derived from granodiorite
Texture of the surface layer: Coarse sandy loam

Gefo
Depth class: Very deep
Drainage class: Somewhat excessively drained
Landform: Outwash plains
Parent material: Glacial outwash derived from granodiorite
Texture of the surface layer: Gravelly loamy coarse sand

Inville
Depth class: Very deep
Drainage class: Well drained
Landform: Alluvial fans and outwash plains
Parent material: Alluvium and outwash derived from mixed sources
Texture of the surface layer: Gravelly coarse sandy loam

Minor components

- Ubaj soils on lake terraces
- Oneidas soils, which are on outwash plains and are shallow to a weak fragipan

Use and management

Major use: Urban development
Management concerns: Permeability and slope

5. Marla-Celio-Oneidas

Very deep, nearly level to strongly sloping, poorly drained and somewhat poorly drained, frigid that soils that formed in alluvium and glacial outwash

Map unit setting

Landform: Outwash plains
Slope: 0 to 15 percent

Map unit composition

Extent of the map unit:
1.18 percent of the survey area

Extent of the components in the map unit:
Marla soils—29 percent
Celio soils—22 percent
Oneidas soils—19 percent
Minor components—30 percent

Soil properties and qualities

Marla
Depth class: Very deep
Drainage class: Poorly drained
Landform: Outwash fans
Parent material: Alluvium derived dominantly from granodiorite
Texture of the surface layer: Loamy coarse sand

Celio
Depth class: Deep
Drainage class: Somewhat poorly drained
Landform: Outwash fans
Parent material: Glacial outwash derived dominantly from granodiorite
Texture of the surface layer: Gravelly loamy coarse sand

Oneidas
Depth class: Very deep
Drainage class: Poorly drained
Landform: Outwash terraces
Parent material: Glacial outwash derived dominantly from granodiorite
Texture of the surface layer: Coarse sandy loam

Minor components

- Tahoe and Watah soils on flood plains
- Gefo, Christopher, and Jabu soils in the slightly higher areas

Use and management

Major uses: Wildlife habitat, recreation, and urban development
Management concerns: Wetness and permeability

Soils and Rock Outcrop on Glacial Moraines and in Glacial Valleys

6. Rock Outcrop-Meeks

Rock outcrop and deep and very deep, gently sloping to very steep, well drained and somewhat excessively drained, frigid soils on moraines

Map unit setting

Landform: Glacial valleys and moraines
Slope: 2 to 70 percent

Map unit composition

Extent of the map unit:
10.66 percent of the survey area

Extent of the components in the map unit:
Rock outcrop—35 percent
Meeks and similar soils—34 percent
Minor components—31 percent

Soil properties and qualities

Meeks soils
Depth class: Deep or very deep

Drainage class: Well drained or somewhat excessively drained
Landform: Moraines
Parent material: Glacial till and outwash derived from granodiorite
Texture of the surface layer: Gravelly loamy coarse sand

Minor components

- Loamy-skeletal Tallac soils on glacial moraines
- Rockbound soils, which are very shallow and formed in colluvium in glacial valleys

Use and management

Major uses: Wildlife habitat and recreation
Management concerns: Depth to bedrock and slope

7. Paige-Kneeridge

Very deep, gently sloping to very steep, moderately well drained and well drained, frigid soils in areas of glacial moraines and valleys dominated by volcanic parent materials

Map unit setting

Landform: Moraines and the footslopes and side slopes of glaciated valleys
Slope: 2 to 60 percent

Map unit composition

Extent of the map unit:
1.46 percent of the survey area

Extent of the components in the map unit:
Paige soils—45 percent
Kneeridge and similar soils—39 percent
Minor components—16 percent

Soil properties and qualities

Paige
Depth class: Very deep
Drainage class: Well drained
Landform: Moraines
Parent material: Colluvium over till derived from volcanic rocks
Texture of the surface layer: Medial sandy loam

Kneeridge
Depth class: Very deep
Drainage class: Well drained and moderately well drained
Landform: Footslopes and side slopes in glaciated valleys
Parent material: Colluvium and/or till derived from andesitic lahar
Texture of the surface layer: Gravelly medial loamy coarse sand

Minor components

- Waca and Jorge soils on mountain slopes and hillsides

Use and management

Major uses: Wildlife habitat, recreation, and urban development
Management concerns: Slope, wetness, and stoniness

8. Meeks-Tallac

Deep or very deep, gently sloping to very steep, moderately well drained to somewhat excessively drained, frigid soils on glacial moraines dominated by granodiorite parent materials

Map unit setting

Landform: Moraines and outwash plains
Slope: 2 to 70 percent

Map unit composition

Extent of the map unit:
3.37 percent of the survey area

Extent of the components in the map unit:
Meeks and similar soils—51 percent
Tallac and similar soils—38 percent
Minor components—11 percent

Soil properties and qualities

Meeks
Depth class: Deep or very deep
Drainage class: Well drained or somewhat excessively drained
Landform: Moraines and outwash plains
Parent material: Glacial till and outwash derived from granodiorite
Texture of the surface layer: Gravelly loamy coarse sand

Tallac
Depth class: Deep or very deep
Drainage class: Moderately well drained or well drained
Landform: Moraines and outwash plains
Parent material: Glacial till and outwash derived dominantly from granodiorite
Texture of the surface layer: Gravelly coarse sandy loam

Minor components

- Burnlake soils in positions on the landscape similar to those of the major soils

Use and management

Major uses: Wildlife habitat, recreation, and urban development
Management concerns: Slope, stoniness, and wetness

9. Waca-Ellispeak

Moderately deep and shallow, strongly sloping to very steep, well drained and excessively drained, frigid soils on glacial valley walls dominated by volcanic parent materials

Map unit setting

Landform: Mountain slopes and glacial valley walls (fig. 2)
Slope: 5 to 70 percent

Map unit composition

Extent of the map unit:
1.68 percent of the survey area

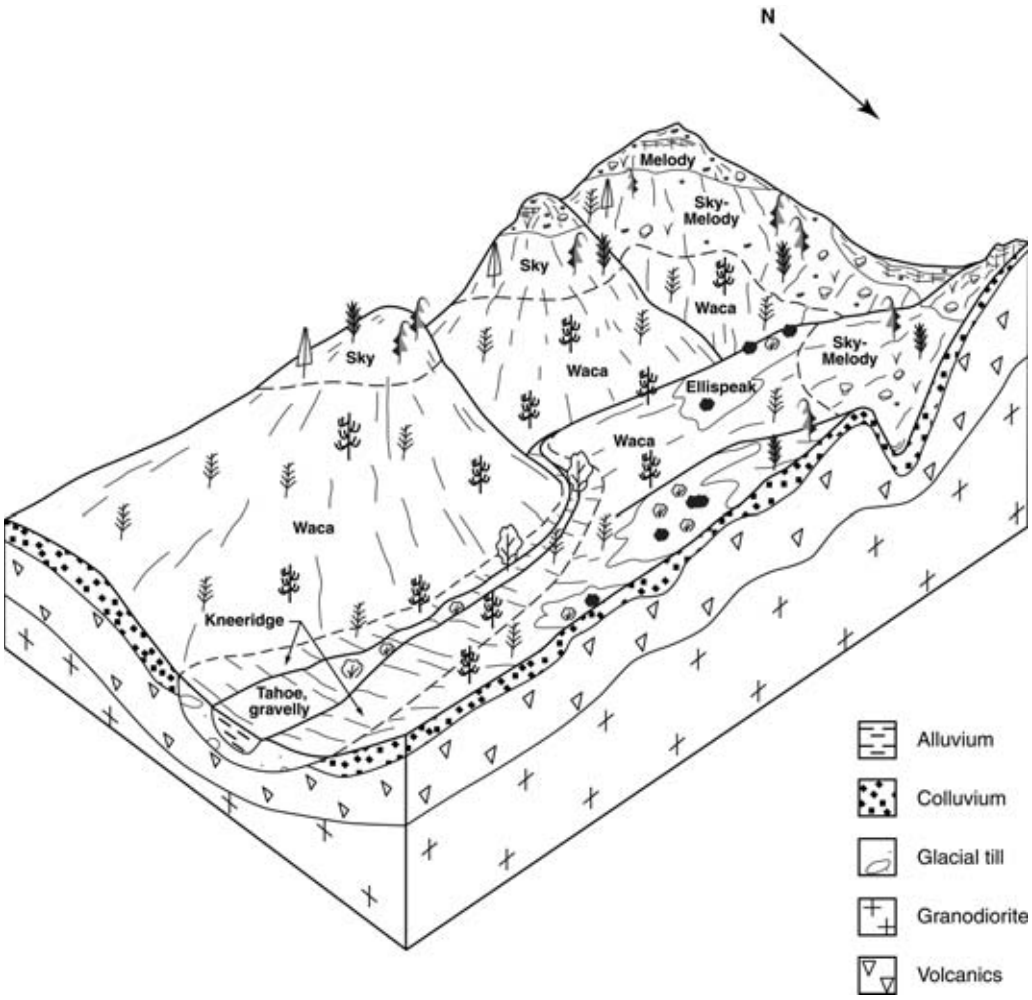

Figure 2.—Representative diagram of the Blackwood Canyon area (not to scale). The Waca-Ellispeak general soil map unit is in this area.

Extent of the components in the map unit:
Waca soils—69 percent
Ellispeak soils—14 percent
Minor components—17 percent

Soil properties and qualities

Waca
Depth class: Moderately deep
Drainage class: Well drained
Landform: Mountain slopes
Parent material: Colluvium over residuum weathered from andesitic lahar
Texture of the surface layer: Very gravelly medial coarse sandy loam

Ellispeak
Depth class: Shallow
Drainage class: Excessively drained
Landform: Side slopes of mountains and ridges
Parent material: Colluvium derived from andesitic lahar
Texture of the surface layer: Stony fine sandy loam

Minor components

- Rock outcrop
- Windy soils, which are in positions on the landscape similar to those of the major soils and are deep to bedrock

Use and management

Major uses: Wildlife habitat and recreation
Management concerns: Slope and depth to bedrock

Soils and Rock Outcrop on Mountains

10. Whittell-Jobsis-Rock Outcrop

Rock outcrop and shallow and moderately deep, strongly sloping to very steep, somewhat excessively drained, cryic soils that formed in colluvium over residuum derived from granodiorite; on mountaintops and shoulders

Map unit setting

Landform: Mountaintops and shoulders (fig. 3)
Slope: 8 to 30 percent

Map unit composition

Extent of the map unit:
2.90 percent of the survey area

Extent of the components in the map unit:
Whittell soils—34 percent
Jobsis soils—30 percent
Rock outcrop—16 percent
Minor components—20 percent

Soil properties and qualities

Whittell
Depth class: Moderately deep
Drainage class: Somewhat excessively drained
Landform: Mountaintops and shoulders
Parent material: Colluvium over residuum derived from granodiorite
Texture of the surface layer: Loamy coarse sand

Jobsis
Depth class: Shallow
Drainage class: Somewhat excessively drained
Landform: Mountaintops and shoulders
Parent material: Colluvium over residuum derived from granodiorite
Texture of the surface layer: Loamy coarse sand

Minor components

- Windyridge and Freelpeak soils at the higher elevations on the shoulders and summits of mountains

Use and management

Major uses: Wildlife habitat and recreation
Management concerns: Fragile soil surface and sensitive plant communities

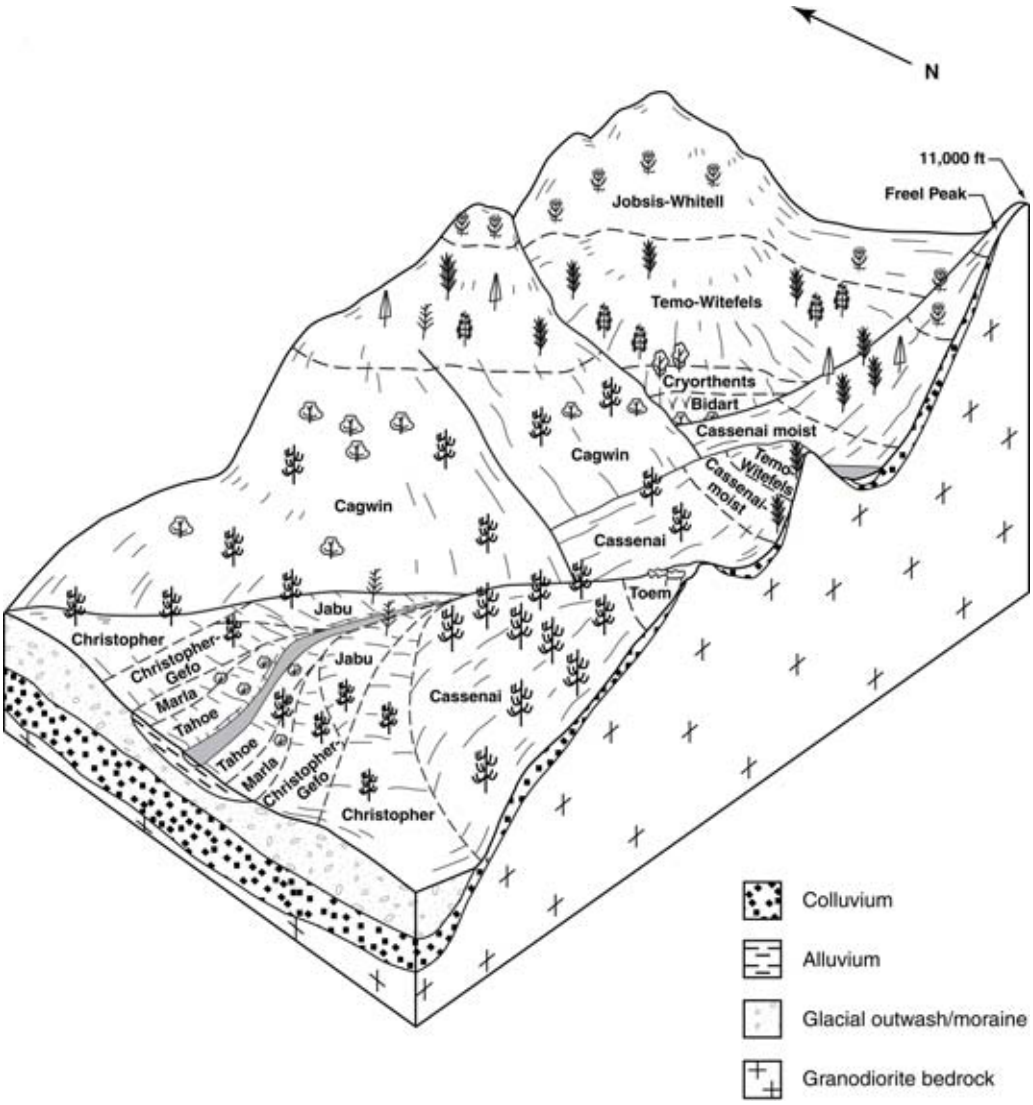

Figure 3.—Representative diagram of the Freel Peak area (not to scale). The Whittell-Jobsis-Rock outcrop general soil map unit is in this area.

11. Dagget-Temo

Deep and shallow, strongly sloping to very steep, excessively drained, cryic soils that formed in colluvium over residuum derived from granodiorite; on mountainsides

Map unit setting

Landform: Mountainsides
Slope: 5 to 70

Map unit composition

Extent of the map unit:
9.63 percent of the survey area

Extent of the components in the map unit:
Dagget and similar soils—33 percent
Temo and similar soils—22 percent

Minor components—45 percent

Soil properties and qualities

Dagget
Depth class: Deep
Drainage class: Excessively drained
Landform: Mountainsides
Parent material: Colluvium over residuum derived from granodiorite
Texture of the surface layer: Very gravelly loamy coarse sand

Temo
Depth class: Shallow
Drainage class: Excessively drained
Landform: Mountainsides
Parent material: Colluvium over residuum derived from granodiorite
Texture of the surface layer: Bouldery coarse sand

Minor components

- Witefels soils in the less convex areas on mountainsides
- Cassenai soils, which are in the lower areas on the mountains and have denser vegetation
- Rock outcrop, which is typically in the more convex areas

Use and management

Major uses: Wildlife habitat and recreation
Management concerns: A bouldery surface, depth to bedrock, and Rock outcrop

12. Melody-Mountrose

Shallow and very deep, strongly sloping to very steep, excessively drained and well drained, cryic soils that formed in andesitic lahar colluvium and residuum on mountaintops and shoulders

Map unit setting

Landform: Mountains
Slope: 9 to 70 percent

Map unit composition

Extent of the map unit:
2.56 percent of the survey area

Extent of the components in the map unit:
Melody and similar soils—37 percent
Mountrose and similar soils—25 percent
Minor components—38 percent

Soil properties and qualities

Melody
Depth class: Shallow
Drainage class: Excessively drained
Landform: Shoulders and ridgetops of mountains
Parent material: Colluvium over residuum weathered from volcanic rocks
Texture of the surface layer: Very cobbly ashy sandy loam

Mountrose
Depth class: Very deep
Drainage class: Well drained
Landform: Shoulders and side slopes of mountains
Parent material: Colluvium derived from volcanic rocks
Texture of the surface layer: Medial loamy coarse sand

Minor components

- Shakespeare soils in areas of metamorphic rocks
- The very shallow Lithnip and shallow Meiss soils
- Rock outcrop
- Wardcreek soils on high backslopes in the mountains
- Sky soils, which are on side slopes and support dense vegetation

Use and management

Major uses: Wildlife habitat and recreation
Management concerns: Slope and depth to bedrock

13. Sky-Callat

Moderately deep, strongly sloping to very steep, well drained, cryic soils that formed in andesitic lahar colluvium and glacial till on mountains

Map unit setting

Landform: Mountains (fig. 4)
Slope: 9 to 70 percent

Map unit composition

Extent of the map unit:
3.32 percent of the survey area

Extent of the components in the map unit:
Sky and similar soils—42 percent
Callat soils—15 percent
Minor components—43 percent

Soil properties and qualities

Sky
Depth class: Moderately deep
Drainage class: Well drained
Landform: Mountain slopes
Parent material: Colluvium over residuum weathered from andesitic lahar
Texture of the surface layer: Gravelly medial sandy loam

Callat
Depth class: Moderately deep
Drainage class: Well drained
Landform: Mountains
Parent material: Colluvium over glacial till derived from volcanic rocks
Texture of the surface layer: Gravelly coarse sandy loam

Minor components

- The shallow Melody soils on mountaintops and shoulders
- The very deep Watsonlake soils on mountain slopes

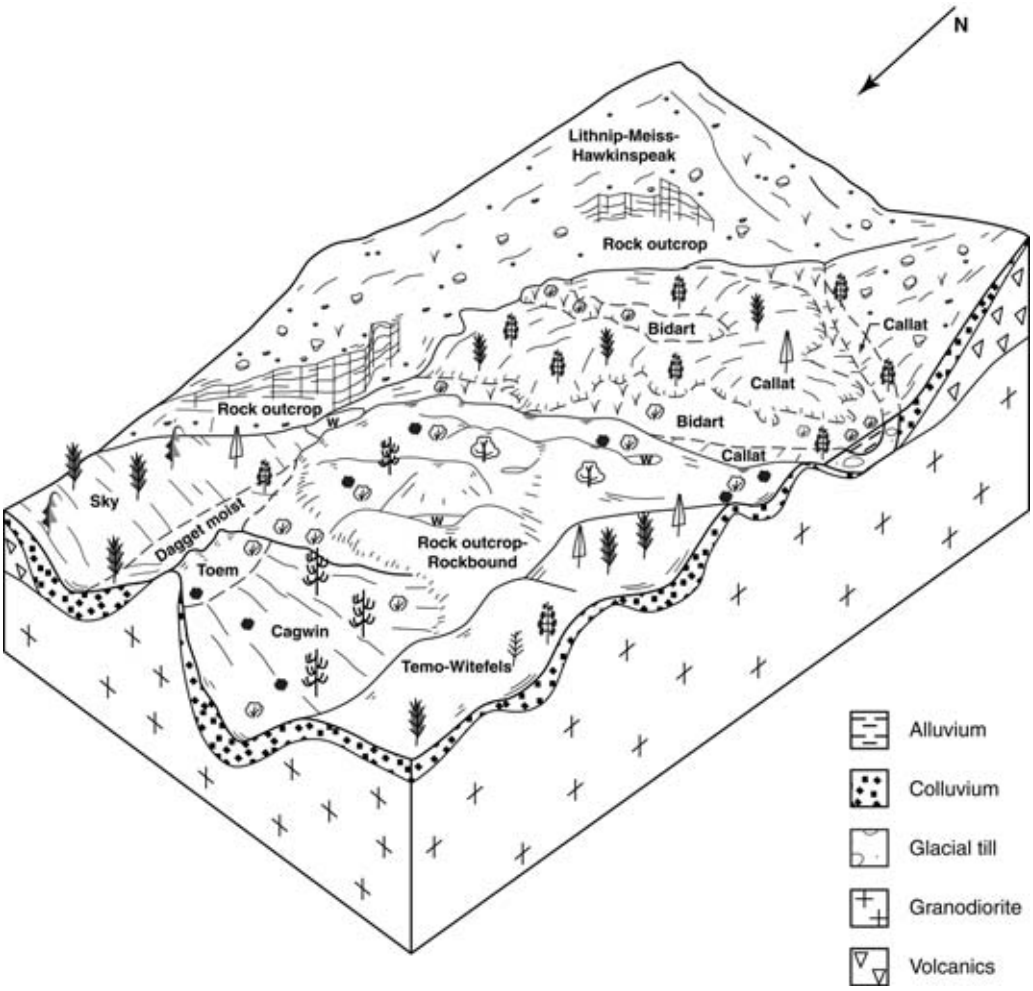

Figure 4.—Representative diagram of the Meiss Meadow area (not to scale). The Sky-Callat general soil map unit is in this area.

Use and management

Major uses: Wildlife habitat and recreation
Management concerns: Slope, depth to bedrock or till, and stoniness

14. Cassenai-Cagwin

Very deep and moderately deep, strongly sloping to very steep, somewhat excessively drained, frigid soils that formed in colluvium over residuum derived from granodiorite; on mountainsides and hillslopes

Map unit setting

Landform: Mountainsides and hillslopes
Slope: 5 to 70 percent

Map unit composition

Extent of the map unit:
11.78 percent of the survey area

Extent of the components in the map unit:
Cassenai soils—36 percent
Cagwin and similar soils—33 percent
Minor components—31 percent

Soil properties and qualities

Cassenai
Depth class: Very deep
Drainage class: Somewhat excessively drained
Landform: Mountainsides and hillslopes
Parent material: Colluvium over residuum derived from granodiorite
Texture of the surface layer: Gravelly loamy sand

Cagwin
Depth class: Moderately deep
Drainage class: Somewhat excessively drained
Landform: Mountainsides and hillslopes
Parent material: Colluvium over residuum derived from granodiorite
Texture of the surface layer: Loamy coarse sand

Minor components

- Rock outcrop
- The shallow Toem soils, which are in landscape positions similar to those of the major soils
- Dagget soils in the higher areas

Use and management

Major uses: Wildlife habitat, recreation, and urban development
Management concerns: Slope, depth to bedrock, and Rock outcrop

15. Jorge-Tahoma

Deep or very deep, strongly sloping to very steep, well drained, frigid soils that formed in colluvium over residuum derived from andesitic lahar; on mountains and hillslopes

Map unit setting

Landform: Mountains and hillslopes
Slope: 5 to 70 percent

Map unit composition

Extent of the map unit:
7.19 percent of the survey area

Extent of the components in the map unit:
Jorge and similar soils—50 percent
Tahoma soils—27 percent
Minor components—23 percent

Soil properties and qualities

Jorge
Depth class: Deep or very deep
Drainage class: Well drained
Landform: Mountains and hillslopes
Parent material: Colluvium over residuum derived from andesitic lahar

Texture of the surface layer: Stony sandy loam

Tahoma
Depth class: Deep or very deep
Drainage class: Well drained
Landform: Mountains and hillslopes
Parent material: Colluvium over residuum derived from andesitic lahar
Texture of the surface layer: Very cobbly sandy loam

Minor components

- The moderately deep Waca soils on mountain slopes
- Kingsbeach soils, which are on alluvial fans and are underlain by lacustrine deposits

Use and management

Major uses: Wildlife habitat, recreation, and urban development
Management concerns: Slope, stoniness, and permeability

16. Deerhill-Southcamp

Very deep, strongly sloping to very steep, well drained, frigid soils that formed in metamorphic and volcanic colluvium and residuum on mountains and hillslopes

Map unit setting

Landform: Mountains and hillslopes
Slope: 9 to 70

Map unit composition

Extent of the map unit:
0.80 percent of the survey area

Extent of the components in the map unit:
Deerhill and similar soils—27 percent
Southcamp soils—25 percent
Minor components—48 percent

Soil properties and qualities

Deerhill
Depth class: Very deep
Drainage class: Well drained
Landform: Mountain flanks and hillsides
Parent material: Colluvium over residuum weathered from metamorphic rocks
Texture of the surface layer: Gravelly fine sandy loam

Southcamp
Depth class: Very deep
Drainage class: Well drained
Landform: Hillslopes and ridgetops
Parent material: Colluvium over residuum weathered from porphyritic trachyte flows
Texture of the surface layer: Very gravelly fine sandy loam

Minor components

- The moderately deep Zephyrcove and Caverock soils in positions on the landscape similar to those of the major soils

- The very deep Cassenai soils, which are in positions on the landscape similar to those of the major soils and formed in colluvium over residuum weathered from granodiorite
- Genoapeak soils in convex areas

Use and management

Major uses: Wildlife and recreation
Management concerns: Slope and permeability

General Vegetation Map Units

The general vegetation map in this publication shows broad areas that have similar vegetation or similar plant assemblages. Each unit on the map is a unique natural landscape dominated by one or two ecological sites. An ecological site is associated with a specific soil component. The ecological site associated with the dominant soil component was used to generate this map. The site is named after its potential natural plant community. The general vegetation map has a minimum polygon size of 100 acres. Areas smaller than 100 acres were merged into surrounding or neighboring vegetation map unit 1. For example, many small polygons of map unit 1, which includes the higher elevation meadows and riparian areas, were merged into map unit 13, the subalpine mixed conifer forests.

The general vegetation map is very similar to the general soil map, but it differs in some areas because the grouping of the detailed soil map units was based on different characteristics. For example, geology was a major break for grouping soils on the general soil map, but the white fir mixed conifer forest types occur on soils derived from both volcanic and granitic parent materials.

Because of its small scale, the map is not suitable for planning the management of forest practices, fire modeling, or any other detailed projects. The vegetation in any one map unit is actually quite varied and is an assemblage of many plant communities.

Following is a description of the general vegetation map units, including the associated ecological site numbers.

Meadows and wetlands

1. At the lower elevations, Nebraska sedge, mixed grasses, and forbs (R022AE208CA) interlace with a mixed willow community (R022AE203CA) on flood plains and alluvial terraces associated with small streams and lakes. In the wetter depressions, Northwest Territory sedge and blister sedge dominate (F022AE2009CA). In the higher elevation meadows, tufted hairgrass and Sierra or mountain willow dominate with mixed forbs (R022AE207CA). An aspen ecological site also is associated with these meadows and riparian corridors (F022AE004CA).
2. Sphagnum fens and associated wetlands (R022AE204CA).

Anthropogenic landforms

3. Disturbed areas of earthwork-creating pits, dumps, and/or fill material. The disturbance results in barren areas or permanently altered vegetation.

Sierra lodgepole pine forests

4. Montane forests dominated by Sierra lodgepole pine, generally associated with meadow edges or river drainages. The associated ecological sites are F022AE002CA, F022AE005CA, and F022AE009CA.

Jeffrey pine forests and associated shrublands

5. Dense forests dominated by Jeffrey pine with very little white fir. The associated ecological site is F022AE006CA.

6. Dense Jeffrey pine forests on north aspects (F022AE023CA) and a more open Jeffrey pine forest community with a high cover of shrubs on south aspects (F022AE021CA). On the rocky ridgetops and upper south-facing slopes, a mixed shrub community is dominated either by mountain sagebrush and antelope bitterbrush or by greenleaf manzanita and huckleberry oak (R022AE210CA).

White fir dominated mixed conifer forests

7. Mixed conifer forests with white fir, Jeffrey pine, incense cedar, and sugar pine (F022AE013CA).
8. White fir and Jeffrey pine forests with occasional incense cedar and very little sugar pine (F022AE007CA).

Red fir and white fir forests

9. Mixed forests dominated by red fir and white fir. Jeffrey pine also occurs. Creeping snowberry is the most common understory associate (F022AE008CA).
10. Mixed forests dominated by red fir and white fir with snowbrush ceanothus and/or mountain whitethorn in the understory (F022AE024CA).

Red fir dominated forests

11. Red fir dominated forests with a high component of western white pine. Pinemat manzanita is common with a high cover in the understory (F022AE010CA).
12. Red fir and Jeffrey pine forests with a high cover of mixed shrubs, including mountain snowberry, mountain sagebrush, and wax currant (F022AE011CA).

Subalpine mixed conifer forests

13. Forests that are generally dominated by Sierra lodgepole pine and mountain hemlock and intermixed with red fir and western white pine. The associated ecological sites are F022AE014CA, F022AE016CA, F022AE019CA, and F022AY118NV.

Whitebark pine forests and areas above timberline

14. Whitebark pine forests with tall upright trees (F022AE001CA) and Whitebark pine forest/shrublands with a more multi-stemmed Krummholz-like growth (F022AY134NV). Above timberline, a very compact and prostrate plant community (R022AY032NV) is dominated by hardy perennials and sub-shrubs, such as dwarf phlox, Nevada podistera, and pygmy fleabane.

Rockland and shrublands

15. Huckleberry oak and greenleaf manzanita shrublands (R022AE213CA and R022AE217CA)
16. Mixed shrubs and forbs (R022AE215CA, R022AE219CA, R022AE211CA, and R022AE012NV)
17. Rockland with scattered trees and pockets of vegetation (R022AE202CA)

Full descriptions of the ecological sites are available at http://esis.sc.egov.usda.gov/. For plant names, see http://plants.usda.gov/.

Detailed Soil Map Units

The map units delineated on the detailed soil maps in this survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions in this section, along with the maps, can be used to determine the suitability and potential of a unit for specific uses. They also can be used to plan the management needed for those uses.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They are not mentioned in the map unit descriptions. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. The contrasting components are mentioned in the map unit descriptions. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives the principal hazards and limitations to be considered in planning for specific uses.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown

on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Tahoe mucky silt loam, drained, 0 to 5 percent slopes, is a phase of the Tahoe series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes or associations.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Ellispeak-Rock outcrop complex, 9 to 30 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Lithnip-Meiss-Hawkinspeak association, 30 to 75 percent slopes, is an example.

This survey includes *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

The detailed soil map also includes information about the natural vegetation within each map unit. Ecological sites with distinct natural plant communities are linked to the soil components within each map unit. See the sections on forest and rangeland management for more information about ecological sites.

Tables 4a and 4b give the acreage and proportionate extent of each map unit. Other tables give properties of the soils and the limitations, capabilities, and potentials for many uses. The Glossary defines many of the terms used in describing the soils or miscellaneous areas.

7011—Beaches

Map unit setting

General location: The shoreline area of Lake Tahoe
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,215 to 6,245 feet (1,895 to 1,905 meters)
Mean annual precipitation: 21 to 27 inches (530 to 690 millimeters)
Mean annual air temperature: 43 to 46 degrees F (6 to 8 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Beaches—64 percent
Minor components—36 percent

Characteristics of Beaches

Slope: 0 to 5 percent
Aspect: North
Landform: Beaches
Kind of material: Beach sand
Typical vegetation: Scant forbs and/or grasses
Percentage of the surface covered by rock fragments: 0 to 35 percent by fine gravel, 0 to 10 percent by coarse gravel, and 0 to 5 percent by cobbles
Restrictive feature: None noted
Slowest permeability: Rapid
Available water capacity to a depth of 60 inches: About 1.8 inches (very low)

Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Negligible
Current water table: Present
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Minor components

Oxyaquic Xeropsamments and similar soils
Extent: About 10 percent of the map unit
Slope: 0 to 5 percent
Landform: Barrier beaches
Typical vegetation: Forbs and grasses
Ecological site: None assigned

Watah and similar soils
Extent: About 7 percent of the map unit
Slope: 0 to 2 percent
Landform: Fens, flood plains, and valley flats
Typical vegetation: Seasonally flooded basins dominated by sedges (*Carex utriculata* and/or *Carex vesicaria*); also, other grasses, rushes, and forbs with small patches of willow
Ecological site: R022AE209CA, Flooded Basins

Gefo, barrier beach, and similar soils
Extent: About 6 percent of the map unit
Slope: 0 to 5 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir, greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Marla and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces and valley flats
Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

Cagwin and similar soils
Extent: About 1 percent of the map unit
Slope: 5 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Cassenai gravelly loamy coarse sand and similar soils
Extent: About 1 percent of the map unit
Slope: 5 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Dunes
Extent: About 1 percent of the map unit
Slope: 5 to 15 percent
Typical vegetation: None assigned
Ecological site: None assigned

Jorge very gravelly sandy loam and similar soils
Extent: About 1 percent of the map unit
Slope: 2 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Rock outcrop
Extent: About 1 percent of the map unit
Slope: 15 to 30 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Tahoe silt loam and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 2 percent
Landform: Flood plains and valley flats
Typical vegetation: Moist meadows dominated by sedges, rushes, and grasses with a variety of forbs
Ecological site: R022AE208CA, Frigid Loamy Terrace

Tahoma and similar soils
Extent: About 1 percent of the map unit
Slope: 2 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Toem and similar soils
Extent: About 1 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes

Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Ecological site: R022AE210CA, Shallow Sandy Slope

7021—Hellhole peat, 0 to 2 percent slopes

Map unit setting

General location: The southern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,705 to 8,510 feet (2,350 to 2,595 meters)
Mean annual precipitation: 45 to 47 inches (1,140 to 1,190 millimeters)
Mean annual air temperature: 37 to 40 degrees F (3 to 4 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Hellhole—80 percent
Minor components—20 percent

Characteristics of Hellhole and similar soils

Slope: 0 to 2 percent
Aspect: North
Landform: Fens
Parent material: Mossy organic material
Typical vegetation: Sphagnum bogs dominated by a mat of floating Sphagnum moss; mountain blueberry, bog laurel, sedges, and a variety of alpine forbs growing on the mat
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted
Slowest permeability: Rapid
Available water capacity to a depth of 60 inches: About 35.4 inches (very high)

Hydrologic properties
Present annual flooding: Rare
Present annual ponding: Frequent
Surface runoff class: Negligible
Current water table: Present
Natural drainage class: Very poorly drained
Hydrologic soil group: A/D

Interpretive groups
Land capability (nonirrigated): 5w
Ecological site: R022AE204CA, Sphagnum Fen

Typical profile
Oi1—0 to 11 inches (0 to 29 centimeters); peat
Oi2—11 to 59 inches (29 to 150 centimeters); peat
Oe—59 to 118 inches (150 to 300 centimeters); mucky peat

Minor components

Bidart, wet, and similar soils
Extent: About 10 percent of the map unit
Slope: 0 to 2 percent
Landform: Flood plains and valley flats

Typical vegetation: None assigned
Ecological site: R022AE207CA, Cold Wet Alluvial Flat

Watah and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 2 percent
Landform: Fens, flood plains, and valley flats
Typical vegetation: Seasonally flooded basins dominated by sedges (*Carex utriculata* and/or *Carex vesicaria*); also, other grasses, rushes, and forbs with small patches of willow
Ecological site: R022AE209CA, Flooded Basins

Water
Extent: About 5 percent of the map unit
Typical vegetation: None assigned
Ecological site: None assigned

7031—Pits and dumps

Map unit setting

Major uses: Urban
MLRA: 22A—Sierra Nevada Mountains
Elevation: 6,230 to 7,180 feet (1,900 to 2,190 meters)
Mean annual precipitation: 23 to 55 inches (580 to 1,400 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)

Map unit composition

Pits—45 percent
Dumps—45 percent
Minor components—10 percent

Characteristics of Pits

Aspect: North
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted

Hydrologic properties
Present annual flooding: None
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Characteristics of Dumps

Aspect: North
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted

Hydrologic properties
Present annual flooding: None
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Minor components

Arents and similar soils
Extent: About 5 percent of the map unit
Typical vegetation: None assigned
Ecological site: None assigned

Xerorthents and similar soils
Extent: About 5 percent of the map unit
Typical vegetation: None assigned
Ecological site: None assigned

7041—Tahoe complex, 0 to 2 percent slopes

Map unit setting

General location: The southern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, urban development, and grazing
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,215 to 7,970 feet (1,895 to 2,430 meters)
Mean annual precipitation: 23 to 51 inches (580 to 1,300 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 20 to 60 days

Map unit composition

Tahoe silt loam—55 percent
Tahoe silt loam, wet—25 percent
Minor components—20 percent

Characteristics of Tahoe silt loam and similar soils

Slope: 0 to 2 percent
Aspect: North
Landform: Flood plains and valley flats
Parent material: Alluvium derived from granitic and volcanic rocks
Typical vegetation: Moist meadows dominated by sedges, rushes, and grasses with a variety of forbs
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted
Available water capacity to a depth of 60 inches: About 9.2 inches (high)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: Occasional
Present annual ponding: Occasional
Surface runoff class: Very high
Current water table: Present
Natural drainage class: Very poorly drained
Hydrologic soil group: C/D

Interpretive groups
Land capability (nonirrigated): 5w
Ecological site: R022AE208CA, Frigid Loamy Terrace

Typical profile

Oe—0 to 3 inches (0 to 8 centimeters); moderately decomposed plant material
A1—3 to 11 inches (8 to 28 centimeters); mucky silt loam
A2—11 to 15 inches (28 to 38 centimeters); mucky silt loam
A3—15 to 20 inches (38 to 51 centimeters); gravelly coarse sand
A4—20 to 30 inches (51 to 76 centimeters); mucky silt loam
Cg1—30 to 49 inches (76 to 125 centimeters); loam
Cg2—49 to 59 inches (125 to 150 centimeters); loamy sand

Characteristics of Tahoe silt loam, wet, and similar soils

Slope: 0 to 2 percent
Aspect: North
Landform: Flood plains and valley flats
Parent material: Alluvium derived from granitic and volcanic rocks
Typical vegetation: Mosaic of Lemmon's willow and Geyer willow with open meadows of sedges and grasses
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted
Slowest permeability: Moderate
Available water capacity to a depth of 60 inches: About 5.5 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties

Present annual flooding: Frequent
Present annual ponding: Frequent
Surface runoff class: Very high
Current water table: Present
Natural drainage class: Very poorly drained
Hydrologic soil group: A/D

Interpretive groups

Land capability (nonirrigated): 5w
Ecological site: R022AE203CA, Frigid Loamy Floodplain

Typical profile

A1—0 to 10 inches (0 to 25 centimeters); mucky silt loam
A2—10 to 27 inches (25 to 68 centimeters); loam
Cg1—27 to 32 inches (68 to 82 centimeters); loamy fine sand
Cg2—32 to 46 inches (82 to 117 centimeters); fine sand

Minor components

Marla and similar soils

Extent: About 10 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces and valley flats
Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

Tahoe, gravelly, and similar soils

Extent: About 5 percent of the map unit
Slope: 0 to 5 percent
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses

Ecological site: R022AE214CA, Gravelly Flats

Watah and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 2 percent
Landform: Fens, flood plains, and valley flats
Typical vegetation: Seasonally flooded basins dominated by sedges (*Carex utriculata* and/or *Carex vesicaria*); also, other grasses, rushes, and forbs with small patches of willow
Ecological site: R022AE209CA, Flooded Basins

7042—Tahoe complex, 0 to 5 percent slopes, gravelly

Map unit setting

General location: The riparian corridors all around the Tahoe Basin, most prevalent in the western part
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,215 to 7,725 feet (1,895 to 2,355 meters)
Mean annual precipitation: 23 to 61 inches (580 to 1,550 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 20 to 75 days

Map unit composition

Tahoe, gravelly—55 percent
Tahoe, gravelly, wet—25 percent
Minor components—20 percent

Characteristics of Tahoe, gravelly, and similar soils

Slope: 0 to 5 percent
Aspect: North
Landform: Flood plains and valley flats
Parent material: Alluvium derived from granitic and volcanic rocks
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses

Riverwash
Extent: About 5 percent of the map unit
Slope: 0 to 5 percent
Typical vegetation: None assigned
Ecological site: None assigned

Tahoe silt loam and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 2 percent
Landform: Flood plains and valley flats

Typical vegetation: Moist meadows dominated by sedges, rushes, and grasses with a variety of forbs
Ecological site: R022AE208CA, Frigid Loamy Terrace

Watah and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 2 percent
Landform: Fens, flood plains, and valley flats
Typical vegetation: Seasonally flooded basins dominated by sedges (*Carex utriculata* and/or *Carex vesicaria*); also, other grasses, rushes, and forbs with small patches of willow
Ecological site: R022AE209CA, Flooded Basins

7043—Tahoe mucky silt loam, drained, 0 to 5 percent slopes

Map unit setting

General location: The southern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, urban development, and grazing
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 6,360 feet (1,900 to 1,940 meters)
Mean annual precipitation: 23 to 25 inches (580 to 640 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 20 to 60 days

Map unit composition

Tahoe, drained—80 percent
Minor components—20 percent

Characteristics of Tahoe, drained, and similar soils

Slope: 0 to 2 percent
Aspect: North
Landform: Flood plains and valley flats
Parent material: Alluvium derived from granitic and volcanic rocks
Typical vegetation: Moist meadows dominated by sedges, rushes, and grasses with a variety of forbs
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted
Slowest permeability: Moderate
Available water capacity to a depth of 60 inches: About 5.5 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Altered hydrology: Hydrology has been altered by stream channelization and subsequent head-cutting.
Present annual flooding: Occasional
Present annual ponding: Occasional
Surface runoff class: Very high
Current water table: Present
Natural drainage class: Very poorly drained
Hydrologic soil group: A/D

Interpretive groups
Land capability (nonirrigated): 5w
Ecological site: R022AE208CA, Frigid Loamy Terrace

Typical profile
A1—0 to 10 inches (0 to 25 centimeters); mucky silt loam
A2—10 to 27 inches (25 to 68 centimeters); loam
Cg1—27 to 32 inches (68 to 82 centimeters); loamy fine sand
Cg2—32 to 46 inches (82 to 117 centimeters); fine sand

Minor components

Marla and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces and valley flats
Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

Tahoe, gravelly, and Tahoe silt loam, wet, and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 5 percent (Tahoe, gravelly); 0 to 2 percent (Tahoe silt loam, wet)
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

Watah and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 2 percent
Landform: Fens, flood plains, and valley flats
Typical vegetation: Seasonally flooded basins dominated by sedges (*Carex utriculata* and/or *Carex vesicaria*); also, other grasses, rushes, and forbs with small patches of willow
Ecological site: R022AE209CA, Flooded Basins

7051—Oxyaquic Xerorthents-Water association, 0 to 5 percent slopes

Map unit setting

General location: The Tahoe Keys
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,215 to 6,230 feet (1,895 to 1,900 meters)
Mean annual precipitation: 23 to 23 inches (580 to 580 millimeters)
Mean annual air temperature: 43 to 46 degrees F (6 to 8 degrees C)
Frost-free period: 40 to 60 days

Map unit composition

Oxyaquic Xerorthents—60 percent
Water—38 percent
Minor components—2 percent

Characteristics of Oxyaquic Xerorthents and similar soils

Slope: 0 to 5 percent
Aspect: North
Landform: Filled marshland
Parent material: Earthy fill derived from granodiorite
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 5.5 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: Present
Natural drainage class: Well drained
Hydrologic soil group: C

Interpretive groups
Land capability (nonirrigated): 6s
Ecological site: None assigned

Typical profile
C—0 to 36 inches (0 to 91 centimeters); very gravelly coarse sand
Ab1—36 to 44 inches (91 to 111 centimeters); mucky silt loam
Ab2—44 to 48 inches (111 to 121 centimeters); mucky silt loam
Ab3—48 to 53 inches (121 to 134 centimeters); gravelly coarse sand
Ab4—53 to 63 inches (134 to 159 centimeters); mucky silt loam

Characteristics of Water

Aspect: North
Typical vegetation: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Minor components

Marla and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces and valley flats
Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

Watah and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 2 percent
Landform: Fens, flood plains, and valley flats
Typical vegetation: Seasonally flooded basins dominated by sedges (*Carex utriculata* and/or *Carex vesicaria*); also, other grasses, rushes, and forbs with small patches of willow

Ecological site: R022AE209CA, Flooded Basins

7061—Urban land

Map unit setting

General location: The southern part of the Tahoe Basin
Major uses: Urban
MLRA: 22A—Sierra Nevada Mountains
Elevation: 6,230 to 6345 feet (1,900 to 1935 meters)
Mean annual precipitation: 25 to 25 inches (640 to 640 millimeters)
Mean annual air temperature: 43 to 46 degrees F (6 to 8 degrees C)
Frost-free period: 25 to 125 days

Map unit composition

Urban land—100 percent

Characteristics of Urban land

Aspect: North
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted

Hydrologic properties
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

7071—Watah peat, 0 to 2 percent slopes

Map unit setting

General location: The southern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,215 to 9,415 feet (1,895 to 2,870 meters)
Mean annual precipitation: 23 to 55 inches (580 to 1,400 millimeters)
Mean annual air temperature: 40 to 46 degrees F (4 to 8 degrees C)
Frost-free period: 20 to 60 days

Map unit composition

Watah—75 percent
Minor components—25 percent

Characteristics of Watah and similar soils

Slope: 0 to 2 percent
Aspect: North to southwest
Landform: Fens, flood plains, and valley flats
Parent material: Organic material over alluvium
Typical vegetation: Seasonally flooded basins dominated by sedges (*Carex utriculata*

and/or *Carex vesicaria*); also, other grasses, rushes, and forbs with small patches of willow
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted
Slowest permeability: Moderate
Available water capacity to a depth of 60 inches: About 5.8 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: Frequent
Present annual ponding: Frequent
Surface runoff class: Very high
Current water table: Present
Natural drainage class: Very poorly drained
Hydrologic soil group: A/D

Interpretive groups
Land capability (nonirrigated): 5w
Ecological site: R022AE209CA, Flooded Basins

Typical profile
Oi—0 to 3 inches (0 to 8 centimeters); peat
Oe—3 to 8 inches (8 to 20 centimeters); mucky peat
A—8 to 15 inches (20 to 38 centimeters); mucky gravelly coarse sandy loam
C—15 to 63 inches (38 to 160 centimeters); gravelly loamy coarse sand

Minor components

Tahoe, gravelly, wet, and similar soils
Extent: About 9 percent of the map unit
Slope: 0 to 5 percent
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

Tahoe silt loam, wet, and similar soils
Extent: About 8 percent of the map unit
Slope: 0 to 2 percent
Landform: Flood plains and valley flats
Typical vegetation: Mosaic of Lemmon's willow and Geyer willow with open meadows of sedges and grasses
Ecological site: R022AE203CA, Frigid Loamy Floodplain

Marla and similar soils
Extent: About 3 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces and valley flats
Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

Bidart, wet, and similar soils
Extent: About 2 percent of the map unit
Slope: 0 to 2 percent
Landform: Flood plains and valley flats
Typical vegetation: None assigned

Ecological site: R022AE207CA, Cold Wet Alluvial Flat

Water
Extent: About 2 percent of the map unit
Typical vegetation: None assigned
Ecological site: None assigned

Hellhole and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 2 percent
Landform: Fens
Typical vegetation: Sphagnum bogs dominated by a mat of floating Sphagnum moss; mountain blueberry, bog laurel, sedges, and a variety of alpine forbs growing on the mat
Ecological site: R022AE204CA, Sphagnum Fen

7101—Caverock sandy loam, 9 to 50 percent slopes

Map unit setting

General location: The eastern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 7,805 feet (1,900 to 2,380 meters)
Mean annual precipitation: 23 to 31 inches (580 to 790 millimeters)
Mean annual air temperature: 41 to 44 degrees F (5 to 6 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Caverock—80 percent
Minor components—20 percent

Characteristics of Caverock and similar soils

Slope: 9 to 50 percent
Aspect: East to northwest
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum weathered from latite
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Percentage of the surface covered by rock fragments: 0 percent
Depth to a restrictive feature (paralithic bedrock): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 4.0 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: C

Interpretive groups

Land capability (nonirrigated): 7e

Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Typical profile

Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
A—2 to 4 inches (5 to 10 centimeters); sandy loam
BA—4 to 11 inches (10 to 27 centimeters); sandy loam
Bw1—11 to 19 inches (27 to 47 centimeters); cobbly sandy loam
Bw2—19 to 26 inches (47 to 67 centimeters); sandy loam
Cr—26 to 36 inches (67 to 92 centimeters); soft bedrock

Minor components

Cagwin and similar soils

Extent: About 5 percent of the map unit
Slope: 30 to 50 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Cassenai gravelly loamy coarse sand and similar soils

Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Deerhill and similar soils

Extent: About 3 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Genoapeak and similar soils

Extent: About 2 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Ecological site: R022AE210CA, Shallow Sandy Slope

Southcamp and similar soils

Extent: About 2 percent of the map unit
Slope: 30 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory

Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Zephyrcove and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

7111—Deerhill gravelly fine sandy loam, 9 to 30 percent slopes, very stony

Map unit setting

General location: The eastern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,280 to 7,970 feet (1,915 to 2,430 meters)
Mean annual precipitation: 23 to 31 inches (580 to 790 millimeters)
Mean annual air temperature: 40 to 44 degrees F (4 to 6 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Deerhill—80 percent
Minor components—20 percent

Characteristics of Deerhill and similar soils

Slope: 9 to 30 percent
Aspect: South to northeast
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum weathered from metavolcanic rocks
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Percentage of the surface covered by rock fragments: 0 to 5 percent by coarse gravel, 0 to 5 percent by stones, and 0 to 5 percent by cobbles
Restrictive feature: None noted
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 10.6 inches (very high)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High

Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A1—1 to 5 inches (3 to 24 centimeters); gravelly fine sandy loam
A2—5 to 9 inches (3 to 24 centimeters); fine sandy loam
Bw—9 to 35 inches (24 to 90 centimeters); fine sandy loam
2Bt1—35 to 51 inches (90 to 130 centimeters); loam
2Bt2—51 to 65 inches (130 to 166 centimeters); extremely paragravelly loam

Minor components

Cassenai gravelly loamy coarse sand and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Cagwin and similar soils
Extent: About 3 percent of the map unit
Slope: 15 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Shakespeare and similar soils
Extent: About 3 percent of the map unit
Slope: 9 to 30 percent
Landform: Mountain slopes
Typical vegetation: Open woodland of red fir and Jeffrey pine with a dense cover of roundleaf snowberry, wax currant, mountain monardella, and silvery lupine
Ecological site: F022AE011CA, Abies magnifica-Pinus jeffreyi/Symphoricarpos rotundifolius-Ribes cereum/Lupinus argenteus

Southcamp and similar soils
Extent: About 3 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Zephyrcove and similar soils
Extent: About 3 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Genoapeak and similar soils
Extent: About 2 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Ecological site: R022AE210CA, Shallow Sandy Slope

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

7112—Deerhill gravelly fine sandy loam, 30 to 50 percent slopes, very stony

Map unit setting

General location: The eastern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,360 to 7,495 feet (1,940 to 2,285 meters)
Mean annual precipitation: 23 to 27 inches (580 to 690 millimeters)
Mean annual air temperature: 40 to 44 degrees F (4 to 6 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Deerhill—80 percent
Minor components—20 percent

Characteristics of Deerhill and similar soils

Slope: 30 to 50 percent
Aspect: South to north
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum weathered from metavolcanic rocks
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Percentage of the surface covered by rock fragments: 0 to 3 percent by cobbles and 0 to 3 percent by stones
Restrictive feature: None noted
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 10.6 inches (very high)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 7e
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A1—1 to 5 inches (3 to 12 centimeters); gravelly fine sandy loam
A2—5 to 9 inches (12 to 24 centimeters); fine sandy loam
Bw—9 to 35 inches (24 to 90 centimeters); fine sandy loam
2Bt1—35 to 51 inches (90 to 130 centimeters); loam
2Bt2—51 to 65 inches (130 to 166 centimeters); extremely paragravelly loam

Minor components

Cassenai gravelly loamy coarse sand and similar soils
Extent: About 5 percent of the map unit
Slope: 30 to 50 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings

Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Genoapeak and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Ecological site: R022AE210CA, Shallow Sandy Slope

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

7121—Ellispeak-Rock outcrop complex, 9 to 30 percent slopes

Map unit setting

General location: The western part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,345 to 7,545 feet (1,935 to 2,300 meters)
Mean annual precipitation: 33 to 63 inches (840 to 1,600 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Ellispeak—45 percent
Rock outcrop, volcanic—40 percent
Minor components—15 percent

Characteristics of Ellispeak and similar soils

Slope: 9 to 30 percent
Aspect: Northeast to south
Landform: Glacial valley walls
Parent material: Colluvium derived from welded tuff and/or lahar
Typical vegetation: Shrubland of huckleberry oak and greenleaf manzanita with scattered Jeffrey pine and white fir

Percentage of the surface covered by rock fragments: 0 to 15 percent by boulders, 0 to 15 percent by stones, 2 to 25 percent by cobbles, and 10 to 50 percent by coarse gravel
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches (25 to 50 centimeters)
Slowest permeability: Rapid above the bedrock
Available water capacity to a depth of 60 inches: About 0.8 inch (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Very high
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 8
Ecological site: R022AE217CA, Volcanic Slopes

Typical profile
A1—0 to 2 inches (0 to 5 centimeters); stony fine sandy loam
A2—2 to 6 inches (5 to 15 centimeters); very cobbly sandy loam
Bw—6 to 12 inches (15 to 30 centimeters); extremely gravelly fine sandy loam
R—12 to 22 inches (30 to 55 centimeters); bedrock

Characteristics of Rock outcrop, volcanic

Slope: 9 to 30 percent
Aspect: Northeast to south
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties
Surface runoff class: Very high
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Minor components

Waca and similar soils
Extent: About 10 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Kneeridge, well drained, and similar soils
Extent: About 2 percent of the map unit
Slope: 5 to 15 percent
Landform: Moraines

Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Paige and similar soils
Extent: About 2 percent of the map unit
Slope: 15 to 30 percent
Landform: Moraines
Typical vegetation: Forest of red fir and white fir with some Jeffrey pine; creeping snowberry, wax currant, and Brewer's aster commonly occurring in the understory
Ecological site: F022AE008CA, Abies magnifica-Abies concolor/Symphoricarpos mollis-Ribes cereum/Eucephalus breweri-Thalictrum fendleri

Tahoe, gravelly, and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 5 percent
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

7122—Ellispeak-Rock outcrop complex, 30 to 50 percent slopes

Map unit setting

General location: The western part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,430 to 7,560 feet (1,960 to 2,305 meters)
Mean annual precipitation: 37 to 59 inches (940 to 1,500 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Ellispeak—45 percent
Rock outcrop, volcanic—40 percent
Minor components—15 percent

Characteristics of Ellispeak and similar soils

Slope: 30 to 50 percent
Aspect: Northeast to south
Landform: Glacial valley walls
Parent material: Colluvium derived from welded tuff and/or lahar
Typical vegetation: Shrubland of huckleberry oak and greenleaf manzanita with scattered Jeffrey pine and white fir
Percentage of the surface covered by rock fragments: 0 to 15 percent by boulders, 10 to 50 percent by coarse gravel, 0 to 15 percent by stones, and 2 to 25 percent by cobbles
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches (25 to 50 centimeters)
Slowest permeability: Rapid above the bedrock
Available water capacity to a depth of 60 inches: About 0.8 inch (very low)

Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Very high
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 8
Ecological site: R022AE217CA, Volcanic Slopes

Typical profile
A1—0 to 2 inches (0 to 5 centimeters); stony fine sandy loam
A2—2 to 6 inches (5 to 15 centimeters); very cobbly sandy loam
Bw—6 to 12 inches (15 to 30 centimeters); extremely gravelly fine sandy loam
R—12 to 22 inches (30 to 55 centimeters); bedrock

Characteristics of Rock outcrop, volcanic

Slope: 30 to 70 percent
Aspect: Northeast to south
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties
Surface runoff class: Very high
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Minor components

Waca and similar soils
Extent: About 10 percent of the map unit
Slope: 30 to 50 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Kneeridge, well drained, and similar soils
Extent: About 3 percent of the map unit
Slope: 5 to 15 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit

Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Paige and similar soils
Extent: About 1 percent of the map unit
Slope: 30 to 60 percent
Landform: Moraines
Typical vegetation: Forest of red fir and white fir with some Jeffrey pine; creeping snowberry, wax currant, and Brewer's aster commonly occurring in the understory
Ecological site: F022AE008CA, Abies magnifica-Abies concolor/Symphoricarpos mollis-Ribes cereum/Eucephalus breweri-Thalictrum fendleri

7123—Ellispeak-Rock outcrop complex, 50 to 70 percent slopes

Map unit setting

General location: The western part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,510 to 7,625 feet (1,985 to 2,325 meters)
Mean annual precipitation: 35 to 63 inches (890 to 1,600 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Ellispeak—45 percent
Rock outcrop, volcanic—40 percent
Minor components—15 percent

Characteristics of Ellispeak and similar soils

Slope: 50 to 70 percent
Aspect: North to south
Landform: Glacial valley walls
Parent material: Colluvium derived from welded tuff and/or lahar
Typical vegetation: Shrubland of huckleberry oak and greenleaf manzanita with scattered Jeffrey pine and white fir
Percentage of the surface covered by rock fragments: 2 to 25 percent by cobbles, 0 to 15 percent by boulders, 10 to 50 percent by coarse gravel, and 0 to 15 percent by stones
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches (25 to 50 centimeters)

Land capability (nonirrigated): 8
Ecological site: R022AE217CA, Volcanic Slopes

Typical profile
A1—0 to 2 inches (0 to 5 centimeters); stony fine sandy loam
A2—2 to 6 inches (5 to 15 centimeters); very cobbly sandy loam
Bw—6 to 12 inches (15 to 30 centimeters); extremely gravelly fine sandy loam

R—12 to 22 inches (30 to 55 centimeters); bedrock

Characteristics of Waca and similar soils

Slope: 9 to 30 percent
Aspect: Northeast to west
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum derived from andesitic tuff
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 0 to 10 percent by subangular stones, 0 to 10 percent by subangular cobbles, and 0 to 10 percent by coarse gravel
Depth to a restrictive feature (paralithic bedrock): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Moderately rapid above the bedrock
Available water capacity to a depth of 60 inches: About 3.4 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 4e-7
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Typical profile
Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
A1—2 to 11 inches (5 to 28 centimeters); very gravelly medial coarse sandy loam
A2—11 to 16 inches (28 to 41 centimeters); very gravelly medial coarse sandy loam
A3—16 to 23 inches (41 to 58 centimeters); very gravelly medial coarse sandy loam
Bw—23 to 38 inches (58 to 97 centimeters); very gravelly medial coarse sandy loam
Cr—38 to 48 inches (97 to 122 centimeters); soft bedrock

Minor components

Rock outcrop
Extent: About 10 percent of the map unit
Slope: 9 to 30 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Windy and similar soils
Extent: About 4 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory

Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Aquic Xerorthents and similar soils

7141—Inville gravelly coarse sandy loam, 2 to 9 percent slopes, stony

Map unit setting

General location: The northern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 6,955 feet (1,900 to 2,120 meters)
Mean annual precipitation: 19 to 33 inches (480 to 840 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 45 to 110 days

Map unit composition

Inville—80 percent
Minor components—20 percent

Characteristics of Inville and similar soils

Slope: 2 to 9 percent
Aspect: East to southwest
Landform: Hillslopes and outwash terraces
Parent material: Outwash derived from mixed sources
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Percentage of the surface covered by rock fragments: 0 to 3 percent by boulders, 0 to 3 percent by stones, and 0 to 3 percent by cobbles
Restrictive feature: None noted
Slowest permeability: Moderately rapid
Available water capacity to a depth of 60 inches: About 3.6 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low

Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 4e-1
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Typical profile
Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
A—2 to 12 inches (5 to 30 centimeters); gravelly coarse sandy loam
Bt—12 to 37 inches (30 to 94 centimeters); extremely cobbly sandy loam
C—37 to 56 inches (94 to 142 centimeters); extremely gravelly loamy coarse sand

Minor components

Christopher loamy coarse sand and similar soils
Extent: About 10 percent of the map unit
Slope: 0 to 9 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Cassenai gravelly loamy coarse sand and similar soils
Extent: About 4 percent of the map unit
Slope: 5 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Jorge very gravelly sandy loam and similar soils
Extent: About 3 percent of the map unit
Slope: 2 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Kingsbeach and similar soils
Extent: About 2 percent of the map unit
Slope: 2 to 9 percent
Landform: Alluvial fans and lake terraces
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

7142—Inville gravelly coarse sandy loam, 9 to 15 percent slopes, stony

Map unit setting

General location: The northern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 7,250 feet (1,900 to 2,210 meters)
Mean annual precipitation: 21 to 37 inches (530 to 940 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 45 to 110 days

Map unit composition

Inville—80 percent
Minor components—20 percent

Characteristics of Inville and similar soils

Slope: 9 to 15 percent
Aspect: East to southwest
Landform: Hillslopes and outwash terraces
Parent material: Outwash derived from mixed sources
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory

Typical profile

Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
A—2 to 12 inches (5 to 30 centimeters); gravelly coarse sandy loam
Bt—12 to 37 inches (30 to 94 centimeters); extremely cobbly sandy loam
C—37 to 56 inches (94 to 142 centimeters); extremely gravelly loamy coarse sand

Minor components

Cassenai gravelly loamy coarse sand and similar soils
Extent: About 10 percent of the map unit
Slope: 5 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Christopher gravelly loamy coarse sand and similar soils
Extent: About 4 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Jorge very gravelly sandy loam and similar soils
Extent: About 3 percent of the map unit
Slope: 2 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Meeks, extremely bouldery, and similar soils
Extent: About 2 percent of the map unit
Slope: 5 to 15 percent
Landform: Moraines
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

7143—Inville gravelly coarse sandy loam, 15 to 30 percent slopes, stony

Map unit setting

General location: The northern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 7,460 feet (1,900 to 2,275 meters)
Mean annual precipitation: 23 to 39 inches (580 to 990 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 45 to 110 days

Map unit composition

Inville—80 percent
Minor components—20 percent

Characteristics of Inville and similar soils

Slope: 15 to 30 percent
Aspect: East to southwest
Landform: Hillslopes and outwash terraces
Parent material: Outwash derived from mixed sources
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Percentage of the surface covered by rock fragments: 0 to 3 percent by cobbles, 0 to 3 percent by stones, and 0 to 3 percent by boulders
Restrictive feature: None noted
Slowest permeability: Moderately rapid
Available water capacity to a depth of 60 inches: About 3.6 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 4e-1
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Typical profile
Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
A—2 to 12 inches (5 to 30 centimeters); gravelly coarse sandy loam
Bt—12 to 37 inches (30 to 94 centimeters); extremely cobbly sandy loam
C—37 to 56 inches (94 to 142 centimeters); extremely gravelly loamy coarse sand

Minor components

Cassenai gravelly loamy coarse sand and similar soils
Extent: About 10 percent of the map unit
Slope: 15 to 30 percent

Landform: Hillslopes and mountain slopes

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

7151—Jorge very cobbly fine sandy loam, 5 to 15 percent slopes, rubbly

Map unit setting

General location: The northern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Landscape setting: Colluvial mountain slopes

Elevation: 6,230 to 7,970 feet (1,900 to 2,430 meters)
Mean annual precipitation: 23 to 41 inches (580 to 1,040 millimeters)
Mean annual air temperature: 40 to 46 degrees F (4 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Jorge very cobbly fine sandy loam—80 percent
Minor components—20 percent

Characteristics of Jorge very cobbly fine sandy loam and similar soils

Slope: 5 to 15 percent
Aspect: Northeast to southwest
Landform: Hillslopes and mountain slopes
Parent material: Colluvium derived from andesite
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Percentage of the surface covered by rock fragments: 0 to 35 percent by coarse, angular gravel; 0 to 15 percent by angular boulders; 0 to 35 percent by angular stones; and 0 to 40 percent by angular cobbles
Restrictive feature: None noted
Slowest permeability: Moderate
Available water capacity to a depth of 60 inches: About 5.7 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 4e-4
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Typical profile
Oi—0 to 2 inches (0 to 6 centimeters); slightly decomposed plant material
A—2 to 9 inches (6 to 22 centimeters); very cobbly fine sandy loam
Bw1—9 to 28 inches (22 to 70 centimeters); very cobbly fine sandy loam
Bw2—28 to 34 inches (70 to 87 centimeters); very cobbly fine sandy loam
2Bt—34 to 59 inches (87 to 150 centimeters); very cobbly loam

Minor components

Tahoma and similar soils
Extent: About 5 percent of the map unit
Slope: 2 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita,

western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Waca and similar soils
Extent: About 5 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Jorge very cobbly loam and similar soils
Extent: About 4 percent of the map unit
Slope: 2 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Ellispeak and similar soils
Extent: About 2 percent of the map unit
Slope: 9 to 30 percent
Landform: Glacial valley walls
Typical vegetation: Shrubland of huckleberry oak and greenleaf manzanita with scattered Jeffrey pine and white fir
Ecological site: R022AE217CA, Volcanic Slopes

Sky and similar soils
Extent: About 2 percent of the map unit
Slope: 9 to 30 percent
Landform: Mountain slopes
Typical vegetation: Subalpine mixed conifer forest with mountain hemlock, lodgepole pine, and red fir as the codominant species; a sparse understory that includes Brewer's aster, Ross' sedge, and several lupine species
Ecological site: F022AE019CA, Tsuga mertensiana-Abies magnifica/Eucephalus breweri

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Rock outcrop
Extent: About 1 percent of the map unit
Slope: 5 to 15 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

7152—Jorge very cobbly fine sandy loam, 15 to 30 percent slopes, rubbly

Map unit setting

General location: The northern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Landscape setting: Colluvial mountain slopes
Elevation: 6,200 to 8,100 feet (1,890 to 2,470 meters)
Mean annual precipitation: 23 to 55 inches (580 to 1,400 millimeters)
Mean annual air temperature: 40 to 46 degrees F (4 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Tahoe, gravelly, and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 5 percent
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

7156—Jorge-Tahoma complex, 15 to 30 percent slopes

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,200 to 8,050 feet (1,890 to 2,455 meters)
Mean annual precipitation: 25 to 57 inches (640 to 1,450 millimeters)
Mean annual air temperature: 40 to 46 degrees F (4 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Jorge very gravelly sandy loam—45 percent
Tahoma—35 percent
Minor components—20 percent

Characteristics of Jorge very gravelly sandy loam and similar soils

Slope: 15 to 30 percent
Aspect: North to south
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum weathered from volcanic rocks
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Percentage of the surface covered by rock fragments: 0 to 20 percent by subangular cobbles, 0 to 10 percent by subangular stones, and 0 to 20 percent by coarse, subangular gravel
Restrictive feature: None noted
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 6.4 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Typical profile
Oi—0 to 2 inches (0 to 4 centimeters); slightly decomposed plant material
A—2 to 24 inches (4 to 60 centimeters); very gravelly sandy loam
BA—24 to 32 inches (60 to 81 centimeters); very gravelly loam
Bt1—32 to 48 inches (81 to 122 centimeters); very gravelly loam
Bt2—48 to 84 inches (122 to 213 centimeters); very gravelly sandy loam

Characteristics of Tahoma and similar soils

Slope: 15 to 30 percent
Aspect: North to south
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum weathered from andesite
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Percentage of the surface covered by rock fragments: 0 to 5 percent by cobbles and 0 to 5 percent by stones
Depth to a restrictive feature (lithic bedrock): 40 to 80 inches (102 to 203 centimeters)
Slowest permeability: Slow above the bedrock
Available water capacity to a depth of 60 inches: About 8.7 inches (high)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Typical profile
Oi—0 to 3 inches (0 to 8 centimeters); slightly decomposed plant material
A1—3 to 14 inches (8 to 36 centimeters); very cobbly sandy loam
A2—14 to 22 inches (36 to 56 centimeters); very cobbly sandy loam
BA—22 to 38 inches (56 to 97 centimeters); gravelly loam
Bt1—38 to 59 inches (97 to 150 centimeters); gravelly clay loam
Bt2—59 to 71 inches (150 to 180 centimeters); clay loam
R—71 to 81 inches (180 to 205 centimeters); bedrock

Minor components

Waca and similar soils
Extent: About 10 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Inville and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory

Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Rubble land
Extent: About 2 percent of the map unit
Slope: 15 to 30 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Ellispeak and similar soils
Extent: About 1 percent of the map unit
Slope: 9 to 30 percent
Landform: Glacial valley walls
Typical vegetation: Shrubland of huckleberry oak and greenleaf manzanita with scattered Jeffrey pine and white fir
Ecological site: R022AE217CA, Volcanic Slopes

Rock outcrop
Extent: About 1 percent of the map unit
Slope: 15 to 30 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Tahoe, gravelly, and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 5 percent
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

7157—Jorge-Tahoma complex, 30 to 50 percent slopes

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,200 to 8,215 feet (1,890 to 2,505 meters)
Mean annual precipitation: 25 to 53 inches (640 to 1,350 millimeters)
Mean annual air temperature: 40 to 46 degrees F (4 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Jorge very gravelly sandy loam—55 percent
Tahoma—25 percent
Minor components—20 percent

Characteristics of Jorge very gravelly sandy loam and similar soils

Slope: 30 to 50 percent
Aspect: Northwest to southeast
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum weathered from volcanic rocks

Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Percentage of the surface covered by rock fragments: 0 to 20 percent by subangular cobbles, 0 to 10 percent by subangular stones, and 0 to 20 percent by coarse, subangular gravel
Restrictive feature: None noted
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 6.4 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted

Typical vegetation: None assigned
Ecological site: None assigned

Tahoe, gravelly, and similar soils

Extent: About 1 percent of the map unit

Slope: 0 to 5 percent
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

7161—Kingsbeach stony sandy loam, 2 to 15 percent slopes

Map unit setting

General location: The northern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,215 to 6,705 feet (1,895 to 2,045 meters)
Mean annual precipitation: 23 to 33 inches (580 to 840 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 30 to 80 days

Map unit composition

Kingsbeach—80 percent
Minor components—20 percent

Characteristics of Kingsbeach and similar soils

Slope: 2 to 15 percent
Aspect: East to southwest
Landform: Alluvial fans and lake terraces
Parent material: Alluvium and/or colluvium derived from andesite over lacustrine deposits
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Percentage of the surface covered by rock fragments: 0 to 5 percent by coarse, subangular gravel; 0 to 5 percent by subangular cobbles; and 0 to 3 percent by subangular stones
Restrictive feature: None noted
Slowest permeability: Impermeable
Available water capacity to a depth of 60 inches: About 9.8 inches (high)
Shrink-swell potential: High (LEP 6 to 9)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: Present
Natural drainage class: Moderately well drained
Hydrologic soil group: C

Interpretive groups
Land capability (nonirrigated): 4e-1
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 6 inches (3 to 15 centimeters); stony sandy loam
Bt1—6 to 20 inches (15 to 51 centimeters); loam
2Bt2—20 to 30 inches (51 to 76 centimeters); sandy clay loam
2C—30 to 61 inches (76 to 155 centimeters); clay loam

Minor components

Tahoma and similar soils
Extent: About 10 percent of the map unit
Slope: 2 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Jorge very gravelly sandy loam and similar soils
Extent: About 8 percent of the map unit
Slope: 2 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Beaches
Extent: About 1 percent of the map unit
Slope: 0 to 5 percent
Landform: Beaches
Typical vegetation: Scant forbs and/or grasses
Ecological site: None assigned

Dunes
Extent: About 1 percent of the map unit
Slope: 5 to 15 percent
Typical vegetation: None assigned
Ecological site: None assigned

7171—Kneeridge gravelly medial sandy loam, 2 to 9 percent slopes, extremely stony

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 7,115 feet (1,900 to 2,170 meters)
Mean annual precipitation: 31 to 61 inches (790 to 1,550 millimeters)
Mean annual air temperature: 40 to 46 degrees F (4 to 8 degrees C)

Frost-free period: 40 to 90 days

Map unit composition

Kneeridge, extremely stony—80 percent
Minor components—20 percent

Characteristics of Kneeridge, extremely stony, and similar soils

Slope: 2 to 9 percent
Aspect: Northwest to southeast
Landform: Moraines
Parent material: Colluvium and/or till derived from andesite
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 5 to 15 percent by stones, 2 to 10 percent by cobbles, and 5 to 25 percent by coarse gravel
Restrictive feature: None noted
Slowest permeability: Moderate
Available water capacity to a depth of 60 inches: About 9.5 inches (high)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: None noted
Natural drainage class: Moderately well drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 4e-7
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Typical profile
Oi—0 to 2 inches (0 to 6 centimeters); slightly decomposed plant material
A—2 to 16 inches (6 to 40 centimeters); gravelly medial sandy loam
Bw—16 to 39 inches (40 to 100 centimeters); gravelly medial sandy loam
C—39 to 79 inches (100 to 200 centimeters); gravelly sandy loam

Minor components

Jorge very gravelly sandy loam and similar soils
Extent: About 9 percent of the map unit
Slope: 2 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Paige and similar soils
Extent: About 5 percent of the map unit
Slope: 5 to 15 percent
Landform: Moraines

Typical vegetation: Forest of red fir and white fir with some Jeffrey pine; creeping snowberry, wax currant, and Brewer's aster commonly occurring in the understory
Ecological site: F022AE008CA, Abies magnifica-Abies concolor/Symphoricarpos mollis-Ribes cereum/Eucephalus breweri-Thalictrum fendleri

Waca and similar soils
Extent: About 5 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Tahoe, gravelly, and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 5 percent
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

7172—Kneeridge gravelly medial sandy loam, well drained, 5 to 15 percent slopes, very stony

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 6,770 feet (1,900 to 2,065 meters)
Mean annual precipitation: 31 to 33 inches (790 to 840 millimeters)
Mean annual air temperature: 40 to 46 degrees F (4 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Kneeridge, well drained—80 percent
Minor components—20 percent

Characteristics of Kneeridge, well drained, and similar soils

Slope: 5 to 15 percent
Aspect: Northeast to southeast
Landform: Moraines
Parent material: Colluvium and/or till derived from andesite
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 1 to 5 percent by stones, 2 to 10 percent by cobbles, and 5 to 25 percent by coarse gravel
Restrictive feature: None noted
Slowest permeability: Moderate
Available water capacity to a depth of 60 inches: About 9.5 inches (high)

Slope: 2 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Paige and similar soils
Extent: About 5 percent of the map unit
Slope: 5 to 15 percent
Landform: Moraines
Typical vegetation: Forest of red fir and white fir with some Jeffrey pine; creeping snowberry, wax currant, and Brewer's aster commonly occurring in the understory
Ecological site: F022AE008CA, Abies magnifica-Abies concolor/Symphoricarpos mollis-Ribes cereum/Eucephalus breweri-Thalictrum fendleri

Waca and similar soils
Extent: About 5 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes

Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Tahoe, gravelly, and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 5 percent
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

7181—Paige medial sandy loam, 5 to 15 percent slopes

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,280 to 7,230 feet (1,915 to 2,205 meters)
Mean annual precipitation: 33 to 63 inches (840 to 1,600 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Paige—80 percent
Minor components—20 percent

Characteristics of Paige and similar soils

Slope: 5 to 15 percent
Aspect: Northwest to south
Landform: Moraines
Parent material: Colluvium over till derived from volcanic rocks
Typical vegetation: Forest of red fir and white fir with some Jeffrey pine; creeping snowberry, wax currant, and Brewer's aster commonly occurring in the understory
Percentage of the surface covered by rock fragments: 0 to 1 percent by subrounded cobbles and 0 to 1 percent by stones
Depth to a restrictive feature (densic bedrock): 59 to 79 inches (150 to 200 centimeters)
Slowest permeability: Impermeable
Available water capacity to a depth of 60 inches: About 9.1 inches (high)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 4e-1

Ecological site: F022AE008CA, Abies magnifica-Abies concolor/Symphoricarpos mollis-Ribes cereum/Eucephalus breweri-Thalictrum fendleri

Typical profile

Oi—0 to 3 inches (0 to 8 centimeters); slightly decomposed plant material
A—3 to 20 inches (8 to 51 centimeters); medial sandy loam
Bw1—20 to 48 inches (51 to 122 centimeters); cobbly medial sandy loam
2Bw2—48 to 62 inches (122 to 157 centimeters); cobbly loam
Cd—62 to 80 inches (157 to 204 centimeters); extremely stony coarse sandy loam

Minor components

Kneeridge, well drained, and similar soils
Extent: About 7 percent of the map unit
Slope: 5 to 15 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Jorge very gravelly sandy loam and similar soils
Extent: About 6 percent of the map unit
Slope: 2 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Tahoe, gravelly, and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 5 percent
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

Waca and similar soils
Extent: About 2 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

7182—Paige medial sandy loam, 15 to 30 percent slopes

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains

Landscape: Mountains
Elevation: 6,230 to 7,330 feet (1,900 to 2,235 meters)
Mean annual precipitation: 31 to 63 inches (790 to 1,600 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Paige—80 percent
Minor components—20 percent

Characteristics of Paige and similar soils

Slope: 15 to 30 percent
Aspect: Northeast to south
Landform: Moraines
Parent material: Colluvium over till derived from volcanic rocks
Typical vegetation: Forest of red fir and white fir with some Jeffrey pine; creeping snowberry, wax currant, and Brewer's aster commonly occurring in the understory
Percentage of the surface covered by rock fragments: 0 to 1 percent by subrounded cobbles and 0 to 1 percent by stones
Depth to a restrictive feature (densic bedrock): 59 to 79 inches (150 to 200 centimeters)
Slowest permeability: Impermeable
Available water capacity to a depth of 60 inches: About 9.1 inches (high)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE008CA, Abies magnifica-Abies concolor/Symphoricarpos mollis-Ribes cereum/Eucephalus breweri-Thalictrum fendleri

Typical profile
Oi—0 to 3 inches (0 to 8 centimeters); slightly decomposed plant material
A—3 to 20 inches (8 to 51 centimeters); medial sandy loam
Bw1—20 to 48 inches (51 to 122 centimeters); cobbly medial sandy loam
2Bw2—48 to 62 inches (122 to 157 centimeters); cobbly loam
Cd—62 to 80 inches (157 to 204 centimeters); extremely stony coarse sandy loam

Minor components

Jorge very gravelly sandy loam and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Hillslopes and mountain slopes

Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

7191—Rock outcrop, volcanic

Map unit setting

General location: The northern, western, and southern parts of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 9,970 feet (1,900 to 3,040 meters)
Mean annual precipitation: 31 to 63 inches (790 to 1,600 millimeters)
Mean annual air temperature: 38 to 46 degrees F (4 to 8 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Rock outcrop, volcanic—90 percent
Minor components—10 percent

Characteristics of Rock outcrop, volcanic

Slope: 15 to 70 percent
Aspect: Northwest to south
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties
Surface runoff class: Very high
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Minor components

Glenalpine and similar soils
Extent: About 2 percent of the map unit
Slope: 50 to 90 percent
Landform: Glacial valley walls and mountain slopes
Typical vegetation: Huckleberry oak shrubland with a few Jeffrey pine, Sierra juniper, and western white pine trees
Ecological site: R022AE213CA, Steep Talus Slope

Lithnip and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: R022AY012NV, Barren Slope 20+ p.z.

Meiss and similar soils
Extent: About 2 percent of the map unit
Slope: 15 to 50 percent
Landform: Mountains
Typical vegetation: Low sagebrush with a diversity of low-growing shrubs, forbs, and grasses
Ecological site: R022AE211CA, Shallow Andesite Ridge

Melody and similar soils
Extent: About 2 percent of the map unit
Slope: 15 to 70 percent
Landform: Mountain slopes
Typical vegetation: Shrubland dominated by mountain big sagebrush, antelope bitterbrush, and woolly mule-ears; also, a variety of forbs and a few red fir trees
Ecological site: R022AE219CA, Cryic Volcanic Slope

Rubble land
Extent: About 2 percent of the map unit
Slope: 15 to 70 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

7201—Rubble land-Glenalpine complex, 50 to 90 percent slopes

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,215 to 9,150 feet (1,895 to 2,790 meters)
Mean annual precipitation: 33 to 61 inches (840 to 1,550 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Rubble land, talus—45 percent

Glenalpine—40 percent
Minor components—15 percent

Characteristics of Rubble land, talus

Slope: 50 to 90 percent
Aspect: Northeast to south
Landform: Glacial valley walls and mountains
Typical vegetation: None assigned
Restrictive feature: None noted

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Characteristics of Glenalpine and similar soils

Slope: 50 to 90 percent
Aspect: Northeast to south
Landform: Glacial valley walls and mountain slopes
Parent material: Colluvium derived from volcanic and metamorphic rocks over till
Typical vegetation: Huckleberry oak shrubland with a few Jeffrey pine, Sierra juniper, and western white pine trees
Percentage of the surface covered by rock fragments: 15 to 45 percent by coarse gravel, 15 to 45 percent by cobbles, 5 to 25 percent by stones, and 0 to 10 percent by boulders
Depth to a restrictive feature (densic bedrock): 39 to 59 inches (100 to 150 centimeters)
Slowest permeability: Impermeable
Available water capacity to a depth of 60 inches: About 3.5 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 8
Ecological site: R022AE213CA, Steep Talus Slope

Typical profile
A—0 to 11 inches (0 to 29 centimeters); very cobbly fine sandy loam
Bw—11 to 40 inches (29 to 102 centimeters); extremely cobbly fine sandy loam
C—40 to 50 inches (102 to 128 centimeters); extremely cobbly fine sandy loam
Cd—50 to 59 inches (128 to 150 centimeters); extremely cobbly fine sandy loam

Minor components

Rock outcrop
Extent: About 10 percent of the map unit
Slope: 50 to 80 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Rockbound very stony loam and similar soils
Extent: About 5 percent of the map unit
Slope: 30 to 70 percent
Landform: Glacial valley walls
Typical vegetation: Scattered Sierra juniper and Jeffrey pine trees with huckleberry oak and greenleaf manzanita in pockets and a high diversity of annuals and perennials
Ecological site: R022AE202CA, Granitic Pocket

7211—Southcamp very gravelly fine sandy loam, 50 to 70 percent slopes

Map unit setting

General location: The eastern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,315 to 7,560 feet (1,925 to 2,305 meters)
Mean annual precipitation: 25 to 29 inches (640 to 740 millimeters)
Mean annual air temperature: 40 to 45 degrees F (4 to 7 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Southcamp—80 percent
Minor components—20 percent

Characteristics of Southcamp and similar soils

Slope: 50 to 70 percent
Aspect: Southwest to northeast
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum weathered from volcanic rocks
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Percentage of the surface covered by rock fragments: 0 to 5 percent by cobbles
Restrictive feature: None noted
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 2.8 inches (low)
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High

Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 7e
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Typical profile
Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
A—2 to 4 inches (5 to 10 centimeters); very gravelly fine sandy loam
E—4 to 15 inches (10 to 38 centimeters); extremely cobbly loam
Bt1—15 to 34 inches (38 to 87 centimeters); extremely cobbly clay loam
Bt2—34 to 53 inches (87 to 134 centimeters); extremely stony clay loam
Bt3—53 to 60 inches (134 to 152 centimeters); extremely stony clay loam

Minor components

Cassenai gravelly loamy coarse sand and similar soils
Extent: About 5 percent of the map unit
Slope: 50 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Genoapeak and similar soils
Extent: About 5 percent of the map unit
Slope: 30 to 80 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Ecological site: R022AE210CA, Shallow Sandy Slope

Zephyrcove and similar soils
Extent: About 5 percent of the map unit
Slope: 30 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Cagwin and similar soils
Extent: About 2 percent of the map unit
Slope: 50 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Deerhill and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 50 percent
Landform: Hillslopes and mountain slopes

Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

7221—Tahoma very cobbly sandy loam, 2 to 15 percent slopes, very stony

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,360 to 7,755 feet (1,940 to 2,365 meters)
Mean annual precipitation: 25 to 43 inches (640 to 1,090 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Tahoma—80 percent
Minor components—20 percent

Characteristics of Tahoma and similar soils

Slope: 2 to 15 percent
Aspect: Northeast to south
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum weathered from andesite
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Percentage of the surface covered by rock fragments: 0 to 5 percent by stones and 0 to 5 percent by cobbles
Depth to a restrictive feature (lithic bedrock): 40 to 80 inches (102 to 203 centimeters)
Slowest permeability: Slow above the bedrock
Available water capacity to a depth of 60 inches: About 8.7 inches (high)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups

Land capability (nonirrigated): 4e-7

Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Typical profile

Oi—0 to 3 inches (0 to 8 centimeters); slightly decomposed plant material
A1—3 to 14 inches (8 to 36 centimeters); very cobbly sandy loam
A2—14 to 22 inches (36 to 56 centimeters); very cobbly sandy loam
BA—22 to 38 inches (56 to 97 centimeters); gravelly loam
Bt1—38 to 59 inches (97 to 150 centimeters); gravelly clay loam
Bt2—59 to 71 inches (150 to 180 centimeters); clay loam
R—71 to 81 inches (180 to 205 centimeters); bedrock

Minor components

Waca and similar soils

Extent: About 10 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Inville and similar soils

Extent: About 4 percent of the map unit
Slope: 9 to 15 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Rubble land

Extent: About 3 percent of the map unit
Slope: 2 to 15 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Aquic Xerorthents and similar soils

Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Ellispeak and similar soils

Extent: About 1 percent of the map unit
Slope: 9 to 30 percent
Landform: Glacial valley walls
Typical vegetation: Shrubland of huckleberry oak and greenleaf manzanita with scattered Jeffrey pine and white fir
Ecological site: R022AE217CA, Volcanic Slopes

Rock outcrop

Extent: About 1 percent of the map unit

Slope: 2 to 15 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

7222—Tahoma-Jorge complex, 2 to 15 percent slopes

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,200 to 7,820 feet (1,890 to 2,385 meters)
Mean annual precipitation: 25 to 53 inches (640 to 1,350 millimeters)
Mean annual air temperature: 40 to 46 degrees F (4 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Tahoma—50 percent
Jorge very gravelly sandy loam—30 percent
Minor components—20 percent

Characteristics of Tahoma and similar soils

Slope: 2 to 15 percent
Aspect: Northeast to south
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum weathered from andesite
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Percentage of the surface covered by rock fragments: 0 to 5 percent by cobbles and 0 to 5 percent by stones
Depth to a restrictive feature (lithic bedrock): 40 to 80 inches (102 to 203 centimeters)
Slowest permeability: Slow above the bedrock
Available water capacity to a depth of 60 inches: About 8.7 inches (high)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 4e-7
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Typical profile
Oi—0 to 3 inches (0 to 8 centimeters); slightly decomposed plant material
A1—3 to 14 inches (8 to 36 centimeters); very cobbly sandy loam
A2—14 to 22 inches (36 to 56 centimeters); very cobbly sandy loam

BA—22 to 38 inches (56 to 97 centimeters); gravelly loam
Bt1—38 to 59 inches (97 to 150 centimeters); gravelly clay loam
Bt2—59 to 71 inches (150 to 180 centimeters); clay loam
R—71 to 81 inches (180 to 205 centimeters); bedrock

Characteristics of Jorge very gravelly sandy loam and similar soils

Slope: 2 to 15 percent
Aspect: Northeast to south
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum weathered from volcanic rocks
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Percentage of the surface covered by rock fragments: 0 to 20 percent by subangular cobbles; 0 to 20 percent by coarse, subangular gravel; and 0 to 10 percent by subangular stones
Restrictive feature: None noted
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 6.4 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 4e-4
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Typical profile
Oi—0 to 2 inches (0 to 4 centimeters); slightly decomposed plant material
A—2 to 24 inches (4 to 60 centimeters); very gravelly sandy loam
BA—24 to 32 inches (60 to 81 centimeters); very gravelly loam
Bt1—32 to 48 inches (81 to 122 centimeters); very gravelly loam
Bt2—48 to 84 inches (122 to 213 centimeters); very gravelly sandy loam

Minor components

Waca and similar soils
Extent: About 10 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Inville and similar soils
Extent: About 5 percent of the map unit
Slope: 9 to 15 percent
Landform: Hillslopes and outwash terraces

Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Rubble land
Extent: About 2 percent of the map unit
Slope: 2 to 15 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Ellispeak and similar soils
Extent: About 1 percent of the map unit
Slope: 9 to 30 percent
Landform: Glacial valley walls
Typical vegetation: Shrubland of huckleberry oak and greenleaf manzanita with scattered Jeffrey pine and white fir
Ecological site: R022AE217CA, Volcanic Slopes

Rock outcrop
Extent: About 1 percent of the map unit
Slope: 2 to 15 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Tahoe, gravelly, and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 5 percent
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

7231—Waca very gravelly medial coarse sandy loam, 9 to 30 percent slopes

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 7,790 feet (1,900 to 2,375 meters)
Mean annual precipitation: 25 to 63 inches (640 to 1,600 millimeters)
Mean annual air temperature: 40 to 45 degrees F (4 to 7 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Waca—80 percent
Minor components—20 percent

Characteristics of Waca and similar soils

Slope: 9 to 30 percent
Aspect: West to south

Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum derived from andesitic tuff
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 0 to 10 percent by subangular stones, 0 to 10 percent by subangular cobbles, and 0 to 10 percent by coarse gravel
Depth to a restrictive feature (paralithic bedrock): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Moderately rapid above the bedrock
Available water capacity to a depth of 60 inches: About 3.4 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 4e-7
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Typical profile
Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
A1—2 to 11 inches (5 to 28 centimeters); very gravelly medial coarse sandy loam
A2—11 to 16 inches (28 to 41 centimeters); very gravelly medial coarse sandy loam
A3—16 to 23 inches (41 to 58 centimeters); very gravelly medial coarse sandy loam
Bw—23 to 38 inches (58 to 97 centimeters); very gravelly medial coarse sandy loam
Cr—38 to 48 inches (97 to 122 centimeters); soft bedrock

Minor components

Ellispeak and similar soils
Extent: About 5 percent of the map unit
Slope: 9 to 30 percent
Landform: Glacial valley walls
Typical vegetation: Shrubland of huckleberry oak and greenleaf manzanita with scattered Jeffrey pine and white fir
Ecological site: R022AE217CA, Volcanic Slopes

Rock outcrop
Extent: About 5 percent of the map unit
Slope: 9 to 30 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Windy and similar soils
Extent: About 5 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes

Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Kneeridge, well drained, and similar soils
Extent: About 2 percent of the map unit
Slope: 5 to 15 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Paige and similar soils
Extent: About 2 percent of the map unit
Slope: 15 to 30 percent
Landform: Moraines
Typical vegetation: Forest of red fir and white fir with some Jeffrey pine; creeping snowberry, wax currant, and Brewer's aster commonly occurring in the understory
Ecological site: F022AE008CA, Abies magnifica-Abies concolor/Symphoricarpos mollis-Ribes cereum/Eucephalus breweri-Thalictrum fendleri

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

7232—Waca very gravelly medial coarse sandy loam, 30 to 50 percent slopes

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, forestland, urban development, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,280 to 7,610 feet (1,915 to 2,320 meters)
Mean annual precipitation: 25 to 63 inches (640 to 1,600 millimeters)
Mean annual air temperature: 40 to 45 degrees F (4 to 7 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Waca—80 percent
Minor components—20 percent

Characteristics of Waca and similar soils

Slope: 30 to 50 percent
Aspect: West to southeast
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum derived from andesitic tuff

Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 0 to 10 percent by coarse gravel, 0 to 10 percent by subangular cobbles, and 0 to 10 percent by subangular stones
Depth to a restrictive feature (paralithic bedrock): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Moderately rapid above the bedrock
Available water capacity to a depth of 60 inches: About 3.4 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted

Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Typical profile
Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
A1—2 to 11 inches (5 to 28 centimeters); very gravelly medial coarse sandy loam
A2—11 to 16 inches (28 to 41 centimeters); very gravelly medial coarse sandy loam
A3—16 to 23 inches (41 to 58 centimeters); very gravelly medial coarse sandy loam
Bw—23 to 38 inches (58 to 97 centimeters); very gravelly medial coarse sandy loam
Cr—38 to 48 inches (97 to 122 centimeters); soft bedrock

Minor components

Ellispeak and similar soils
Extent: About 5 percent of the map unit
Slope: 30 to 50 percent
Landform: Glacial valley walls
Typical vegetation: Shrubland of huckleberry oak and greenleaf manzanita with scattered Jeffrey pine and white fir
Ecological site: R022AE217CA, Volcanic Slopes

Rock outcrop
Extent: About 5 percent of the map unit
Slope: 30 to 50 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Windy and similar soils
Extent: About 4 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory

Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Kneeridge, well drained, and similar soils
Extent: About 2 percent of the map unit
Slope: 5 to 15 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Paige and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 60 percent
Landform: Moraines
Typical vegetation: Forest of red fir and white fir with some Jeffrey pine; creeping snowberry, wax currant, and Brewer's aster commonly occurring in the understory
Ecological site: F022AE008CA, Abies magnifica-Abies concolor/Symphoricarpos mollis-Ribes cereum/Eucephalus breweri-Thalictrum fendleri

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Typic Epiaquents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Mountain slopes
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

7233—Waca very gravelly medial coarse sandy loam, 50 to 70 percent slopes

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, forestland, urban development, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,430 to 7,610 feet (1,960 to 2,320 meters)
Mean annual precipitation: 33 to 61 inches (840 to 1,550 millimeters)
Mean annual air temperature: 40 to 45 degrees F (4 to 7 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Waca—80 percent
Minor components—20 percent

Characteristics of Waca and similar soils

Slope: 50 to 70 percent
Aspect: West to east
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum derived from andesitic tuff
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 0 to 10 percent by subangular stones, 0 to 10 percent by subangular cobbles, and 0 to 10 percent by coarse gravel
Depth to a restrictive feature (paralithic bedrock): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Moderately rapid above the bedrock
Available water capacity to a depth of 60 inches: About 3.4 inches (low)

7241—Zephyrcove-Southcamp-Genoapeak complex, 9 to 30 percent slopes

Map unit setting

General location: The eastern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,315 to 7,575 feet (1,925 to 2,310 meters)
Mean annual precipitation: 23 to 29 inches (580 to 740 millimeters)
Mean annual air temperature: 40 to 45 degrees F (4 to 7 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Zephyrcove—50 percent
Southcamp—20 percent
Genoapeak—17 percent
Minor components—13 percent

Characteristics of Zephyrcove and similar soils

Slope: 9 to 30 percent
Aspect: Southeast to west
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum weathered from trachyte
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Percentage of the surface covered by rock fragments: 5 to 10 percent by boulders, 10 to 15 percent by stones, and 1 to 5 percent by cobbles
Depth to a restrictive feature (paralithic bedrock): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Slow above the bedrock
Available water capacity to a depth of 60 inches: About 6.1 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: C

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Typical profile
Oi—0 to 2 inches (0 to 6 centimeters); slightly decomposed plant material
Oe—2 to 4 inches (6 to 11 centimeters); moderately decomposed plant material
A—4 to 7 inches (11 to 18 centimeters); stony sandy loam
BA—7 to 16 inches (18 to 41 centimeters); stony sandy loam
Bt—16 to 35 inches (41 to 88 centimeters); gravelly sandy clay loam
Cr—35 to 44 inches (88 to 113 centimeters); soft bedrock

Characteristics of Southcamp and similar soils

Slope: 9 to 30 percent
Aspect: Southeast to west
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum weathered from volcanic rocks
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Percentage of the surface covered by rock fragments: 0 to 5 percent by cobbles
Restrictive feature: None noted
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 2.8 inches (low)
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None

Surface runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 4e-7
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Typical profile
Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
A—2 to 4 inches (5 to 10 centimeters); very gravelly fine sandy loam
E—4 to 15 inches (10 to 38 centimeters); extremely cobbly loam
Bt1—15 to 34 inches (38 to 87 centimeters); extremely cobbly clay loam
Bt2—34 to 53 inches (87 to 134 centimeters); extremely stony clay loam
Bt3—53 to 60 inches (134 to 152 centimeters); extremely stony clay loam

Characteristics of Genoapeak and similar soils

Slope: 9 to 30 percent
Aspect: Southeast to west
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum weathered from trachyte
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Percentage of the surface covered by rock fragments: 2 to 10 percent by cobbles and 50 to 85 percent by coarse gravel
Restrictive feature: None noted
Slowest permeability: Moderate
Available water capacity to a depth of 60 inches: About 1.8 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 7e
Ecological site: R022AE210CA, Shallow Sandy Slope

Typical profile
Oi—0 to 2 inches (0 to 4 centimeters); slightly decomposed plant material
A—2 to 4 inches (4 to 10 centimeters); very gravelly sandy loam
Bw—4 to 7 inches (10 to 19 centimeters); very gravelly coarse sandy loam
C1—7 to 16 inches (19 to 40 centimeters); cobbles
C2—16 to 60 inches (40 to 152 centimeters); cobbles

Minor components

Cagwin and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Hillslopes and mountain slopes

Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Cassenai gravelly loamy coarse sand and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Deerhill and similar soils
Extent: About 2 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

7242—Zephyrcove-Southcamp-Genoapeak complex, 30 to 70 percent slopes

Map unit setting

General location: The eastern part of the Tahoe Basin

Landform: Hillslopes and mountain slopes
Parent material: Colluvium over residuum weathered from trachyte
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Percentage of the surface covered by rock fragments: 50 to 85 percent by coarse gravel and 2 to 10 percent by cobbles
Restrictive feature: None noted
Slowest permeability: Moderate
Available water capacity to a depth of 60 inches: About 1.8 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: A

Interpretive groups

Land capability (nonirrigated): 7e
Ecological site: R022AE210CA, Shallow Sandy Slope

Typical profile

Oi—0 to 2 inches (0 to 4 centimeters); slightly decomposed plant material
A—2 to 4 inches (4 to 10 centimeters); very gravelly sandy loam
Bw—4 to 7 inches (10 to 19 centimeters); very gravelly coarse sandy loam
C1—7 to 16 inches (19 to 40 centimeters); cobbles
C2—16 to 60 inches (40 to 152 centimeters); cobbles

Minor components

Cagwin and similar soils

Extent: About 5 percent of the map unit
Slope: 30 to 50 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Cassenai gravelly loamy coarse sand and similar soils

Extent: About 5 percent of the map unit

Slope: 30 to 50 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Deerhill and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 50 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

7401—Burnlake-Roadcat association, 4 to 30 percent slopes

Map unit setting

Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountain valleys or canyons
Elevation: 7,000 to 7,995 feet (2,134 to 2,438 meters)
Mean annual precipitation: 30 to 45 inches (762 to 1,143 millimeters)
Mean annual air temperature: 39 to 45 degrees F (4 to 7 degrees C)
Frost-free period: 40 to 70 days

Map unit composition

Burnlake—60 percent
Roadcat—25 percent
Minor components—15 percent

Characteristics of Burnlake and similar soils

Slope: 8 to 30 percent
Aspect: None noted
Landform: Moraines
Parent material: Till derived from mixed rock sources
Typical vegetation: An overstory of Jeffrey pine with an understory of mountain big sagebrush, snowberry, currant, and perennial forbs
Percentage of the surface covered by rock fragments: 0 to 10 percent by cobbles, 0 to 10 percent by stones, 2 to 8 percent by boulders, and 35 to 55 percent by coarse gravel
Restrictive feature: None noted
Slowest permeability: Moderately rapid
Available water capacity to a depth of 60 inches: About 3.0 inches (low)

Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
- *Present annual flooding:* None
- *Present annual ponding:* None
- *Surface runoff class:* Low
- *Current water table:* None noted
- *Natural drainage class:* Well drained
- *Hydrologic soil group:* A

Interpretive groups
- *Land capability (nonirrigated):* 6s
- *Ecological site:* F022AY116NV, Pinus jeffreyi-Abies concolor var. lowiana/ Artemisia tridentata ssp. vaseyana/Achnatherum occidentale ssp. occidentale

Typical profile
- A1—0 to 2 inches (0 to 6 centimeters); extremely gravelly sandy loam
- A2—2 to 17 inches (6 to 43 centimeters); extremely gravelly sandy loam
- Bw—17 to 26 inches (43 to 66 centimeters); extremely gravelly coarse sandy loam
- C—26 to 60 inches (66 to 152 centimeters); extremely gravelly loamy sand

Characteristics of Roadcat and similar soils

Slope: 4 to 30 percent
Aspect: None noted
Landform: Moraines
Parent material: Till derived from mixed rock sources
Typical vegetation: An overstory of lodgepole pine with an understory of mountain big sagebrush
Percentage of the surface covered by rock fragments: 1 to 10 percent by stones, 0 to 10 percent by cobbles, 5 to 25 percent by coarse gravel, 10 to 30 percent by fine gravel, and 0 to 10 percent by boulders
Restrictive feature: None noted
Slowest permeability: Rapid
Available water capacity to a depth of 60 inches: About 2.7 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
- *Present annual flooding:* None
- *Present annual ponding:* None
- *Surface runoff class:* Low
- *Current water table:* None noted
- *Natural drainage class:* Somewhat excessively drained
- *Hydrologic soil group:* A

Interpretive groups
- *Land capability (nonirrigated):* 6s
- *Ecological site:* F022AY102NV, Pinus contorta/Artemisia tridentata ssp. vaseyana-Ribes/Carex-Achnatherum

Typical profile
- A—0 to 8 inches (0 to 20 centimeters); extremely gravelly loamy coarse sand
- Bw—8 to 19 inches (20 to 48 centimeters); extremely gravelly coarse sandy loam
- C1—19 to 36 inches (48 to 91 centimeters); extremely gravelly loamy coarse sand
- C2—36 to 60 inches (91 to 152 centimeters); extremely gravelly loamy coarse sand

Minor components

Hardtil and similar soils
Extent: About 4 percent of the map unit
Slope: 8 to 30 percent
Landform: Mountains
Typical vegetation: Lodgepole pine and mountain big sagebrush
Ecological site: F022AY102NV, Pinus contorta/Artemisia tridentata ssp. vaseyana-Ribes/Carex-Achnatherum

Aquic Haplocryolls and similar soils
Extent: About 2 percent of the map unit
Slope: 4 to 30 percent
Landform: Moraines
Typical vegetation: Quaking aspen, streambank wheatgrass, slender wheatgrass, Nevada bluegrass, Woods' rose, willow, carex, and perennial forbs
Ecological site: F022AY104NV, Populus tremuloides/Salix-Rosa woodsii/Poa-Elymus trachycaulus ssp. trachycaulus

Aspetill and similar soils
Extent: About 2 percent of the map unit
Slope: 8 to 30 percent
Landform: Moraines
Typical vegetation: Quaking aspen, mountain brome, slender wheatgrass, snowberry, and perennial forbs
Ecological site: F022AY103NV, Populus tremuloides/Symphoricarpos/Bromus marginatus-Elymus trachycaulus ssp. trachycaulus

Cumulic Cryaquolls and similar soils
Extent: About 2 percent of the map unit
Slope: 8 to 30 percent
Landform: Moraines
Typical vegetation: Creeping bentgrass, perennial forbs, bluegrass, Baltic rush, tufted hairgrass, carex, and perennial grasses
Ecological site: R022AY017NV, Semi-Wet Meadow

Stumpatil and similar soils
Extent: About 2 percent of the map unit
Slope: 8 to 30 percent
Landform: Moraines
Typical vegetation: California red fir, lodgepole pine, snowberry, wild mint, currant, mountain brome, lupine, western needlegrass, and mountain big sagebrush
Ecological site: F022AY118NV, Abies magnifica-Pinus contorta/Artemisia tridentata ssp. vaseyana/Bromus marginatus-Achnatherum occidentale ssp. occidentale

Typic Haploxerepts and similar soils
Extent: About 2 percent of the map unit
Slope: 4 to 30 percent
Landform: Moraines
Typical vegetation: Western needlegrass, carex, bluegrass, and mountain big sagebrush
Ecological site: R022AY013NV, Gravelly Outwash

Rock outcrop
Extent: About 1 percent of the map unit
Slope: 15 to 99 percent
Landform: Mountains

Typical vegetation: None assigned
Ecological site: None assigned

7411—Cagwin-Rock outcrop complex, 5 to 15 percent slopes, extremely stony

Map unit setting

General location: The eastern and southern parts of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 8,200 feet (1,900 to 2,500 meters)
Mean annual precipitation: 21 to 53 inches (530 to 1,350 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Cagwin—50 percent
Rock outcrop, granitic—20 percent
Minor components—30 percent

Characteristics of Cagwin and similar soils

Slope: 5 to 15 percent
Aspect: East to northwest
Landform: Hillslopes and mountain slopes
Parent material: Colluvium over grus derived from granodiorite
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Percentage of the surface covered by rock fragments: 1 to 25 percent by cobbles, 1 to 10 percent by boulders, 1 to 25 percent by coarse gravel, and 1 to 10 percent by stones
Depth to a restrictive feature (paralithic bedrock): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 2.1 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
- *Present annual flooding:* None
- *Present annual ponding:* None
- *Surface runoff class:* Low
- *Current water table:* None noted
- *Natural drainage class:* Somewhat excessively drained
- *Hydrologic soil group:* B

Interpretive groups
- *Land capability (nonirrigated):* 6s
- *Ecological site:* F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Typical profile
- Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
- A—1 to 9 inches (3 to 23 centimeters); gravelly loamy coarse sand

AC—9 to 13 inches (23 to 33 centimeters); gravelly loamy coarse sand
C—13 to 27 inches (33 to 69 centimeters); gravelly coarse sand
Cr—27 to 37 inches (69 to 94 centimeters); soft bedrock

Characteristics of Rock outcrop, granitic

Slope: 5 to 15 percent
Aspect: East to northwest
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties
Surface runoff class: Very high
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Minor components

Cassenai gravelly loamy coarse sand and similar soils
Extent: About 10 percent of the map unit
Slope: 5 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Toem and similar soils
Extent: About 10 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Ecological site: R022AE210CA, Shallow Sandy Slope

Dagget very gravelly loamy coarse sand and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Temo and similar soils
Extent: About 2 percent of the map unit
Slope: 5 to 15 percent
Landform: Mountain slopes
Typical vegetation: Red fir, lodgepole pine, and western white pine over low-growing sub-shrubs and grasses, such as sulphur-flowered buckwheat and needlegrasses

Ecological site: F022AY121NV, Pinus contorta-Abies magnifica/Artemisia tridentata ssp. tridentata/Achnatherum occidentale ssp. occidentale-Carex rossii

Witefels and similar soils
Extent: About 2 percent of the map unit
Slope: 5 to 15 percent
Landform: Mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Marla and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces and valley flats
Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

7412—Cagwin-Rock outcrop complex, 15 to 30 percent slopes, extremely stony

Map unit setting

Landscape: Mountains
Elevation: 6,230 to 7,920 feet (1,900 to 2,415 meters)
Mean annual precipitation: 21 to 43 inches (530 to 1,090 millimeters)
Mean annual air temperature: 42 to 46 degrees F (6 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Cassenai gravelly loamy coarse sand—78 percent
Minor components—22 percent

Characteristics of Cassenai gravelly loamy coarse sand and similar soils

Slope: 5 to 15 percent
Aspect: South to northwest
Landform: Hillslopes and mountain slopes
Parent material: Colluvium derived from granodiorite
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Percentage of the surface covered by rock fragments: 0 to 25 percent by coarse gravel, 0 to 5 percent by cobbles, 0 to 3 percent by stones, and 0 to 2 percent by boulders
Restrictive feature: None noted
Slowest permeability: Moderately rapid
Available water capacity to a depth of 60 inches: About 4.4 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: None noted
Natural drainage class: Somewhat excessively drained

Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6s
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Typical profile
Oi—0 to 1 inch (0 to 2 centimeters); slightly decomposed plant material
A—1 to 6 inches (2 to 16 centimeters); gravelly loamy coarse sand
Bw—6 to 43 inches (16 to 110 centimeters); gravelly loamy coarse sand
C—43 to 79 inches (110 to 200 centimeters); gravelly loamy coarse sand

Minor components

Cagwin and similar soils
Extent: About 12 percent of the map unit
Slope: 5 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Toem and similar soils
Extent: About 4 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Ecological site: R022AE210CA, Shallow Sandy Slope

Rock outcrop
Extent: About 3 percent of the map unit
Slope: 5 to 15 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Christopher gravelly loamy coarse sand and loamy coarse sand and similar soils
Extent: For each of the two components, about 1 percent of the map unit
Slope: 9 to 30 percent in areas of gravelly loamy coarse sand and 0 to 5 percent in areas of loamy coarse sand
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Marla and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces and valley flats
Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory

Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

7422—Cassenai gravelly loamy coarse sand, 15 to 30 percent slopes, very stony

Map unit setting

General location: The southern and eastern parts of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 7,985 feet (1,900 to 2,435 meters)
Mean annual precipitation: 21 to 49 inches (530 to 1,240 millimeters)
Mean annual air temperature: 42 to 46 degrees F (6 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Cassenai gravelly loamy coarse sand—73 percent
Minor components—27 percent

Characteristics of Cassenai gravelly loamy coarse sand and similar soils

Slope: 15 to 30 percent
Aspect: South to north
Landform: Hillslopes and mountain slopes
Parent material: Colluvium derived from granodiorite
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Percentage of the surface covered by rock fragments: 0 to 25 percent by coarse gravel, 0 to 5 percent by cobbles, 0 to 3 percent by stones, and 0 to 2 percent by boulders
Restrictive feature: None noted
Slowest permeability: Moderately rapid
Available water capacity to a depth of 60 inches: About 4.4 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
- *Present annual flooding:* None
- *Present annual ponding:* None
- *Surface runoff class:* Medium
- *Current water table:* None noted
- *Natural drainage class:* Somewhat excessively drained
- *Hydrologic soil group:* A

Interpretive groups
- *Land capability (nonirrigated):* 6e
- *Ecological site:* F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Typical profile
- Oi—0 to 1 inch (0 to 2 centimeters); slightly decomposed plant material
- A—1 to 6 inches (2 to 16 centimeters); gravelly loamy coarse sand
- Bw—6 to 43 inches (16 to 110 centimeters); gravelly loamy coarse sand
- C—43 to 79 inches (110 to 200 centimeters); gravelly loamy coarse sand

Minor components

Cagwin and similar soils
Extent: About 12 percent of the map unit
Slope: 15 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Dagget very gravelly loamy coarse sand and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Toem and similar soils
Extent: About 4 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Ecological site: R022AE210CA, Shallow Sandy Slope

Aquic Xerorthents and similar soils
Extent: About 2 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Christopher gravelly loamy coarse sand and similar soils
Extent: About 2 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Rock outcrop
Extent: About 2 percent of the map unit
Slope: 15 to 30 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

7423—Cassenai gravelly loamy coarse sand, 30 to 50 percent slopes, very stony

Map unit setting

General location: The southern and eastern parts of the Tahoe Basin

Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 8,115 feet (1,900 to 2,475 meters)
Mean annual precipitation: 19 to 47 inches (480 to 1,190 millimeters)
Mean annual air temperature: 42 to 46 degrees F (6 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Cassenai gravelly loamy coarse sand—78 percent
Minor components—22 percent

Characteristics of Cassenai gravelly loamy coarse sand and similar soils

Slope: 30 to 50 percent
Aspect: Southwest to north
Landform: Hillslopes and mountain slopes
Parent material: Colluvium derived from granodiorite
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Percentage of the surface covered by rock fragments: 0 to 2 percent by boulders, 0 to 3 percent by stones, 0 to 5 percent by cobbles, and 0 to 25 percent by coarse gravel

Aspect: Southwest to northeast
Landform: Hillslopes and mountain slopes
Parent material: Colluvium derived from granodiorite
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Percentage of the surface covered by rock fragments: 0 to 3 percent by stones, 0 to 10 percent by cobbles, 0 to 15 percent by coarse gravel, and 0 to 3 percent by boulders
Restrictive feature: None noted
Slowest permeability: Moderately rapid
Available water capacity to a depth of 60 inches: About 4.7 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 8
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Typical profile
Oi—0 to 3 inches (0 to 7 centimeters); slightly decomposed plant material
A—3 to 11 inches (7 to 27 centimeters); cobbly loamy coarse sand
Bw—11 to 20 inches (27 to 52 centimeters); cobbly loamy coarse sand
C—20 to 63 inches (52 to 160 centimeters); gravelly coarse sand

Minor components

Cagwin and similar soils
Extent: About 5 percent of the map unit
Slope: 50 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Meeks, extremely bouldery, and similar soils
Extent: About 5 percent of the map unit

Slope: 30 to 70 percent
Landform: Moraines
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Toem and similar soils
Extent: About 5 percent of the map unit
Slope: 50 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Ecological site: R022AE210CA, Shallow Sandy Slope

Rock outcrop
Extent: About 2 percent of the map unit
Slope: 50 to 70 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Tallac, very stony, and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 70 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

7431—Celio loamy coarse sand, 0 to 5 percent slopes

Map unit setting

General location: The southern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,215 to 6,475 feet (1,895 to 1,975 meters)
Mean annual precipitation: 25 to 47 inches (640 to 1,190 millimeters)
Mean annual air temperature: 41 to 45 degrees F (5 to 7 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Celio—80 percent
Minor components—20 percent

Characteristics of Celio and similar soils

Slope: 0 to 5 percent
Aspect: West to east
Landform: Outwash terraces
Parent material: Alluvium and/or outwash
Typical vegetation: Lodgepole pine and western juniper woodland with mixed grasses and forbs in the understory
Percentage of the surface covered by rock fragments: 5 to 20 percent by coarse, subrounded gravel
Depth to a restrictive feature (duripan): 39 to 59 inches (100 to 150 centimeters)
Available water capacity to a depth of 60 inches: About 1.7 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: Rare
Present annual ponding: Occasional
Surface runoff class: High
Current water table: Present
Natural drainage class: Somewhat poorly drained
Hydrologic soil group: A/D

Interpretive groups
Land capability (nonirrigated): 6s
Ecological site: F022AE005CA, Pinus contorta var. murrayana-Juniperus occidentalis/Ribes/Carex rossii

Typical profile
A1—0 to 8 inches (0 to 20 centimeters); loamy coarse sand
A2—8 to 16 inches (20 to 41 centimeters); gravelly loamy coarse sand
BA—16 to 23 inches (41 to 58 centimeters); gravelly loamy coarse sand
Bw—23 to 45 inches (58 to 114 centimeters); extremely gravelly coarse sand
2Bqm—45 to 56 inches (114 to 142 centimeters); strongly cemented material
2Bg—56 to 80 inches (142 to 203 centimeters); extremely gravelly coarse sand

Minor components

Meeks, stony, and similar soils
Extent: About 7 percent of the map unit
Slope: 0 to 5 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Tahoe, gravelly, and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 5 percent
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

Marla and similar soils
Extent: About 4 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces and valley flats

Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

Watah and similar soils
Extent: About 4 percent of the map unit
Slope: 0 to 2 percent
Landform: Fens, flood plains, and valley flats
Typical vegetation: Seasonally flooded basins dominated by sedges (*Carex utriculata* and/or *Carex vesicaria*); also, other grasses, rushes, and forbs with small patches of willow
Ecological site: R022AE209CA, Flooded Basins

7441—Christopher loamy coarse sand, 0 to 9 percent slopes

Map unit setting

General location: The southern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,245 to 6,610 feet (1,905 to 2,015 meters)
Mean annual precipitation: 23 to 33 inches (580 to 840 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Christopher loamy coarse sand—80 percent
Minor components—20 percent

Characteristics of Christopher loamy coarse sand and similar soils

Slope: 0 to 9 percent
Aspect: South to northwest
Landform: Hillslopes and outwash terraces
Parent material: Outwash derived from granodiorite
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Percentage of the surface covered by rock fragments: 0 to 2 percent by subrounded cobbles; 0 to 5 percent by coarse, subrounded gravel; 0 to 1 percent by subrounded boulders; and 0 to 2 percent by subrounded stones
Restrictive feature: None noted
Slowest permeability: Rapid
Available water capacity to a depth of 60 inches: About 6.6 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6s
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 8 inches (3 to 20 centimeters); loamy coarse sand
Bw1—8 to 26 inches (20 to 66 centimeters); loamy coarse sand
Bw2—26 to 42 inches (66 to 107 centimeters); loamy coarse sand
Bw3—42 to 61 inches (107 to 155 centimeters); loamy coarse sand

Minor components

Gefo gravelly loamy coarse sand and similar soils
Extent: About 10 percent of the map unit
Slope: 2 to 9 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Jabu and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 9 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Oneidas and similar soils
Extent: About 3 percent of the map unit
Slope: 0 to 5 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Lodgepole pine forest with grasses in the understory
Ecological site: F022AE009CA, Pinus contorta var. murrayana/Elymus elymoides

Marla and similar soils
Extent: About 2 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces and valley flats
Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

7442—Christopher loamy coarse sand, 9 to 30 percent slopes

Map unit setting

General location: The southern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains

Elevation: 6,230 to 6,545 feet (1,900 to 1,995 meters)
Mean annual precipitation: 23 to 31 inches (580 to 790 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Christopher loamy coarse sand—80 percent
Minor components—20 percent

Characteristics of Christopher loamy coarse sand and similar soils

Slope: 9 to 30 percent
Aspect: North
Landform: Hillslopes and outwash terraces
Parent material: Outwash derived from granodiorite
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Percentage of the surface covered by rock fragments: 0 to 1 percent by subrounded boulders, 0 to 2 percent by subrounded stones, 0 to 2 percent by subrounded cobbles, and 0 to 5 percent by coarse, subrounded gravel
Restrictive feature: None noted
Slowest permeability: Rapid
Available water capacity to a depth of 60 inches: About 6.6 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 8 inches (3 to 20 centimeters); loamy coarse sand
Bw1—8 to 26 inches (20 to 66 centimeters); loamy coarse sand
Bw2—26 to 42 inches (66 to 107 centimeters); loamy coarse sand
Bw3—42 to 61 inches (107 to 155 centimeters); loamy coarse sand

Minor components

Gefo gravelly loamy coarse sand and similar soils
Extent: About 10 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Jabu and similar soils
Extent: About 5 percent of the map unit

Slope: 9 to 30 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory

Minor components

Christopher loamy coarse sand and similar soils
Extent: About 10 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Jabu and similar soils
Extent: About 5 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Oneidas and similar soils
Extent: About 3 percent of the map unit
Slope: 5 to 15 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Lodgepole pine forest with grasses in the understory
Ecological site: F022AE009CA, Pinus contorta var. murrayana/Elymus elymoides

Marla and similar soils
Extent: About 2 percent of the map unit
Slope: 0 to 5 percent

Landform: Outwash terraces and valley flats
Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

7461—Jabu coarse sandy loam, 0 to 9 percent slopes

Map unit setting

General location: The southern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 6,805 feet (1,900 to 2,075 meters)
Mean annual precipitation: 23 to 35 inches (580 to 890 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Jabu—80 percent
Minor components—20 percent

Characteristics of Jabu and similar soils

Slope: 0 to 9 percent
Aspect: Southwest to east
Landform: Hillslopes and outwash terraces
Parent material: Outwash derived from granodiorite
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Percentage of the surface covered by rock fragments: 0 percent
Depth to restrictive features: Fragipan—39 to 79 inches (100 to 200 centimeters); densic bedrock—59 to 79 inches (150 to 200 centimeters)
Slowest permeability: Very slow
Available water capacity to a depth of 60 inches: About 5.4 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
- *Present annual flooding:* None
- *Present annual ponding:* None
- *Surface runoff class:* Low
- *Current water table:* Present
- *Natural drainage class:* Well drained
- *Hydrologic soil group:* A

Interpretive groups
- *Land capability (nonirrigated):* 4e-1
- *Ecological site:* F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Typical profile
- Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
- A—1 to 7 inches (3 to 18 centimeters); coarse sandy loam
- Bt1—7 to 21 inches (18 to 53 centimeters); coarse sandy loam
- Bt2—21 to 46 inches (53 to 117 centimeters); gravelly coarse sandy loam
- Bx—46 to 67 inches (117 to 170 centimeters); coarse sandy loam

C—67 to 73 inches (170 to 185 centimeters); stratified fine sandy loam to silty clay
Cd—73 to 101 inches (185 to 257 centimeters); coarse sandy loam

Minor components

Christopher loamy coarse sand and similar soils
Extent: About 10 percent of the map unit
Slope: 0 to 9 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Oneidas and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 5 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Lodgepole pine forest with grasses in the understory
Ecological site: F022AE009CA, Pinus contorta var. murrayana/Elymus elymoides

Gefo gravelly loamy coarse sand and similar soils
Extent: About 3 percent of the map unit
Slope: 2 to 9 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Marla and similar soils
Extent: About 2 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces and valley flats
Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

7462—Jabu coarse sandy loam, 9 to 30 percent slopes

Map unit setting

General location: The southern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 7,410 feet (1,900 to 2,260 meters)
Mean annual precipitation: 23 to 41 inches (580 to 1,040 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Jabu—80 percent
Minor components—20 percent

Characteristics of Jabu and similar soils

Slope: 9 to 30 percent
Aspect: Southwest to northeast
Landform: Hillslopes and outwash terraces
Parent material: Outwash derived from granodiorite
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Percentage of the surface covered by rock fragments: 0 percent
Depth to restrictive features: Fragipan—39 to 79 inches (100 to 200 centimeters); densic bedrock—59 to 79 inches (150 to 200 centimeters)
Slowest permeability: Very slow
Available water capacity to a depth of 60 inches: About 5.4 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: Present
Natural drainage class: Well drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 7 inches (3 to 18 centimeters); coarse sandy loam
Bt1—7 to 21 inches (18 to 53 centimeters); coarse sandy loam
Bt2—21 to 46 inches (53 to 117 centimeters); gravelly coarse sandy loam
Bx—46 to 67 inches (117 to 170 centimeters); coarse sandy loam
C—67 to 73 inches (170 to 185 centimeters); stratified fine sandy loam to silty clay
Cd—73 to 101 inches (185 to 257 centimeters); coarse sandy loam

Minor components

Christopher loamy coarse sand and similar soils
Extent: About 10 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory

Ecological site: F022AE009CA, Pinus contorta var. murrayana/Elymus elymoides

Gefo gravelly loamy coarse sand and similar soils
Extent: About 3 percent of the map unit

Slope: 9 to 30 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Marla and similar soils
Extent: About 2 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces and valley flats
Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

7471—Marla loamy coarse sand, 0 to 5 percent slopes

Map unit setting

General location: The southern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,215 to 6,495 feet (1,895 to 1,980 meters)
Mean annual precipitation: 23 to 49 inches (580 to 1,240 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 20 to 75 days

Map unit composition

Marla—80 percent
Minor components—20 percent

Characteristics of Marla and similar soils

Slope: 0 to 5 percent
Aspect: Southwest to northeast
Landform: Outwash terraces and valley flats
Parent material: Alluvium derived from granodiorite
Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 6.8 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: Rare
Present annual ponding: Frequent
Surface runoff class: Very high
Current water table: Present
Natural drainage class: Poorly drained
Hydrologic soil group: A/D

Interpretive groups
Land capability (nonirrigated): 6w
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

Typical profile
Oi—0 to 3 inches (0 to 8 centimeters); slightly decomposed plant material
A—3 to 14 inches (8 to 36 centimeters); loamy coarse sand
C—14 to 47 inches (36 to 119 centimeters); loamy coarse sand
2Cg1—47 to 59 inches (119 to 150 centimeters); clay loam
2Cg2—59 to 68 inches (150 to 173 centimeters); stratified sandy loam to fine sandy loam

Minor components

Christopher loamy coarse sand and similar soils
Extent: About 4 percent of the map unit
Slope: 0 to 5 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Gefo gravelly loamy coarse sand and similar soils
Extent: About 4 percent of the map unit
Slope: 0 to 5 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Tahoe silt loam and similar soils
Extent: About 4 percent of the map unit
Slope: 0 to 2 percent
Landform: Flood plains and valley flats
Typical vegetation: Moist meadows dominated by sedges, rushes, and grasses with a variety of forbs
Ecological site: R022AE208CA, Frigid Loamy Terrace

Ubaj and similar soils
Extent: About 4 percent of the map unit
Slope: 0 to 9 percent
Landform: Lake terraces and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Watah and similar soils
Extent: About 4 percent of the map unit
Slope: 0 to 2 percent
Landform: Fens, flood plains, and valley flats
Typical vegetation: Seasonally flooded basins dominated by sedges (*Carex utriculata* and/or *Carex vesicaria*); also, other grasses, rushes, and forbs with small patches of willow
Ecological site: R022AE209CA, Flooded Basins

7481—Meeks gravelly loamy coarse sand, 0 to 5 percent slopes, stony

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,315 to 6,395 feet (1,925 to 1,950 meters)
Mean annual precipitation: 31 to 39 inches (790 to 990 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Meeks, stony—85 percent
Minor components—15 percent

Characteristics of Meeks, stony, and similar soils

Slope: 0 to 5 percent
Aspect: Southwest to northwest
Landform: Moraines
Parent material: Outwash and/or till derived from granodiorite
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 0 to 1 percent by cobbles
Depth to a restrictive feature (duripan): 41 to 73 inches (104 to 185 centimeters)
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 2.9 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Negligible
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6s
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Typical profile
Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
A—2 to 13 inches (5 to 33 centimeters); gravelly loamy coarse sand
Bw—13 to 63 inches (33 to 160 centimeters); extremely stony loamy coarse sand
Bqm—63 to 73 inches (160 to 185 centimeters); gravelly loamy coarse sand

Minor components

Cassenai gravelly loamy coarse sand and similar soils
Extent: About 5 percent of the map unit
Slope: 5 to 15 percent

Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Celio and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces
Typical vegetation: Lodgepole pine and western juniper woodland with mixed grasses and forbs in the understory
Ecological site: F022AE005CA, Pinus contorta var. murrayana-Juniperus occidentalis/Ribes/Carex rossii

Gefo gravelly loamy coarse sand and similar soils
Extent: About 4 percent of the map unit
Slope: 0 to 5 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Tahoe, gravelly, and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 5 percent
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

7482—Meeks gravelly loamy coarse sand, 5 to 15 percent slopes, stony

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,295 to 6,560 feet (1,920 to 2,000 meters)
Mean annual precipitation: 27 to 43 inches (690 to 1,090 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Meeks, stony—80 percent
Minor components—20 percent

Characteristics of Meeks, stony, and similar soils

Slope: 5 to 15 percent
Aspect: Northwest to southeast

Landform: Moraines
Parent material: Outwash and/or till derived from granodiorite
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 0 to 1 percent by cobbles
Depth to a restrictive feature (duripan): 41 to 73 inches (104 to 185 centimeters)
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 2.9 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties

Bw—13 to 63 inches (33 to 160 centimeters); extremely stony loamy coarse sand
Bqm—63 to 73 inches (160 to 185 centimeters); gravelly loamy coarse sand

Minor components

Cassenai gravelly loamy coarse sand and similar soils
Extent: About 10 percent of the map unit
Slope: 5 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Oneidas and similar soils
Extent: About 7 percent of the map unit
Slope: 5 to 15 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Lodgepole pine forest with grasses in the understory
Ecological site: F022AE009CA, Pinus contorta var. murrayana/Elymus elymoides

Celio and similar soils
Extent: About 3 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces
Typical vegetation: Lodgepole pine and western juniper woodland with mixed grasses and forbs in the understory
Ecological site: F022AE005CA, Pinus contorta var. murrayana-Juniperus occidentalis/Ribes/Carex rossii

7483—Meeks gravelly loamy coarse sand, 0 to 5 percent slopes, very stony

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,315 to 6,625 feet (1,925 to 2,020 meters)
Mean annual precipitation: 29 to 49 inches (740 to 1,240 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Meeks, very stony—85 percent
Minor components—15 percent

Characteristics of Meeks, very stony, and similar soils

Slope: 2 to 5 percent
Aspect: West to east
Landform: Moraines
Parent material: Outwash and/or till derived from granodiorite
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 0 to 1 percent by boulders and 1 to 4 percent by stones
Depth to a restrictive feature (duripan): 41 to 73 inches (104 to 185 centimeters)
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 2.9 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Negligible
Current water table: None noted
Natural drainage class: Somewhat excessively drained

Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

7484—Meeks gravelly loamy coarse sand, 5 to 15 percent slopes, extremely bouldery

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,215 to 7,970 feet (1,895 to 2,430 meters)
Mean annual precipitation: 25 to 61 inches (640 to 1,550 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Meeks, extremely bouldery—80 percent
Minor components—20 percent

Characteristics of Meeks, extremely bouldery, and similar soils

Slope: 5 to 15 percent
Aspect: West to southeast
Landform: Moraines
Parent material: Till derived from granodiorite
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Percentage of the surface covered by rock fragments: 3 to 12 percent by stones and 2 to 12 percent by boulders
Depth to a restrictive feature (duripan): 41 to 73 inches (104 to 185 centimeters)
Slowest permeability: Slow

Available water capacity to a depth of 60 inches: About 2.9 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Very low
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6s
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Typical profile
Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
A—2 to 13 inches (5 to 33 centimeters); gravelly loamy coarse sand
Bw—13 to 63 inches (33 to 160 centimeters); extremely stony loamy coarse sand
Bqm—63 to 73 inches (160 to 185 centimeters); gravelly loamy coarse sand

Minor components

Burnlake and similar soils
Extent: About 5 percent of the map unit
Slope: 8 to 30 percent
Landform: Moraines
Typical vegetation: None assigned
Ecological site: F022AY116NV, Pinus jeffreyi-Abies concolor var. lowiana/Artemisia tridentata ssp. vaseyana/Achnatherum occidentale ssp. occidentale

Meeks, rubbly, and similar soils
Extent: About 5 percent of the map unit
Slope: 5 to 15 percent
Landform: Moraines
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Dagget, moist, and similar soils
Extent: About 3 percent of the map unit
Slope: 5 to 15 percent
Landform: Mountain slopes
Typical vegetation: Subalpine forest with lodgepole pine, mountain hemlock, and red fir; common shrubs—mountain heather and mountain spirea
Ecological site: F022AE014CA, Pinus contorta-Tsuga mertensiana/Phyllodoce breweri

Tallac, very stony, and similar soils
Extent: About 3 percent of the map unit
Slope: 5 to 15 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Roadcat and similar soils
Extent: About 2 percent of the map unit
Slope: 4 to 30 percent
Landform: Moraines
Typical vegetation: None assigned
Ecological site: F022AY102NV, Pinus contorta/Artemisia tridentata ssp. vaseyana-Ribes/Carex-Achnatherum

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Jabu and similar soils
Extent: About 1 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

7485—Meeks gravelly loamy coarse sand, 15 to 30 percent slopes, extremely bouldery

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,215 to 8,115 feet (1,895 to 2,475 meters)
Mean annual precipitation: 23 to 63 inches (580 to 1,600 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Meeks, extremely bouldery—80 percent
Minor components—20 percent

Characteristics of Meeks, extremely bouldery, and similar soils

Slope: 15 to 30 percent
Aspect: West to southeast
Landform: Moraines
Parent material: Till derived from granodiorite
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Percentage of the surface covered by rock fragments: 2 to 12 percent by boulders and 3 to 12 percent by stones
Depth to a restrictive feature (duripan): 41 to 73 inches (104 to 185 centimeters)
Slowest permeability: Slow

Available water capacity to a depth of 60 inches: About 2.9 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Typical profile
Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
A—2 to 13 inches (5 to 33 centimeters); gravelly loamy coarse sand
Bw—13 to 63 inches (33 to 160 centimeters); extremely stony loamy coarse sand
Bqm—63 to 73 inches (160 to 185 centimeters); gravelly loamy coarse sand

Minor components

Burnlake and similar soils
Extent: About 5 percent of the map unit
Slope: 8 to 30 percent
Landform: Moraines
Typical vegetation: None assigned
Ecological site: F022AY116NV, Pinus jeffreyi-Abies concolor var. lowiana/Artemisia tridentata ssp. vaseyana/Achnatherum occidentale ssp. occidentale

Meeks, rubbly, and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Moraines
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Dagget, moist, and similar soils
Extent: About 3 percent of the map unit
Slope: 15 to 30 percent
Landform: Mountain slopes
Typical vegetation: Subalpine forest with lodgepole pine, mountain hemlock, and red fir; common shrubs—mountain heather and mountain spirea
Ecological site: F022AE014CA, Pinus contorta-Tsuga mertensiana/Phyllodoce breweri

Tallac, very stony, and similar soils
Extent: About 3 percent of the map unit
Slope: 15 to 30 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Roadcat and similar soils
Extent: About 2 percent of the map unit
Slope: 4 to 30 percent
Landform: Moraines
Typical vegetation: None assigned
Ecological site: F022AY102NV, Pinus contorta/Artemisia tridentata ssp. vaseyana-Ribes/Carex-Achnatherum

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Jabu and similar soils
Extent: About 1 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

7486—Meeks gravelly loamy coarse sand, 30 to 70 percent slopes, extremely bouldery

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 8,200 feet (1,900 to 2,500 meters)
Mean annual precipitation: 27 to 59 inches (690 to 1,500 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Meeks, extremely bouldery—80 percent

Ecological site: R022AE210CA, Shallow Sandy Slope

7491—Oneidas coarse sandy loam, 0 to 5 percent slopes

Map unit setting

General location: The southern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development

MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,245 to 6,705 feet (1,905 to 2,045 meters)
Mean annual precipitation: 23 to 33 inches (580 to 840 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Oneidas—80 percent
Minor components—20 percent

Characteristics of Oneidas and similar soils

Slope: 0 to 5 percent
Aspect: Southwest to east
Landform: Hillslopes and outwash terraces
Parent material: Outwash and/or till derived from granodiorite
Typical vegetation: Lodgepole pine forest with grasses in the understory
Percentage of the surface covered by rock fragments: 0 to 5 percent by subrounded stones, 0 to 5 percent by subrounded cobbles, and 0 to 15 percent by coarse, subrounded gravel
Depth to a restrictive feature (fragipan): 10 to 20 inches (25 to 50 centimeters)
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 1.3 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Very high
Current water table: Present
Natural drainage class: Poorly drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE009CA, Pinus contorta var. murrayana/Elymus elymoides

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 9 inches (3 to 23 centimeters); coarse sandy loam
Bt—9 to 12 inches (23 to 30 centimeters); coarse sandy loam
Btx—12 to 65 inches (30 to 165 centimeters); coarse sandy loam
C—65 to 201 inches (165 to 511 centimeters); loamy coarse sand

Minor components

Jabu and similar soils
Extent: About 10 percent of the map unit
Slope: 0 to 9 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Christopher loamy coarse sand and similar soils
Extent: About 3 percent of the map unit

Slope: 0 to 5 percent
Landform: Hillslopes and outwash terraces

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE009CA, Pinus contorta var. murrayana/Elymus elymoides

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 9 inches (3 to 23 centimeters); coarse sandy loam
Bt—9 to 12 inches (23 to 30 centimeters); coarse sandy loam
Btx—12 to 65 inches (30 to 165 centimeters); coarse sandy loam
C—65 to 201 inches (165 to 511 centimeters); loamy coarse sand

Minor components

Jabu and similar soils
Extent: About 10 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Christopher loamy coarse sand and similar soils
Extent: About 3 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Meeks, stony, and similar soils
Extent: About 3 percent of the map unit
Slope: 5 to 15 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Gefo gravelly loamy coarse sand and similar soils
Extent: About 2 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Marla and similar soils
Extent: About 2 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces and valley flats
Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

7500—Rock outcrop, granitic

Map unit setting

General location: The eastern and southern parts of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,970 to 9,890 feet (2,125 to 3,015 meters)
Mean annual precipitation: 37 to 65 inches (940 to 1,650 millimeters)
Mean annual air temperature: 38 to 46 degrees F (4 to 8 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Rock outcrop, granitic—90 percent
Minor components—10 percent

Characteristics of Rock outcrop, granitic

Slope: 15 to 70 percent
Aspect: Northwest to east
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties
Surface runoff class: Very high
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Minor components

Rockbound very stony loam and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 70 percent

Landform: Glacial valley walls
Typical vegetation: Scattered Sierra juniper and Jeffrey pine trees with huckleberry oak and greenleaf manzanita in pockets and a high diversity of annuals and perennials
Ecological site: R022AE202CA, Granitic Pocket

Rubble land
Extent: About 2 percent of the map unit
Slope: 15 to 70 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Toem and similar soils
Extent: About 2 percent of the map unit
Slope: 50 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Ecological site: R022AE210CA, Shallow Sandy Slope

Windyridge and similar soils
Extent: About 2 percent of the map unit
Slope: 15 to 30 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: R022AY032NV, Alpine Ridge

Freelpeak and similar soils
Extent: About 1 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: R022AY032NV, Alpine Ridge

Jobsis and similar soils
Extent: About 1 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: F022AY134NV, Pinus albicaulis/Carex-Poa

7501—Rock outcrop-Rockbound complex, 5 to 30 percent slopes

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,345 to 9,280 feet (1,935 to 2,830 meters)
Mean annual precipitation: 37 to 65 inches (940 to 1,650 millimeters)
Mean annual air temperature: 40 to 45 degrees F (4 to 7 degrees C)
Frost-free period: 50 to 110 days

Map unit composition

Rock outcrop, granitic—50 percent
Rockbound very gravelly loam—30 percent
Minor components—20 percent

Characteristics of Rock outcrop, granitic

Slope: 0 to 30 percent
Aspect: West to southeast
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties
Surface runoff class: Very high
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Characteristics of Rockbound very gravelly loam and similar soils

Slope: 5 to 30 percent
Aspect: West to southeast
Landform: Glacial valley floors
Parent material: Colluvium derived from granodiorite
Typical vegetation: Scattered Sierra juniper and Jeffrey pine trees with huckleberry oak and greenleaf manzanita in pockets and a high diversity of annuals and perennials
Percentage of the surface covered by rock fragments: 5 to 30 percent by cobbles, 5 to 30 percent by stones, 5 to 25 percent by boulders, and 5 to 20 percent by coarse gravel
Depth to a restrictive feature (lithic bedrock): 7 to 20 inches (18 to 50 centimeters)
Slowest permeability: Moderately rapid above the bedrock
Available water capacity to a depth of 60 inches: About 1.1 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Very high
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 7s
Ecological site: R022AE202CA, Granitic Pocket

Typical profile
A—0 to 6 inches (0 to 15 centimeters); very gravelly loamy sand
Bw—6 to 8 inches (15 to 20 centimeters); very gravelly loamy sand
R—8 to 20 inches (20 to 50 centimeters); bedrock

Minor components

Dagget, moist, and similar soils
Extent: About 5 percent of the map unit
Slope: 5 to 15 percent
Landform: Mountain slopes
Typical vegetation: Subalpine forest with lodgepole pine, mountain hemlock, and red fir; common shrubs—mountain heather and mountain spirea
Ecological site: F022AE014CA, Pinus contorta-Tsuga mertensiana/Phyllodoce breweri

Meeks, rubbly, and similar soils
Extent: About 5 percent of the map unit
Slope: 5 to 15 percent
Landform: Moraines
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Temo and similar soils
Extent: About 5 percent of the map unit
Slope: 5 to 15 percent
Landform: Mountain slopes
Typical vegetation: California red fir and lodgepole pine forest with a few western white pine and Sierra juniper trees; a low understory cover of shrubs and grasses
Ecological site: F022AY121NV, Pinus contorta-Abies magnifica/Artemisia tridentata ssp. tridentata/Achnatherum occidentale ssp. occidentale-Carex rossii

Witefels and similar soils
Extent: About 5 percent of the map unit
Slope: 5 to 15 percent
Landform: Mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

7502—Rock outcrop-Rockbound complex, 30 to 70 percent slopes

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,265 to 9,280 feet (1910 to 2,830 meters)
Mean annual precipitation: 39 to 65 inches (990 to 1,650 millimeters)
Mean annual air temperature: 40 to 45 degrees F (4 to 7 degrees C)
Frost-free period: 50 to 110 days

Map unit composition

Rock outcrop, granitic—50 percent
Rockbound very stony loam—25 percent
Minor components—25 percent

Characteristics of Rock outcrop, granitic

Slope: 30 to 70 percent
Aspect: Northwest to southeast
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties
Surface runoff class: Very high
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Characteristics of Rockbound very stony loam and similar soils

Slope: 30 to 70 percent
Aspect: Northwest to southeast
Landform: Glacial valley walls
Parent material: Colluvium derived from granodiorite
Typical vegetation: Scattered Sierra juniper and Jeffrey pine trees with huckleberry oak and greenleaf manzanita in pockets and a high diversity of annuals and perennials
Percentage of the surface covered by rock fragments: 5 to 20 percent by coarse gravel, 5 to 25 percent by stones, 5 to 30 percent by cobbles, and 5 to 25 percent by boulders
Depth to a restrictive feature (lithic bedrock): 7 to 20 inches (18 to 50 centimeters)
Slowest permeability: Rapid above the bedrock
Available water capacity to a depth of 60 inches: About 0.4 inch (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Very high
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 8
Ecological site: R022AE202CA, Granitic Pocket

Typical profile
A—0 to 2 inches (0 to 5 centimeters); very gravelly coarse sand
Bw1—2 to 5 inches (5 to 13 centimeters); extremely cobbly coarse sand
Bw2—5 to 17 inches (13 to 43 centimeters); extremely cobbly coarse sand
R—17 to 27 inches (43 to 68 centimeters); bedrock

Minor components

Dagget, moist, and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Mountain slopes

Typical vegetation: Subalpine forest with lodgepole pine, mountain hemlock, and red fir; common shrubs—mountain heather and mountain spirea
Ecological site: F022AE014CA, Pinus contorta-Tsuga mertensiana/Phyllodoce breweri

Glenalpine and similar soils
Extent: About 5 percent of the map unit
Slope: 50 to 90 percent
Landform: Glacial valley walls and mountain slopes
Typical vegetation: Huckleberry oak shrubland with a few Jeffrey pine, Sierra juniper, and western white pine trees
Ecological site: R022AE213CA, Steep Talus Slope

Rubble land
Extent: About 5 percent of the map unit
Landform: Glacial valley walls and mountains
Typical vegetation: None assigned
Ecological site: None assigned

Temo and similar soils
Extent: About 5 percent of the map unit
Slope: 30 to 50 percent
Landform: Mountain slopes
Typical vegetation: California red fir and lodgepole pine forest with a few western white pine and Sierra juniper trees; a low understory cover of shrubs and grasses
Ecological site: F022AY121NV, Pinus contorta-Abies magnifica/Artemisia tridentata ssp. tridentata/Achnatherum occidentale ssp. occidentale-Carex rossii

Witefels and similar soils
Extent: About 5 percent of the map unit
Slope: 30 to 50 percent
Landform: Mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

7511—Shalgran-Rock outcrop complex, 30 to 75 percent slopes

Map unit setting

Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,995 to 8,995 feet (2,438 to 2,743 meters)
Mean annual precipitation: 35 to 55 inches (889 to 1,397 millimeters)
Mean annual air temperature: 36 to 39 degrees F (2 to 4 degrees C)
Frost-free period: 30 to 60 days

Map unit composition

Shalgran—70 percent
Rock outcrop—15 percent
Minor components—15 percent

Characteristics of Shalgran and similar soils

Slope: 30 to 75 percent
Aspect: None noted
Landform: Mountains
Parent material: Colluvium derived from granodiorite over residuum derived from granodiorite
Typical vegetation: An overstory of Jeffrey pine with an understory of pinemat manzanita, snowberry, Sierra chinkapin, snowbrush ceanothus, and perennial forbs
Percentage of the surface covered by rock fragments: 10 to 20 percent by boulders, 2 to 8 percent by stones, 5 to 15 percent by coarse gravel, and 10 to 20 percent by fine gravel
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches (25 to 51 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 0.8 inch (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 7s
Ecological site: F022AY120NV, Pinus jeffreyi/Arctostaphylos nevadensis/ Achnatherum lettermanii

Typical profile
A—0 to 3 inches (0 to 8 centimeters); very bouldery coarse sand
C—3 to 14 inches (8 to 36 centimeters); very bouldery coarse sand
Cr—14 inches (36 centimeters); bedrock

Characteristics of Rock outcrop

Slope: 15 to 99 percent
Aspect: None noted
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Minor components

Sofgran and similar soils
Extent: About 6 percent of the map unit
Slope: 30 to 50 percent

Landform: Mountains
Typical vegetation: California red fir, lodgepole pine, pinemat manzanita, bluegrass, Ross' sedge, and western needlegrass
Ecological site: F022AY106NV, Pinus contorta-Abies magnifica/Arctostaphylos nevadensis/Achnatherum occidentale ssp. occidentale-Carex rossii

Dystric Xerorthents and similar soils
Extent: About 3 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: Jeffrey pine, pinemat manzanita, snowbrush ceanothus, Sierra chinkapin, and snowberry
Ecological site: F022AY120NV, Pinus jeffreyi/Arctostaphylos nevadensis/Achnatherum lettermanii

Burnlake and similar soils
Extent: About 2 percent of the map unit
Slope: 15 to 50 percent
Landform: Moraines
Typical vegetation: None assigned
Ecological site: F022AY116NV, Pinus jeffreyi-Abies concolor var. lowiana/Artemisia tridentata ssp. vaseyana/Achnatherum occidentale ssp. occidentale

Jobsis and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: Whitebark pine
Ecological site: F022AY134NV, Pinus albicaulis/Carex-Poa

Temo and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: Lodgepole pine
Ecological site: F022AY121NV, Pinus contorta-Abies magnifica/Artemisia tridentata ssp. tridentata/Achnatherum occidentale ssp. occidentale-Carex rossii

7521—Tallac gravelly coarse sandy loam, 5 to 15 percent slopes, very stony

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 7985 feet (1,900 to 2435 meters)
Mean annual precipitation: 25 to 51 inches (640 to 1,300 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Tallac, very stony—75 percent
Minor components—25 percent

Characteristics of Tallac, very stony, and similar soils

Slope: 5 to 15 percent
Aspect: Southwest to southeast
Landform: Moraines
Parent material: Colluvium over till derived from mixed sources
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 1 to 5 percent by stones, 1 to 3 percent by cobbles
Depth to a restrictive feature (duripan): 39 to 71 inches (100 to 181 centimeters)
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 3.2 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: Present
Natural drainage class: Well drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 4e-7
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 22 inches (3 to 56 centimeters); gravelly coarse sandy loam
Bw1—22 to 32 inches (56 to 81 centimeters); extremely cobbly coarse sandy loam
Bw2—32 to 43 inches (81 to 109 centimeters); very gravelly coarse sandy loam
Bqm—43 to 66 inches (109 to 168 centimeters); gravelly coarse sandy loam

Minor components

Tallac, rubbly, and similar soils
Extent: About 10 percent of the map unit
Slope: 2 to 9 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Tallac, moderately well drained, and similar soils
Extent: About 9 percent of the map unit
Slope: 0 to 5 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Meeks, extremely bouldery, and similar soils
Extent: About 5 percent of the map unit

Slope: 5 to 15 percent
Landform: Moraines
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

7522—Tallac gravelly coarse sandy loam, 15 to 30 percent slopes, very stony

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,245 to 7,755 feet (1,905 to 2,365 meters)
Mean annual precipitation: 25 to 47 inches (640 to 1,190 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Tallac, very stony—85 percent
Minor components—15 percent

Characteristics of Tallac, very stony, and similar soils

Slope: 15 to 30 percent
Aspect: Southwest to southeast
Landform: Moraines
Parent material: Colluvium over till derived from mixed sources
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 1 to 3 percent by cobbles and 1 to 5 percent by stones
Depth to a restrictive feature (duripan): 39 to 71 inches (100 to 181 centimeters)
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 3.2 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: Present
Natural drainage class: Well drained
Hydrologic soil group: A

Interpretive groups

Land capability (nonirrigated): 6e

Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Typical profile

Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material

A—1 to 22 inches (3 to 56 centimeters); gravelly coarse sandy loam

Bw1—22 to 32 inches (56 to 81 centimeters); extremely cobbly coarse sandy loam

Bw2—32 to 43 inches (81 to 109 centimeters); very gravelly coarse sandy loam

Bqm—43 to 66 inches (109 to 168 centimeters); gravelly coarse sandy loam

Minor components

Meeks, extremely bouldery, and similar soils

Extent: About 10 percent of the map unit

Slope: 15 to 30 percent

Landform: Moraines

Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory

Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Aquic Xerorthents and similar soils

Extent: About 1 percent of the map unit

Slope: 0 to 15 percent

Landform: Drainageways

Typical vegetation: Aspen grove with a dense understory of grasses and forbs

Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Cagwin and similar soils

Extent: About 1 percent of the map unit

Slope: 15 to 30 percent

Landform: Hillslopes and mountain slopes

Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species

Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Cassenai gravelly loamy coarse sand and similar soils

Extent: About 1 percent of the map unit

Slope: 15 to 30 percent

Landform: Hillslopes and mountain slopes

Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings

Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Dagget, moist, and similar soils

Extent: About 1 percent of the map unit

Slope: 15 to 30 percent

Landform: Mountain slopes

Typical vegetation: Subalpine forest with lodgepole pine, mountain hemlock, and red fir; common shrubs—mountain heather and mountain spirea

Ecological site: F022AE014CA, Pinus contorta-Tsuga mertensiana/Phyllodoce breweri

Rockbound very gravelly loam and similar soils
Extent: About 1 percent of the map unit
Slope: 5 to 30 percent
Landform: Glacial valley floors
Typical vegetation: Scattered Sierra juniper and Jeffrey pine trees with huckleberry oak and greenleaf manzanita in pockets and a high diversity of annuals and perennials
Ecological site: R022AE202CA, Granitic Pocket

7523—Tallac gravelly coarse sandy loam, 30 to 70 percent slopes, very stony

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,315 to 7,740 feet (1,925 to 2,360 meters)
Mean annual precipitation: 25 to 49 inches (640 to 1,240 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Tallac, very stony—85 percent
Minor components—15 percent

Characteristics of Tallac, very stony, and similar soils

Slope: 30 to 70 percent
Aspect: Southwest to southeast
Landform: Moraines
Parent material: Colluvium over till derived from mixed sources
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 1 to 3 percent by cobbles and 1 to 5 percent by stones
Depth to a restrictive feature (duripan): 39 to 71 inches (100 to 181 centimeters)
Slowest permeability: Slow

Cagwin and similar soils

Extent: About 1 percent of the map unit
Slope: 50 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Cassenai gravelly loamy coarse sand and similar soils

Extent: About 1 percent of the map unit
Slope: 50 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Dagget, moist, and similar soils

Extent: About 1 percent of the map unit
Slope: 30 to 70 percent
Landform: Mountain slopes
Typical vegetation: Subalpine forest with lodgepole pine, mountain hemlock, and red fir; common shrubs—mountain heather and mountain spirea
Ecological site: F022AE014CA, Pinus contorta-Tsuga mertensiana/Phyllodoce breweri

Rockbound very stony loam and similar soils
Extent: About 1 percent of the map unit
Slope: 30 to 70 percent
Landform: Glacial valley walls
Typical vegetation: Scattered Sierra juniper and Jeffrey pine trees with huckleberry oak and greenleaf manzanita in pockets and a high diversity of annuals and perennials
Ecological site: R022AE202CA, Granitic Pocket

7524—Tallac gravelly coarse sandy loam, moderately well drained, 0 to 5 percent slopes

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,215 to 6,610 feet (1,895 to 2,015 meters)
Mean annual precipitation: 23 to 39 inches (580 to 990 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 30 to 90 days

Map unit composition

Tallac, moderately well drained—80 percent
Minor components—20 percent

Characteristics of Tallac, moderately well drained, and similar soils

Slope: 0 to 5 percent
Aspect: West to north
Landform: Moraines
Parent material: Colluvium over till derived from mixed sources
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 0 percent
Depth to a restrictive feature (duripan): 39 to 71 inches (100 to 181 centimeters)
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 3.2 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Very low
Current water table: Present
Natural drainage class: Moderately well drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material

A—1 to 22 inches (3 to 56 centimeters); gravelly coarse sandy loam
Bw1—22 to 32 inches (56 to 81 centimeters); extremely cobbly coarse sandy loam
Bw2—32 to 43 inches (81 to 109 centimeters); very gravelly coarse sandy loam
Bqm—43 to 66 inches (109 to 168 centimeters); gravelly coarse sandy loam

Minor components

Tallac, moderately well drained, and similar soils
Extent: About 10 percent of the map unit
Slope: 5 to 9 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Meeks, very stony, and similar soils
Extent: About 5 percent of the map unit
Slope: 2 to 5 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Callat and similar soils
Extent: About 4 percent of the map unit
Slope: 9 to 30 percent
Landform: Mountains
Typical vegetation: Open woodland of lodgepole pine and red fir; greenleaf fescue, squirreltail, and needlegrass covering the open areas
Ecological site: F022AE016CA, Pinus contorta-Abies magnifica/Festuca viridula-Elymus elymoides

Tahoe, gravelly, and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 5 percent
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

7525—Tallac gravelly coarse sandy loam, moderately well drained, 5 to 9 percent slopes

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,215 to 6,985 feet (1,895 to 2,130 meters)
Mean annual precipitation: 23 to 43 inches (580 to 1,090 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 30 to 90 days

Map unit composition

Tallac, moderately well drained—80 percent
Minor components—20 percent

Characteristics of Tallac, moderately well drained, and similar soils

Slope: 5 to 9 percent
Aspect: West to east
Landform: Moraines
Parent material: Colluvium over till derived from mixed sources
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 0 percent
Depth to a restrictive feature (duripan): 39 to 71 inches (100 to 181 centimeters)
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 3.2 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: Present
Natural drainage class: Moderately well drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 22 inches (3 to 56 centimeters); gravelly coarse sandy loam
Bw1—22 to 32 inches (56 to 81 centimeters); extremely cobbly coarse sandy loam
Bw2—32 to 43 inches (81 to 109 centimeters); very gravelly coarse sandy loam
Bqm—43 to 66 inches (109 to 168 centimeters); gravelly coarse sandy loam

Minor components

Tallac, moderately well drained, and similar soils
Extent: About 10 percent of the map unit
Slope: 0 to 5 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Meeks, extremely bouldery, and similar soils
Extent: About 5 percent of the map unit
Slope: 5 to 15 percent
Landform: Moraines
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory

Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Callat and similar soils
Extent: About 4 percent of the map unit
Slope: 9 to 30 percent
Landform: Mountains
Typical vegetation: Open woodland of lodgepole pine and red fir; greenleaf fescue, squirreltail, and needlegrass covering the open areas
Ecological site: F022AE016CA, Pinus contorta-Abies magnifica/Festuca viridula-Elymus elymoides

Tahoe, gravelly, and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 5 percent
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

7526—Tallac gravelly coarse sandy loam, moderately well drained, 2 to 9 percent slopes, rubbly

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 6,805 feet (1,900 to 2,075 meters)
Mean annual precipitation: 31 to 39 inches (790 to 990 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Tallac, rubbly—85 percent
Minor components—15 percent

Characteristics of Tallac, rubbly, and similar soils

Slope: 2 to 9 percent
Aspect: Northwest to east
Landform: Moraines
Parent material: Colluvium over till derived from mixed sources
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Percentage of the surface covered by rock fragments: 5 to 15 percent by cobbles and 5 to 15 percent by stones
Depth to a restrictive feature (duripan): 39 to 71 inches (100 to 181 centimeters)
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 3.2 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None

Surface runoff class: Low
Current water table: Present
Natural drainage class: Moderately well drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 4e-7
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 22 inches (3 to 56 centimeters); gravelly coarse sandy loam
Bw1—22 to 32 inches (56 to 81 centimeters); extremely cobbly coarse sandy loam
Bw2—32 to 43 inches (81 to 109 centimeters); very gravelly coarse sandy loam
Bqm—43 to 66 inches (109 to 168 centimeters); gravelly coarse sandy loam

Minor components

Tallac, moderately well drained, and similar soils
Extent: About 10 percent of the map unit
Slope: 5 to 9 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Tallac, very stony, and similar soils
Extent: About 4 percent of the map unit
Slope: 5 to 15 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Aquic Xerorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

7531—Toem-Rock outcrop complex, 9 to 30 percent slopes

Map unit setting

General location: The eastern and southern parts of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 8,265 feet (1,900 to 2,520 meters)
Mean annual precipitation: 25 to 43 inches (640 to 1,090 millimeters)

Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Toem—45 percent
Rock outcrop, granitic—40 percent
Minor components—15 percent

Characteristics of Toem and similar soils

Slope: 9 to 30 percent
Aspect: Northeast to west
Landform: Hillslopes and mountain slopes
Parent material: Colluvium and/or residuum weathered from granodiorite
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Percentage of the surface covered by rock fragments: 0 percent
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches (25 to 50 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 1.4 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 7e
Ecological site: R022AE210CA, Shallow Sandy Slope

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 10 inches (3 to 25 centimeters); gravelly coarse sand
C—10 to 18 inches (25 to 46 centimeters); gravelly coarse sand
Cr—18 to 32 inches (46 to 81 centimeters); soft bedrock

Characteristics of Rock outcrop, granitic

Slope: 9 to 30 percent
Aspect: Northeast to west
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties
Surface runoff class: Very high
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Minor components

Cagwin and similar soils
Extent: About 10 percent of the map unit
Slope: 15 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Cassenai gravelly loamy coarse sand and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

7532—Toem-Rock outcrop complex, 30 to 50 percent slopes

Map unit setting

General location: The eastern and southern parts of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,395 to 8,890 feet (1,950 to 2,710 meters)
Mean annual precipitation: 23 to 47 inches (580 to 1,190 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Toem—45 percent
Rock outcrop, granitic—40 percent
Minor components—15 percent

Characteristics of Toem and similar soils

Slope: 30 to 50 percent
Aspect: Northeast to west
Landform: Hillslopes and mountain slopes
Parent material: Colluvium and/or residuum weathered from granodiorite
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Percentage of the surface covered by rock fragments: 0 percent
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches (25 to 50 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 1.4 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None

Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 7e
Ecological site: R022AE210CA, Shallow Sandy Slope

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 10 inches (3 to 25 centimeters); gravelly coarse sand
C—10 to 18 inches (25 to 46 centimeters); gravelly coarse sand
Cr—18 to 32 inches (46 to 81 centimeters); soft bedrock

Characteristics of Rock outcrop, granitic

Slope: 30 to 50 percent
Aspect: Northeast to west
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties
Surface runoff class: Very high
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned

Minor components

Cagwin and similar soils
Extent: About 5 percent of the map unit
Slope: 30 to 50 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Cassenai gravelly loamy coarse sand and similar soils
Extent: About 5 percent of the map unit
Slope: 30 to 50 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Dagget very gravelly loamy coarse sand and similar soils
Extent: About 5 percent of the map unit
Slope: 30 to 50 percent
Landform: Mountain slopes

Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

7533—Toem-Rock outcrop complex, 50 to 70 percent slopes

Map unit setting

General location: The eastern and southern parts of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 8,675 feet (1,900 to 2,645 meters)
Mean annual precipitation: 29 to 57 inches (740 to 1,450 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Toem—45 percent
Rock outcrop, granitic—40 percent
Minor components—15 percent

Characteristics of Toem and similar soils

Slope: 50 to 70 percent
Aspect: South to west
Landform: Hillslopes and mountain slopes
Parent material: Colluvium and/or residuum weathered from granodiorite
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Percentage of the surface covered by rock fragments: 0 percent
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches (25 to 50 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 1.4 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 8
Ecological site: R022AE210CA, Shallow Sandy Slope

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 10 inches (3 to 25 centimeters); gravelly coarse sand
C—10 to 18 inches (25 to 46 centimeters); gravelly coarse sand
Cr—18 to 32 inches (46 to 81 centimeters); soft bedrock

Characteristics of Rock outcrop, granitic

Slope: 50 to 70 percent
Aspect: South to west
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties
Surface runoff class: Very high
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): 8
Ecological site: None assigned

Minor components

Cagwin and similar soils
Extent: About 10 percent of the map unit
Slope: 50 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Cassenai gravelly loamy coarse sand and similar soils
Extent: About 5 percent of the map unit
Slope: 50 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

7541—Ubaj sandy loam, 0 to 9 percent slopes

Map unit setting

General location: The southern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and urban development
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,230 to 6,525 feet (1,900 to 1,990 meters)
Mean annual precipitation: 23 to 39 inches (580 to 990 millimeters)
Mean annual air temperature: 41 to 46 degrees F (5 to 8 degrees C)
Frost-free period: 40 to 90 days

Map unit composition

Ubaj—80 percent
Minor components—20 percent

Characteristics of Ubaj and similar soils

Slope: 0 to 9 percent

Aspect: Southwest to east
Landform: Lake terraces and outwash terraces
Parent material: Alluvium and/or colluvium derived from granodiorite over lacustrine deposits
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted
Slowest permeability: Very slow
Available water capacity to a depth of 60 inches: About 8.4 inches (high)
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: Present
Natural drainage class: Moderately well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 4e-1
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Typical profile
Oi—0 inches (0 to 1 centimeter); slightly decomposed plant material
A—0 to 7 inches (1 to 19 centimeters); sandy loam
BA—7 to 17 inches (19 to 44 centimeters); sandy loam
Bt1—17 to 28 inches (44 to 70 centimeters); sandy clay loam
2Bt2—28 to 42 inches (70 to 107 centimeters); clay loam
2Bt3—42 to 49 inches (107 to 124 centimeters); clay
2Cg—49 to 120 inches (124 to 305 centimeters); clay

Minor components

Christopher loamy coarse sand and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 9 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Jabu and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 9 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Oneidas and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 5 percent
Landform: Hillslopes and outwash terraces

Typical vegetation: Lodgepole pine forest with grasses in the understory
Ecological site: F022AE009CA, Pinus contorta var. murrayana/Elymus elymoides

Gefo gravelly loamy coarse sand and similar soils
Extent: About 3 percent of the map unit
Slope: 2 to 9 percent
Landform: Hillslopes and outwash terraces
Typical vegetation: Jeffrey pine woodland with some white fir; greenleaf manzanita, mahala mat, and whitethorn ceanothus in the understory
Ecological site: F022AE006CA, Pinus jeffreyi-Abies concolor/Arctostaphylos patula-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides

Marla and similar soils
Extent: About 2 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces and valley flats
Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

9001—Bidart complex, 0 to 2 percent slopes

Map unit setting

General location: The southern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, recreation, and (historically) grazing
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,985 to 9,265 feet (2,130 to 2,825 meters)
Mean annual precipitation: 33 to 65 inches (840 to 1,650 millimeters)
Mean annual air temperature: 37 to 41 degrees F (3 to 5 degrees C)
Frost-free period: 20 to 60 days

Map unit composition

Bidart mucky silt loam—50 percent
Bidart, wet—30 percent
Minor components—20 percent

Characteristics of Bidart mucky silt loam and similar soils

Slope: 0 to 2 percent
Aspect: North
Landform: Flood plains and valley flats
Parent material: Alluvium derived from mixed sources
Typical vegetation: Upper elevation meadows dominated by graminoid species, primarily Nebraska sedge and tufted hairgrass, with a diversity of forbs
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted
Slowest permeability: Moderate
Available water capacity to a depth of 60 inches: About 9.0 inches (high)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: Occasional
Present annual ponding: Occasional
Surface runoff class: Negligible

Current water table: Present
Natural drainage class: Very poorly drained
Hydrologic soil group: A/D

Interpretive groups
Land capability (nonirrigated): 5w
Ecological site: R022AE221CA, Cold Semi-Wet Alluvial Flat

Typical profile
Oa—0 to 3 inches (0 to 7 centimeters); moderately decomposed plant material
A—3 to 9 inches (7 to 22 centimeters); mucky silt loam
Bg—9 to 16 inches (22 to 40 centimeters); silt loam
C—16 to 17 inches (40 to 43 centimeters); extremely gravelly coarse sand
2Bg1—17 to 39 inches (43 to 100 centimeters); very fine sandy loam
2Bg2—39 to 59 inches (100 to 150 centimeters); sandy loam

Characteristics of Bidart, wet, and similar soils

Slope: 0 to 2 percent
Aspect: North
Landform: Flood plains and valley flats
Parent material: Alluvium derived from mixed sources
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted
Slowest permeability: Moderate
Available water capacity to a depth of 60 inches: About 9.0 inches (high)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: Frequent
Present annual ponding: Frequent
Surface runoff class: Negligible
Current water table: Present
Natural drainage class: Very poorly drained
Hydrologic soil group: A/D

Interpretive groups
Land capability (nonirrigated): 5w
Ecological site: R022AE207CA, Cold Wet Alluvial Flat

Typical profile
Oa—0 to 3 inches (0 to 7 centimeters); moderately decomposed plant material
A—3 to 9 inches (7 to 22 centimeters); mucky silt loam
Bg—9 to 16 inches (22 to 40 centimeters); silt loam
C—16 to 17 inches (40 to 43 centimeters); extremely gravelly coarse sand
2Bg1—17 to 39 inches (43 to 100 centimeters); very fine sandy loam
2Bg2—39 to 59 inches (100 to 150 centimeters); sandy loam

Minor components

Tahoe, gravelly, and similar soils and Tahoe silt loam and similar soils
Extent: For each of the two components, about 5 percent of the map unit
Slope: 0 to 5 percent in areas of Tahoe, gravelly, and 0 to 2 percent in areas of Tahoe silt loam
Landform: Flood plains and valley flats
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Ecological site: R022AE214CA, Gravelly Flats

Watah and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 2 percent
Landform: Fens, flood plains, and valley flats
Typical vegetation: Seasonally flooded basins dominated by sedges (*Carex utriculata* and/or *Carex vesicaria*); also, other grasses, rushes, and forbs with small patches of willow
Ecological site: R022AE209CA, Flooded Basins

Water
Extent: About 3 percent of the map unit
Typical vegetation: None assigned
Ecological site: None assigned

Hellhole and similar soils
Extent: About 2 percent of the map unit
Slope: 0 to 2 percent
Landform: Fens
Typical vegetation: Sphagnum bogs dominated by a mat of floating Sphagnum moss; mountain blueberry, bog laurel, sedges, and a variety of alpine forbs growing on the mat
Ecological site: R022AE204CA, Sphagnum Fen

9011—Oxyaquic Cryorthents-Aquic Xerorthents-Tahoe complex, 0 to 15 percent slopes

Map unit setting

General location: Scattered areas throughout the Tahoe Basin, most prevalent in the eastern part
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,215 to 8,790 feet (1,895 to 2,680 meters)
Mean annual precipitation: 23 to 61 inches (580 to 1,550 millimeters)
Mean annual air temperature: 39 to 46 degrees F (4 to 8 degrees C)
Frost-free period: 20 to 75 days

Map unit composition

Oxyaquic Cryorthents—30 percent
Aquic Xerorthents—28 percent
Tahoe, gravelly—15 percent
Minor components—27 percent

Characteristics of Oxyaquic Cryorthents and similar soils

Slope: 0 to 15 percent
Aspect: Southwest to northeast
Landform: Drainageways
Parent material: Alluvium and/or colluvium derived from mixed sources
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted
Slowest permeability: Moderate
Available water capacity to a depth of 60 inches: About 2.5 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: Frequent
Present annual ponding: None
Surface runoff class: High
Current water table: Present
Natural drainage class: Somewhat poorly drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6w
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Typical profile
Oe—0 inches (0 to 1 centimeter); moderately decomposed plant material
A1—0 to 2 inches (1 to 5 centimeters); gravelly loamy coarse sand
A2—2 to 5 inches (5 to 13 centimeters); gravelly loamy coarse sand
Bw—5 to 9 inches (13 to 23 centimeters); gravelly loamy coarse sand
C1—9 to 20 inches (23 to 50 centimeters); gravelly loamy coarse sand
C2—20 to 32 inches (50 to 81 centimeters); very gravelly loamy coarse sand
C3—32 to 52 inches (81 to 132 centimeters); very gravelly coarse sand
C4—52 to 80 inches (132 to 203 centimeters); coarse sand
C5—80 to 112 inches (203 to 284 centimeters); coarse sand

Characteristics of Aquic Xerorthents and similar soils

Slope: 0 to 15 percent
Aspect: Southwest to northeast
Landform: Drainageways
Parent material: Alluvium and/or colluvium derived from mixed sources
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted
Slowest permeability: Moderate
Available water capacity to a depth of 60 inches: About 6.5 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: Frequent
Present annual ponding: None
Surface runoff class: High
Current water table: Present
Natural drainage class: Poorly drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6w
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Typical profile
Oe—0 inches (0 to 1 centimeter); moderately decomposed plant material
Oa—0 to 1 inch (1 to 3 centimeters); highly decomposed plant material
A1—1 to 4 inches (3 to 10 centimeters); sandy loam
A2—4 to 9 inches (10 to 23 centimeters); sandy loam
C1—9 to 14 inches (23 to 36 centimeters); coarse sandy loam
C2—14 to 29 inches (36 to 74 centimeters); sandy loam
C3—29 to 41 inches (74 to 104 centimeters); gravelly sandy loam

C4—41 to 45 inches (104 to 114 centimeters); loamy coarse sand
C5—45 to 59 inches (114 to 150 centimeters); sandy loam

Characteristics of Tahoe, gravelly, and similar soils

Slope: 0 to 5 percent
Aspect: Southwest to northeast
Landform: Flood plains and valley flats
Parent material: Alluvium derived from granitic and volcanic rocks
Typical vegetation: Patches of Lemmon's willow intermixed with scattered forbs and grasses
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted
Slowest permeability: Moderate
Available water capacity to a depth of 60 inches: About 5.5 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: Occasional
Present annual ponding: Occasional
Surface runoff class: Very high
Current water table: Present
Natural drainage class: Poorly drained
Hydrologic soil group: A/D

Interpretive groups
Land capability (nonirrigated): 6w
Ecological site: R022AE214CA, Gravelly Flats

Typical profile
A1—0 to 10 inches (0 to 25 centimeters); mucky gravelly silt loam
A2—10 to 27 inches (25 to 68 centimeters); gravelly loam
Cg1—27 to 32 inches (68 to 82 centimeters); gravelly loamy fine sand
Cg2—32 to 46 inches (82 to 117 centimeters); gravelly fine sand

Minor components

Bidart mucky silt loam and similar soils
Extent: About 10 percent of the map unit
Slope: 0 to 2 percent
Landform: Flood plains and valley flats
Typical vegetation: Upper elevation meadows dominated by graminoid species, primarily Nebraska sedge and tufted hairgrass, with a diversity of forbs
Ecological site: R022AE221CA, Cold Semi-Wet Alluvial Flat

Watah and similar soils
Extent: About 10 percent of the map unit
Slope: 0 to 2 percent
Landform: Fens, flood plains, and valley flats
Typical vegetation: Seasonally flooded basins dominated by sedges (*Carex utriculata* and/or *Carex vesicaria*); also, other grasses, rushes, and forbs with small patches of willow
Ecological site: R022AE209CA, Flooded Basins

Marla and similar soils
Extent: About 5 percent of the map unit
Slope: 0 to 5 percent
Landform: Outwash terraces and valley flats

Typical vegetation: Lodgepole pine forest with a few white fir and Jeffrey pine trees in moist areas surrounding meadows; willows, grasses, and forbs included in the understory
Ecological site: F022AE002CA, Pinus contorta var. murrayana/Salix lemmonii

Riverwash
Extent: About 2 percent of the map unit
Typical vegetation: None assigned
Ecological site: None assigned

9101—Callat very gravelly coarse sandy loam, 9 to 30 percent slopes, very stony

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,380 to 9,545 feet (1,945 to 2,910 meters)
Mean annual precipitation: 37 to 61 inches (940 to 1,550 millimeters)
Mean annual air temperature: 38 to 42 degrees F (4 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Callat—82 percent
Minor components—18 percent

Characteristics of Callat and similar soils

Slope: 9 to 30 percent
Aspect: North
Landform: Mountains
Parent material: Colluvium over till derived from volcanic rocks
Typical vegetation: Open woodland of lodgepole pine and red fir; greenleaf fescue, squirreltail, and needlegrass covering the open areas
Percentage of the surface covered by rock fragments: 0 to 3 percent by stones, 0 to 25 percent by cobbles, and 0 to 3 percent by boulders
Depth to a restrictive feature (dense material): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Impermeable
Available water capacity to a depth of 60 inches: About 1.9 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 7e
Ecological site: F022AE016CA, Pinus contorta-Abies magnifica/Festuca viridula-Elymus elymoides

Typical profile
Oi—0 inches (0 to 1 centimeter); slightly decomposed plant material
A—0 to 9 inches (1 to 24 centimeters); very gravelly coarse sandy loam
AC—9 to 15 inches (24 to 37 centimeters); very stony coarse sandy loam
C—15 to 24 inches (37 to 62 centimeters); very stony coarse sandy loam
Cd—24 to 41 inches (62 to 103 centimeters); extremely stony coarse sandy loam

Minor components

Glenalpine and similar soils
Extent: About 5 percent of the map unit
Slope: 50 to 90 percent
Landform: Glacial valley walls and mountain slopes
Typical vegetation: Huckleberry oak shrubland with a few Jeffrey pine, Sierra juniper, and western white pine trees
Ecological site: R022AE213CA, Steep Talus Slope

Meeks, extremely bouldery, and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Moraines
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Tallac, very stony, and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Rock outcrop
Extent: About 2 percent of the map unit
Slope: 9 to 30 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Oxyaquic Cryorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

9102—Callat very gravelly coarse sandy loam, 30 to 50 percent slopes, very stony

Map unit setting

General location: The southwestern part of the Tahoe Basin

Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 6,445 to 9,330 feet (1,965 to 2,845 meters)
Mean annual precipitation: 37 to 61 inches (940 to 1,550 millimeters)
Mean annual air temperature: 38 to 42 degrees F (4 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Callat—82 percent
Minor components—18 percent

Characteristics of Callat and similar soils

Slope: 30 to 50 percent
Aspect: North
Landform: Mountains
Parent material: Colluvium over till derived from volcanic rocks
Typical vegetation: Open woodland of lodgepole pine and red fir; greenleaf fescue, squirreltail, and needlegrass covering the open areas
Percentage of the surface covered by rock fragments: 0 to 2 percent by boulders, 0 to 2 percent by stones, and 0 to 15 percent by cobbles
Depth to a restrictive feature (dense material): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Impermeable
Available water capacity to a depth of 60 inches: About 1.9 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 7e
Ecological site: F022AE016CA, Pinus contorta-Abies magnifica/Festuca viridula-Elymus elymoides

Typical profile
Oi—0 inches (0 to 1 centimeter); slightly decomposed plant material
A—0 to 9 inches (1 to 24 centimeters); very gravelly coarse sandy loam
AC—9 to 15 inches (24 to 37 centimeters); very stony coarse sandy loam
C—15 to 24 inches (37 to 62 centimeters); very stony coarse sandy loam
Cd—24 to 41 inches (62 to 103 centimeters); extremely stony coarse sandy loam

Minor components

Glenalpine and similar soils
Extent: About 5 percent of the map unit
Slope: 50 to 90 percent
Landform: Glacial valley walls and mountain slopes
Typical vegetation: Huckleberry oak shrubland with a few Jeffrey pine, Sierra juniper, and western white pine trees
Ecological site: R022AE213CA, Steep Talus Slope

Meeks, extremely bouldery, and similar soils
Extent: About 5 percent of the map unit
Slope: 30 to 70 percent
Landform: Moraines
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Tallac, very stony, and similar soils
Extent: About 5 percent of the map unit
Slope: 30 to 70 percent
Landform: Moraines
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Rock outcrop
Extent: About 2 percent of the map unit
Slope: 30 to 50 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Oxyaquic Cryorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

9111—Florand-Lostridge-Fishsnooze association, 15 to 50 percent slopes

Map unit setting

Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,995 to 8,995 feet (2,438 to 2,743 meters)
Mean annual precipitation: 35 to 55 inches (889 to 1,397 millimeters)
Mean annual air temperature: 36 to 39 degrees F (2 to 4 degrees C)
Frost-free period: 30 to 60 days

Map unit composition

Florand—40 percent
Lostridge—30 percent
Fishsnooze—15 percent
Minor components—15 percent

Characteristics of Florand and similar soils

Slope: 15 to 50 percent

Aspect: None noted
Landform: Mountains
Parent material: Colluvium derived from andesite or tuff breccia over residuum derived from andesite or tuff breccia
Typical vegetation: An overstory of California red fir and lodgepole pine and an understory of western needlegrass, snowberry, wild mint, currant, lupine, mountain brome, and mountain big sagebrush
Percentage of the surface covered by rock fragments: 0 to 2 percent by stones and 25 to 45 percent by coarse gravel
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches (102 to 152 centimeters)
Slowest permeability: Slow above the bedrock
Available water capacity to a depth of 60 inches: About 5.2 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6s
Ecological site: F022AY118NV, Abies magnifica-Pinus contorta/Artemisia tridentata ssp. vaseyana/Bromus marginatus-Achnatherum occidentale ssp. occidentale

Typical profile
A1—0 to 1 inch (0 to 3 centimeters); very gravelly peaty sandy loam
A2—1 to 4 inches (3 to 10 centimeters); very gravelly sandy loam
A3—4 to 12 inches (10 to 30 centimeters); gravelly sandy loam
A4—12 to 18 inches (30 to 46 centimeters); gravelly sandy loam
Bw1—18 to 28 inches (46 to 71 centimeters); very gravelly sandy loam
Bw2—28 to 38 inches (71 to 97 centimeters); very gravelly sandy loam
2Bw3—38 to 47 inches (97 to 119 centimeters); gravelly sandy loam
2Cr—47 inches (119 centimeters); bedrock

Characteristics of Lostridge and similar soils

Slope: 15 to 50 percent
Aspect: None noted
Landform: Mountains
Parent material: Colluvium derived from andesite or tuff breccia over residuum derived from andesite or tuff breccia
Typical vegetation: An overstory of California red fir and lodgepole pine and an understory of snowberry, mountain big sagebrush, currant, mountain brome, western needlegrass, Letterman needlegrass, Ross' sedge, and currant
Percentage of the surface covered by rock fragments: 25 to 45 percent by coarse gravel
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches (50 to 102 centimeters)
Slowest permeability: Slow above the bedrock
Available water capacity to a depth of 60 inches: About 3.2 inches (low)

Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 6s
Ecological site: F022AY105NV, Pinus contorta-Abies magnifica/Artemisia tridentata ssp. vaseyana/Bromus marginatus-Achnatherum occidentale ssp. californicum

Typical profile
A1—0 to 3 inches (0 to 8 centimeters); very gravelly coarse sandy loam
A2—3 to 11 inches (8 to 28 centimeters); very gravelly coarse sandy loam
Bw—11 to 23 inches (28 to 58 centimeters); very gravelly coarse sandy loam
C—23 to 29 inches (58 to 74 centimeters); very gravelly coarse sandy loam
Cr—29 inches (74 centimeters); bedrock

Characteristics of Fishsnooze and similar soils

Slope: 15 to 50 percent
Aspect: None noted
Landform: Mountains
Parent material: Colluvium derived from andesite or tuff breccia over residuum derived from andesite or tuff breccia
Typical vegetation: Mountain hemlock
Percentage of the surface covered by rock fragments: 2 to 8 percent by cobbles and 25 to 45 percent by coarse gravel
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches (50 to 102 centimeters)
Slowest permeability: Moderately rapid above the bedrock
Available water capacity to a depth of 60 inches: About 2.8 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Very high
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 6s
Ecological site: F022AY114NV, Tsuga mertensiana/Carex-Poa

Typical profile
A1—0 to 1 inch (0 to 3 centimeters); very gravelly peaty coarse sandy loam
A2—1 to 9 inches (3 to 23 centimeters); very gravelly coarse sandy loam
A3—9 to 13 inches (23 to 33 centimeters); extremely gravelly coarse sandy loam
Bw—13 to 35 inches (33 to 89 centimeters); extremely cobbly coarse sandy loam
R—35 inches (89 centimeters); bedrock

Minor components

Aquic Haplocryolls and similar soils
Extent: About 3 percent of the map unit
Slope: 4 to 15 percent
Landform: Moraines
Typical vegetation: Quaking aspen, willow, Woods' rose, carex, Nevada bluegrass, slender wheatgrass, and streambank wheatgrass
Ecological site: F022AY104NV, Populus tremuloides/Salix-Rosa woodsii/Poa-Elymus trachycaulus ssp. trachycaulus

Lithnip, moist, and similar soils
Extent: About 3 percent of the map unit
Slope: 8 to 30 percent
Landform: Mountains
Typical vegetation: Needlegrass and bluegrass
Ecological site: R022AY032NV, Alpine Ridge

Stumpatil and similar soils
Extent: About 3 percent of the map unit
Slope: 8 to 30 percent
Landform: Moraines
Typical vegetation: California red fir, lodgepole pine, mountain big sagebrush, snowberry, currant, lupine, mountain brome, and western needlegrass
Ecological site: F022AY118NV, Abies magnifica-Pinus contorta/Artemisia tridentata ssp. vaseyana/Bromus marginatus-Achnatherum occidentale ssp. occidentale

Lithnip and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: Eriogonum, mulesears wyethia, goldenweed, wild mint, lupine, Indian ricegrass, western needlegrass, and bluegrass
Ecological site: R022AY012NV, Barren Slope 20+ p.z.

Morscour and similar soils
Extent: About 2 percent of the map unit
Slope: 8 to 30 percent
Landform: Mountains
Typical vegetation: Western needlegrass, mountain brome, mountain big sagebrush, antelope bitterbrush, and snowberry
Ecological site: R022AY038NV, Shallow Loam 30+ p.z.

Typic Cryaquolls and similar soils
Extent: About 2 percent of the map unit
Slope: 4 to 30 percent
Landform: Flood plains
Typical vegetation: Willow, perennial forbs, bluegrass, slender wheatgrass, and carex
Ecological site: R022AY034NV, Moist Willow

9121—Watsonlake gravelly sandy loam, 5 to 15 percent slopes, rubbly

Map unit setting

General location: The northern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation

MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Landscape setting: Colluvial mountain slopes
Elevation: 7,495 to 8,415 feet (2,285 to 2,565 meters)
Mean annual precipitation: 37 to 43 inches (940 to 1,090 millimeters)
Mean annual air temperature: 38 to 42 degrees F (4 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Watsonlake—80 percent
Minor components—20 percent

Characteristics of Watsonlake and similar soils

Slope: 5 to 15 percent
Aspect: Northwest to southeast
Landform: Mountain slopes
Parent material: Colluvium derived from andesite
Typical vegetation: Red fir and white fir forest with an understory of greenleaf manzanita and whitethorn ceanothus
Percentage of the surface covered by rock fragments: 0 to 35 percent by coarse, angular gravel; 0 to 15 percent by angular boulders; 15 to 35 percent by angular stones; and 0 to 40 percent by angular cobbles
Depth to a restrictive feature (lithic bedrock): 59 to 79 inches (150 to 200 centimeters)
Slowest permeability: Slow above the bedrock
Available water capacity to a depth of 60 inches: About 6.9 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE024CA, Abies magnifica-Abies concolor/Ceanothus cordulatus-Arctostaphylos patula

Typical profile
Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
A1—2 to 8 inches (5 to 20 centimeters); gravelly sandy loam
A2—8 to 18 inches (20 to 46 centimeters); gravelly sandy loam
BA—18 to 27 inches (46 to 69 centimeters); very gravelly sandy clay loam
Bt1—27 to 35 inches (69 to 89 centimeters); very cobbly sandy clay loam
Bt2—35 to 52 inches (89 to 132 centimeters); very cobbly sandy clay loam
Bt3—52 to 67 inches (132 to 170 centimeters); stony loam
R—67 to 77 inches (170 to 195 centimeters); bedrock

Minor components

Jorge very cobbly fine sandy loam and similar soils
Extent: About 5 percent of the map unit
Slope: 5 to 15 percent
Landform: Hillslopes and mountain slopes

Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Sky and similar soils
Extent: About 5 percent of the map unit
Slope: 9 to 30 percent
Landform: Mountain slopes
Typical vegetation: Subalpine mixed conifer forest with mountain hemlock, lodgepole pine, and red fir as the codominant species; a sparse understory that includes Brewer's aster, Ross' sedge, and several lupine species
Ecological site: F022AE019CA, Tsuga mertensiana-Abies magnifica/Eucephalus breweri

Tahoma and similar soils
Extent: About 5 percent of the map unit
Slope: 2 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Waca and similar soils
Extent: About 2 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Ellispeak and similar soils
Extent: About 1 percent of the map unit
Slope: 9 to 30 percent
Landform: Glacial valley walls
Typical vegetation: Shrubland of huckleberry oak and greenleaf manzanita with scattered Jeffrey pine and white fir
Ecological site: R022AE217CA, Volcanic Slopes

Oxyaquic Cryorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Rock outcrop
Extent: About 1 percent of the map unit
Slope: 5 to 15 percent
Landform: Mountains
Typical vegetation: None assigned

Ecological site: None assigned

9122—Watsonlake gravelly sandy loam, 15 to 30 percent slopes, rubbly

Map unit setting

General location: The northern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Landscape setting: Colluvial mountain slopes
Elevation: 7,295 to 8,560 feet (2,225 to 2,610 meters)
Mean annual precipitation: 35 to 43 inches (890 to 1,090 millimeters)
Mean annual air temperature: 38 to 42 degrees F (4 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Watsonlake—80 percent
Minor components—20 percent

Characteristics of Watsonlake and similar soils

Slope: 15 to 30 percent
Aspect: North
Landform: Mountain slopes
Parent material: Colluvium derived from andesite
Typical vegetation: Red fir and white fir forest with an understory of greenleaf manzanita and whitethorn ceanothus
Percentage of the surface covered by rock fragments: 15 to 35 percent by angular stones, 0 to 40 percent by angular cobbles, 0 to 15 percent by angular boulders, and 0 to 35 percent by coarse, angular gravel
Depth to a restrictive feature (lithic bedrock): 59 to 79 inches (150 to 200 centimeters)
Slowest permeability: Slow above the bedrock
Available water capacity to a depth of 60 inches: About 6.9 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
- *Present annual flooding:* None
- *Present annual ponding:* None
- *Surface runoff class:* Medium
- *Current water table:* None noted
- *Natural drainage class:* Well drained
- *Hydrologic soil group:* B

Interpretive groups
- *Land capability (nonirrigated):* 6e
- *Ecological site:* F022AE024CA, Abies magnifica-Abies concolor/Ceanothus cordulatus-Arctostaphylos patula

Typical profile
- Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
- A1—2 to 8 inches (5 to 20 centimeters); gravelly sandy loam
- A2—8 to 18 inches (20 to 46 centimeters); gravelly sandy loam
- BA—18 to 27 inches (46 to 69 centimeters); very gravelly sandy clay loam
- Bt1—27 to 35 inches (69 to 89 centimeters); very cobbly sandy clay loam

Bt2—35 to 52 inches (89 to 132 centimeters); very cobbly sandy clay loam
Bt3—52 to 67 inches (132 to 170 centimeters); stony loam
R—67 to 77 inches (170 to 195 centimeters); bedrock

Minor components

Jorge very cobbly fine sandy loam and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Tahoma and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory
Ecological site: F022AE013CA, Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta

Waca and similar soils
Extent: About 5 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir and Jeffrey pine forest with scattered whitethorn ceanothus and creeping snowberry in the understory
Ecological site: F022AE007CA, Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides

Sky and similar soils
Extent: About 2 percent of the map unit
Slope: 9 to 30 percent
Landform: Mountain slopes
Typical vegetation: Subalpine mixed conifer forest with mountain hemlock, lodgepole pine, and red fir as the codominant species; a sparse understory that includes Brewer's aster, Ross' sedge, and several lupine species
Ecological site: F022AE019CA, Tsuga mertensiana-Abies magnifica/Eucephalus breweri

Ellispeak and similar soils
Extent: About 1 percent of the map unit
Slope: 9 to 30 percent
Landform: Glacial valley walls
Typical vegetation: Shrubland of huckleberry oak and greenleaf manzanita with scattered Jeffrey pine and white fir
Ecological site: R022AE217CA, Volcanic Slopes

Oxyaquic Cryorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent

Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Rock outcrop
Extent: About 1 percent of the map unit
Slope: 5 to 15 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

9123—Watsonlake gravelly sandy loam, 30 to 50 percent slopes, rubbly

Map unit setting

General location: The northern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Landscape setting: Colluvial mountain slopes
Elevation: 7,315 to 9,035 feet (2,230 to 2,755 meters)
Mean annual precipitation: 35 to 57 inches (890 to 1,450 millimeters)
Mean annual air temperature: 38 to 42 degrees F (4 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Watsonlake—80 percent
Minor components—20 percent

Characteristics of Watsonlake and similar soils

Slope: 30 to 50 percent
Aspect: Northwest to southwest
Landform: Mountain slopes
Parent material: Colluvium derived from andesite
Typical vegetation: Red fir and white fir forest with an understory of greenleaf manzanita and whitethorn ceanothus
Percentage of the surface covered by rock fragments: 0 to 35 percent by coarse, angular gravel; 0 to 15 percent by angular boulders; 15 to 35 percent by angular stones; and 0 to 40 percent by angular cobbles
Depth to a restrictive feature (lithic bedrock): 59 to 79 inches (150 to 200 centimeters)
Slowest permeability: Slow above the bedrock
Available water capacity to a depth of 60 inches: About 6.9 inches (moderate)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 7e

Ecological site: F022AE024CA, Abies magnifica-Abies concolor/Ceanothus cordulatus-Arctostaphylos patula

Typical profile

Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material
A1—2 to 8 inches (5 to 20 centimeters); gravelly sandy loam
A2—8 to 18 inches (20 to 46 centimeters); gravelly sandy loam
BA—18 to 27 inches (46 to 69 centimeters); very gravelly sandy clay loam
Bt1—27 to 35 inches (69 to 89 centimeters); very cobbly sandy clay loam
Bt2—35 to 52 inches (89 to 132 centimeters); very cobbly sandy clay loam
Bt3—52 to 67 inches (132 to 170 centimeters); stony loam
R—67 to 77 inches (170 to 195 centimeters); bedrock

Minor components

Jorge very cobbly fine sandy loam and similar soils

Extent: About 5 percent of the map unit
Slope: 30 to 50 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: White fir, Jeffrey pine, sugar pine, and incense cedar occurring as components of a mixed conifer forest; huckleberry oak, greenleaf manzanita, western serviceberry, and creeping snowberry commonly occurring in the understory

Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Rock outcrop
Extent: About 1 percent of the map unit
Slope: 5 to 15 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

9131—Lithnip-Meiss-Hawkinspeak association, 30 to 75 percent slopes

Map unit setting

Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,995 to 9,995 feet (2,438 to 3,048 meters)
Mean annual precipitation: 40 to 50 inches (1,016 to 1,270 millimeters)
Mean annual air temperature: 36 to 39 degrees F (2 to 4 degrees C)
Frost-free period: 30 to 60 days

Map unit composition

Lithnip—40 percent
Meiss—30 percent
Hawkinspeak—15 percent
Minor components—15 percent

Characteristics of Lithnip and similar soils

Slope: 30 to 75 percent
Aspect: None noted
Landform: Mountains
Parent material: Colluvium derived from andesite or tuff breccia over residuum derived from andesite or tuff breccia
Typical vegetation: Eriogonum, bluegrass, mulesears wyethia, goldenweed, wild mint, lupine, western needlegrass, and Indian ricegrass
Percentage of the surface covered by rock fragments: 0 to 2 percent by stones and 50 to 70 percent by coarse gravel
Depth to a restrictive feature (lithic bedrock): 4 to 10 inches (10 to 25 centimeters)
Slowest permeability: Moderately rapid above the bedrock
Available water capacity to a depth of 60 inches: About 0.3 inch (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Very high
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 7s
Ecological site: R022AY012NV, Barren Slope 20+ p.z.

Typical profile
A—0 to 2 inches (0 to 5 centimeters); extremely gravelly sandy loam
C—2 to 5 inches (5 to 13 centimeters); very gravelly sandy loam
R—5 inches (13 centimeters); bedrock

Characteristics of Meiss and similar soils

Slope: 15 to 50 percent
Aspect: None noted
Landform: Mountains
Parent material: Colluvium over residuum weathered from andesite and andesitic lahar
Typical vegetation: Low sagebrush with a diversity of low-growing shrubs, forbs, and grasses
Percentage of the surface covered by rock fragments: 5 to 20 percent by cobbles and 10 to 30 percent by coarse gravel
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches (25 to 50 centimeters)
Slowest permeability: Moderately rapid above the bedrock
Available water capacity to a depth of 60 inches: About 1.7 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Very high
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 7e
Ecological site: R022AE211CA, Shallow Andesite Ridge

Typical profile
A1—0 to 6 inches (0 to 15 centimeters); gravelly ashy loam
A2—6 to 13 inches (15 to 33 centimeters); gravelly ashy loam
R—13 inches (33 centimeters); bedrock

Characteristics of Hawkinspeak and similar soils

Slope: 30 to 50 percent
Aspect: None noted
Landform: Mountains
Parent material: Colluvium derived from andesite or tuff breccia over residuum derived from andesite or tuff breccia
Typical vegetation: Antelope bitterbrush, mountain big sagebrush, western needlegrass, and mountain brome

Percentage of the surface covered by rock fragments: 35 to 55 percent by coarse gravel, 0 to 10 percent by cobbles, 2 to 4 percent by stones, and 0 to 2 percent by boulders
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches (50 to 102 centimeters)
Slowest permeability: Moderate above the bedrock
Available water capacity to a depth of 60 inches: About 3.2 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Very high
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 6s
Ecological site: R022AY021NV, South Slope 30+ p.z.

Typical profile
A1—0 to 3 inches (0 to 8 centimeters); very gravelly sandy loam
A2—3 to 9 inches (8 to 23 centimeters); very gravelly sandy loam
Bt—9 to 33 inches (23 to 84 centimeters); very gravelly sandy clay loam
R—33 inches (84 centimeters); bedrock

Minor components

Lostridge and similar soils
Extent: About 4 percent of the map unit
Slope: 15 to 50 percent
Landform: Mountains
Typical vegetation: California red fir, lodgepole pine, mountain big sagebrush, snowberry, currant, mountain brome, Ross' sedge, western needlegrass, and Letterman needlegrass
Ecological site: F022AY105NV, Pinus contorta-Abies magnifica/Artemisia tridentata ssp. vaseyana/Bromus marginatus-Achnatherum occidentale ssp. californicum

Fishsnooze and similar soils
Extent: About 3 percent of the map unit
Slope: 30 to 50 percent
Landform: Mountains
Typical vegetation: Limber pine, whitebark pine, Ross' sedge, bluegrass, and rockcress
Ecological site: F022AY134NV, Pinus albicaulis/Carex-Poa

Rock outcrop
Extent: About 3 percent of the map unit
Slope: 15 to 99 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Hawkinspeak, moist, and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 50 percent
Landform: Mountains

Typical vegetation: Mountain brome, mountain big sagebrush, melic, and western needlegrass
Ecological site: R022AY031NV, Loamy Slope 30+ p.z.

Aspocket and similar soils
Extent: About 1 percent of the map unit
Slope: 4 to 30 percent
Landform: Mountains
Typical vegetation: Quaking aspen, mountain brome, slender wheatgrass, and snowberry
Ecological site: F022AY103NV, Populus tremuloides/Symphoricarpos/Bromus marginatus-Elymus trachycaulus ssp. trachycaulus

Hawkridge and similar soils
Extent: About 1 percent of the map unit
Slope: 8 to 30 percent
Landform: Mountains
Typical vegetation: Prairie junegrass, pine needlegrass, goldenweed, and low sagebrush
Ecological site: R022AY011NV, Mountain Ridge 30+ p.z.

Typic Cryaquolls and similar soils
Extent: About 1 percent of the map unit
Slope: 4 to 15 percent
Landform: Flood plains
Typical vegetation: Willow, bluegrass, slender wheatgrass, and carex
Ecological site: R022AY034NV, Moist Willow

9141—Melody-Rock outcrop complex, 9 to 30 percent slopes

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,200 to 8,825 feet (2,195 to 2690 meters)
Mean annual precipitation: 39 to 63 inches (990 to 1,600 millimeters)
Mean annual air temperature: 38 to 42 degrees F (4 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Melody—55 percent
Rock outcrop, volcanic—25 percent
Minor components—20 percent

Characteristics of Melody and similar soils

Slope: 9 to 30 percent
Aspect: North to south
Landform: Mountain slopes
Parent material: Colluvium derived from volcanic rocks
Typical vegetation: Shrubland dominated by mountain big sagebrush, antelope bitterbrush, and woolly mule-ears; also, a variety of forbs and a few red fir trees

Percentage of the surface covered by rock fragments: 10 to 25 percent by subangular cobbles, 10 to 35 percent by subangular stones, 1 to 15 percent by subangular boulders, and 20 to 50 percent by coarse, subangular gravel
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches (25 to 50 centimeters)
Slowest permeability: Moderate above the bedrock
Available water capacity to a depth of 60 inches: About 1.2 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Very high
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 7e
Ecological site: R022AE219CA, Cryic Volcanic Slope

Typical profile
Oi—0 to 1 inch (0 to 2 centimeters); slightly decomposed plant material
A—1 to 2 inches (2 to 5 centimeters); very cobbly ashy sandy loam
AC—2 to 9 inches (5 to 23 centimeters); very cobbly ashy sandy loam
C—9 to 15 inches (23 to 38 centimeters); very cobbly ashy sandy loam
R—15 to 25 inches (38 to 63 centimeters); bedrock

Characteristics of Rock outcrop, volcanic

Slope: 9 to 30 percent
Aspect: North to south
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties
Surface runoff class: Very high
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Minor components

Sky and similar soils
Extent: About 10 percent of the map unit
Slope: 9 to 30 percent
Landform: Mountain slopes
Typical vegetation: Subalpine mixed conifer forest with mountain hemlock, lodgepole pine, and red fir as the codominant species; a sparse understory that includes Brewer's aster, Ross' sedge, and several lupine species
Ecological site: F022AE019CA, Tsuga mertensiana-Abies magnifica/Eucephalus breweri

Mountrose and similar soils
Extent: About 5 percent of the map unit

Slope: 30 to 70 percent
Landform: Mountain slopes
Typical vegetation: A sparse cover of woolly mule-ears, coyote mint, and lupine and less than 25 percent cover of red fir, western white pine, Jeffrey pine, and whitebark pine
Ecological site: R022AE215CA, Deep Cryic Volcanic Slope

Wardcreek and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 70 percent
Landform: Mountain slopes
Typical vegetation: Shrubland dominated by mountain big sagebrush, antelope bitterbrush, and woolly mule-ears; also, a variety of forbs and a few red fir trees
Ecological site: R022AE219CA, Cryic Volcanic Slope

Lithnip and similar soils
Extent: About 1 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: R022AY012NV, Barren Slope 20+ p.z.

Meiss and similar soils
Extent: About 1 percent of the map unit
Slope: 15 to 50 percent
Landform: Mountains
Typical vegetation: Low sagebrush with a diversity of low-growing shrubs, forbs, and grasses
Ecological site: R022AE211CA, Shallow Andesite Ridge

Oxyaquic Cryorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

9142—Melody-Rock outcrop complex, 30 to 50 percent slopes

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,135 to 9,070 feet (2,175 to 2,765 meters)
Mean annual precipitation: 41 to 67 inches (1,040 to 1,700 millimeters)
Mean annual air temperature: 38 to 42 degrees F (4 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Melody—55 percent
Rock outcrop, volcanic—25 percent
Minor components—20 percent

Characteristics of Melody and similar soils

Slope: 30 to 50 percent
Aspect: North to south
Landform: Mountain slopes
Parent material: Colluvium derived from volcanic rocks
Typical vegetation: Shrubland dominated by mountain big sagebrush, antelope bitterbrush, and woolly mule-ears; also, a variety of forbs and a few red fir trees
Percentage of the surface covered by rock fragments: 10 to 35 percent by subangular stones, 10 to 25 percent by subangular cobbles, 1 to 15 percent by subangular boulders, and 20 to 50 percent by coarse, subangular gravel
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches (25 to 50 centimeters)
Slowest permeability: Moderate above the bedrock

Slope: 50 to 70 percent
Landform: Mountain slopes
Typical vegetation: Subalpine mixed conifer forest with mountain hemlock, lodgepole pine, and red fir as the codominant species; a sparse understory that includes Brewer's aster, Ross' sedge, and several lupine species
Ecological site: F022AE019CA, Tsuga mertensiana-Abies magnifica/Eucephalus breweri

Mountrose and similar soils
Extent: About 5 percent of the map unit
Slope: 30 to 70 percent
Landform: Mountain slopes
Typical vegetation: A sparse cover of woolly mule-ears, coyote mint, and lupine and less than 25 percent cover of red fir, western white pine, Jeffrey pine, and whitebark pine
Ecological site: R022AE215CA, Deep Cryic Volcanic Slope

Wardcreek and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 70 percent
Landform: Mountain slopes
Typical vegetation: Shrubland dominated by mountain big sagebrush, antelope bitterbrush, and woolly mule-ears; also, a variety of forbs and a few red fir trees
Ecological site: R022AE219CA, Cryic Volcanic Slope

Lithnip and similar soils
Extent: About 1 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: R022AY012NV, Barren Slope 20+ p.z.

Meiss and similar soils
Extent: About 1 percent of the map unit
Slope: 15 to 50 percent
Landform: Mountains
Typical vegetation: Low sagebrush with a diversity of low-growing shrubs, forbs, and grasses
Ecological site: R022AE211CA, Shallow Andesite Ridge

Oxyaquic Cryorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

9151—Shakespeare silt loam, 9 to 30 percent slopes

Map unit setting

General location: The eastern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,675 to 8,825 feet (2,340 to 2,690 meters)
Mean annual precipitation: 31 to 37 inches (790 to 940 millimeters)
Mean annual air temperature: 38 to 42 degrees F (4 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Shakespeare—80 percent
Minor components—20 percent

Characteristics of Shakespeare and similar soils

Slope: 9 to 30 percent
Aspect: South to northwest
Landform: Mountain slopes
Parent material: Colluvium over residuum weathered from metamorphic rocks
Typical vegetation: Open woodland of red fir and Jeffrey pine with a dense cover of roundleaf snowberry, wax currant, mountain monardella, and silvery lupine
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: None noted
Slowest permeability: Very slow
Available water capacity to a depth of 60 inches: About 7.4 inches (moderate)
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties
- *Present annual flooding:* None
- *Present annual ponding:* None
- *Surface runoff class:* High
- *Current water table:* Present
- *Natural drainage class:* Well drained
- *Hydrologic soil group:* C

Interpretive groups
- *Land capability (nonirrigated):* 6e
- *Ecological site:* F022AE011CA, Abies magnifica-Pinus jeffreyi/Symphoricarpos rotundifolius-Ribes cereum/Lupinus argenteus

Typical profile
- Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
- A1—1 to 2 inches (3 to 5 centimeters); silt loam
- A2—2 to 5 inches (5 to 13 centimeters); very gravelly loam
- Bt—5 to 34 inches (13 to 86 centimeters); very gravelly clay loam
- 2C—34 to 61 inches (86 to 155 centimeters); silty clay loam

Minor components

Deerhill and similar soils
Extent: About 5 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes

Typical vegetation: Jeffrey pine and white fir forest with scattered greenleaf manzanita and mountain whitethorn in the canopy openings
Ecological site: F022AE023CA, Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides

Mountrose and similar soils
Extent: About 4 percent of the map unit
Slope: 30 to 70 percent
Landform: Mountain slopes
Typical vegetation: A sparse cover of woolly mule-ears, coyote mint, and lupine and less than 25 percent cover of red fir, western white pine, Jeffrey pine, and whitebark pine
Ecological site: R022AE215CA, Deep Cryic Volcanic Slope

Melody and similar soils
Extent: About 3 percent of the map unit
Slope: 30 to 70 percent
Landform: Mountain slopes
Typical vegetation: Shrubland dominated by mountain big sagebrush, antelope bitterbrush, and woolly mule-ears; also, a variety of forbs and a few red fir trees
Ecological site: R022AE219CA, Cryic Volcanic Slope

Wardcreek and similar soils
Extent: About 3 percent of the map unit
Slope: 30 to 70 percent
Landform: Mountain slopes
Typical vegetation: Shrubland dominated by mountain big sagebrush, antelope bitterbrush, and woolly mule-ears; also, a variety of forbs and a few red fir trees
Ecological site: R022AE219CA, Cryic Volcanic Slope

Dagget very gravelly loamy coarse sand and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 50 percent
Landform: Mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Oxyaquic Cryorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Temo and similar soils
Extent: About 1 percent of the map unit
Slope: 15 to 30 percent
Landform: Mountain slopes
Typical vegetation: Red fir, lodgepole pine, and western white pine over low-growing sub-shrubs and grasses, such as sulphur-flowered buckwheat and needlegrasses
Ecological site: F022AY121NV, Pinus contorta-Abies magnifica/Artemisia tridentata ssp. tridentata/Achnatherum occidentale ssp. occidentale-Carex rossii

Witefels and similar soils
Extent: About 1 percent of the map unit

Slope: 15 to 30 percent
Landform: Mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

9152—Shakespeare silt loam, 30 to 50 percent slopes, very stony

Map unit setting

General location: The eastern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,805 to 8,690 feet (2,380 to 2,650 meters)
Mean annual precipitation: 31 to 33 inches (790 to 840 millimeters)
Mean annual air temperature: 38 to 42 degrees F (4 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Shakespeare—80 percent
Minor components—20 percent

Characteristics of Shakespeare and similar soils

Slope: 30 to 50 percent

9161—Sky gravelly sandy loam, 9 to 30 percent slopes

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,115 to 8,840 feet (2,170 to 2,695 meters)
Mean annual precipitation: 35 to 65 inches (890 to 1,650 millimeters)
Mean annual air temperature: 38 to 42 degrees F (4 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Sky—80 percent
Minor components—20 percent

Characteristics of Sky and similar soils

Slope: 9 to 30 percent
Aspect: Northwest to southeast
Landform: Mountain slopes
Parent material: Colluvium over residuum derived from andesitic tuff
Typical vegetation: Subalpine mixed conifer forest with mountain hemlock, lodgepole pine, and red fir as the codominant species; a sparse understory that includes Brewer's aster, Ross' sedge, and several lupine species
Percentage of the surface covered by rock fragments: 0 to 10 percent by subangular cobbles and 0 to 10 percent by subangular stones
Depth to a restrictive feature (paralithic bedrock): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 2.3 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted

Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE019CA, Tsuga mertensiana-Abies magnifica/Eucephalus breweri

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
Oa—1 to 2 inches (3 to 5 centimeters); highly decomposed plant material
A—2 to 3 inches (5 to 8 centimeters); gravelly medial sandy loam
E—3 to 5 inches (8 to 13 centimeters); cobbly sandy loam
Bw—5 to 24 inches (13 to 61 centimeters); very stony medial sandy loam
Cr—24 to 34 inches (61 to 86 centimeters); soft bedrock

Minor components

Melody and similar soils
Extent: About 10 percent of the map unit
Slope: 9 to 30 percent
Landform: Mountain slopes
Typical vegetation: Shrubland dominated by mountain big sagebrush, antelope bitterbrush, and woolly mule-ears; also, a variety of forbs and a few red fir trees
Ecological site: R022AE219CA, Cryic Volcanic Slope

Landform: Mountains
Typical vegetation: None assigned
Ecological site: R022AY012NV, Barren Slope 20+ p.z.

Meiss and similar soils
Extent: About 1 percent of the map unit
Slope: 15 to 50 percent
Landform: Mountains

Typical vegetation: Low sagebrush with a diversity of low-growing shrubs, forbs, and grasses
Ecological site: R022AE211CA, Shallow Andesite Ridge

Oxyaquic Cryorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

9165—Sky-Melody complex, 30 to 50 percent slopes

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,035 to 8,725 feet (2,145 to 2,660 meters)
Mean annual precipitation: 29 to 63 inches (740 to 1,600 millimeters)
Mean annual air temperature: 38 to 42 degrees F (4 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Sky—50 percent
Melody—40 percent
Minor components—10 percent

Characteristics of Sky and similar soils

Slope: 30 to 50 percent
Aspect: Northwest to southwest
Landform: Mountain slopes
Parent material: Colluvium over residuum derived from andesitic tuff
Typical vegetation: Subalpine mixed conifer forest with mountain hemlock, lodgepole pine, and red fir as the codominant species; a sparse understory that includes Brewer's aster, Ross' sedge, and several lupine species
Percentage of the surface covered by rock fragments: 0 to 10 percent by subangular cobbles and 0 to 10 percent by subangular stones
Depth to a restrictive feature (paralithic bedrock): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 2.3 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 7e

Ecological site: F022AE019CA, Tsuga mertensiana-Abies magnifica/Eucephalus breweri

Typical profile

Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
Oa—1 to 2 inches (3 to 5 centimeters); highly decomposed plant material
A—2 to 3 inches (5 to 8 centimeters); gravelly medial sandy loam
E—3 to 5 inches (8 to 13 centimeters); cobbly sandy loam
Bw—5 to 24 inches (13 to 61 centimeters); very stony medial sandy loam
Cr—24 to 34 inches (61 to 86 centimeters); soft bedrock

Characteristics of Melody and similar soils

Slope: 30 to 50 percent
Aspect: Northwest to southwest
Landform: Mountain slopes
Parent material: Colluvium derived from volcanic rocks
Typical vegetation: Shrubland dominated by mountain big sagebrush, antelope bitterbrush, and woolly mule-ears; also, a variety of forbs and a few red fir trees
Percentage of the surface covered by rock fragments: 20 to 50 percent by coarse, subangular gravel; 1 to 15 percent by subangular boulders; 10 to 35 percent by subangular stones; and 10 to 25 percent by subangular cobbles
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches (25 to 50 centimeters)
Slowest permeability: Moderate above the bedrock
Available water capacity to a depth of 60 inches: About 1.2 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None
Surface runoff class: Very high
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: D

Interpretive groups

Land capability (nonirrigated): 7e
Ecological site: R022AE219CA, Cryic Volcanic Slope

Typical profile

Oi—0 to 1 inch (0 to 2 centimeters); slightly decomposed plant material
A—1 to 2 inches (2 to 5 centimeters); very cobbly ashy sandy loam
AC—2 to 9 inches (5 to 23 centimeters); very cobbly ashy sandy loam
C—9 to 15 inches (23 to 38 centimeters); very cobbly ashy sandy loam
R—15 to 25 inches (38 to 63 centimeters); bedrock

Minor components

Mountrose and similar soils

Extent: About 4 percent of the map unit
Slope: 30 to 70 percent
Landform: Mountain slopes
Typical vegetation: A sparse cover of woolly mule-ears, coyote mint, and lupine and less than 25 percent cover of red fir, western white pine, Jeffrey pine, and whitebark pine
Ecological site: R022AE215CA, Deep Cryic Volcanic Slope

Wardcreek and similar soils

Extent: About 3 percent of the map unit

Slope: 30 to 70 percent
Landform: Mountain slopes
Typical vegetation: Shrubland dominated by mountain big sagebrush, antelope bitterbrush, and woolly mule-ears; also, a variety of forbs and a few red fir trees
Ecological site: R022AE219CA, Cryic Volcanic Slope

Lithnip and similar soils
Extent: About 1 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: R022AY012NV, Barren Slope 20+ p.z.

Meiss and similar soils
Extent: About 1 percent of the map unit
Slope: 15 to 50 percent
Landform: Mountains
Typical vegetation: Low sagebrush with a diversity of low-growing shrubs, forbs, and grasses
Ecological site: R022AE211CA, Shallow Andesite Ridge

Oxyaquic Cryorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

9166—Sky-Melody complex, 50 to 70 percent slopes

Map unit setting

General location: The northwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,215 to 8,530 feet (2,200 to 2,600 meters)
Mean annual precipitation: 37 to 61 inches (940 to 1,550 millimeters)
Mean annual air temperature: 38 to 42 degrees F (4 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Sky—50 percent
Melody—40 percent
Minor components—10 percent

Characteristics of Sky and similar soils

Slope: 50 to 70 percent
Aspect: East to north
Landform: Mountain slopes
Parent material: Colluvium over residuum derived from andesitic tuff
Typical vegetation: Subalpine mixed conifer forest with mountain hemlock, lodgepole pine, and red fir as the codominant species; a sparse understory that includes Brewer's aster, Ross' sedge, and several lupine species

9171—Mountrose-Wardcreek-Melody complex, 50 to 70 percent slopes

Map unit setting

General location: The northern end of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,050 to 10,330 feet (2,150 to 3,150 meters)
Mean annual precipitation: 31 to 63 inches (790 to 1,600 millimeters)

Mean annual air temperature: 37 to 43 degrees F (3 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Mountrose—35 percent
Wardcreek—25 percent
Melody—20 percent
Minor components—20 percent

Characteristics of Mountrose and similar soils

Slope: 30 to 70 percent
Aspect: Northeast to west
Landform: Mountain slopes
Parent material: Colluvium derived from volcanic rocks
Typical vegetation: A sparse cover of woolly mule-ears, coyote mint, and lupine and less than 25 percent cover of red fir, western white pine, Jeffrey pine, and whitebark pine
Percentage of the surface covered by rock fragments: 0 to 10 percent by subangular cobbles; 30 to 80 percent medium, subangular gravel; 0 to 10 percent by subangular stones; and 0 to 5 percent by subangular boulders
Restrictive feature: None noted
Slowest permeability: Slow
Available water capacity to a depth of 60 inches: About 3.6 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 8
Ecological site: R022AE215CA, Deep Cryic Volcanic Slope

Typical profile
A—0 to 4 inches (0 to 9 centimeters); medial loamy coarse sand
Bw1—4 to 15 inches (9 to 38 centimeters); gravelly medial coarse sandy loam
Bw2—15 to 29 inches (38 to 74 centimeters); extremely cobbly medial sandy loam
Bw3—29 to 59 inches (74 to 150 centimeters); extremely gravelly medial sandy loam

Characteristics of Wardcreek and similar soils

Slope: 30 to 70 percent
Aspect: Northeast to west
Landform: Mountain slopes
Parent material: Colluvium over residuum weathered from andesite
Typical vegetation: Shrubland dominated by mountain big sagebrush, antelope bitterbrush, and woolly mule-ears; also, a variety of forbs and a few red fir trees
Percentage of the surface covered by rock fragments: 30 percent by gravel, 20 percent by cobbles, and 10 percent by stones
Depth to a restrictive feature (lithic bedrock): 20 to 39 inches (50 to 100 centimeters)

Slowest permeability: Moderate above the bedrock
Available water capacity to a depth of 60 inches: About 1.9 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 7e
Ecological site: R022AE219CA, Cryic Volcanic Slope

Typical profile
A—0 to 4 inches (0 to 9 centimeters); ashy very stony loam
AB—4 to 12 inches (9 to 30 centimeters); ashy very stony sandy loam
Bt—12 to 18 inches (30 to 45 centimeters); ashy very stony sandy loam
BC—18 to 25 inches (45 to 64 centimeters); ashy very stony sandy loam
R—25 to 35 inches (64 to 89 centimeters); bedrock

Characteristics of Melody and similar soils

Slope: 30 to 70 percent
Aspect: Northeast to west
Landform: Mountain slopes
Parent material: Colluvium derived from volcanic rocks
Typical vegetation: Shrubland dominated by mountain big sagebrush, antelope bitterbrush, and woolly mule-ears; also, a variety of forbs and a few red fir trees

Ecological site: F022AE019CA, Tsuga mertensiana-Abies magnifica/Eucephalus breweri

9401—Dagget very gravelly loamy coarse sand, 15 to 30 percent slopes, extremely bouldery

Map unit setting

General location: The eastern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,625 to 9,890 feet (2,325 to 3,015 meters)
Mean annual precipitation: 29 to 55 inches (740 to 1,400 millimeters)
Mean annual air temperature: 38 to 42 degrees F (4 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Dagget very gravelly loamy coarse sand—75 percent
Minor components—25 percent

Characteristics of Dagget very gravelly loamy coarse sand and similar soils

Slope: 15 to 30 percent
Aspect: South to north

Landform: Mountain slopes
Parent material: Colluvium derived from granodiorite over grus
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Percentage of the surface covered by rock fragments: 10 to 40 percent by coarse, subrounded gravel; 2 to 20 percent by subrounded cobbles; 2 to 20 percent by subrounded stones; and 2 to 20 percent by subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 39 to 59 inches (100 to 150 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 2.6 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 9 inches (3 to 23 centimeters); very gravelly loamy coarse sand
C—9 to 49 inches (23 to 125 centimeters); very gravelly loamy coarse sand
Cr—49 to 59 inches (125 to 150 centimeters); soft bedrock

Minor components

Temo and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent
Landform: Mountain slopes
Typical vegetation: Red fir, lodgepole pine, and western white pine over low-growing sub-shrubs and grasses, such as sulphur-flowered buckwheat and needlegrasses
Ecological site: F022AY121NV, Pinus contorta-Abies magnifica/Artemisia tridentata ssp. tridentata/Achnatherum occidentale ssp. occidentale-Carex rossii

Witefels and similar soils
Extent: About 4 percent of the map unit
Slope: 15 to 30 percent
Landform: Mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Jobsis and similar soils
Extent: About 3 percent of the map unit
Slope: 8 to 30 percent
Landform: Mountains
Typical vegetation: None assigned

Ecological site: F022AY134NV, Pinus albicaulis/Carex-Poa

Rock outcrop
Extent: About 3 percent of the map unit
Slope: 15 to 30 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Whittell and similar soils
Extent: About 3 percent of the map unit
Slope: 8 to 30 percent
Landform: Mountain slopes
Typical vegetation: Whitebark pine
Ecological site: F022AE001CA, Pinus albicaulis/Arabis platysperma

Cagwin and similar soils
Extent: About 2 percent of the map unit
Slope: 15 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Cassenai, moist, and similar soils
Extent: About 2 percent of the map unit
Slope: 15 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Toem and similar soils
Extent: About 2 percent of the map unit
Slope: 9 to 30 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Ecological site: R022AE210CA, Shallow Sandy Slope

Oxyaquic Cryorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

9402—Dagget very gravelly loamy coarse sand, 30 to 50 percent slopes, extremely bouldery

Map unit setting

General location: The eastern part of the Tahoe Basin

9403—Dagget very gravelly loamy coarse sand, 50 to 70 percent slopes, extremely bouldery

Map unit setting

General location: The eastern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,430 to 9,415 feet (2,265 to 2,870 meters)
Mean annual precipitation: 27 to 45 inches (690 to 1,140 millimeters)
Mean annual air temperature: 38 to 42 degrees F (4 to 6 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Dagget very gravelly loamy coarse sand—75 percent
Minor components—25 percent

Characteristics of Dagget very gravelly loamy coarse sand and similar soils

Slope: 50 to 70 percent
Aspect: Southwest to northwest
Landform: Mountain slopes
Parent material: Colluvium derived from granodiorite over grus
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Percentage of the surface covered by rock fragments: 2 to 20 percent by subrounded boulders, 2 to 20 percent by subrounded stones, 2 to 20 percent by subrounded cobbles, and 10 to 40 percent by coarse, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 39 to 59 inches (100 to 150 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 2.6 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
- *Present annual flooding:* None
- *Present annual ponding:* None
- *Surface runoff class:* Low
- *Current water table:* None noted
- *Natural drainage class:* Excessively drained
- *Hydrologic soil group:* A

Interpretive groups
- *Land capability (nonirrigated):* 8
- *Ecological site:* F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material

A—1 to 9 inches (3 to 23 centimeters); very gravelly loamy coarse sand
C—9 to 49 inches (23 to 125 centimeters); very gravelly loamy coarse sand
Cr—49 to 59 inches (125 to 150 centimeters); soft bedrock

Minor components

Temo and similar soils
Extent: About 5 percent of the map unit
Slope: 50 to 70 percent
Landform: Mountain slopes
Typical vegetation: Red fir, lodgepole pine, and western white pine over low-growing sub-shrubs and grasses, such as sulphur-flowered buckwheat and needlegrasses
Ecological site: F022AY121NV, Pinus contorta-Abies magnifica/Artemisia tridentata ssp. tridentata/Achnatherum occidentale ssp. occidentale-Carex rossii

Witefels and similar soils
Extent: About 4 percent of the map unit
Slope: 50 to 70 percent
Landform: Mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Jobsis and similar soils
Extent: About 3 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: F022AY134NV, Pinus albicaulis/Carex-Poa

Rock outcrop
Extent: About 3 percent of the map unit
Slope: 50 to 70 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Whittell and similar soils
Extent: About 3 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountain slopes
Typical vegetation: Whitebark pine
Ecological site: F022AE001CA, Pinus albicaulis/Arabis platysperma

Cagwin and similar soils
Extent: About 2 percent of the map unit
Slope: 50 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Cassenai, moist, and similar soils
Extent: About 2 percent of the map unit
Slope: 50 to 70 percent

Landform: Hillslopes and mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Toem and similar soils
Extent: About 2 percent of the map unit
Slope: 50 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Sandy slopes with a patchy cover of greenleaf manzanita, huckleberry oak, and a few scattered white fir and Jeffrey pine trees
Ecological site: R022AE210CA, Shallow Sandy Slope

Oxyaquic Cryorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

9404—Dagget very gravelly loamy coarse sand, moist, 5 to 15 percent slopes, rubbly

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,330 to 8,905 feet (2,235 to 2,715 meters)
Mean annual precipitation: 41 to 65 inches (1,040 to 1,650 millimeters)
Mean annual air temperature: 38 to 43 degrees F (4 to 6 degrees C)
Frost-free period: 50 to 125 days

Map unit composition

Dagget, moist—80 percent
Minor components—20 percent

Characteristics of Dagget, moist, and similar soils

Slope: 5 to 15 percent
Aspect: South to northeast
Landform: Mountain slopes
Parent material: Colluvium and/or till derived from granodiorite
Typical vegetation: Subalpine forest with lodgepole pine, mountain hemlock, and red fir; common shrubs—mountain heather and mountain spirea
Percentage of the surface covered by rock fragments: 10 to 20 percent by boulders, 10 to 20 percent by cobbles, and 10 to 20 percent by stones
Depth to a restrictive feature (paralithic bedrock): 39 to 59 inches (100 to 150 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 2.6 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Very low
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6s
Ecological site: F022AE014CA, Pinus contorta-Tsuga mertensiana/Phyllodoce breweri

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 9 inches (3 to 23 centimeters); very gravelly loamy coarse sand
C—9 to 49 inches (23 to 125 centimeters); very gravelly loamy coarse sand
Cr—49 to 59 inches (125 to 150 centimeters); soft bedrock

Minor components

Cassenai, moist, and similar soils
Extent: About 5 percent of the map unit
Slope: 5 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Rockbound very gravelly loam and similar soils
Extent: About 5 percent of the map unit
Slope: 5 to 30 percent
Landform: Glacial valley floors
Typical vegetation: Scattered Sierra juniper and Jeffrey pine trees with huckleberry oak and greenleaf manzanita in pockets and a high diversity of annuals and perennials
Ecological site: R022AE202CA, Granitic Pocket

Jobsis and similar soils
Extent: About 2 percent of the map unit
Slope: 8 to 30 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: F022AY134NV, Pinus albicaulis/Carex-Poa

Oxyaquic Cryorthents and similar soils
Extent: About 2 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

Temo and similar soils
Extent: About 2 percent of the map unit
Slope: 5 to 15 percent
Landform: Mountain slopes

Typical vegetation: Red fir, lodgepole pine, and western white pine over low-growing sub-shrubs and grasses, such as sulphur-flowered buckwheat and needlegrasses
Ecological site: F022AY121NV, Pinus contorta-Abies magnifica/Artemisia tridentata ssp. tridentata/Achnatherum occidentale ssp. occidentale-Carex rossii

Whittell and similar soils
Extent: About 2 percent of the map unit
Slope: 8 to 30 percent
Landform: Mountain slopes
Typical vegetation: Whitebark pine
Ecological site: F022AE001CA, Pinus albicaulis/Arabis platysperma

Witefels and similar soils
Extent: About 2 percent of the map unit
Slope: 5 to 15 percent
Landform: Mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

9405—Dagget very gravelly loamy coarse sand, moist, 15 to 30 percent slopes, rubbly

Map unit setting

General location: The southwestern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,050 to 9,645 feet (2,150 to 2,940 meters)
Mean annual precipitation: 39 to 65 inches (990 to 1,650 millimeters)
Mean annual air temperature: 38 to 43 degrees F (4 to 6 degrees C)
Frost-free period: 50 to 125 days

Map unit composition

Dagget, moist—80 percent
Minor components—20 percent

Characteristics of Dagget, moist, and similar soils

Slope: 15 to 30 percent
Aspect: Southwest to east
Landform: Mountain slopes
Parent material: Colluvium and/or till derived from granodiorite
Typical vegetation: Subalpine forest with lodgepole pine, mountain hemlock, and red fir; common shrubs—mountain heather and mountain spirea
Percentage of the surface covered by rock fragments: 10 to 20 percent by boulders, 10 to 20 percent by stones, and 10 to 20 percent by cobbles
Depth to a restrictive feature (paralithic bedrock): 39 to 59 inches (100 to 150 centimeters)

Typical vegetation: None assigned
Ecological site: F022AY134NV, Pinus albicaulis/Carex-Poa

Oxyaquic Cryorthents and similar soils
Extent: About 2 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

9411—Freelpeak-Windyridge-Rock outcrop complex, 15 to 75 percent slopes

Map unit setting

Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 8,995 to 11,000 feet (2,743 to 3,353 meters)
Mean annual precipitation: 40 to 55 inches (1,016 to 1,397 millimeters)
Mean annual air temperature: 34 to 37 degrees F (1 to 3 degrees C)
Frost-free period: 20 to 30 days

Map unit composition

Freelpeak—50 percent
Windyridge—25 percent
Rock outcrop—10 percent
Minor components—15 percent

Characteristics of Freelpeak and similar soils

Slope: 30 to 75 percent
Aspect: None noted

Landform: Mountains
Parent material: Colluvium derived from granodiorite over residuum derived from granodiorite
Typical vegetation: Needlegrass, bluegrass, perennial forbs, and shrubs
Percentage of the surface covered by rock fragments: 25 to 75 percent by coarse gravel, 15 to 50 percent by cobbles, 5 to 25 percent by stones, and 0 to 5 percent by boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches (50 to 102 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 1.9 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: B

Interpretive groups
Land capability (nonirrigated): 8e
Ecological site: R022AY032NV, Alpine Ridge

Typical profile
C—0 to 2 inches (0 to 4 centimeters); gravel
2A—2 to 4 inches (4 to 9 centimeters); extremely gravelly coarse sand
2Bw—4 to 8 inches (9 to 21 centimeters); very gravelly sand
2C—8 to 36 inches (21 to 91 centimeters); very cobbly loamy fine sand
3Cr—36 inches (91 centimeters); bedrock

Characteristics of Windyridge and similar soils

Slope: 15 to 30 percent
Aspect: None noted
Landform: Mountains
Parent material: Colluvium derived from granodiorite over residuum derived from granodiorite
Typical vegetation: Needlegrass, shrubs, bluegrass, and perennial forbs
Percentage of the surface covered by rock fragments: 0 to 4 percent by stones, 10 to 20 percent by coarse gravel, 0 to 10 percent by cobbles, and 40 to 60 percent by fine gravel
Depth to a restrictive feature (paralithic bedrock): 4 to 10 inches (10 to 25 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 0.4 inch (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 8s
Ecological site: R022AY032NV, Alpine Ridge

Typical profile
0 to 2 inches (0 to 5 centimeters); very gravelly loamy coarse sand
2 to 10 inches (5 to 25 centimeters); very gravelly loamy coarse sand
10 to 20 inches (25 to 51 centimeters); bedrock

Characteristics of Rock outcrop

Slope: 30 to 99 percent
Aspect: None noted
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Minor components

Jobsis and similar soils
Extent: About 8 percent of the map unit
Slope: 15 to 50 percent
Landform: Mountains
Typical vegetation: Whitebark pine, perennial forbs, and bluegrass
Ecological site: R022AY051NV, Krummholz

Whittell and similar soils
Extent: About 3 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: Whitebark pine
Ecological site: F022AE001CA, Pinus albicaulis/Arabis platysperma

Waterpeak and similar soils
Extent: About 2 percent of the map unit
Slope: 15 to 50 percent
Landform: Mountains
Typical vegetation: Mountain brome, mountain big sagebrush, antelope bitterbrush, and western needlegrass
Ecological site: R022AY021NV, South Slope 30+ p.z.

Buggin and similar soils
Extent: About 1 percent of the map unit
Slope: 15 to 50 percent
Landform: Mountains
Typical vegetation: Snowberry, needlegrass, curlleaf mountainmahogany, and bluegrass
Ecological site: R022AY025NV, Mahogany Thicket

Glaciers
Extent: About 1 percent of the map unit
Slope: 15 to 75 percent
Landform: Glaciers
Typical vegetation: None assigned
Ecological site: None assigned

9421—Jobsis-Whittell-Rock outcrop complex, cool, 8 to 30 percent slopes

Map unit setting

Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 8,995 to 12,000 feet (2,743 to 3,659 meters)
Mean annual precipitation: 35 to 55 inches (889 to 1,397 millimeters)
Mean annual air temperature: 34 to 37 degrees F (1 to 3 degrees C)
Frost-free period: 25 to 45 days

Map unit composition

Jobsis—45 percent
Whittell—25 percent
Rock outcrop—15 percent
Minor components—15 percent

Characteristics of Jobsis and similar soils

Slope: 8 to 30 percent
Aspect: None noted
Landform: Mountains
Parent material: Colluvium derived from granodiorite over residuum derived from granodiorite
Typical vegetation: Whitebark pine
Percentage of the surface covered by rock fragments: 2 to 8 percent by stones, 10 to 20 percent by fine gravel, 10 to 20 percent by boulders, and 5 to 15 percent by coarse gravel
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches (25 to 50 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 0.8 inch (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 7s
Ecological site: F022AY134NV, Pinus albicaulis/Carex-Poa

Typical profile

A—0 to 5 inches (0 to 13 centimeters); very gravelly loamy coarse sand
Bw—5 to 17 inches (13 to 43 centimeters); very gravelly loamy coarse sand
2C—17 to 20 inches (43 to 50 centimeters); very gravelly coarse sand
2Cr—20 inches (50 centimeters); bedrock

Characteristics of Whittell and similar soils

Slope: 8 to 30 percent
Aspect: East to southwest
Landform: Mountains
Parent material: Colluvium derived from granodiorite over residuum derived from granodiorite
Typical vegetation: Whitebark pine
Percentage of the surface covered by rock fragments: 2 to 20 percent by subrounded boulders, 0 to 15 percent by subrounded cobbles, 1 to 15 percent by subrounded stones, and 45 to 90 percent by angular gravel
Depth to a restrictive feature (paralithic bedrock): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 1.1 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: C

Interpretive groups

Land capability (nonirrigated): 7e
Ecological site: F022AE001CA, Pinus albicaulis/Arabis platysperma

Typical profile

Oi—0 inches (0 to 1 centimeter); slightly decomposed plant material
A—0 to 7 inches (1 to 18 centimeters); very cobbly loamy coarse sand
Bw—7 to 20 inches (18 to 50 centimeters); very stony loamy coarse sand
C—20 to 32 inches (50 to 82 centimeters); extremely stony loamy coarse sand
Cr—32 inches (82 centimeters); bedrock

Characteristics of Rock outcrop

Slope: 15 to 99 percent
Aspect: None noted
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties

Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups

Land capability (nonirrigated): None assigned
Ecological site: None assigned

Minor components

Typic Cryorthents and similar soils
Extent: About 4 percent of the map unit
Slope: 8 to 30 percent
Landform: Mountains
Typical vegetation: Whitebark pine
Ecological site: F022AY134NV, Pinus albicaulis/Carex-Poa

Windyridge and similar soils
Extent: About 4 percent of the map unit
Slope: 8 to 30 percent
Landform: Mountains
Typical vegetation: Needlegrass and bluegrass
Ecological site: R022AY032NV, Alpine Ridge

Klauspeak and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 50 percent
Landform: Mountains
Typical vegetation: California red fir, lodgepole pine, snowberry, mountain big sagebrush, wild mint, currant, lupine, mountain brome, and western needlegrass
Ecological site: F022AY118NV, Abies magnifica-Pinus contorta/Artemisia tridentata ssp. vaseyana/Bromus marginatus-Achnatherum occidentale ssp. occidentale

Shalgran and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: Jeffrey pine, snowbrush ceanothus, snowberry, Sierra chinkapin, and pinemat manzanita
Ecological site: F022AY120NV, Pinus jeffreyi/Arctostaphylos nevadensis/ Achnatherum lettermanii

Buggin and similar soils
Extent: About 1 percent of the map unit
Slope: 8 to 30 percent
Landform: Mountains
SEX*Typical vegetation:* Curlleaf mountainmahogany, mountain big sagebrush, bluegrass, and needlegrass
Ecological site: R022AY024NV, Mahogany Savanna

Typic Cryorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 4 to 30 percent
Landform: Mountains
Typical vegetation: Whitebark pine and Ross' sedge
Ecological site: F022AY109NV, Pinus contorta-Tsuga mertensiana/Carex

Waterpeak and similar soils
Extent: About 1 percent of the map unit
Slope: 8 to 30 percent
Landform: Mountains
Typical vegetation: Antelope bitterbrush, mountain big sagebrush, mountain brome, and western needlegrass
Ecological site: R022AY021NV, South Slope 30+ p.z.

9431—Sofgran-Klauspeak-Temo association, 15 to 50 percent slopes

Map unit setting

Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,995 to 8,995 feet (2,438 to 2,743 meters)
Mean annual precipitation: 35 to 55 inches (889 to 1,397 millimeters)
Mean annual air temperature: 36 to 39 degrees F (2 to 4 degrees C)
Frost-free period: 30 to 60 days

Map unit composition

Sofgran—40 percent
Klauspeak—30 percent
Temo—15 percent
Minor components—15 percent

Characteristics of Sofgran and similar soils

Slope: 15 to 50 percent
Aspect: None noted
Landform: Mountains
Parent material: Colluvium derived from granodiorite over residuum derived from granodiorite
Typical vegetation: An overstory of California red fir, lodgepole pine, and an understory of Ross' sedge, bluegrass, pinemat manzanita, and western needlegrass
Percentage of the surface covered by rock fragments: 1 to 5 percent by boulders, 0 to 2 percent by stones, 0 to 10 percent by cobbles, 2 to 8 percent by coarse gravel, and 10 to 20 percent by fine gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches (152 to 203 centimeters)
Slowest permeability: Rapid
Available water capacity to a depth of 60 inches: About 2.5 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
- *Present annual flooding:* None
- *Present annual ponding:* None
- *Surface runoff class:* Medium
- *Current water table:* None noted
- *Natural drainage class:* Somewhat excessively drained
- *Hydrologic soil group:* A

Interpretive groups
- *Land capability (nonirrigated):* 6e
- *Ecological site:* F022AY106NV, Pinus contorta-Abies magnifica/Arctostaphylos nevadensis/Achnatherum occidentale ssp. occidentale-Carex rossii

Typical profile
- A1—0 to 3 inches (0 to 8 centimeters); gravelly loamy coarse sand
- A2—3 to 6 inches (8 to 15 centimeters); gravelly loamy coarse sand
- Bw1—6 to 9 inches (15 to 23 centimeters); very gravelly loamy coarse sand
- Bw2—9 to 19 inches (23 to 48 centimeters); very gravelly loamy coarse sand
- Bw3—19 to 27 inches (48 to 69 centimeters); very gravelly coarse sand

Bw4—27 to 45 inches (69 to 114 centimeters); extremely gravelly loamy coarse sand
Bw5—45 to 60 inches (114 to 152 centimeters); very gravelly loamy coarse sand

Characteristics of Klauspeak and similar soils

Slope: 15 to 50 percent
Aspect: None noted
Landform: Mountains
Parent material: Colluvium derived from granodiorite
Typical vegetation: An overstory of California red fir and lodgepole pine and an understory of snowberry, currant, mountain brome, mountain big sagebrush, western needlegrass, and lupine
Percentage of the surface covered by rock fragments: 5 to 15 percent by fine gravel, 2 to 8 percent by boulders, 2 to 8 percent by coarse gravel, and 2 to 8 percent by stones
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches (152 to 203 centimeters)
Slowest permeability: Rapid
Available water capacity to a depth of 60 inches: About 3.5 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6e
Ecological site: F022AY118NV, Abies magnifica-Pinus contorta/Artemisia tridentata ssp. vaseyana/Bromus marginatus-Achnatherum occidentale ssp. occidentale

Typical profile
A1—0 to 5 inches (0 to 13 centimeters); gravelly loamy sand
A2—5 to 16 inches (13 to 41 centimeters); gravelly loamy sand
Bw1—16 to 22 inches (41 to 56 centimeters); very stony loamy sand
Bw2—22 to 40 inches (56 to 102 centimeters); very stony loamy coarse sand
C—40 to 60 inches (102 to 152 centimeters); very cobbly coarse sand

Characteristics of Temo and similar soils

Slope: 15 to 50 percent
Aspect: None noted
Landform: Mountains
Parent material: Colluvium derived from granodiorite over residuum derived from granodiorite
Typical vegetation: Lodgepole pine
Percentage of the surface covered by rock fragments: 2 to 8 percent by boulders, 0 to 10 percent by cobbles, 5 to 15 percent by coarse gravel, 15 to 25 percent by fine gravel, and 2 to 8 percent by stones
Depth to a restrictive feature (paralithic bedrock): 8 to 20 inches (20 to 51 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 0.8 inch (very low)

Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 8
Ecological site: F022AY121NV, Pinus contorta-Abies magnifica/Artemisia tridentata ssp. tridentata/Achnatherum occidentale ssp. occidentale-Carex rossii

Typical profile
0 to 10 inches (0 to 25 centimeters); very gravelly loamy coarse sand
10 to 16 inches (25 to 41 centimeters); gravelly coarse sand
16 to 26 inches (41 to 66 centimeters); bedrock

Minor components

Rock outcrop
Extent: About 4 percent of the map unit
Slope: 15 to 99 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Shalgran and similar soils
Extent: About 4 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: Jeffrey pine, pinemat manzanita, snowbrush ceanothus, Sierra chinkapin, and snowberry
Ecological site: F022AY120NV, Pinus jeffreyi/Arctostaphylos nevadensis/Achnatherum lettermanii

Xeric Humicryepts and similar soils
Extent: About 3 percent of the map unit
Slope: 15 to 50 percent
Landform: Mountains
Typical vegetation: Mountain hemlock
Ecological site: F022AY114NV, Tsuga mertensiana/Carex-Poa

Stumpatil and similar soils
Extent: About 2 percent of the map unit
Slope: 8 to 30 percent
Landform: Moraines
Typical vegetation: California red fir, lodgepole pine, western needlegrass, mountain big sagebrush, snowberry, wild mint, currant, lupine, and mountain brome
Ecological site: F022AY118NV, Abies magnifica-Pinus contorta/Artemisia tridentata ssp. vaseyana/Bromus marginatus-Achnatherum occidentale ssp. occidentale

Aquic Haplocryolls and similar soils
Extent: About 1 percent of the map unit
Slope: 4 to 30 percent
Landform: Mountains

Typical vegetation: Quaking aspen, willow, streambank wheatgrass, Woods' rose, Nevada bluegrass, slender wheatgrass, and carex
Ecological site: F022AY104NV, Populus tremuloides/Salix-Rosa woodsii/Poa-Elymus trachycaulus ssp. trachycaulus

Hopeval and similar soils
Extent: About 1 percent of the map unit
Slope: 2 to 8 percent
Landform: Flood plains
Typical vegetation: Creeping bentgrass, perennial grasses, carex, tufted hairgrass, Baltic rush, and bluegrass
Ecological site: R022AY017NV, Semi-Wet Meadow

9441—Temo-Witefels complex, 5 to 15 percent slopes

Map unit setting

General location: The eastern part of the Tahoe Basin
Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,050 to 9,265 feet (2,150 to 2,825 meters)
Mean annual precipitation: 33 to 53 inches (840 to 1,350 millimeters)
Mean annual air temperature: 35 to 41 degrees F (2 to 5 degrees C)
Frost-free period: 25 to 75 days

Map unit composition

Temo—45 percent
Witefels—35 percent
Minor components—20 percent

Characteristics of Temo and similar soils

Slope: 5 to 15 percent
Aspect: Southeast to northeast
Landform: Mountain slopes
Parent material: Colluvium over residuum weathered from granodiorite
Typical vegetation: California red fir and lodgepole pine forest with a few western white pine and Sierra juniper trees; a low understory cover of shrubs and grasses
Percentage of the surface covered by rock fragments: 0 to 15 percent by boulders, 0 to 15 percent by stones, and 0 to 15 percent by cobbles
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches (25 to 50 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 0.6 inch (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Excessively drained
Hydrologic soil group: D

Interpretive groups
Land capability (nonirrigated): 8
Ecological site: F022AY121NV, Pinus contorta-Abies magnifica/Artemisia tridentata ssp. tridentata/Achnatherum occidentale ssp. occidentale-Carex rossii

Typical profile
A—0 to 10 inches (0 to 25 centimeters); gravelly coarse sand
C—10 to 16 inches (25 to 41 centimeters); gravelly coarse sand
Cr—16 to 26 inches (41 to 65 centimeters); soft bedrock

Characteristics of Witefels and similar soils

Slope: 5 to 15 percent
Aspect: Southeast to northeast
Landform: Mountain slopes
Parent material: Colluvium and/or residuum weathered from granodiorite
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Percentage of the surface covered by rock fragments: 0 to 15 percent by stones, 0 to 15 percent by cobbles, and 0 to 15 percent by boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 2.2 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Low
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 6s
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 9 inches (3 to 23 centimeters); gravelly loamy coarse sand
AC—9 to 14 inches (23 to 36 centimeters); gravelly loamy coarse sand
C—14 to 36 inches (36 to 91 centimeters); gravelly loamy coarse sand
Cr—36 to 39 inches (91 to 100 centimeters); soft bedrock

Minor components

Rock outcrop
Extent: About 10 percent of the map unit
Slope: 5 to 15 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Dagget very gravelly loamy coarse sand and similar soils
Extent: About 5 percent of the map unit
Slope: 15 to 30 percent

Landform: Mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Cagwin and similar soils
Extent: About 4 percent of the map unit
Slope: 5 to 15 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Oxyaquic Cryorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

9442—Temo-Witefels complex, 15 to 30 percent slopes

Depth to a restrictive feature (paralithic bedrock): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 2.2 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Somewhat excessively drained

Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 8
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Typical profile
Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 9 inches (3 to 23 centimeters); gravelly loamy coarse sand
AC—9 to 14 inches (23 to 36 centimeters); gravelly loamy coarse sand
C—14 to 36 inches (36 to 91 centimeters); gravelly loamy coarse sand
Cr—36 to 39 inches (91 to 100 centimeters); soft bedrock

Minor components

Rock outcrop
Extent: About 10 percent of the map unit
Slope: 50 to 70 percent
Landform: Mountains
Typical vegetation: None assigned
Ecological site: None assigned

Dagget very gravelly loamy coarse sand and similar soils
Extent: About 5 percent of the map unit
Slope: 50 to 70 percent
Landform: Mountain slopes
Typical vegetation: Red fir and western white pine forest with pinemat manzanita in the understory
Ecological site: F022AE010CA, Abies magnifica-Pinus monticola/Arctostaphylos nevadensis

Cagwin and similar soils
Extent: About 4 percent of the map unit
Slope: 50 to 70 percent
Landform: Hillslopes and mountain slopes
Typical vegetation: Open woodland of Jeffrey pine with a few white fir trees; high shrub cover of antelope bitterbrush, greenleaf manzanita, and several other montane chaparral species
Ecological site: F022AE021CA, Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula

Oxyaquic Cryorthents and similar soils
Extent: About 1 percent of the map unit
Slope: 0 to 15 percent
Landform: Drainageways
Typical vegetation: Aspen grove with a dense understory of grasses and forbs
Ecological site: F022AE004CA, Populus tremuloides-Abies concolor/Elymus glaucus

9451—Waterpeak-Rock outcrop complex, 30 to 75 percent slopes

Map unit setting

Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 7,995 to 9,995 feet (2,438 to 3,048 meters)

Mean annual precipitation: 35 to 45 inches (889 to 1,143 millimeters)
Mean annual air temperature: 36 to 39 degrees F (2 to 4 degrees C)
Frost-free period: 30 to 60 days

Map unit composition

Waterpeak—80 percent
Rock outcrop—10 percent
Minor components—10 percent

Characteristics of Waterpeak and similar soils

Slope: 30 to 75 percent
Aspect: None noted
Landform: Mountains
Parent material: Colluvium derived from granodiorite over residuum derived from granodiorite
Typical vegetation: Antelope bitterbrush, mountain big sagebrush, mountain brome, and western needlegrass
Percentage of the surface covered by rock fragments: 2 to 8 percent by boulders, 0 to 10 percent by stones, 5 to 15 percent by coarse gravel, and 5 to 25 percent by fine gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches (152 to 203 centimeters)
Slowest permeability: Moderately rapid
Available water capacity to a depth of 60 inches: About 4.8 inches (low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: Medium
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: A

Interpretive groups
Land capability (nonirrigated): 7s
Ecological site: R022AY021NV, South Slope 30+ p.z.

Typical profile
A1—0 to 5 inches (0 to 13 centimeters); very bouldery coarse sand
A2—5 to 18 inches (13 to 46 centimeters); very stony coarse sand
A3—18 to 27 inches (46 to 69 centimeters); very stony loamy coarse sand
Bw—27 to 60 inches (69 to 152 centimeters); very stony sandy loam

Characteristics of Rock outcrop

Slope: 15 to 99 percent
Aspect: None noted
Landform: Mountains
Typical vegetation: None assigned
Percentage of the surface covered by rock fragments: 0 percent
Restrictive feature: Lithic bedrock at the surface

Hydrologic properties
Current water table: None noted
Hydrologic soil group: None assigned

Interpretive groups
Land capability (nonirrigated): None assigned
Ecological site: None assigned

Minor components

Shalgran and similar soils
Extent: About 4 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: Jeffrey pine, pinemat manzanita, snowbrush ceanothus, Sierra chinkapin, and snowberry
Ecological site: F022AY120NV, Pinus jeffreyi/Arctostaphylos nevadensis/ Achnatherum lettermanii

Typic Cryorthents and similar soils
Extent: About 4 percent of the map unit
Slope: 15 to 50 percent
Landform: Mountains
Typical vegetation: Pine needlegrass, goldenweed, prairie junegrass, and low sagebrush
Ecological site: R022AY011NV, Mountain Ridge 30+ p.z.

Pachic Haplocryolls and similar soils
Extent: About 2 percent of the map unit
Slope: 30 to 75 percent
Landform: Mountains
Typical vegetation: Mountain big sagebrush, western needlegrass, mountain brome, and muttongrass
Ecological site: R022AY020NV, Prunus Pocket

9461—Whittell-Jobsis-Rock outcrop complex, cool, 30 to 75 percent slopes

Map unit setting

Major uses: Watershed, wildlife habitat, and recreation
MLRA: 22A—Sierra Nevada Mountains
Landscape: Mountains
Elevation: 8,995 to 12,000 feet (2,743 to 3,659 meters)
Mean annual precipitation: 35 to 55 inches (889 to 1,397 millimeters)
Mean annual air temperature: 34 to 37 degrees F (1 to 3 degrees C)
Frost-free period: 25 to 45 days

Map unit composition

Whittell—45 percent
Jobsis—25 percent
Rock outcrop—15 percent
Minor components—15 percent

Characteristics of Whittell and similar soils

Slope: 30 to 75 percent
Aspect: East to southwest
Landform: Mountains
Parent material: Colluvium derived from granodiorite over residuum derived from granodiorite

Typical vegetation: Whitebark pine
Percentage of the surface covered by rock fragments: 1 to 15 percent by subrounded stones, 0 to 15 percent by subrounded cobbles, 45 to 90 percent by angular gravel, and 2 to 20 percent by subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 39 inches (50 to 100 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 1.1 inches (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: C

Interpretive groups
Land capability (nonirrigated): 7e
Ecological site: F022AE001CA, Pinus albicaulis/Arabis platysperma

Typical profile
Oi—0 inches (0 to 1 centimeter); slightly decomposed plant material
A—0 to 7 inches (1 to 18 centimeters); very cobbly loamy coarse sand
Bw—7 to 20 inches (18 to 50 centimeters); very stony loamy coarse sand
C—20 to 32 inches (50 to 82 centimeters); extremely stony loamy coarse sand
Cr—32 inches (82 centimeters); bedrock

Characteristics of Jobsis and similar soils

Slope: 30 to 75 percent
Aspect: None noted
Landform: Mountains
Parent material: Colluvium derived from granodiorite over residuum derived from granodiorite
Typical vegetation: Whitebark pine
Percentage of the surface covered by rock fragments: 5 to 15 percent by coarse gravel, 10 to 20 percent by fine gravel, 2 to 8 percent by stones, and 10 to 20 percent by boulders
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches (25 to 50 centimeters)
Slowest permeability: Very slow above the bedrock
Available water capacity to a depth of 60 inches: About 0.8 inch (very low)
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties
Present annual flooding: None
Present annual ponding: None
Surface runoff class: High

Use and Management of the Soils

This soil survey is an inventory and evaluation of the soils in the survey area. It can be used to adjust land uses to the limitations and potentials of natural resources and the environment. Also, it can help to prevent soil-related failures in land uses.

In preparing a soil survey, soil scientists, conservationists, engineers, and others collect extensive field data about the nature and behavioral characteristics of the soils. They collect data on erosion, droughtiness, flooding, and other factors that affect various soil uses and management. Field experience and collected data on soil properties and performance are used as a basis in predicting soil behavior.

Information in this section can be used to plan the use and management of soils for crops and pasture; as rangeland and forestland; and as sites for buildings, sanitary facilities, highways and other transportation systems, and parks and other recreational facilities. It can be used to identify the potentials and limitations of each soil for specific land uses and to help prevent construction failures caused by unfavorable soil properties.

Planners and others using soil survey information can evaluate the effect of specific land uses on productivity and on the environment in all or part of the survey area. The survey can help planners to maintain or create a land use pattern in harmony with the natural soil.

Contractors can use this survey to locate sources of sand and gravel, roadfill, and topsoil. They can use it to identify areas where bedrock, wetness, or very firm soil layers can cause difficulty in excavation.

Health officials, highway officials, engineers, and others may also find this survey useful. The survey can help them plan the safe disposal of wastes and locate sites for pavements, sidewalks, campgrounds, playgrounds, lawns, and trees and shrubs.

Interpretive Ratings

The interpretive tables in this survey rate the soils in the survey area for various uses. Many of the tables identify the limitations that affect specified uses and indicate the severity of those limitations. The ratings in these tables are both verbal and numerical.

Rating Class Terms

Rating classes are expressed in the tables in terms that indicate the extent to which the soils are limited by soil features that affect a specified use or in terms that indicate the suitability or potential of the soils for the use. Terms for limitation classes are *no limitations* and *limitations*, or they are *slight, moderate,* and *severe*. Terms for suitability ratings are *suited* and *unsuited,* or they are three or four of the following: *well suited, moderately suited, poorly suited,* and *unsuited.* Terms indicating potential are *good, fair,* and *poor*.

Numerical Ratings

Numerical ratings in the tables indicate the relative severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.00 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use and the point at which the soil feature is not a limitation. The limitations appear in order from the most limiting to the least limiting. Thus, if more than one limitation is identified, the most severe limitation is listed first and the least severe one is listed last.

Major Land Resource Area

A major land resource area (MLRA) is a broad geographic area that has a distinct combination of climate, topography, vegetation, land use, and general type of farming (USDA, 2006). Part of one of these nationally designated areas is in the Tahoe Basin area—the Sierra Nevada Mountains, MLRA 22A.

This MLRA is in California (98 percent) and western Nevada (2 percent). It makes up about 18,850 square miles (48,800 square kilometers). The Sierra Nevada is almost entirely coniferous forest used for forest products, wildlife habitat, watershed, and recreation. The dominant tree species are ponderosa pine, Douglas-fir, incense cedar, sugar pine, white fir, California red fir, Jeffrey pine, and lodgepole pine. The Sierra Nevada is a strongly asymmetric mountain range with a long, gentle western slope and a steep eastern escarpment. Most of the soils are Alfisols, Entisols, Inceptisols, Mollisols, and Ultisols. The soils generally have a mesic, frigid, or cryic soil temperature regime, depending largely on elevation; a xeric soil moisture regime; and mixed mineralogy. This MLRA is a major source of water. Much of this water is stored in large reservoirs and is used in the Sacramento and San Joaquin Valleys and in southern California. The erosion hazard is severe on the soils if the vegetative cover is depleted or destroyed by overgrazing or fire. Preventing and controlling wildland fires is a major resource management objective.

Ecological Subregions

The Lake Tahoe Basin is a drop-down block on the western edge of the Basin and Range Province. It is situated between the Sierra Nevada Mountain Range and the Carson Range. It is in five of the ecological subsections within the Sierra Nevada Ecological Section (M261E), as described in “Ecological Subregions in California” (Scott and Goudey, 1997). The northern part of the basin is in the Tahoe-Truckee Subsection (M261Ej). It is dominated by Cenozoic volcanic rocks (andesite, basalt, and pyroclastic rocks). The Upper Batholith and Volcanic Flows Subsection (M261Eh) and the Glaciated Batholith and Volcanic Flows Subsection (M261Ek) and are along the Sierra Nevada Crest, on the western side of the basin. These subsections are dominated by granite batholith and post-batholith volcanic rocks. Glaciation has shaped much of this area. The Tahoe Valley Subsection (M261El) occurs in the dropped section at the southern end of the basin. It is characterized by quaternary glacial till, outwash, lacustrine deposits, and alluvium. The Carson Range Subsection (M261Et) is along the northeastern and eastern sides of Lake Tahoe. It is dominantly granitic, with andesite rocks and lahar in the northern area. Glaciation was not extensive in this area.

The different subsections in this survey area tend to support different rangeland plant communities. Elevation in the survey area ranges from 6,200 to almost 11,000 feet. This range in elevation is accompanied by a range in annual temperature and precipitation, which have a dramatic effect on the rangeland plant communities. All

the rangeland plant communities in the survey area are adapted to heavy snow in winter and low precipitation in summer.

Land Capability Classification

Land capability classification shows, in a general way, the suitability of soils for most kinds of field crops. Crops that require special management are excluded. The soils are grouped according to their limitations for field crops, the risk of damage if they are used for crops, and the way they respond to management. The criteria used in grouping the soils do not include major and generally expensive landforming that would change slope, depth, or other characteristics of the soils, nor do they include possible but unlikely major reclamation projects. Capability classification is not a substitute for interpretations designed to show suitability and limitations of groups of soils for rangeland, for forestland, or for engineering purposes.

In the capability system, soils are generally grouped at three levels—capability class, subclass, and unit.

Capability classes, the broadest groups, are designated by the numbers 1 through 8. The numbers indicate progressively greater limitations and narrower choices for practical use. The classes are defined as follows:

Class 1 soils have slight limitations that restrict their use.

Class 2 soils have moderate limitations that restrict the choice of plants or that require moderate conservation practices.

Class 3 soils have severe limitations that restrict the choice of plants or that require special conservation practices, or both.

Class 4 soils have very severe limitations that restrict the choice of plants or that require very careful management, or both.

Class 5 soils are subject to little or no erosion but have other limitations, impractical to remove, that restrict their use mainly to pasture, rangeland, forestland, or wildlife habitat.

Class 6 soils have severe limitations that make them generally unsuitable for cultivation and that restrict their use mainly to pasture, rangeland, forestland, or wildlife habitat.

Class 7 soils have very severe limitations that make them unsuitable for cultivation and that restrict their use mainly to grazing, forestland, or wildlife habitat.

Class 8 soils and miscellaneous areas have limitations that preclude commercial plant production and that restrict their use to recreational purposes, wildlife habitat, watershed, or esthetic purposes.

Capability subclasses are soil groups within one class. They are designated by adding a small letter, *e, w, s,* or *c,* to the class numeral, for example, 2e. The letter *e* shows that the main hazard is the risk of erosion unless close-growing plant cover is maintained; *w* shows that water in or on the soil interferes with plant growth or cultivation (in some soils the wetness can be partly corrected by artificial drainage); *s* shows that the soil is limited mainly because it is shallow, droughty, or stony; and *c,* used in only some parts of the United States, shows that the chief limitation is climate that is very cold or very dry.

In class 1 there are no subclasses because the soils of this class have few limitations. Class 5 contains only the subclasses indicated by *w, s,* or *c* because the soils in class 5 are subject to little or no erosion. They have other limitations that restrict their use to pasture, rangeland, forestland, wildlife habitat, or recreation.

Capability units are soil groups within a subclass. The soils in a capability unit are enough alike to be suited to the same crops and pasture plants, to require similar management, and to have similar productivity. Capability units are generally

designated by adding an Arabic numeral to the subclass symbol, for example, 2e-4 and 3e-6. These units are not given for all of the soils in the survey area.

The capability classification of map units in this survey area is given in the section "Detailed Soil Map Units" and in table 5. The classification is given even though field crops are not currently grown in the Tahoe Basin. The classification system has potential alternative uses that may apply to the soils in the basin.

Forestland

By Marchel Munnecke, Natural Resources Conservation Service.

For the purposes of developing ecological site descriptions, forestland is a spatially defined site where the historic climax plant community was dominated by a minimum of 25 percent overstory canopy cover of tree species, as determined by a crown perimeter-vertical projection. The historic climax plant community in North America is defined as the plant community that existed at the time of European immigration and settlement. It developed in equilibrium with natural disturbances, such as drought, fire, and insects. During different points of disturbance, the historic plant community may be represented by different seral stages. Vegetation on forestland provides many habitat components, aids in controlling soil erosion, is suitable for grazing or browsing by wildlife, and offers scenic and recreational opportunities. Forestland is environmentally and economically important. For more information about NRCS national forestry policies, see the NRCS "National Forestry Manual," which is available online at http://policy.nrcs.usda.gov/scripts/lpsiis.dll/M/M_190_NFM.htm.

Characterization and Management of Forestland in the Lake Tahoe Basin

Because forested areas are used for many purposes, it is important to characterize forestland on the basis of its ability to produce various kinds, proportions, and amounts of plants. This ability and the resultant plant communities are largely dependent on the soils, climate, topography, aspect, elevation, slope, and other abiotic features of the landscape. To understand the soil-plant interactions and the effects of selected management practices, the Natural Resources Conservation Service has developed ecological sites. An ecological site is a distinctive kind of land with specific physical characteristics that differs from other kinds of land in its ability to produce a distinctive kind and amount of vegetation (USDA, "National Range and Pasture Handbook"). Seventeen forestland ecological sites were developed for this soil survey. Twelve forestland ecological sites developed for the Toiyabe National Forest are also correlated in this survey area.

The correlated soil types and plant communities identified in this survey area serve as the basis for the development of each ecological site description. Soil properties that affect moisture supply and plant nutrients, such as soil texture, depth, temperature, and parent material, have a significant influence on the productivity, composition, and distribution of forest plant communities. The tree species in this survey area occur within bands of their tolerance ranges for elevation, droughtiness, and annual precipitation. Elevation in this survey area ranges from 6,200 to 11,000 feet. Jeffrey pine and white fir dominate at the lower elevations, then grade into California red fir and western white pine at the mid elevations. Sierra lodgepole pine occurs in cold air drainages and wet areas at the lower elevations and are mixed with California red fir and mountain hemlock at the upper elevations. Whitebark pine forests occur at the upper limit of the forested areas. There is a precipitation gradient across the Lake Tahoe Basin watershed; annual precipitation increases from east to

west and from lower elevations to higher elevations. The Sierra Nevada Mountains along the west shore receive more precipitation in winter and hold the snow longer in spring than the Carson Range on the east shore. The combination of elevation, aspect, soil characteristics, and precipitation create a complex pattern of montane, subalpine, and alpine forest distribution. Red fir forest occurs on the west shore, almost to lake level in some areas but more commonly above 7,500 feet. On the east side of the Carson Range, Jeffrey pine communities dominate in droughty soils and the lower precipitation zone up to an elevation of 8,000 feet before red fir becomes dominant. Southern and western aspects commonly support pine forest communities or shrub-dominated rangeland sites because of the heat intensities, high evapotranspiration rates, and the resultant droughtiness. Northern and eastern aspects, which are exposed to less solar radiation, generally support fir or hemlock forests. The upper elevation range for tree species tends to be wider on southern aspects than on northern aspects.

The geology and glacial history of the survey area affect the distribution of forest communities. The geology is dominated by volcanic and granitic bedrock, with some metamorphic bedrock. Glaciation along the southern and western areas of the Lake Tahoe Basin has formed glacially scoured basins and valleys with moraines and outwash fans. The northern and eastern areas were not heavily glaciated, and the soils in these areas formed primarily in colluvium and residuum. Differences in soil properties affect the composition, production, and distribution of the plant communities. They are important in the correlation of ecological sites to individual soil components in the map units in the survey area.

Table 6 lists the overstory and understory canopy cover by map unit and soil component. Characteristic vegetation is listed by common name and by percent cover. See Appendix 1 for a list of the common and scientific names of the plants that commonly occur in the survey area.

General Characteristics of Forestland Ecological Sites

Complete ecological site descriptions can be obtained from the Natural Resources Conservation Service or downloaded from the NRCS Ecological Site Information System Web site at http://esis.sc.egov.usda.gov. To find the ecological sites linked to this survey area, select the “ESD” option and then select “Approved ESD Reports.” This survey area is in MLRA 22A in California and Nevada. See Appendix 2 for a complete list of the ecological sites in the survey area.

F022AE001CA—Pinus albicaulis/Arabis platysperma.—This site is on moderately sloping to steep mountainsides at elevations of 8,500 to 12,000 feet (fig. 5). The site is on all aspects, but it is generally on northwest- to south-facing slopes. Slopes range from 8 to 75 percent. The plant community is a whitebark pine (*Pinus albicaulis*) forest. A few mountain hemlocks (*Tsuga mertensiana*) and Sierra lodgepole pines (*Pinus contorta* var. *murrayana*) are intermixed. The understory is dominated by gravel and rock and has a low cover of herbaceous species. The soils associated with this site are moderately deep and formed in colluvium and residuum weathered from granodiorite. They are excessively drained, are less than 39 inches deep to paralithic contact, and are very slowly permeable. The available water capacity is very low (0.77 inch to 1.07 inches) above the paralithic contact. The surface layer is very cobbly loamy coarse sand, and subsurface textures are sandy.

F022AE002CA—Pinus contorta var. murrayana/Salix lemmonii.—This site is on level to gently sloping alluvial flats along the meadow and forest interface. It occurs primarily near lake level, along the south shore of Lake Tahoe, at elevations of 6,230

Figure 5.—An area of ecological site F022AE001CA.

and 6,500 feet. The historic plant community is a Sierra lodgepole pine (*Pinus contorta* var. *murrayana*) forest with a few large, scattered white fir (*Abies concolor*), Jeffrey pine (*Pinus jeffreyi*), and incense cedar (*Calocedrus decurrens*) trees. The understory is lush with willows (*Salix* spp.), grasses, and sedges. The soils associated with this site formed primarily in alluvium derived from granodiorite. They are very deep and have a surface layer of loamy coarse sand and finer textures in the

lower horizons. The subsurface horizons reveal different episodes of deposition; fine textured horizons may be from lake sediments. The C horizon has gleyed properties from prolonged periods of saturation. Mottles from the seasonal high water table occur below a depth of 14 inches. These soils are poorly drained and are slowly permeable. They have a moderate (5.91 to 7.52 inches) available water capacity in the upper 60 inches.

F022AE004CA—Populus tremuloides-Abies concolor/Elymus glaucus.—This site is in mountain drainages at elevations of 6,230 to 9,000 feet. It is on all aspects. Slopes range from 0 to 15 percent. The plant community is an aspen (*Populus tremuloides*) grove with a lush understory of forbs and grasses. White fir (*Abies concolor*) commonly encroaches on this community during extended periods without fire. Common plants include blue wildrye (*Elymus glaucus*), Gray's licorice-root (*Ligusticum grayi*), California false hellebore (*Veratrum californicum* var. *californicum*), Fendler's meadow-rue (*Thalictrum fendleri*), Oregon checkerbloom (*Sidalcea oregana* spp. *spicata*), sweetcicely (*Osmorhiza berteroi*), slender cinquefoil (*Potentilla gracilis* var. *fastigiata*), seep monkeyflower (*Mimulus guttatus*), scarlet paintbrush (*Castilleja miniata*), slim larkspur (*Delphinium depauperatum*), western buttercup (*Ranunculus occidentalis*), arrowleaf ragwort (*Senecio triangularis*), and Sierra lodgepole pine (*Pinus contorta* var. *murrayana*). This site is flooded during the spring snowmelt, and the water table remains at a depth of 20 to 30 inches from March to May. The water table drops below a depth of 60 inches in summer and fall. The soils associated with this site formed in alluvium and colluvium derived from mixed sources. They are very deep and moderately permeable. The runoff class is high. The surface layer is loamy coarse sand or sandy loam, and subsurface textures are similar. The soils have a very low to moderate (1.94 to 6.93 inches) available water capacity in the upper 60 inches.

F022AE005CA—Pinus contorta var. murrayana-Juniperus occidentalis/Ribes/Carex rossii.—This site is in areas of glacial outwash. It is on all aspects and at elevations of 6,230 to 7,500 feet. Slopes range from 0 to 9 percent. The largest area of this site is near Meyers, California, around the Upper Truckee River. The historic climax plant community was most likely a Sierra lodgepole pine (*Pinus contorta* var. *murrayana*) forest with a few large, scattered western juniper (*Juniperus occidentalis*), white fir (*Abies concolor*), and Jeffrey pine (*Pinus jeffreyi*) trees. The understory cover was probably moderate in the openings and probably included grasses, forbs, and scattered shrubs. The soils associated with this site formed primarily in granitic material and are somewhat poorly drained and slowly permeable. The surface runoff class is high. The available water capacity is very low (1.45 to 2.02 inches) above the hardpan. The surface layer is loamy coarse sand, and subsurface textures are sandy. The soils are deep to a root-restricting, cemented hardpan at a depth of about 45 inches. Redoximorphic features indicating a seasonal high water table occur at a depth of 23 inches.

F022AE006CA—Pinus jeffreyi-Abies concolor/Ceanothus cordulatus-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides.—This site is on glacial outwash terraces and moraines at elevations of 6,240 to 7,500 feet. It is near lake level along the south side of Lake Tahoe, commonly in developed areas. It is on all aspects but is generally on northwest- to southwest-facing slopes. Slopes range from 0 to 30 percent. The plant community is a Jeffrey pine (*Pinus jeffreyi*) forest. Shrubs and forbs are in open areas between the trees. The shrubs commonly occurring in the understory include greenleaf manzanita (*Arctostaphlos patula*), whitethorn ceanothus (*Ceanothus cordulatus*), and prostrate ceanothus (*Ceanothus prostratus*). The soils associated with this site formed primarily in granitic parent material. They are very deep and have sandy surface and subsurface horizons. They

are moderately well drained to somewhat excessively drained. Permeability is very slow to rapid. The surface runoff class is slow to high. The available water capacity is low to high (2.55 to 9.26 inches) in the upper 60 inches.

F022AE007CA—Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides.—This site is in areas of glacial outwash and moraines at elevations of 6,240 and 7,900 feet (fig. 6). It is on all aspects. Slopes range from 0 to 70 percent. This is a dense white fir (*Abies concolor*)

Figure 6.—An area of ecological site F022AE007CA.

and Jeffrey pine forest (*Pinus jeffreyi*) with some incense cedar (*Calocedrus decurrens*). The understory is sparse because of a heavy tree canopy cover. The most common understory plants are western needlegrass (*Achnatherum occidentale*), whitethorn ceanothus (*Ceanothus cordulatus*), sanddune wallflower (*Erysimum capitatum* var. *perenne*), milk kelloggia (*Kelloggia galioides*), Brown's peony (*Paeonia brownii*), pinewoods lousewort (*Pedicularis semibarbata*), lambstongue ragwort (*Senecio integerrimus*), and creeping snowberry (*Symphoricarpos mollis*). This site is associated with several soils that, in areas of glacial outwash and moraines, formed in mixed granitic and volcanic material, in colluvium derived from till over andesitic rocks, or in material weathered from andesitic tuff. The soils are very deep to moderately deep and are sandy. They are moderately well drained to somewhat excessively drained and are impermeable to rapidly permeable. The surface runoff class is low to high. The available water capacity is low to high (2.80 to 10.3 inches) in the upper 60 inches.

F022AE008CA—Abies magnifica-Abies concolor/Symphoricarpos mollis-Ribes cereum/Eucephalus breweri-Thalictrum fendleri.—This site is on a glacial valley floor on the side of a mountain. It is primarily in the Ward Creek Watershed on the west side of Lake Tahoe, near Paige Meadows. It is on all aspects but is generally on northeast- to southeast-facing slopes. Elevations range from 6,240 to 7,500 feet. Slopes range from 5 to 60 percent. This community is dominated by a multilayered forest of California red fir (*Abies magnifica*) and white fir (*Abies concolor*) with a few Jeffrey pine (*Pinus jeffreyi*) trees. The understory cover is moderate. It includes shrubs, forbs, and grasses. Common plants include greenleaf manzanita (*Arctostaphylos patula*), little prince's pine (*Chimaphila menziesii*), rose thistle (*Cirsium andersonii*), Brewer's aster (*Eucephalus breweri*), mountain monardella (*Monardella odoratissima*), whitevein shinleaf (*Pyrola picta*), wax currant (*Ribes cereum*), and creeping snowberry (*Symphoricarpos mollis*). The site is associated with Paige soils, which formed in ablation till over lodgement till derived from pyroclastic rocks. The soils are deep over bedrock and have a surface layer of sandy loam and subsurface texture of cobbly sandy loam. They are well drained and slowly permeable. The surface runoff class is low to high. The available water capacity is high (8.51 to 9.97 inches) in the upper 60 inches.

F022AE009CA—Pinus contorta var. murrayana/Elymus elymoides.—This site is in areas of glacial outwash at elevations of 6,250 feet to 6,800 feet. It is on all aspects. Slopes range from 0 to 15 percent. The largest area of this site is off Pioneer Trail in South Lake Tahoe. This is a Sierra lodgepole pine (*Pinus contorta* var. *murrayana*) forest with a few white fir (*Abies concolor*) and Jeffrey pine (*Pinus jeffreyi*) trees. The understory is sparse with scattered grasses. Ross' sedge (*Carex rossii*) and squirreltail (*Elymus elymoides*) are common along with a variety of other grasses (*Poa* spp.). This site is associated with Oneidas soils. The surface layer is coarse sandy loam, which continues into the subsurface horizons. The soils have several argillic horizons and a weak fragipan beginning at a depth of 30 inches. The fragipan can restrict roots. Redoximorphic concentrations and depletions begin at a depth of 12 inches and occur throughout the rest of the profile. The soils are somewhat poorly drained and slowly permeable. The seasonal high water table is at a depth of 10 to 20 inches, dropping to greater depths in the summer. The surface runoff class is low to medium. The available water capacity is very low (1.13 to 1.49 inches) above the fragipan.

F022AE010CA—Abies magnifica-Pinus monticola/Arctostaphylos nevadensis.—This site is on mountain slopes and hillslopes at elevations of 6,800 to 9,900 feet (fig. 7). Aspects vary, and slopes range from 5 to 70 percent. This community is a California red fir (*Abies magnifica*) and western white pine (*Pinus*

Figure 7.—An area of ecological site F022AE010CA.

monticola) forest. The canopy is open and has large, widely spaced trees. Pinemat manzanita (*Arctostaphylos nevadensis*) is the most common understory shrub. This site is associated with moderately deep to very deep, somewhat excessively drained or excessively drained soils that formed in colluvium over residuum derived from granodiorite over grus. The surface layer is loamy coarse sand, coarse sand, or very gravelly loamy coarse sand. The subsurface textures are loamy coarse sand or gravelly loamy coarse sand. Permeability is very low to moderately rapid, and the surface runoff class is low to medium. The available water capacity is low or moderate (2.09 to 5.48 inches) in the upper 60 inches.

F022AE011CA—Abies magnifica-Pinus jeffreyi/Symphoricarpos rotundifolius-Ribes cereum/Lupinus argenteus.—This site is on mountain slopes at elevations of 7,600 to 8,900 feet. It is in the Carson Range, along the eastern side of the Lake Tahoe Basin. Slopes range from 9 to 50 percent. This is an open forest. California red fir (*Abies magnifica*) and Jeffrey pine (*Pinus jeffreyi*) are the most common trees. There are a few white fir (*Abies concolor*) and western white pine (*Pinus monticola*) trees. The understory is covered with a dense canopy of mixed shrubs, primarily pinemat manzanita (*Arctostaphylos nevadensis*), mountain big sagebrush (*Artemisia tridentata* spp. *vaseyana*), wax currant (*Ribes cereum* var. *cereum*), and roundleaf snowberry (*Symphoricarpos rotundifolius*). Other common plants include pine Indian paintbrush (*Castilleja applegatei*), silvery lupine (*Lupinus argenteus*), and mountain monardella (*Monardella odoratissima*). This site is associated with Shakespeare soils, which formed in colluvium derived from undifferentiated metamorphic rocks. The surface layer is gravelly loam, and the subsurface texture is gravelly heavy loam. The soils are 48 to 60 inches deep over bedrock. They are moderately well drained and slowly permeable. The surface runoff

class is medium to rapid. The available water capacity is moderate or high (5.67 to 8.77 inches) in the upper 60 inches.

F022AE013CA—Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta.—This site is on mountain slopes and hillslopes at elevations of 6,240 to 8,200 feet (fig. 8). It is on all aspects. Slopes range from 2 to 70 percent. This is a mixed conifer forest dominated by white fir (*Abies concolor*), Jeffrey Pine (*Pinus jeffreyi*), sugar pine (*Pinus lambertiana*), and incense cedar (*Calocedrus decurrens*). Various shrubs provide moderate cover in the understory. They include western serviceberry (*Amelanchier utahensis*), greenleaf manzanita (*Arctostaphylos patula*), whitethorn ceanothus (*Ceanothus cordulatus*), prostrate ceanothus (*Ceanothus prostratus*), huckleberry oak (*Quercus vacciniifolia*), Scouler's willow (*Salix scouleriana*), and creeping snowberry (*Symphoricarpos mollis*). The soils associated with this site formed in both granitic and volcanic material. Most of the site is associated with Jorge and Tahoma soils, which formed in colluvium derived from volcanic rocks. In some areas the site is on lateral moraines of primarily granitic rocks and mixed alluvium of old lake sediments. The soils are moderately deep to very deep. The surface layer is sandy loam, loamy coarse sand, or stony sandy loam. The subsurface textures are loam, loamy coarse sand, or very gravelly sandy loam. The soils are moderately well drained to somewhat excessively drained. Permeability is slow to moderate. The surface runoff class is low to high. The available water capacity is low to high (2.50 to 10.98 inches) in the upper 60 inches.

F022AE014CA—Pinus contorta-Tsuga mertensiana/Phyllodoce breweri.—This site is on mountain slopes and hillslopes at elevations of 7,000 to 9,700 feet. It is commonly in concave mountain swales. Aspects vary, and slopes range from 5 to 70 percent. This subalpine moist forest is dominated by mountain hemlock (*Tsuga mertensiana*), western white pine (*Pinus monticola*), Sierra lodgepole pine (*Pinus*

Figure 8.—An area of ecological site F022AE013CA.

contorta var. *murrayana*), and California red fir (*Abies magnifica*). The understory commonly includes purple mountainheath (*Phyllodoce breweri*) and rose meadowsweet (*Spiraea splendens* var. *splendens*) with a high diversity of other species, which may include pinemat manzanita (*Arctostaphylos nevadensis*), western Labrador tea (*Ledum glandulosum*), and Parry's rush (*Juncus parryi*). This site is associated with the moist phase of the Dagget soil. This soil is deep and excessively drained. It formed in colluvium over residuum derived from granodiorite over grus. The surface layer is gravelly loamy coarse sand. The subsurface texture is very gravelly loamy coarse sand. The soil is excessively drained and moderately permeable. The surface runoff class is low. The available water capacity is very low or low (2.09 to 3.17 inches) in the upper 60 inches.

F022AE016CA—Pinus contorta-Abies magnifica/Festuca viridula-Lupinus arbustus.—This site is on mountain slopes at elevations of 6,500 feet to 9,500 feet (fig. 9). Aspects vary, and slopes range from 9 to 50 percent. This is an open forest of Sierra lodgepole pine (*Pinus contorta* var. *murrayana*), California red fir (*Abies magnifica*), and occasional white fir (*Abies concolor*) and western white pine (*Pinus monticola*). The understory has a heavy cover of greenleaf fescue (*Festuca viridula*) and miscellaneous grasses and forbs. Common plants include needlegrass (*Achnatherum* spp.), dusky onion (*Allium campanulatum*), mountain big sagebrush (*Artemisia tridentata* spp. *vaseyana*), asters (*Aster* spp.), Ross' sedge (*Carex rossii*), squirreltail (*Elymus elymoides*), silvery lupine (*Lupinus argenteus*), and longspur lupine (*Lupinus arbustus*). This site is associated with moderately deep, well drained soils that formed in colluvium over glacial till derived from volcanic rocks. The surface layer is gravelly loamy coarse sand. The subsurface texture is very gravelly loamy coarse sand. The C horizon has is a densic, root-restrictive layer, which begins at a

Figure 9.—An area of ecological site F022AE016CA

depth of about 25 inches. This layer may be from compact glacial till. The soils are impermeable. The surface runoff class is high. The available water capacity is low (1.65 to 2.02 inches) above the densic layer.

F022AE019CA—Tsuga mertensiana-Abies magnifica/Eucephalus breweri.—This site is on mountain slopes at elevations of 6,900 to 9,000 feet. Aspects are generally north to southeast, and slopes range from 5 to 70 percent. This is a subalpine forest with mountain hemlock (*Tsuga mertensiana*), Sierra lodgepole pine (*Pinus contorta* var. *murrayana*), California red fir (*Abies magnifica*), and western white pine (*Pinus monticola*). The understory cover is low and has scattered forbs and grasses. This site is associated with moderately deep, well drained soils that formed in colluvium over residuum weathered from andesitic tuff. The surface layer is gravelly medial sandy loam. The subsurface texture is very stony medial sandy loam. Paralithic contact is at a depth of 24 to 36 inches. Permeability is moderately rapid above the bedrock. The surface runoff class is high. The available water capacity is very low or low (2.03 to 2.67 inches) above the bedrock.

F022AE021CA—Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula.—This site is on gently sloping to steep slopes at elevations of 6,240 to 8,700 feet. The aspects are generally south, west, and northwest. This is an open Jeffrey pine (*Pinus jeffreyi*) forest with occasional white fir (*Abies concolor*) and a tree canopy of less than 50 percent. The understory is a mixture of several different shrub species, including greenleaf manzanita (*Arctostaphylos patula*), huckleberry oak (*Quercus vacciniifolia*), antelope bitterbrush (*Purshia tridentata*), whitethorn ceanothus (*Ceanothus cordulatus*), mountain big sagebrush (*Artemisia tridentata* spp. *vaseyana*), prostrate ceanothus (*Ceanothus prostratus*), and snowbrush ceanothus (*Ceanothus velutinus*). The dominance of these shrubs varies, depending on the aspect, elevation, and the history of fire in the area. This site is associated with somewhat excessively drained, deep or moderately deep, sandy soils. Most of these soils formed in colluvium over residuum derived from latite, trachyte, or granodiorite. In some areas the soils formed in till derived from granodiorite. Permeability is very slow or slow, and the surface runoff class is low to high. The available water capacity is low or moderate (1.64 to 5.76 inches) in the upper 60 inches.

F022AE023CA—Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides.—This site is on mountain side slopes, generally in unglaciated areas, at elevations of 6,240 feet and 8,400 feet. It is on all aspects but is generally on north- to northwest-facing slopes. Slopes range from 5 to 70 percent. This is a Jeffrey pine (*Pinus jeffreyi*) forest with an average of 70 percent canopy cover. White fir (*Abies concolor*) occasionally occurs. The understory is a low cover of shrubs, forbs, and grasses. It includes needlegrass (*Achnatherum* spp.), squirreltail (*Elymus elymoides*), Sandberg bluegrass (*Poa secunda*), greenleaf manzanita (*Arctostaphylos patula*), roundleaf snowberry (*Symphoricarpos rotundifolius*), woolly mule-ears (*Wyethia mollis*), catchfly (*Silene* spp.), lambstongue ragwort (*Senecio integerrimus*), and silverleaf phacelia (*Phacelia hastata*). The soils associated with this site formed in colluvium over residuum weathered from granodiorite or metamorphic rocks. The surface layer is gravelly loamy sand or gravelly fine sandy loam. The subsurface texture is loamy sand or fine sandy loam. The soils are very deep and are somewhat excessively drained or well drained. Permeability ranges from slow to moderately rapid. The surface runoff class is low to high. The available water capacity is low to very high (3.87 to 10.16 inches) in the upper 60 inches.

F022AE024CA—Abies concolor-Abies magnifica/Ceanothus velutinus-Ceanothus cordulatus.—This site is on mountain slopes, generally on southern aspects, at elevations of 7,300 to 9,050 feet. Slopes range from 5 to 50 percent. This is a forest of California red fir (*Abies magnifica*) and white fir (*Abies concolor*) with

very little diversity in the understory. Pinemat manzanita (*Arctostaphylos nevadensis*), greenleaf manzanita (*Arctostaphylos patula*), snowbrush ceanothus (*Ceanothus velutinus*), and Sierra chinquapin (*Chrysolepis sempervirens*) are the most common understory plants. They are intermixed with sparse grasses. The soils associated with this site formed in colluvium over residuum weathered from andesite. The surface layer is gravelly sandy loam. The subsurface texture is mainly very gravelly to very cobbly sandy clay loam. Stony loam occurs above hard andesite bedrock at a depth of about 67 inches. The soils are very deep and well drained. Permeability is moderate, and the surface runoff class is low to medium. The available water capacity is moderate or high (5.6 to 7.3 inches) in the upper 60 inches.

The following Nevada ecological sites occur within the Lake Tahoe Basin.

F022AY102NV—Pinus contorta/Artemisia tridentata ssp. vaseyana- Ribes/ Carex-Achnatherum lemmonii var. lemmonii.—This site occurs on mountain slopes and moraines that are characteristically above 7,000 feet. It is on southeast- and southwest-facing slopes in most areas and on northwest-facing slopes in some areas. Slopes range from 4 to 30 percent. A Sierra lodgepole pine (*Pinus contorta* var. *murrayana*) forest dominates the landscape. Jeffrey pine (*Pinus jeffreyi*), Sierra juniper (*Juniperus occidentalis* var. *australis*), and white fir (*Abies concolor*) also are common. Mountain big sagebrush (*Artemisia tridentata* spp. *Vaseyana*) and currant (*Ribes* spp.) are abundant in the understory. Other common plants include Letterman's needlegrass (*Achnatherum lettermanii*), western needlegrass (*Achnatherum occidentale* spp. *occidentale*), mountain brome (*Bromus marginatus*), threadleaf sedge (*Carex filifolia*), Ross's sedge (*Carex rossii*), bottlebrush squirreltail (*Elymus elymoides*), slender wheatgrass (*Elymus trachycaulus*), spike trisetum (*Trisetum spicatum*), and a forb called mule-ears (*Wyethia amplexicaulis*). The soils associated with this site are very deep and somewhat excessively drained and formed in till derived mainly from granitic rocks. The surface layer is extremely gravelly loamy coarse sand, which continues through the profile. The surface runoff class is low to medium. Permeability is rapid. The available water capacity is very low or low (2.06 to 3.48 inches) in the upper 60 inches.

F022AY105NV—Pinus contorta-Abies magnifica/Artemisia tridentata ssp. vaseyana/Bromus marginatus-Achnatherum occidentale ssp californicum.—This site typically occurs on the middle to upper side slopes on mountains above 8,000 feet. It occurs on all aspects but is most common on northeast- and northwest-facing slopes. Slopes range from 8 to 50 percent. Sierra lodgepole pine (*Pinus contorta* var. *murrayana*) and California red fir (*Abies magnifica*) dominate this forest community. Sierra juniper (*Juniperus occidentalis* var. *australis*) and western white pine (*Pinus monticola*) also occur along with a low cover. The understory is similar to that of the site F022AY102NV, but mountain snowberry (*Symphoricarpos oreophilus*) is a major associate. The soils associated with this site are moderately deep and well drained and formed in residuum and colluvium derived from andesitic tuff and tuff-breccia. The surface layer is very gravelly coarse sandy loam, which extends downward to weathered tuff at a depth of 29 inches. The surface runoff class is medium or high. Permeability is moderately rapid. The available water capacity is low (2.62 to 3.79 inches) above the weathered tuff.

F022AY106NV—Pinus contorta-Abies magnifica/Arctostaphylos nevadensis/ Achnatherum occidentale ssp. occidentale-Carex.—This site typically is on mountains that characteristically are above 7,500 feet. It is on the middle to upper side slopes and on ridgetops. It occurs on all aspects but is most common on southeast- and southwest-facing slopes. Slopes range from 8 to 50 percent. They are

typically less than 30 percent. This site is dominated by Sierra lodgepole pine (*Pinus contorta* var. *murrayana*) and California red fir (*Abies magnifica*). Western white pine (*Pinus monticola*) and mountain hemlock (*Tsuga mertensiana*) occur in the overstory. The understory is dominated by pinemat manzanita (*Arctostaphylos nevadensis*). Ross's sedge (*Carex rossii*) and western needlegrass (*Achnatherum occidentale* spp. *occidentale*) are the most prevalent understory plants. Lupine (*Lupinus* spp.), rockcress (*Arabis* spp.), mountain monardella (*Monardella odoratissima*), phlox (*Phlox* spp.), and buckwheat (*Eriogonum* spp.) also are common. The soils associated with this site are very deep and somewhat excessively drained and formed in colluvium and residuum derived from granitic rocks. The surface layer is gravelly loamy coarse sand, and the subsurface horizons are gravelly loamy coarse sand. The surface runoff class is low or medium. Permeability is rapid. The available water capacity is very low (0.65 to 0.93 inch) in the upper 60 inches.

F022AY114NV—Tsuga mertensiana/Carex-Poa.—This site typically occurs on the upper mountain side slopes and is most common is directly below ridgetops on very steep north-facing slopes. It is characteristically above 7,500 feet. Winter snowpacks persist into the summer season in many years. Slopes are steep or very steep, ranging from 15 to 50 percent. This site is dominated by mountain hemlock (*Tsuga mertensiana*), but western white pine (*Pinus monticola*) and California red fir (*Abies magnifica*) may be associated with the overstory community. Lodgepole pine (*Pinus contorta* var. *murrayana*) occasionally occurs in the overstory. The understory is sparse, and the shrub layer is essentially nonexistent. Ross' sedge (*Carex rossii*), other sedges (*Carex* spp.), slender wheatgrass (*Elymus trachycaulus*), and Bolander's bluegrass (*Poa bolanderi*) are the most prevalent grasses and grasslike plants in the understory. Rockcress (*Arabis* spp.), phacelia (*Phacelia* spp.), lousewort (*Pedicularis* spp.), and white hawkweed (*Hieracium albiflorum*) are common understory forbs. The soils associated with this site are moderately deep and well drained and formed in colluvium and residuum derived from andesite, tuff, and tuff-breccia. The surface layer is very gravelly peaty coarse sandy loam about 1 inch thick. The subsurface textures are very gravelly coarse sandy loam, which extends downward to extremely gravelly and extremely cobbly coarse sandy loam. Hard andesite bedrock is at a depth of about 35 inches. The surface runoff class is high. Permeability is moderately rapid. The available water capacity is very low or low (2.27 to 4.20 inches) above the bedrock.

F022AY116NV—Pinus jeffreyi-Abies concolor var. lowiana/Artemisia tridentata ssp. vaseyana/Achnatherum occidentale ssp. occidentale.—This site is on all aspects on moraines and mountain side slopes at elevations of 6,000 to 9,000 feet. Slopes range from 8 to more than 50 percent. They are generally 30 to 50 percent. The historic climax plant community is characterized by an overstory canopy of 25 to 35 percent, dominated by Jeffrey pine (*Pinus jeffreyi*). California white fir (*Abies concolor*) and Sierra juniper (*Juniperus occidentalis* var. *australis*) also are common in the overstory. Mountain big sagebrush (*Artemisia tridentata* spp. *vaseyana*), bitterbrush (*Purshia tridentata*), whitethorn ceanothus (*Ceanothus cordulatus*), and currant (*Ribes* spp.) are the principal understory shrubs. Western needlegrass (*Achnatherum occidentale* spp. *occidentale*), Letterman's needlegrass (*Achnatherum lettermanii*), big squirreltail (*Elymus multisetus*), and sedges (*Carex* spp.) are the most prevalent understory grasses and grasslike plants, and arrowleaf balsamroot (*Balsamorhiza sagittata*), coyote mint (*Monardella villosa*), rockcress (*Arabis* spp.), and buckwheat (*Eriogonum* spp.) are common understory forbs. The soils associated with this site are very deep and well drained and formed in till derived from mixed rocks. They have a surface layer of extremely gravelly sandy loam and have similar subsurface textures. The surface runoff class is low.

Permeability is moderately rapid. The available water capacity is very low or low (2.20 to 3.87 inches) in the upper 60 inches.

F022AY118NV—Abies magnifica-Pinus contorta/Artemisia tridentata ssp. vaseyana/Bromus marginatus-Achnatherum occidentale ssp. occidentale.—This site typically is on the middle to upper side slopes on mountains that characteristically are above 7,500 feet. It occurs on all aspects but is most common on northeast- and northwest-facing slopes. Slopes range from 8 to 50 percent. The site is dominated by California red fir (*Abies magnifica*) and Sierra lodgepole pine (*Pinus contorta* var. *murrayana*). Western white pine (*Pinus monticola*), whitebark pine (*Pinus albicaulis*), and mountain hemlock (*Tsuga mertensiana*) may also occur in the overstory. The understory is dominated by mountain big sagebrush (*Artemisia tridentata* spp. *vaseyana*), currant (*Ribes* spp.), and snowberry (*Symphoricarpos* spp.). Also in the understory are mountain brome (*Bromus marginatus*), western needlegrass (*Achnatherum occidentale spp. occidentale*), Ross' sedge (*Carex rossii*), lupine (*Lupinus* spp.), rockcress (*Arabis* spp.), coyote mint (*Monardella villosa*), and mule-ears (*Wyethia amplexicaulis*). The soils associated with this site are very deep, are well drained or somewhat excessively drained, and formed in colluvium derived from granitic rocks or in till derived from mixed rocks. They have a surface layer of gravelly loamy sand or very gravelly coarse sandy loam and have similar subsurface textures. The surface runoff class is low to medium. Permeability is moderate to rapid. The available water capacity is low or moderate (2.99 to 6.09 inches) in the upper 60 inches.

F022AY120NV—Pinus jeffreyi/Arctostaphylos nevadensis/Achnatherum lettermanii.—This site is on mountains at elevations of 8,000 to more than 10,000 feet. It is on the middle to upper side slopes and on ridgetops. It occurs on all aspects but is most common on south-facing slopes. Slopes range from 30 to 75 percent. They are generally 30 to 50 percent. This site is dominated by Jeffrey pine (*Pinus jeffreyi*) with a canopy cover of 25 to 35 percent. California red fir (*Abies magnifica*) and Sierra juniper (*Juniperus occidentalis* var. *australis*) also are common. Pinemat manzanita (*Arctostaphylos nevadensis*), bitter cherry (*Prunus emarginata*), snowbrush ceanothus (*Ceanothus velutinus*), whitethorn ceanothus (*Ceanothus cordulatus*), creeping snowberry (*Symphoricarpos mollis*), and Sierra chinquapin (*Chrysolepis sempervirens*) are the primary understory shrubs. The herbaceous layer varies. Letterman's (*Achnatherum lettermanii*) and western needlegrass (*Achnatherum occidentale spp. occidentale*) are the most prevalent understory grasses. Coyote mint (*Monardella villosa*), rockcress (*Arabis* spp.), wallflower (*Erysimum* spp.), buckwheat (*Eriogonum* spp.), and lupine (*Lupinus* spp.) are common understory forbs. The soils associated with this site are shallow and somewhat excessively drained and formed in colluvium and residuum derived from granitic rocks. The surface layer is very bouldery coarse sand, which extends downward to soft, weathered granodiorite bedrock at a depth of 14 to 20 inches. The surface runoff class is high. Permeability is rapid. The available water capacity is very low or low (0.65 inch to 2.61 inches) above the weathered bedrock.

F022AY121NV—Pinus contorta-Abies magnifica/Artemisia tridentata ssp. tridentata/Achnatherum occidentale ssp. occidentale-Carex rossii.—This site typically is on mountains at elevations above 8,000 feet. It is on the middle to upper side slopes and on ridgtops. It occurs on all aspects but is most common on southeast- and southwest-facing slopes. Slopes range from 15 to 75 percent. The historic climax plant community is characterized by an overstory of Sierra lodgepole pine (*Pinus contorta* var. *murrayana*) and California red fir (*Abies magnifica*). Western white pine (*Pinus monticola*), Jeffrey pine (*Pinus jeffreyi*), and Sierra juniper (*Juniperus occidentalis* var. *australis*) may also occur in the overstory. Shrubs are sparse, making the herbaceous layer most abundant. Ross' sedge (*Carex rossii*),

western needlegrass (*Achnatherum occidentale* spp. *occidentale*), rockcress (*Arabis* spp.), coyote mint (*Monardella villosa*), phlox (*Phlox* spp.), and buckwheat (*Eriogonum* spp.) are very common. The soils associated with this site are very shallow or shallow, are excessively drained, and formed in residuum and colluvium derived from granitic rocks. The surface layer is bouldery coarse sand. It is underlain by gravelly loamy coarse sand. Weathered granodiorite bedrock is at a depth of 16 inches. The surface runoff class is medium or high. Permeability is rapid. The available water capacity is very low (0.42 to 0.93 inch) above the weathered bedrock.

F022AY134NV—Pinus albicaulis/Carex-Poa. —This site is on smooth or concave side slopes on mountains at elevations that generally are more than 8,500 feet. It is typically on north aspects at the lower elevations and on all aspects at the higher elevations. Slopes range from 8 to more than 75 percent. They are typically more than 30 percent. This site is dominated by open woodland of primarily whitebark pine (*Pinus albicaulis*). Lodgepole pine (*Pinus contorta* var. *murrayana*) commonly is a minor constituent of the overstory. Mountain brome (*Bromus marginatus*), Letterman's needlegrass (*Achnatherum lettermanii*), pine needlegrass (*Achnatherum pinetorum*), western needlegrass (*Achnatherum occidentale spp. occidentale*), bluegrasses (*Poa* spp.), sedges (*Carex* spp.), and lupines (*Lupinus* spp.) are the most common understory species. The soils associated with this site are shallow and somewhat excessively drained and formed in colluvium and residuum derived from granitic rocks. The surface layer is very gravelly loamy coarse sand, which extends to soft, weathered granodiorite bedrock at a depth of 20 to 30 inches. The surface runoff class is very high. Permeability is rapid. The available water capacity is very low (0.45 to 0.75 inch) above the weathered bedrock.

Numerical List of Forestland Ecological Sites

An asterisk (*) in the following list indicates Nevada ecological sites that are only minor components in this survey area and are not described in this survey.

F022AE001CA	Pinus albicaulis/Arabis platysperma
F022AE002CA	Pinus contorta var. murrayana/Salix lemmonii
F022AE004CA	Populus tremuloides-Abies concolor/Elymus glaucus
F022AE005CA	Pinus contorta var. murrayana-Juniperus occidentalis/Ribes/Carex rossii
F022AE006CA	Pinus jeffreyi-Abies concolor/Ceanothus cordulatus-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides
F022AE007CA	Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides
F022AE008CA	Abies magnifica-Abies concolor/Symphoricarpos mollis-Ribes cereum/Eucephalus breweri-Thalictrum fendleri
F022AE009CA	Pinus contorta var. murrayana/Ceanothus cordulatus/Elymus elymoides
F022AE010CA	Abies magnifica-Pinus monticola/Arctostaphylos nevadensis
F022AE011CA	Abies magnifica-Pinus jeffreyi/Symphoricarpos rotundifolius-Ribes cereum/Lupinus argenteus
F022AE013CA	Abies concolor-Pinus lambertiana/Quercus vacciniifolia-Amelanchier utahensis/Pyrola picta
F022AE014CA	Pinus contorta-Tsuga mertensiana/Phyllodoce breweri

F022AE016CA	Pinus contorta-Abies magnifica/Festuca viridula-Lupinus arbustus
F022AE019CA	Tsuga mertensiana-Abies magnifica/Eucephalus breweri
F022AE021CA	Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula
F022AE023CA	Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/ Elymus elymoides
F022AE024CA	Abies concolor-Abies magnifica/Ceanothus velutinus-Ceanothus cordulatus
F022AY102NV	Pinus contorta/Artemisia tridentata ssp. vaseyana- Ribes/Carex-Achnatherum lemmonii var. lemmonii
F022AY103NV*	Populus tremuloides/Symphoricarpos/Bromus marginatus-Elymus trachycaulus ssp. trachycaulus
F022AY104NV*	Populus tremuloides/Salix-Rosa woodsii/Poa-Elymus trachycaulus ssp. trachycaulus
F022AY105NV	Pinus contorta-Abies magnifica/Artemisia tridentata ssp. vaseyana/Bromus marginatus-Achnatherum occidentale ssp californicum
F022AY106NV	Pinus contorta-Abies magnifica/Arctostaphylos nevadensis/ Achnatherum occidentale ssp. occidentale-Carex
F022AY109NV*	Pinus contorta-Tsuga mertensiana/Carex
F022AY114NV	Tsuga mertensiana/Carex-Poa
F022AY116NV	Pinus jeffreyi-Abies concolor var. lowiana/Artemisia tridentata ssp. vaseyana/Achnatherum occidentale ssp. occidentale
F022AY118NV	Abies magnifica-Pinus contorta/Artemisia tridentata ssp. vaseyana/Bromus marginatus-Achnatherum occidentale ssp. Occidentale
F022AY120NV	Pinus jeffreyi/Arctostaphylos nevadensis/Achnatherum lettermanii
F022AY121NV	Pinus contorta-Abies magnifica/Artemisia tridentata ssp. tridentata/Achnatherum occidentale ssp. occidentale-Carex rossii
F022AY134NV	Pinus albicaulis/Carex-Poa

Alphabetical List of Forestland Ecological Sites

An asterisk (*) in the following list indicates Nevada ecological sites that are only minor components in this survey area and are not described in this survey.

Abies concolor-Abies magnifica/Ceanothus velutinus-Ceanothus cordulatus (F022AE024CA)

Abies concolor-Pinus jeffreyi/Ceanothus cordulatus-Symphoricarpos mollis/Kelloggia galioides (F022AE007CA)

Abies concolor-Pinus lambertiana/Quercus vacciniifolia- Amelanchier utahensis/ Pyrola picta (F022AE013CA)

Abies magnifica-Abies concolor/Symphoricarpos mollis-Ribes cereum/Eucephalus breweri-Thalictrum fendleri (F022AE008CA)

Abies magnifica-Pinus contorta/Artemisia tridentata ssp. vaseyana/Bromus marginatus-Achnatherum occidentale ssp. Occidentale (F022AY118NV)

Abies magnifica-Pinus jeffreyi/Symphoricarpos rotundifolius-Ribes cereum/Lupinus argenteus (F022AE011CA)

Abies magnifica-Pinus monticola/Arctostaphylos nevadensis (F022AE010CA)

Pinus albicaulis/Arabis platysperma (F022AE001CA)

Pinus albicaulis/Carex-Poa (F022AY134NV)

Pinus contorta var. murrayana/Ceanothus cordulatus/Elymus elymoides (F022AE009CA)*

Pinus contorta var. murrayana/Salix lemmonii (F022AE002CA)

Pinus contorta var. murrayana-Juniperus occidentalis/Ribes/Carex rossii (F022AE005CA)

Pinus contorta/Artemisia tridentata ssp. vaseyana- Ribes/Carex-Achnatherum lemmonii var. lemmonii (F022AY102NV)

Pinus contorta-Abies magnifica/Arctostaphylos nevadensis/Achnatherum occidentale ssp. occidentale-Carex (F022AY106NV)

Pinus contorta-Abies magnifica/Artemisia tridentata ssp. tridentata/Achnatherum occidentale ssp. occidentale-Carex rossii (F022AY121NV)

Pinus contorta-Abies magnifica/Artemisia tridentata ssp. vaseyana/Bromus marginatus-Achnatherum occidentale ssp californicum (F022AY105NV)

Pinus contorta-Abies magnifica/Festuca viridula-Lupinus arbustus (F022AE016CA)

Pinus contorta-Tsuga mertensiana/Carex (F022AY109NV)

Pinus contorta-Tsuga mertensiana/Phyllodoce breweri (F022AE014CA)

Pinus jeffreyi/Arctostaphylos nevadensis/Achnatherum lettermanii (F022AY120NV)

Pinus jeffreyi/Arctostaphylos patula-Ceanothus cordulatus/Elymus elymoides (F022AE023CA)

Pinus jeffreyi/Purshia tridentata-Arctostaphylos patula (F022AE021CA)

Pinus jeffreyi-Abies concolor var. lowiana/Artemisia tridentata ssp. vaseyana/ Achnatherum occidentale ssp. occidentale (F022AY116NV)

Pinus jeffreyi-Abies concolor/Ceanothus cordulatus-Ceanothus prostratus/Pedicularis semibarbata-Kelloggia galioides (F022AE006CA)

Populus tremuloides/Salix-Rosa woodsii/Poa-Elymus trachycaulus ssp. trachycaulus (F022AY104NV)*

Populus tremuloides/Symphoricarpos/Bromus marginatus- Elymus trachycaulus ssp. trachycaulus (F022AY103NV)*

Populus tremuloides-Abies concolor/Elymus glaucus (F022AE004CA)

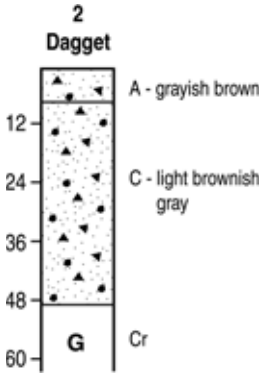
Tsuga mertensiana/Carex-Poa (F022AY114NV)

Tsuga mertensiana-Abies magnifica/Eucephalus breweri (F022AE019CA)

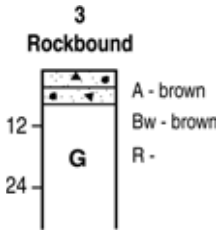
Selected Forestland and Rangeland Ecological Sites

The following paragraphs describe selected ecological sites in the survey area. Illustrations showing the profiles of the major soil components in the sites accompany the descriptions. The profile ID number, component name, typical vegetation, and ecological site number precede the descriptions. Figures 10 and 11 are legends for the symbols used in the illustrations.

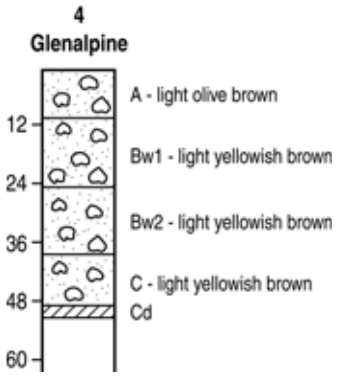
1 Rock outcrop and rubble land; barren; N/A.—Generally, mountain peaks and talus fields at upper elevations with very little vegetation.



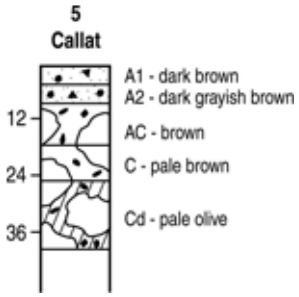
2 Dagget, moist; subalpine mixed conifer forest; F022AE014CA.—This site is on mountain slopes and hillslopes at elevations of 7,000 to 9,700 feet. Aspects vary, and slopes range from 5 to 70 percent. This site is associated with the moist phase of the Dagget series. It is commonly in mountain swales. The soil is deep and excessively drained. It formed in colluvium over residuum derived from granodiorite over grus. The surface layer is gravelly loamy coarse sand. This moist subalpine forest is dominated by mountain hemlock (*Tsuga mertensiana*), western white pine (*Pinus monticola*), Sierra lodgepole pine (*Pinus contorta* var. *murrayana*), and California red fir (*Abies magnifica*). The understory commonly includes purple mountainheath (*Phyllodoce breweri*) and rose meadowsweet (*Spiraea splendens* var. *splendens*) along with a high diversity of other species.



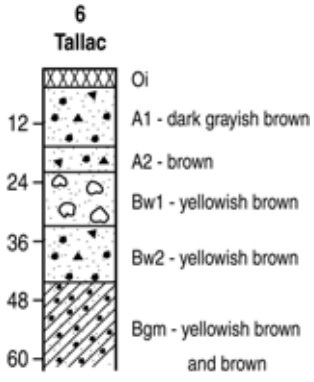
3 Rockbound; scattered trees and shrubs among granite bedrock; R022AE202CA.—This site is in areas of glacially scoured valleys and side slopes. Granite bedrock covers more than 50 percent of the area. This site is on all aspects but is generally on south- to southeast-facing slopes. It is at elevations of 6,300 to 9,000 feet. Slopes range from 0 to 70 percent. The Rockbound soil associated with this site formed in colluvium derived from granodiorite. The soil is in patches between rock outcrops and large boulders. It is shallow, having lithic contact at a depth of 4 to 10 inches. The surface and subsurface horizons are very gravelly loamy coarse sand. Western juniper (*Juniperus occidentalis* var. *australis*), Jeffrey pine (*Pinus jeffreyi*), and lodgepole pine (*Pinus contorta* ssp. *murrayana*) provide less than 10 percent cover. Huckleberry oak (*Quercus vacciniifolia*) and greenleaf manzanita (*Arctostaphylos patula*) are common on sides lopes. This plant community has a high diversity of annuals.



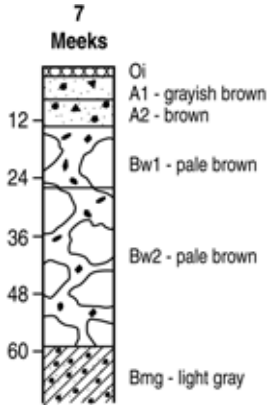
4 Glenalpine; huckleberry oak and greenleaf manzanita shrubland; R022AE213CA.—This site is on glacially scoured valley walls. Rubble land (talus) and rock outcrop cover more than 50 percent of the area. The site is on all aspects but is generally on south- to southeast-facing slopes. Elevations range from 6,240 to 9,100 feet. Slopes range from 50 to 90 percent. The Glenalpine soil associated with this site is deep and excessively drained. It formed in colluvium derived from volcanic and metamorphic rocks. The surface layer is very cobbly fine sandy loam. It is underlain by extremely cobbly fine sandy loam. A root-restrictive layer of dense glacial till is at a depth of 40 to 60 inches. This site is a shrubland dominated by huckleberry oak (*Quercus vacciniifolia*). The tree cover is less than 5 percent. Greenleaf manzanita (*Arctostaphylos patula*), whitethorn ceanothus (*Ceanothus cordulatus*), and bitter cherry (*Prunus emarginata*) are common. Western serviceberry (*Amelanchier utahensis*), oceanspray (*Holodiscus discolor*), and roundleaf snowberry (*Symphoricarpos rotundifolius*) are at the higher elevations.

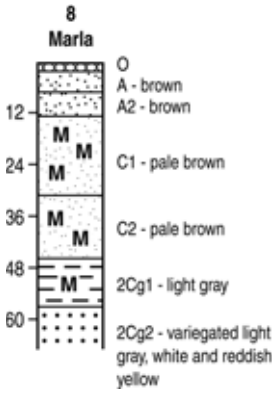


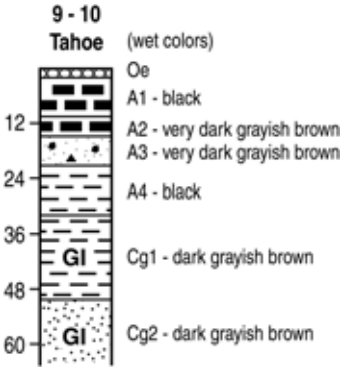
5 Callat; open Sierra lodgepole pine/western white pine/red fir forest; F022AE016CA.—This site is on mountain slopes at elevations of 6,500 to 9,500 feet. Aspects vary, and slopes range from 9 to 50 percent. The Callat soil associated with this site is moderately deep and well drained. It formed in colluvium over glacial till derived from volcanic rocks. The surface layer is gravelly loamy coarse sand. The subsurface texture is very gravelly loamy coarse sand. There is a densic, root-restrictive layer (Cd horizon), beginning about 25 inches below the surface. This layer may be from compacted glacial till. This site is an open forest of Sierra lodgepole pine *(Pinus contorta* var. *murrayana*), California red fir (*Abies magnifica*), and occasional white fir (*Abies concolor*) and western white pine (*Pinus monticola*). The understory has a heavy cover of greenleaf fescue (*Festuca viridula*) and other grasses with a variety of forbs.



6 Tallac; white fir/Jeffrey pine forest; F022AE007CA.—This site is in areas of glacial outwash and on moraines. It is on all aspects. Slopes range from 0 to 70 percent. Elevations range from 6,240 to 7,900 feet. The Tallac soil associated with this site formed in glacial outwash and other glacial material derived mixed granitic and volcanic parent materials. It is deep or very deep and has subsurface textures of very gravelly or cobbly coarse sandy loam. This is a dense white fir (*Abies concolor*) and Jeffrey pine (*Pinus jeffreyi*) forest with some incense cedar (*Calocedrus decurrens*). The understory is







sparse because of a high tree canopy cover. Common understory plants are western needlegrass (*Achnatherum occidentale*), whitethorn ceanothus (*Ceanothus cordulatus*), milk kelloggia (*Kelloggia galioides*), pinewoods lousewort (*Pedicularis semibarbata*), lambstongue ragwort (*Senecio integerrimus*), and creeping snowberry (*Symphoricarpos mollis*).

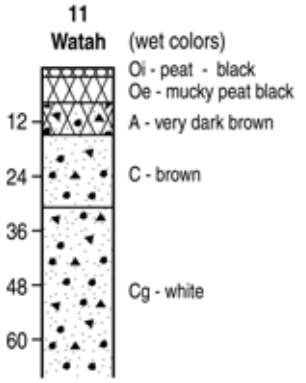
7 Meeks, extremely stony; open Jeffrey pine and white fir forest with huckleberry oak and greenleaf manzanita; F022AE021CA.—This site is on gently sloping to steep slopes at elevations of 6,240 to 8,700 feet. Aspects are generally south, west, and northwest. The Meeks soil associated with this site is deep or very deep and formed in till derived from granodiorite. This is an open Jeffrey pine (*Pinus jeffreyi*) forest with occasional white fir (*Abies concolor*). The total tree canopy is less than 50 percent. The understory has a heavy cover of shrubs. Species composition depends on aspect, elevation, and the history of fires. Common shrubs include huckleberry oak (*Quercus vacciniifolia*), greenleaf manzanita (*Arctostaphylos patula*), antelope bitterbrush (*Purshia tridentata*), and whitethorn ceanothus (*Ceanothus cordulatus*).

8 Marla; lodgepole pine forest with willows; F022AE002CA.—This site is on level to gently sloping alluvial flats along the meadow and forest interface. It is primarily near lake level, along the south shore of Lake Tahoe. Elevations are 6,230 to 6,500 feet. The Marla associated with this site soil formed primarily in alluvium derived from granodiorite. It is very deep, has a surface layer of loamy coarse sand, and is finer textured in the lower horizons. This is a Sierra lodgepole pine (*Pinus contorta* var. *murrayana*) forest with a few large scattered white fir (*Abies concolor*), Jeffrey pine (*Pinus jeffreyi*), and incense cedar (*Calocedrus decurrens*) trees. The understory is lush with willows (*Salix* spp.), grasses, and sedges.

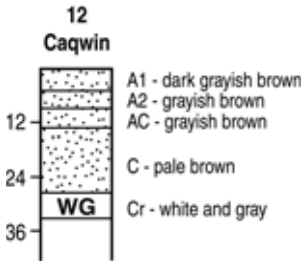
9 Tahoe; grass and sedge community; R022AE208CA.—This site is on alluvial flats and flood plains. Stream channels meander through the site. Slopes range from 0 to 2 percent, and elevations range from 6,200 to 8,000 feet. The Tahoe soil associated with this site formed in alluvium derived from mixed sources. It is very deep and very poorly drained and has a surface layer of mucky silt loam. The vegetation is dominated by graminoids and forbs. Common species include common yarrow (*Achillea millefolium*), hairy arnica (*Arnica mollis*), Nebraska sedge (*Carex nebrascensis*), tufted hairgrass (*Deschampsia caespitosa*), Baltic rush (*Juncus balticus*), straightleaf rush (*Juncus*

orthophyllus), bluegrass (*Poa* spp.), American bistort (*Polygonum bistortoides*), slender cinquefoil (*Potentilla gracilis* var*. fastigiata*), and Oregon checkerbloom (*Sidalcea oregana* ssp. *Spicata*).

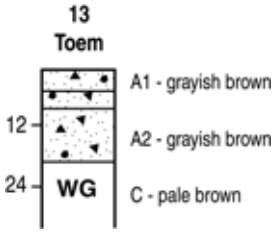
10 Tahoe mucky silt loam, wet phase; mixed willow and sedge community; R022AE203CA.—This site is on alluvial flats and flood plains. Stream channels meander through the site. Slopes range from 0 to 2 percent, and elevations range from 6,200 to 8,000 feet. The wet silty loam phase of the Tahoe soil associated with this site formed in alluvium derived from mixed sources. It is very deep and very poorly drained and has a surface layer of mucky silt loam. It has a higher water table during the summer than the Tahoe soil on the site R022AE208CA. The plant community is a mixed willow shrubland with Lemmon's willow (*Salix lemmonii*), Geyer willow (*Salix geyeriana*) and shining willow (*Salix lucida*). The understory has a heavy cover of mostly graminoid species, including Nebraska sedge (*Calamagrostis stricta*) and whitestem gooseberry (*Ribes inerme* var*. inerme*).



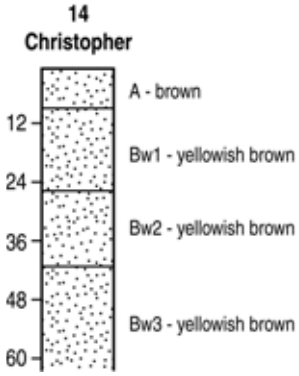
11 Watah; sedge community; R022AE209CA.—This site is on wet flood plains, on low-angle slopes that range to as much as 2 percent. Elevations range from 6,220 to 9,416 feet. The Watah soil associated with this site formed in thick organic peat over sandy alluvial deposits. It is very deep and poorly drained. Northwest Territory sedge (*Carex utriculata*) and blister sedge (*Carex vesicaria*) generally dominate this fen ecological site. Other common plants include miscellaneous sedges (*Carex* spp.), spikerush (*Eleocharis*), Baltic rush (*Juncus balticus*), Geyer's willow (*Salix geyeriana*), and Lemmon's willow (*Salix lemmonii*).



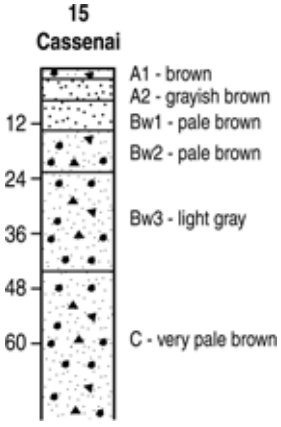
12 Cagwin; open Jeffrey pine and white fir forest with huckleberry oak and greenleaf manzanita; F022AE021CA.—This site is on gently sloping to steep slopes in areas of moderately deep, sandy soils. Elevations range from 6,240 to 8,700 feet. Aspects are generally south, west, and northwest. The Cagwin soil associated with this site formed in colluviuim over granodiorite. This is an open Jeffrey pine (*Pinus jeffreyi*) forest with occasional white fir (*Abies concolor*). The total tree canopy is less than 50 percent. The understory has a heavy cover of shrubs. Species composition depends on aspect, elevation, and the history of fires. Common shrubs include greenleaf manzanita (*Arctostaphylos patula*), antelope bitterbrush (*Purshia tridentata*), and mountain big sagebrush (*Artemisia tridentata* ssp. *vaseyana*).



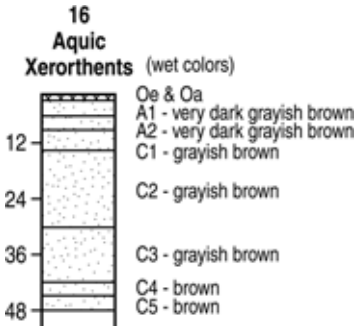
13 Toem; huckleberry oak and greenleaf manzanita shrubland; R022AE210CA.—This site is on mountain slopes at elevations of 6,300 to 8,900 feet. Slopes range from 9 to 70 percent. Aspects generally are southern. The Toem soil associated with this site is shallow and formed in colluvium and residuum derived from granitic rocks. It is gravelly coarse sand throughout. The vegetation is patchy and is dominated by greenleaf manzanita (*Arctostaphylos patula*) and huckleberry oak (*Quercus vacciniifolia*). California red fir (*Abies magnifica*), white fir (*Abies concolor*), Jeffrey pine (*Pinus jeffreyi*), and western white pine (*Pinus monticola*) provide less than 10 percent cover. Other common plants include pinemat manzanita (*Arctostaphylos nevadensis*), sulphur-flower buckwheat (*Eriogonum umbellatum*), and bastardsage (*Eriogonum wrightii*).

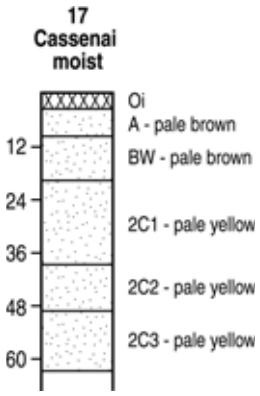


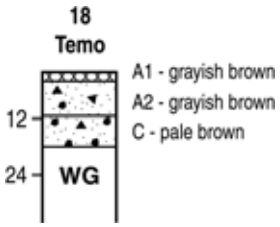
14 Christopher; Jeffrey pine forest; F022AE006CA.—This site is on glacial outwash terraces and moraines at elevations of 6,240 to 7,500 feet. Slopes range from 0 to 30 percent. The Christopher soil associated with this site is very deep and has sandy surface and subsurface horizons. It formed primarily in granitic parent material. The plant community is a Jeffrey pine (*Pinus jeffreyi*) forest with shrubs and forbs in open areas between the trees. Greenleaf manzanita (*Arctostaphlos patula*), whitethorn ceanothus (*Ceanothus cordulatus*), and prostrate ceanothus (*Ceanothus prostratus*) are common in the understory.



15 Cassenai; Jeffrey pine forest; F022AE023CA.—This site is on mountain side slopes, generally in unglaciated areas. Slopes range from 5 to 70 percent, and elevations range from 6,240 feet to 8,400 feet. The site occurs on all aspects but is generally on north- to northwest-facing slopes. The Cassenai soil associated with this site is very deep and formed in colluvium over residuum weathered from granodiorite. The texture is gravelly loamy sand and loamy sand. This is a Jeffrey pine (*Pinus jeffreyi*) forest with an average of 70 percent canopy cover. White fir (*Abies concolor*) occasionally occurs. There is a low cover of shrubs, forbs, and grasses.



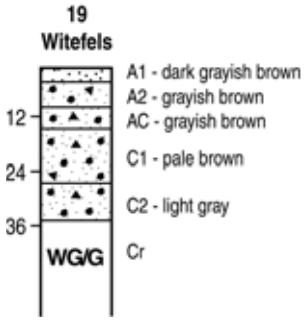




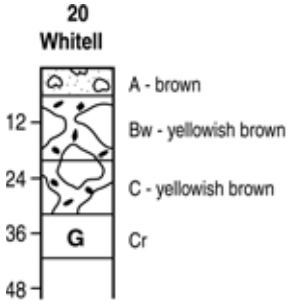
16 Aquic Xerorthents; aspen forest; F022AE004CA.—This site is in mountain drainages at elevations of 6,230 to 9,000 feet. Slopes range from 0 to 15 percent. The soils associated with this site formed in alluvium and colluvium derived from mixed sources. They are very deep and have a surface layer of loamy coarse sand or sandy loam and similar subsurface textures. The plant community is an aspen (*Populus tremuloides*) grove with a lush understory of forbs and grasses. Common plants include blue wildrye (*Elymus glaucus*), Gray's licorice-root (*Ligusticum grayi*), California false hellebore (*Veratrum californicum* var. *californicum*), Fendler's meadow-rue (*Thalictrum fendleri*), sweetcicely (*Osmorhiza berteroi*), and arrowleaf ragwort (*Senecio triangularis*).

17 Cassenai, moist; red fir/western white pine forest with pinemat manzanita; F022AE010CA. — This site is on mountain slopes and hillslopes at elevations of 6 ,800 to 9,900 feet. Aspects vary, and slopes range from 5 to 70 percent. The Cassenai soil associated with this site is very deep and formed in colluvium over residuum derived from granodiorite over grus. The texture is loamy coarse sand or gravelly loamy coarse sand. The plant community is a California red fir (*Abies magnifica*) and western white pine (*Pinus monticola*) forest. The canopy is open, having large, widely spaced trees. Pinemat manzanita (*Arctostaphylos nevadensis*) is the most common understory shrub.

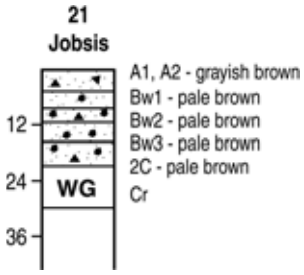
18 Temo; Sierra lodgepole pine/California red fir forest; F022AY121NV.—This site typically occurs on mountains above 8,000 feet. It is on the middle to upper side slopes and on ridgetops. It occurs on all aspects but is most common on southeast- and southwest-facing slopes. Slopes range from 15 to 75 percent. The Temo soil associated with this site very shallow or shallow. It formed in residuum and colluvium derived from granitic rocks. The surface layer is bouldery coarse sand. It is underlain by gravelly loamy coarse sand, which extends to weathered granodiorite at a depth of 16 inches. This is an open forest with 10 to 25 percent canopy cover. It is dominated by Sierra lodgepole pine (*Pinus contorta* var. *murrayana*) and California red fir (*Abies magnifica*). Western white pine (*Pinus monticola*), Jeffrey pine (*Pinus jeffrreyi*), and Sierra juniper (*Juniperus occidentalis* var. *australis*) also may occur in the overstory. Ross' sedge (*Carex rossii*) and western needlegrass (*Achnatherum occidentale* ssp. *occidentale*) are the most common understory associates.



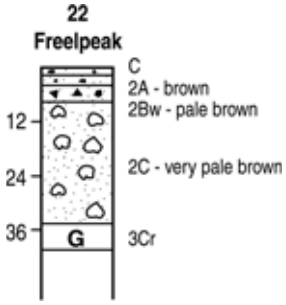
19 Witefels; red fir/western white pine forest with pinemat manzanita; F022AE010CA. —This site is on mountain slopes and hillslopes at elevations of 6,800 to 9,900 feet. Aspects vary, and slopes range from 5 to 70 percent. The Witefels soil associated with this site is moderately deep and formed in colluvium and residuum derived from granodiorite. The texture is coarse sand and gravelly loamy coarse sand. The plant community is a California red fir (*Abies magnifica*) and western white pine (*Pinus monticola*) forest. The canopy is open, having large, widely spaced trees. Pinemat manzanita (*Arctostaphylos nevadensis*) is the most common understory shrub.



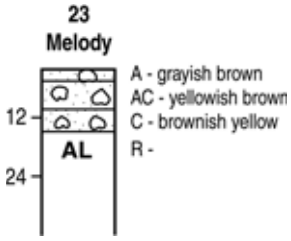
20 Whitell; whitebark pine forest; F022AE001CA. —This site is on moderately sloping to steep mountainsides at elevations of 8,500 to 12,000 feet. It occurs on all aspects but is generally on northwest- to south-facing slopes. Slopes range from 8 to 75 percent. The Whitell soil associated with this site is moderately deep and formed in colluvium and residuum weathered from granodiorite. The surface layer is very cobbly loamy coarse sand, and subsurface textures are sandy. The plant community is a whitebark pine (*Pinus albicaulis*) forest with 25 to 50 percent canopy cover. A few mountain hemlocks (*Tsuga mertensiana*) and Sierra lodgepole pines (*Pinus contorta* var. *murrayana*) are intermixed. The understory is dominated by gravel and rock and has a low cover of graminoid and herbaceous species.



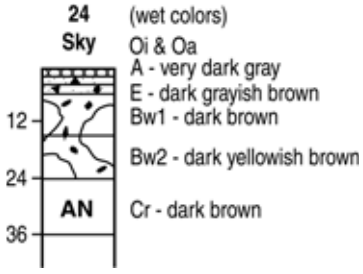
21 Jobsis; open and stunted whitebark pine forest; F022AY134NV. —This site occurs on the smooth or concave side slopes of mountains at elevations of generally more than 8,500 feet. It is typically on northerly aspects at the lower elevations and on all aspects at the higher elevations. Slopes range from 8 to more than 75 percent. They are typically more than 30 percent. The Jobsis soil associated with this site is shallow and somewhat excessively drained and formed in colluvium and residuum derived from granitic rocks. The surface layer is very gravelly loamy coarse sand. This texture extends to soft, weathered granodiorite at a depth of 20 to 30 inches. This site is dominated by an open woodland of whitebark pine (*Pinus albicaulis*) with 20 to 40 percent canopy cover. Trees commonly are stunted and multistemmed. Sierra lodgepole pine (*Pinus contorta* var. *murrayana*) is common. The understory is dominated by gravel and rock and has a low cover of graminoid and herbaceous species.



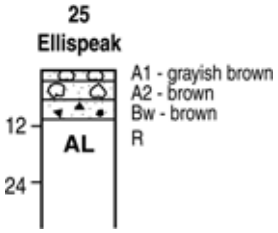
22 Freelpeak; alpine fell fields; F022AY032NV.—This site is on exposed ridges and peaks above timberline, at elevations of 10,000 to 12,000 feet. Slopes range from 4 to 75 percent. The Freelpeak soil associated with this site is moderately deep and formed in residuum and colluvium derived from granodiorite. The surface layer consists of gravel with crushed extremely gravelly coarse sand, crushed very gravelly sand, and crushed very cobbly loamy fine sand. Because of an extremely compact and prostrate growth form, the vegetation on this site could be mistaken for mosses or lichen at first glance. Common plant species include dwarf alpine paintbrush (*Castilleja nana*), fewseed draba (*Draba oligiosperma*), rosy buckwheat (*Eriogonum rosense*), dwarf phlox (*Phlox condensata*), and Nevada podistera (*Podistera nevadensis*). Grasses include timberline bluegrass (*Poa glauca*), squirreltail grass (*Elymus elymoides* ssp. *californicu*s), and needlegrass (*Achnatherum* spp).



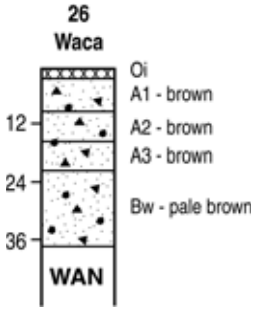
23 Melody; mixed shrubs; R022AE219CA.—This site is on the southern aspects of mountain ridges and slopes at elevations of 8,000 to 10,000 feet. Slopes range from 9 to 70 percent. The Melody soil associated with this site is shallow and formed in colluvium over residuum weathered from volcanic rocks. This is a mixed shrubland with a mosiac of mountain big sagebrush (*Artemisia tridentata* ssp. *vaseyana*), antelope bitterbrush (*Purshia tridentata*), sulphur-flower buckwheat (*Eriogonum umbellatum*), woolly mule-ears (*Wyethia mollis*), roundleaf snowberry (*Symphoricarpos rotundifolius*), and mountain monardella (*Monardella odoratissima*).



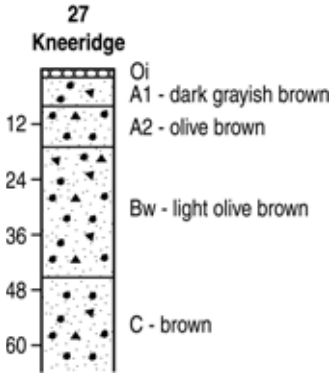
24 Sky; mountain hemlock/western white pine/red fir forest; F022AE019CA.—This site is on mountain slopes at elevations of 6,900 to 9000 feet. Aspects are generally north to southeast, and slopes range from 5 to 70 percent. The Sky soil associated with this site is moderately deep and formed in colluvium over residuum weathered from andesitic tuff. The surface layer is gravelly medial sandy loam. The subsurface texture is very stony medial sandy loam. Paralithic contact is at a depth of 24 to 36 inches. This is a dense subalpine forest mixed with mountain hemlock (*Tsuga mertensiana*), Sierra lodgepole pine (*Pinus contorta* var. *murrayana*), California red fir (*Abies magnifica*), and western white pine (*Pinus monticola*). The understory cover is low and has with scattered forbs and grasses.



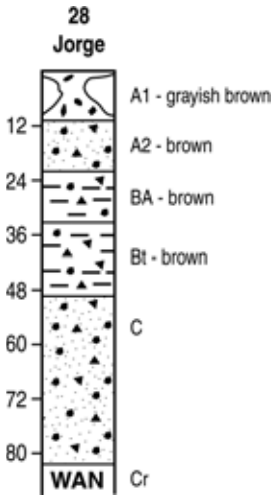
25 Ellispeak; huckleberry oak and greenleaf manzanita shrubland; R022AE217CA.—This site is on glacially scoured side slopes at elevations of 6,200 to 7,700 feet. It is generally on south- to southeast-facing slopes. Slopes range from 9 to 70 percent. The Ellispeak soil associated with this site is shallow and excessively drained. It formed in colluvium derived from andesitic lahar or welded tuff. The surface layer is stony very fine sandy loam, and subsurface textures are very cobbly sandy loam and extremely gravelly fine sandy loam. Strongly cemented andesitic lahar is at a depth of 10 to 20 inches. This is a shrubland site with less than 30 percent cover. It is dominated by huckleberry oak (*Quercus vacciniifolia*), greenleaf manzanita (*Arctostaphylos patula*), pinemat manzanita (*Arctostaphylos nevadensis*), whitethorn ceanothus (*Ceanothus cordulatus*), and bitter cherry (*Prunus emarginata*). Trees cover is less than 5 percent of the area. The site has a diversity of plants.

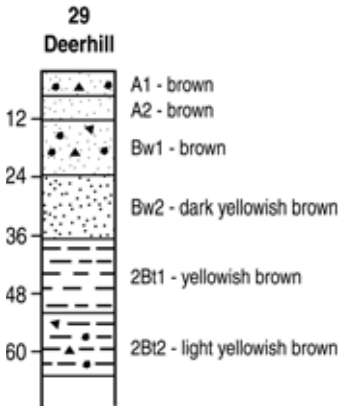


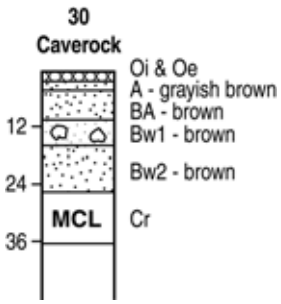
26 Waca; white fir/Jeffrey pine forest; F022AE007CA.—This site is in areas of glacial outwash and on moraines and hillslopes at elevations of 6,240 to 7,900 feet. It is on all aspects. Slopes range from 0 to 70 percent. The Waca soil associated with this site is moderately deep and formed in material weathered from andesitic tuff. The texture of the soil is very gravelly medial coarse sandy loam. The plant community is a dense white fir (*Abies concolor*) and Jeffrey pine (*Pinus jeffreyi*) forest with some incense cedar (*Calocedrus decurrens*). The understory is sparse because of a heavy tree canopy cover. Common understory plants are western needlegrass (*Achnatherum occidentale*), whitethorn ceanothus (*Ceanothus cordulatus*), milk kelloggia (*Kelloggia galioides*), Brown's peony (*Paeonia brownii*), pinewoods lousewort (*Pedicularis semibarbata*), lambstongue ragwort (*Senecio integerrimus*), and creeping snowberry (*Symphoricarpos mollis*).



27 Kneeridge; whitefir/Jeffrey pine forest; F022AE007CA.—This site is in areas of glacial outwash and on moraines and hillslopes at elevations of 6,240 and 7,900 feet. It is on all aspects. Slopes range from 0 to 70 percent. The Kneeridge soil associated with this site is very deep and formed in colluvium and/or till derived from andesite and andesitic lahar. The plant community is a dense white fir (*Abies concolor*) and Jeffrey pine (*Pinus jeffreyi*) forest with some incense cedar (*Calocedrus decurrens*). The understory is sparse because of a heavy tree canopy cover. Common understory plants are western needlegrass (*Achnatherum occidentale*), whitethorn ceanothus





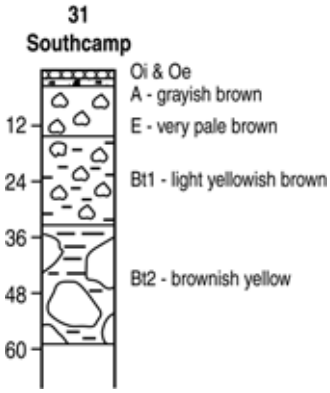


(*Ceanothus cordulatus*), milk kelloggia (*Kelloggia galioides*), Brown's peony (*Paeonia brownii*), pinewoods lousewort (*Pedicularis semibarbata*), lambstongue ragwort (*Senecio integerrimus*), and creeping snowberry (*Symphoricarpos mollis*).

28 Jorge; mixed conifer forest; F022AE013CA.—This site is on mountain slopes and hillslopes at elevations of 6,240 to 8,200 feet. It is on all aspects. Slopes range from 2 to 70 percent. The Jorge soil associated with this site is deep or very deep and formed in colluvium derived from volcanic rocks. The surface layer is stony sandy loam and very gravelly sandy loam. This is a mixed conifer forest dominated by white fir (*Abies concolor*), Jeffrey Pine (*Pinus jeffreyi*), sugar pine (*Pinus lambertiana*), and incense cedar (*Calocedrus decurrens*). Various shrubs provide moderate cover in the understory. Common shrubs include western serviceberry (*Amelanchier utahensis*), greenleaf manzanita (*Arctostaphylos patula*), whitethorn ceanothus (*Ceanothus cordulatus*), prostrate ceanothus (*Ceanothus prostratus*), huckleberry oak (*Quercus vacciniifolia*), Scouler's willow (*Salix scouleriana*), and creeping snowberry (*Symphoricarpos mollis*).

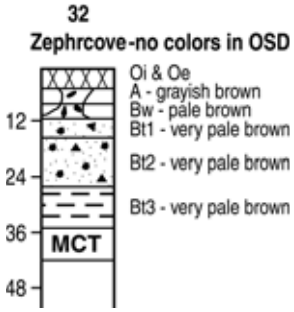
29 Deerhill; Jeffrey pine forest; F022AE023CA.—This site is on mountain side slopes, generally in unglaciated areas. Elevations range from 6,240 to 8,400 feet. Slopes range from 5 to 70 percent. The Deerhill soil associated with this site is very deep and formed in colluvium over residuum weathered from metamorphic rocks. The surface layer is gravelly fine sandy loam. The subsurface textures are gravelly fine sandy loam, fine sandy loam, and loam. This is a Jeffrey pine (*Pinus jeffreyi*) forest with an average of 70 percent canopy cover. White fir (*Abies concolor*) occasionally occurs. There is a low cover of shrubs, forbs, and grasses under canopy openings.

30 Caverock; open Jeffrey pine and white fir forest with huckleberry oak and greenleaf manzanita; F022AE021CA.—This site is on gently sloping to steep slopes at elevations of 6,240 to 8,700 feet. Aspects are generally south, west, and northwest. The Caverock soil associated with this site formed in colluvium over residuum weathered from latite. The surface layer is sandy loam, and subsurface textures sandy loam and cobbly sandy loam. This is an open Jeffrey pine (*Pinus jeffreyi*) forest with occasional white fir (*Abies concolor*). The total tree canopy is less than 50 percent. The understory has a heavy cover of shrubs. Species

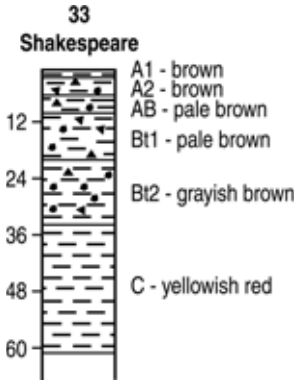


composition depends on aspect, elevation, and the history of fires. Common shrubs include greenleaf manzanita (*Arctostaphylos patula*), antelope bitterbrush (*Purshia tridentata*), whitethorn ceanothus (*Ceanothus cordulatus*), mountain big sagebrush (*Artemisia tridentata* ssp. *vaseyana*), prostrate ceanothus (*Ceanothus prostratus*), and snowbrush ceanothus (*Ceanothus velutinus*).

31 Southcamp; mixed conifer forest; F022AE013CA.—This site is on mountain slopes and hillslopes at elevations of 6,240 feet to 8,200 feet. It is on all aspects. Slopes range from 2 to 70 percent., The Southcamp soil associated with this site is very deep and formed in colluvium over residuum weathered from porphyritic trachyte flows. The surface layer is very gravelly fine sandy loam. The subsurface textures are extremely cobbly loam, extremely cobbly clay loam, and extremely stony clay loam. This is a mixed conifer forest dominated by white fir (*Abies concolor*), Jeffrey Pine (*Pinus jeffreyi*), sugar pine (*Pinus lambertiana*), and incense cedar (*Calocedrus decurrens*). Various shrubs provide moderate cover in the understory. Common shrubs include western serviceberry (*Amelanchier utahensis*), greenleaf manzanita (*Arctostaphylos patula*), whitethorn ceanothus (*Ceanothus cordulatus*), prostrate ceanothus (*Ceanothus prostratus*), huckleberry oak (*Quercus vacciniifolia*), Scouler's willow (*Salix scouleriana*), and creeping snowberry (*Symphoricarpos mollis*).



32 Zephrcove; open Jeffrey pine and white fir forest with huckleberry oak and greenleaf manzanita; F022AE021CA.—This site is on gently sloping to steep slopes at elevations of 6,240 to 8,700 feet. Aspects are generally south, west, and northwest. The Zephrcove soil associated with this site is moderately deep and formed in colluvium over residuum weathered from trachyte. The surface layer is stony sandy loam. Subsurface textures are stony sandy loam, gravelly sandy loam, and sandy clay loam. The plant community is an open Jeffrey pine (*Pinus jeffreyi*) forest with occasional white fir (*Abies concolor*). The total tree canopy is less than 50 percent. The understory has a heavy cover of shrubs. Species composition depends on aspect, elevation, and the history of fires. Common shrubs include greenleaf manzanita (*Arctostaphylos patula*), antelope bitterbrush (*Purshia tridentata*), mountain big sagebrush (*Artemisia tridentata* ssp. *vaseyana*), prostrate ceanothus (*Ceanothus prostratus*), and snowbrush ceanothus (*Ceanothus velutinus*).



33 Shakespeare; open red fir/Jeffrey pine forest with roundleaf snowberry and wax currant; F022AE011CA.—This site is on mountain slopes at elevations of 7,600 to 8,900 feet. It is in the Carson Range, along the eastern side of the Lake Tahoe Basin. Slopes range from 9 to 50 percent. The Shakespeare soil associated with this site is very deep and formed in colluvium derived from undifferentiated metamorhic rocks. The surface layer is gravelly loam. The subsurface texture is gravelly heavy loam. This is an open forest. The most common tree species are California red fir (*Abies magnifica*) and Jeffrey pine (*Pinus jeffreyi*). There are a few white firs (*Abies concolor*) and western white pines (*Pinus monticola*). The understory is covered by a dense canopy of mixed shrubs, primarily pinemat manzanita (*Arctostaphylos nevadensis*), mountain big sagebrush (*Artemisia tridentata* ssp. *vaseyana*), wax currant (*Ribes cereum* var. *cereum*), and roundleaf snowberry (*Symphoricarpos rotundifolius*).

G	Moderately cemented granite bedrock Indurated granodiorite bedrock

Forest Productivity and Management

The tables in this section can help forest owners or managers plan the use of soils for wood crops. They show the potential productivity of the soils for wood crops and rate the soils according to the limitations that affect various aspects of forest management.

Forest Productivity

In table 7, the *potential productivity* of merchantable or *common trees* on a soil is expressed as a site index and as a volume number. *Site index average* is the average height, in feet, that dominant and codominant trees of a given species attain in a specified number of years. The site index applies to fully stocked, even-aged, unmanaged stands. *Site index base* is a number that refers to the site index curve used to determine the site index for a specific tree species. For example, a site index base number of 600 refers to a site index curve used for Jeffrey pine (Meyer, 1961); a site index base number of 605 refers to a site index curve used for sugar pine (Dunning, 1942); and a site index base number of 030 refers to a site index curve used for white fir (Schumacher, 1926). *Site index base age* indicates the age used for the site curves. For the site index base curve number 605, for example, the base age is 300 years; for the curve number 600, it is 100 years; and for the curve number 030, it is 50 years. More detailed information regarding site index is available in the "National Forestry Manual," which is available in local offices of the Natural Resources Conservation Service or on the Internet.

The *volume of wood fiber*, a number, is the yield likely to be produced by the most important tree species at the age of culmination of the mean annual increment (CMAI). It is the amount of fiber produced in a fully stocked, even-aged, unmanaged stand. *CMAI age* is the point at which the stand reaches its maximum annual rate of growth.

Forest trees are all trees that occur in a forest type, including the less common ones.

Forest Management

In tables 8 through 12, interpretive ratings are given for various aspects of forest management. The ratings are both verbal and numerical.

Some rating class terms indicate the degree to which the soils are suited to a specified forest management practice. *Well suited* indicates that the soil has features that are favorable for the specified practice and has no limitations. Good performance can be expected, and little or no maintenance is needed. *Moderately suited* indicates that the soil has features that are moderately favorable for the specified practice. One or more soil properties are less than desirable, and fair performance can be expected. Some maintenance is needed. *Poorly suited* indicates that the soil has one or more properties that are unfavorable for the specified practice. Overcoming the unfavorable properties requires special design, extra maintenance, and costly alteration. *Unsuited* indicates that the expected performance of the soil is unacceptable for the specified practice or that extreme measures are needed to overcome the undesirable soil properties.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the specified forest management practice (1.00) and the point at which the soil feature is not a limitation (0.00).

Rating class terms for fire damage and seedling mortality are expressed as *low, moderate,* and *high*. Where these terms are used, the numerical ratings indicate

gradations between the point at which the potential for fire damage or seedling mortality is highest (1.00) and the point at which the potential is lowest (0.00).

The paragraphs that follow indicate the soil properties considered in rating the soils for forest management practices. More detailed information about the criteria used in the ratings is available in the "National Forestry Manual," which is available in local offices of the Natural Resources Conservation Service or on the Internet (http://nsscnt.nssc.nrcs.usda.gov/nfm/).

Ratings in the columns *suitability for hand planting* and *suitability for mechanical planting* are based on slope, depth to a restrictive layer, content of sand, plasticity index, rock fragments on or below the surface, depth to a water table, and ponding. The soils are described as well suited, moderately suited, poorly suited, or unsuited to these methods of planting. It is assumed that necessary site preparation is completed before seedlings are planted.

Ratings in the column *suitability for use of harvesting equipment* are based on slope, rock fragments on the surface, plasticity index, content of sand, the Unified classification, depth to a water table, and ponding. The soils are described as well suited, moderately suited, or poorly suited to this use.

Ratings in the column *suitability for mechanical site preparation (surface)* are based on slope, depth to a restrictive layer, plasticity index, rock fragments on or below the surface, depth to a water table, and ponding. The soils are described as well suited, poorly suited, or unsuited to this management activity. The part of the soil from the surface to a depth of about 1 foot is considered in the ratings.

Ratings in the column *suitability for mechanical site preparation (deep)* are based on slope, depth to a restrictive layer, rock fragments on or below the surface, depth to a water table, and ponding. The soils are described as well suited, poorly suited, or unsuited to this management activity. The part of the soil from the surface to a depth of about 3 feet is considered in the ratings.

For *limitations affecting construction of haul roads and log landings*, the ratings are based on slope, flooding, permafrost, plasticity index, the hazard of soil slippage, content of sand, the Unified classification, rock fragments on or below the surface, depth to a restrictive layer that is indurated, depth to a water table, and ponding. The limitations are described as slight, moderate, or severe. A rating of *slight* indicates that no significant limitations affect construction activities, *moderate* indicates that one or more limitations can cause some difficulty in construction, and *severe* indicates that one or more limitations can make construction very difficult or very costly.

The ratings of *suitability for log landings* are based on slope, rock fragments on the surface, plasticity index, content of sand, the Unified classification, depth to a water table, ponding, flooding, and the hazard of soil slippage. The soils are described as well suited, moderately suited, or poorly suited to use as log landings.

Ratings in the column *soil rutting hazard* are based on depth to a water table, rock fragments on or below the surface, the Unified classification, depth to a restrictive layer, and slope. Ruts form as a result of the operation of forest equipment. The hazard is described as slight, moderate, or severe. A rating of *slight* indicates that the soil is subject to little or no rutting, *moderate* indicates that rutting is likely, and *severe* indicates that ruts form readily.

Ratings in the column *hazard of off-road or off-trail erosion* are based on slope and on soil erodibility factor K. The soil loss is caused by sheet or rill erosion in off-road or off-trail areas where 50 to 75 percent of the surface has been exposed by logging, grazing, mining, or other kinds of disturbance. The hazard is described as slight, moderate, severe, or very severe. A rating of *slight* indicates that erosion is unlikely under ordinary climatic conditions; *moderate* indicates that some erosion is likely and that erosion-control measures may be needed; *severe* indicates that erosion is very likely and that erosion-control measures, including revegetation of bare areas, are

advised; and *very severe* indicates that significant erosion is expected, loss of soil productivity and off-site damage are likely, and erosion-control measures are costly and generally impractical.

Ratings in the column *hazard of erosion on roads and trails* are based on the soil erodibility factor K, slope, and content of rock fragments. The ratings apply to unsurfaced roads and trails. The hazard is described as slight, moderate, or severe. A rating of *slight* indicates that little or no erosion is likely; *moderate* indicates that some erosion is likely, that the roads or trails may require occasional maintenance, and that simple erosion-control measures are needed; and *severe* indicates that significant erosion is expected, that the roads or trails require frequent maintenance, and that costly erosion-control measures are needed.

Ratings in the column *suitability for roads (natural surface)* are based on slope, rock fragments on the surface, plasticity index, content of sand, the Unified classification, depth to a water table, ponding, flooding, and the hazard of soil slippage. The ratings indicate the suitability for using the natural surface of the soil for roads. The soils are described as well suited, moderately suited, or poorly suited to this use.

Ratings in the column *potential for damage to soil by fire* are based on texture of the surface layer, content of rock fragments and organic matter in the surface layer, thickness of the surface layer, and slope. The soils are described as having a low, moderate, or high potential for this kind of damage. The ratings indicate an evaluation of the potential impact of prescribed fires or wildfires that are intense enough to remove the duff layer and consume organic matter in the surface layer.

Ratings in the column *potential for seedling mortality* are based on flooding, ponding, depth to a water table, content of lime, reaction, salinity, available water capacity, soil moisture regime, soil temperature regime, aspect, and slope. The soils are described as having a low, moderate, or high potential for seedling mortality.

Rangeland

By Marchel Munnecke, Natural Resources Conservation Service.

Rangeland, sometimes referred to as “wildland,” has a native vegetation of grasses, grasslike plants, forbs, shrubs, and trees with a total tree canopy cover of less than 25 percent.

Because rangeland is used for many purposes, it is important to characterize rangeland on the basis of its ability to produce various kinds, proportions, and amounts of plants. This ability and the resultant plant communities are largely dependent on the soils, climate, topography, aspect, elevation, slope, and other abiotic features of the landscape. To understand these soil-plant interactions and the effects of selected management practices, the Natural Resources Conservation Service has developed ecological sites. An ecological site is a distinctive kind of land with specific physical characteristics that differs from other kinds of land in its ability to produce a distinctive kind and amount of vegetation (USDA, “National Range and Pasture Handbook”).

The correlated soil types and plant communities identified in this survey area serve as the basis for the development of each ecological site description. Soil properties that affect moisture supply and plant nutrients, such as soil texture, depth, parent material, and content of coarse fragments have a significant influence on the productivity, composition, and distribution of rangeland plant communities. The rangeland ecological sites in this soil survey area can be grouped by landscape position. Several of these sites are associated with seasonally flooded and ponded flood plains, terraces, and basins. These sites are dominated by wetland plants, such as sedges and willows. The rest of the rangeland sites are on upland hillslopes, ridges, and mountain peaks. Elevation, aspect, soil depth, and precipitation further

characterize the species composition of these rangeland sites. Elevations in this soil survey area range from 6,200 to nearly 11,000 feet. This range in elevation affects the annual temperature and precipitation, which dramatically influence the rangeland plant communities. The rangeland plant communities in this survey area are adapted to heavy snow in winter and low precipitation in summer. South- and west-facing slopes at the lower elevations commonly support chaparral species and plant communities because of the heat intensities, high evapotranspiration rates, and the resultant droughtiness. North- and east-facing slopes, which are exposed to less solar radiation than south and west aspects, generally support forestland plant communities. At the higher elevations, the ecological sites tend to support a mixture of shrubs and forbs; mountain big sagebrush, antelope bitterbrush, woolly mule-ears, and mountain monardella are the dominant species. Several rangeland ecological sites have very low annual production and little plant cover. These sites are on exposed mountain peaks and ridges or on shallow soils in areas with a high percentage of rock outcrop. Differences in soil properties affecting plant community composition, production, and distribution are accounted for in the correlation of ecological sites to the individual soil map unit components. The survey area has 17 major and 10 minor rangeland ecological sites.

Table 13 lists the ecological sites for the soil components of the map units in the survey area commonly used as rangeland; the total dry-weight production of vegetation in favorable, normal, and unfavorable years; the characteristic vegetation by common names; and the average species composition by percent of the total annual air-dry weight.

Total dry-weight production is the amount of air-dry vegetation that can be expected to grow annually on well managed rangeland that is supporting the potential natural plant community. It includes all vegetation, whether or not it is palatable to grazing animals. It includes the current year's growth of leaves, twigs, and fruits of woody plants. It does not include the increase in stem diameter of trees and shrubs. It is expressed in pounds per acre of air-dry vegetation for favorable, normal, and unfavorable years. In a favorable year, the amount and distribution of precipitation make growing conditions substantially better than average. In a normal year, growing conditions are about average. In an unfavorable year, growing conditions are well below average, generally because of low available soil moisture. Yields are adjusted to a common percent of air-dry moisture content. The relationship of green weight to air-dry weight varies according to such factors as exposure, amount of shade, recent rains, and unseasonable dry periods. The production amounts can be used to calculate the carrying capacity and stocking rates for management of domestic or wild animals or to determine fuel-loading in preparation of prescribed burning plans or fire modeling.

Characteristic vegetation (the grasses, forbs, shrubs, and trees that make up most of the potential natural plant community on each soil component) is listed by common name. Under *species composition by weight*, the expected percentage of the total annual production is given for each species making up the characteristic vegetation. The amount that can be used as forage depends on the kinds of grazing animals and on the grazing season.

Table 14 lists the ecological sites for the soil components of the map units in the survey area commonly used as rangeland, the characteristic vegetation by common names, and the average species composition by canopy cover. Cover is the amount of cover determined by crown perimeter-vertical projection by species. The data were collected in 1,000-meter plots representing the cover composition across the landscape. This cover can overlap in layers by species, so the total cover can be more than 100 percent.

See Appendix 1 for a list of the common and scientific names of the plants that commonly occur in the survey area.

General Characteristics of Rangeland Ecological Sites

Complete ecological site descriptions can be obtained from the Natural Resources Conservation Service or downloaded from the NRCS Ecological Site Information System Web site at http://esis.sc.egov.usda.gov. To find the ecological sites linked to this survey area, select the "ESD" option and then select "Approved ESD Reports." This survey area is in MLRA 22A in California and Nevada. See Appendix 2 for a complete list of the ecological sites in the survey area.

R022AE202CA—Granitic Pocket.—This site is in areas of glacially scoured valleys and side slopes (fig. 17). Granite bedrock covers more than 50 percent of the area. The site occurs on all aspects, but it is most commonly on south- to southeast-facing slopes. Slopes range from 0 to 70 percent, and elevations range from 6,300 and 9,000 feet. The reference plant community on this site is dominantly montane chaparral shrubs, including huckleberry oak (*Quercus vacciniifolia*) and greenleaf manzanita (*Arctostaphylos patula*) on the side slopes. Talus and pinemat manzanita (*Arctostaphylos nevadensis*) are common in soil pockets. The herbaceous layer is typically dominated by a wide variety of colorful annuals, but a significant portion consists of both shorthair sedge (*Carex exserta*) and Sandberg bluegrass (*Poa secunda*). Western juniper (*Juniperus occidentalis* var. *australis*), Jeffrey pine (*Pinus jeffreyi*), and Sierra lodgepole pine (*Pinus contorta* ssp. *murrayana*) provide less than 10 percent cover and occur primarily in the fractured bedrock. This site is associated with Rockbound soils, which formed in colluvium derived from granodiorite. The soils are in patches between rock outcrops and large boulders. They are shallow, having lithic contact at a depth of 4 to 10 inches. Permeability is rapid above the bedrock. The surface runoff class is very high. The soils have a very low (0.19 to 1.18 inches) available water capacity above the bedrock. The surface and subsurface horizons are very gravelly loamy course sand

R022AE203CA—Frigid Loamy Floodplain.—This site is on alluvial flats and flood plains with meandering stream channels (fig. 18). Slopes are 0 to 2 percent, and elevations range from 6,200 to 8,000 feet. The site has a mixed willow community dominated by Lemmon's willow (*Salix lemmonii*), Geyer willow (*Salix geyeriana*), and shining willow (*Salix lucida*). The understory is dominantly graminoid species, including Nebraska sedge (*Carex nebrascensis*), tufted hairgrass (*Deschampsia cespitosa*), slimstem reedgrass (*Calamagrostis stricta*), Northwest Territory sedge (*Carex utriculata*), and Baltic rush (*Juncus balticus*). Whitestem gooseberry (*Ribes inerme* var. *inerme*) grows under the willows, and Woods' rose (*Rosa woodsii* var. *ultramontana*) is common near the scattered Sierra lodgepole pines (*Pinus contorta* var. *murrayana*). This site is associated with Tahoe soils, which formed in alluvium derived from mixed sources. These soils are very deep and very poorly drained and have a surface layer of mucky silt loam. The wet silty loam phase of the Tahoe series has a higher water table during the summer. Permeability is moderate, and the surface runoff class is very high. The soils have a moderate (5.5 to 5.8 inches) available water capacity in the upper 60 inches. They are frequently ponded and flooded for very long periods during spring and early summer.

R022AE204CA—Sphagnum Fen.—This site is in closed basins in areas of valley bottoms and relict glacial lakes. It is at elevations of 7,710 feet to 8,514 feet. Slopes are 0 to 2 percent. Sphagnum moss (*Sphagnum squarrosum*) is the dominant vegetation (fig. 19). It forms floating mats of peat more than 6 feet thick. Mountain blueberry (*Vaccinium uliginosum*) and bog laurel (*Kalmia polifolia*) are in areas that are slightly raised above the sphagnum. The associated species vary, but alpine shootingstar (*Dodecatheon alpinum*) and alpine aster (*Aster alpinus*) are common. The soils on this site are characterized by seasonal ponding and year-round saturation. They consist almost completely of slightly decomposed moss fibers

Figure 17.—An area of ecological site R022AE202CA, Granitic Pocket.

Figure 18.—An area of ecological site R022AE203CA, Frigid Loamy Floodplain.

Figure 19.—Sphagnum moss in an area of ecological site R022AE204CA, Sphagnum Fen.

and have very little mineral material. The texture is peat or mucky peat. The soils are very poorly drained and rapidly permeable. Surface runoff is negligible. The available water capacity is very high in the upper 60 inches.

R022AE207CA—Cold Wet Alluvial Flat.—This site is on flood plains in mountain basins at elevations of 7,000 to 9,500 feet. It occurs on all aspects. Slopes are 0 to 2 percent. This is an alpine willow community dominated by mountain willow (*Salix eastwoodiae*) and Sierra willow (*Salix orestera*). The plant community is extremely diverse because of the associated microclimate and water influx to the site. Some

common plants include California false hellebore (*Veratrum californicum* var. *californicum*), arrowleaf ragwort (*Senecio triangularis*), scarlet paintbrush (*Castilleja miniata*), fireweed (*Chamerion angustifolium* ssp. *circumvagum*), Gray's licorice-root (*Ligusticum grayi*), bigleaf lupine (*Lupinus polyphyllus*), Sierra shootingstar (*Dodecatheon jeffreyi*), western mountain aster (*Symphyotrichum spathulatum* var. *spathulatum*), Fendler's meadow-rue (*Thalictrum fendleri*), seep monkeyflower (*Mimulus guttatus*), primrose monkeyflower (*Mimulus primuloides*), elephanthead lousewort (*Pedicularis groenlandica*), tufted hairgrass (*Deschampsia caespitosa*), Sandberg bluegrass (*Poa secunda*), water sedge (*Carex aquatilis*), and mountain sedge (*Carex scopulorum*). Murray lodgepole pine (*Pinus contorta* var. *murrayana*) occurs in scattered areas. This site is associated with the wet phase of the Bidart series, which is very deep, has a surface layer of mucky silt loam and sandy subsurface textures, and is saturated longer than the typical Bidart soils. The water table remains within a depth of 20 inches throughout the growing season, and redoximorphic features are near the surface. Permeability is moderate, and surface runoff is negligible. The soil is frequently flooded and ponded for very long periods in spring and summer. The available water capacity is moderate or high (7.24 to 9.83 inches) in the upper 60 inches.

R022AE208CA—Frigid Loamy Terrace.—This site is on alluvial flats and flood plains with meandering stream channels (fig. 20). Slopes are 0 to 2 percent, and elevations range from 6,200 to 8,000 feet. This site is dominated by graminoids and forbs. Some of the more common species are common yarrow (*Achillea millefolium*), hairy arnica (*Arnica mollis*), Nebraska sedge (*Carex nebrascensis*), tufted hairgrass (*Deschampsia caespitosa*), Baltic rush (*Juncus balticus*), straightleaf rush (*Juncus orthophyllus*), mat muhly (*Muhlenbergia richardsonis*), beardtongue (*Penstemon* spp.), bluegrass (*Poa* spp.), American bistort (*Polygonum bistortoides*), Ashland

Figure 20.—An area of ecological site R022AE208CA, Frigid Loamy Terrace.

cinquefoil (*Potentilla glandulosa* spp. *ashlandica*), slender cinquefoil (*Potentilla gracilis* var. *fastigiata*), Oregon checkerbloom (*Sidalcea oregana* spp. *spicata*), and longstalk clover (*Trifolium longipes*). This site is associated with Tahoe soils, which formed in alluvium derived from mixed sources, are very deep and very poorly drained, and have a surface layer of mucky silt loam. Permeability is moderate, and the surface runoff class is very high. The available water capacity is moderate (5.5 to 5.8 inches) in the upper 60 inches. These soils are frequently ponded and flooded for very long periods during spring and early summer. This site is associated with Frigid Loamy Floodplain ecological site (R022AE203CA). It is in slightly higher areas than that site and has a lower water table during the summer.

R022AE209CA—Flooded Basins.—This site is on wet flood plains at elevations of 6,220 and 9,416 feet (fig. 21). It is on low-angle slopes of as much as 2 percent. Most of the site is in the marshes adjacent to Lake Tahoe. The species that dominate this fen ecological site are Northwest Territory sedge (*Carex utriculata*) and blister sedge (*Carex vesicaria*). Other species include sedges (*Carex* spp.), spikerush (*Eleocharis*), Baltic rush (*Juncus balticus*), tinker's penny (*Hypericum anagalloides*), primrose monkeyflower (*Mimulus primuloides*), knotweed (*Polygonum* spp.), ticklegrass (*Agrostis scabra*), Geyer willow (*Salix geyeriana*), and Lemmon's willow (*Salix lemmonii*). This site is associated with Watah soils, which formed in thick organic peat over sandy alluvial deposits. These soils are very deep, poorly drained, and moderately permeable. The surface runoff class is high. The soils are frequently flooded and ponded for very long periods in spring and summer. The available water capacity is moderate (5.4 to 6.78 inches) in the upper 60 inches.

Figure 21.—An area of ecological site R022AE209CA, Flooded Basins.

R022AE210CA—Shallow Sandy Slope.—This site is on mountain slopes at elevations of 6,300 to 8,900 feet (fig. 22). It generally is on southern aspects. Slopes range from 9 to 70 percent. Greenleaf manzanita (*Arctostaphylos patula*) and huckleberry oak (*Quercus vacciniifolia*) dominate this site, although the cover is very patchy because of a significant amount of exposed bedrock. Other species include whitethorn ceanothus (*Ceanothus cordulatus*), Sierra chinkapin (*Chrysolepis sempervirens*), pinemat manzanita (*Arctostaphylos nevadensis*), snowbrush ceanothus (*Ceanothus velutinus*), sulphur-flower buckwheat (*Eriogonum umbellatum*), and bastardsage (*Eriogonum wrightii*). California red fir (*Abies magnifica*), white fir (*Abies concolor*), Jeffrey pine (*Pinus jeffreyi*), and western white pine (*Pinus monticola*) provide less than 10 percent cover and are commonly associated with the fractured bedrock on the site. This site is associated with Toem and Genoapeak soils, which are shallow or shallow to fractured bedrock and formed in residuum derived from granitic bedrock or colluvium over highly fractured trachyte bedrock. The surface layer is gravelly coarse sand or very gravelly sandy loam. The soils are excessively drained. Permeability is moderately rapid or rapid. The surface runoff class is medium to high. The available water capacity is very low (1.16 to 1.19 inches) above the bedrock.

Figure 22.—An area of ecological site R022AE210CA, Shallow Sandy Slope.

R022AE211CA—Shallow Andesite Ridge.—This site is on mountainous uplands at elevations of 7,000 to 10,000 feet (fig. 23). It occurs on all aspects, but it is generally on northeast- to northwest-facing slopes. Slopes range from 2 to 50 percent. This site is extremely stable because of its very high elevation. It is dominated primarily by low sagebrush (*Artemisia arbuscula*), spreading phlox (*Phlox diffusa*), and sulphur-flower buckwheat (*Eriogonum umbellatum*). Other common plants include roundleaf snowberry (*Symphoricarpos rotundifolius*), several species of goldenbush (*Ericameria* spp.), prairie flax (*Linum lewisii*), granite prickly phlox (*Leptodactylon pungens*), western needlegrass (*Achnatherum occidentale*), and Sandberg bluegrass (*Poa secunda*). This site is associated with Meiss soils, which

formed in material weathered from andesitic rock. These soils are shallow, having lithic contact at a depth of 10 to 20 inches, and have a surface layer of cobbly ashy loam and a subsurface texture of gravelly ashy loam. Permeability is moderately rapid above the bedrock, and the surface runoff class is very high. The available water capacity is very low (1.35 to 1.95 inches) above the bedrock.

Figure 23.—An area of ecological site R022AE211CA, Shallow Andesite Ridge.

R022AE213CA—Steep Talus Slope.—This site is on glacially scoured valley walls in areas where rubble land (talus) and rock outcrop cover more than 50 percent of the surface (fig. 24). It occurs on all aspects, but it is mostly on south- to southeast-facing slopes. Elevations range from 6,240 to 9,100 feet. Slopes range from 50 to 90 percent. This is a shrubland dominated by huckleberry oak (*Quercus vacciniifolia*) with lesser dominants, including greenleaf manzanita (*Arctostaphylos patula*), whitethorn ceanothus (*Ceanothus cordulatus*), and bitter cherry (*Prunus emarginata*). At the higher elevations, western serviceberry (*Amelanchier utahensis*), oceanspray (*Holodiscus discolor*), and roundleaf snowberry (*Symphoricarpos rotundifolius*) are more common. Scattered white fir (*Abies concolor*), California red fir (*Abies magnifica*), western juniper (*Juniperus occidentalis*), Jeffrey pine (*Pinus jeffreyi*), and western white pine (*Pinus monticola*) are on the site, but their cover is generally less than 5 percent of the total area. Herbaceous cover is very low on this site and is commonly in pockets of sediment deposition. This site is associated with Glenalpine soils, which are deep and formed in colluvium derived from volcanic and metamorphic rocks. The surface layer is very cobbly fine sandy loam. It is underlain by extremely cobbly fine sandy loam. A root-restrictive layer from dense glacial till is between depths of 40 and 60 inches. The soils are excessively drained and slowly permeable. The surface runoff class is low. The available water capacity is low (3.09 to 3.59 inches) above the dense glacial till.

Figure 24.—An area of ecological site R022AE213CA, Steep Talus Slope.

R022AE214CA—Gravelly Flats.—This site is on alluvial flats and flood plains with actively meandering stream channels in areas with a limited overall vegetative cover and a high cover of gravel and sand. Slopes are 0 to 2 percent, and elevations range from 6,220 to 7,730 feet. The plant community on this site is dominated by Lemmon's willow (*Salix lemmonii*). The less dominant plants include mountain alder (*Alnus incana* ssp. *tenuifolia*), wax currant (*Ribes cereum*), and Douglas' sagewort (*Artemisia douglasiana*). Herbaceous species commonly include common yarrow (*Achillea millefolium*), anaphalis (*Anaphalis* spp.), brome (*Bromus* spp.), sedges (*Carex* spp.), fireweed (*Chamerion angustifolium* ssp. *circumvagum*), blue wildrye (*Elymus glaucus*), sticky cinquefoil (*Potentilla glandulosa*), Kentucky bluegrass (*Poa pratensis*), and Canada goldenrod (*Solidago canadensis*). Sierra lodgepole pine (*Pinus contorta* var. *murrayana*) and Oregon checkerbloom (*Sidalcea oregana* spp. *spicata*) can occur but at lower percentages. Many of the plants currently are pioneer and disturbance-dependent species. The soil associated with this site is the gravelly phase of the Tahoe series. This soil formed in alluvium derived from mixed sources and is very deep and very poorly drained. The surface layer is gravelly mucky silt loam. Permeability is moderate. The surface runoff class is very high. The available water capacity is moderate (5.5 to 5.8 inches) in the upper 60 inches. The soil is frequently ponded and flooded for very long periods during spring and early summer.

R022AE215CA—Deep Cryic Volcanic Slope.—This site is on mountain slopes at elevations of 7,000 to 10,500 feet. Aspects vary, but southern exposures are most common. Slopes range from 30 to 70 percent. Woolly mule-ears (*Wyethia mollis*) dominates much of this site, possibly because of a high content of aluminum in the soils associated with the site. The less dominant species include Thurber's needlegrass (*Achnatherum thurberianum*), mountain big sagebrush (*Artemisia tridentata* spp. *vaseyana*), squirreltail (*Elymus elymoides*), sulphur-flower buckwheat

(*Eriogonum umbellatum*), lupine (*Lupinus* spp.), mountain monardella (*Monardella odoratissima*), and spreading phlox (*Phlox diffusa*). The tree cover is less than 25 percent. California red fir (*Abies magnifica*) and western white pine (*Pinus monticola*) are the most common trees. Jeffrey pine (*Pinus jeffreyi*) is an associate at the lower elevations, and whitebark pine (*Pinus albicaulis*) is an associate at the higher elevations. This site is associated with very deep, somewhat excessively drained soils that formed in colluvium derived from volcanic rocks. The surface layer is medial loamy coarse sand, and the subsurface texture is cobbly or gravelly medial sandy loam. Permeability is s slow. The surface runoff class is high. The available water capacity is very low or low (1.40 to 4.68 inches) in the upper 60 inches. This site is sparsely vegetated and has about 40 percent canopy cover and 60 percent bare soil or gravel.

R022AE217CA—Volcanic Slopes.—This site is on glacially scoured side slopes at elevations of 6,200 to 7,700 feet (fig. 25). It is generally on south- to southeast-facing slopes. Slopes range from 9 to 70 percent. This site is dominated by huckleberry oak (*Quercus vacciniifolia*), greenleaf manzanita (*Arctostaphylos patula*), pinemat manzanita (*Arctostaphylos nevadensis*), whitethorn ceanothus (*Ceanothus cordulatus*), and bitter cherry (*Prunus emarginata*). The site has a few white fir (*Abies concolor*), California red fir (*Abies magnifica*), Jeffrey pine (*Pinus jeffreyi*), and western white pine (*Pinus monticola*) trees, but their cover is generally less than 5 percent. Other common species might include dusky onion (*Allium campanulatum*), western serviceberry (*Amelanchier utahensis*), prostrate ceanothus (*Ceanothus prostratus*), squirreltail (*Elymus elymoides*), buckwheat species (*Eriogonum* spp.), subalpine fleabane (*Erigeron peregrinus*), Brewer's aster (*Eucephalus breweri*), mountain monardella (*Monardella odoratissima*), Sierra gooseberry (*Ribes roezlii* var. *roezlii*), lambstongue ragwort (*Senecio integerrimus*), and waxy checkerbloom (*Sidalcea glaucescens*). This site is associated with Ellispeak soils, which are shallow

Figure 25.—An area of ecological site R022AE217CA, Volcanic Slopes.

and excessively drained and formed in colluvium derived from andesitic lahar or welded tuff. The surface layer is stony very fine sandy loam, and the subsurface textures are very cobbly sandy loam and extremely gravelly fine sandy loam. Strongly cemented andesitic lahar is at a depth of 10 to 20 inches. Permeability is moderately rapid. The surface runoff class is very high. The available water capacity is very low (0.85 inch to 1.10 inches) above the bedrock.

R022AE219CA—Cryic Volcanic Slope.—This site is on mountain ridges and slopes at elevations of 8,000 to 10,000 feet. Slopes range from 9 to 70 percent. Aspects are southern. The reference plant community on this site is dominated by mountain big sagebrush (*Artemisia tridentata* spp. *vaseyana*), antelope bitterbrush (*Purshia tridentata*), roundleaf snowberry (*Symphoricarpos rotundifolius*), sulphur-flower buckwheat (*Eriogonum umbellatum*), woolly mule-ears (*Wyethia mollis*), and mountain monardella (*Monardella odoratissima*). The common associates include California red fir (*Abies magnifica*), Brewer's angelica (*Angelica breweri*), pinemat manzanita (*Arctostaphylos nevadensis*), Lewis flax (*Linum lewisii*), snowbrush ceanothus (*Ceanothus velutinus*), squirreltail (*Elymus elymoides*), needlegrass (*Achnatherum* spp.), longspur lupine (*Lupinus arbustus*), spreading phlox (*Phlox diffusa*), and waxy checkerbloom (*Sidalcea glaucescens*). This site is associated with soils that formed from colluvium derived from volcanic rocks or colluvium over residuum derived from andesitic rocks. They are shallow or moderately deep and well drained to excessively drained. The surface runoff class is high or very high. Permeability is moderate to rapid above the bedrock. The available water capacity is low or very low (1.17 to 3.39 inches) above the bedrock.

R022AE221CA—Cold Semi-Wet Alluvial Flat.—This site is on flood plains in mountain basins at elevations of 7,000 to 9,500 feet. It occurs on all aspects. Slopes are 0 to 2 percent. The site is an alpine meadow dominated by a variety of grasses and sedges. The most common species may include Nebraska sedge (*Carex nebrascensis*), tufted hairgrass (*Deschampsia caespitosa*), Baltic rush (*Juncus balticus*), pullup muhly (*Muhlenbergia filiformis*), mat muhly (*Muhlenbergia richardsonis*), tundra aster (*Oreostemma alpigenum* var. *alpigenum*), little elephantshead (*Pedicularis attollens*), yampah (*Perideridia* spp.), bluegrass (*Poa* spp.), American bistort (*Polygonum bistortoides*), arrowleaf ragwort (*Senecio triangularis*), and sticky cinquefoil (*Potentilla glandulosa*). This site is associated with Bidart soils, which are very deep and have a surface layer of mucky silt loam and sandy subsurface textures. They are frequently flooded and ponded for very long periods in spring and summer. The water table fluctuates from depths of 2 to 40 inches throughout the growing season, creating redoximorphic features near the surface. Permeability is moderate. Surface runoff is negligible. The available water capacity is moderate or high (7.24 to 9.83 inches) in the upper 60 inches.

R022AY012NV—Barren Slope 20+ p.z.—This site is on mountain summits and side slopes at elevations of 7,000 to more than 11,000 feet. Slopes range from 8 to 75 percent. They are mainly 8 to 30 percent. The plant community is dominated by woolly mule-ears (*Wyethia mollis*) and a variety of other forbs. Other species include mountain big sagebrush (*Artemisia tridentata* spp. *vaseyana*), low sagebrush (*Artemisia arbuscula*), Letterman's needlegrass (*Achnatherum lettermanii*), western needlegrass (*Achnatherum occidentale* spp. *occidentale*), and bottlebrush squirreltail (*Elymus elymoides*). This site is associated with very shallow, well drained soils that formed in residuum and colluvium derived from tuff, tuff-breccia, and andesite. The surface layer is extremely gravelly sandy loam. It is underlain by gravelly sandy loam. Hard tuff bedrock is at a depth of 5 inches. The surface runoff class is very high. Permeability is moderately rapid. The available water capacity is very low (0.19 to 0.37 inch) above the bedrock.

R022AY021NV—South Slope 30+ p.z.—This site is on the south aspects of mountain side slopes at elevations of 8,000 to more than 11,000 feet. Slopes range

from 8 to 75 percent. They are mainly 15 to 50 percent. The plant community is dominated by western needlegrass (*Achnatherum occidentale* spp. *occidentale*), mountain brome (*Bromus marginatus*), antelope bitterbrush (*Purshia tridentate*), and mountain big sagebrush (*Artemisia tridentata* spp. *vaseyana*). This site is associated with soils that typically are moderately deep to very deep, are well drained or somewhat excessively drained, have a high content of organic matter in the upper part, and formed in residuum and colluvium derived from volcanic or granitic rocks and from mixed glacial till. The surface layer is coarse textured or moderately coarse textured and has more than 35 percent rock fragments. The soils have a mollic epipedon that is more than 24 inches thick. The surface runoff class is medium to high. Permeability is moderate or moderately rapid. The available water capacity is low or moderate (2.80 to 5.82 inches) in the upper 60 inches. The additional available soil moisture received via wind deposition of snow is the main soil-related feature influencing the vegetation on these soils.

R022AY032NV—Alpine Ridge.—This site is on exposed ridges and peaks above timberline, at elevations of 10,000 to 12,000 feet (fig. 26). Slopes range from 4 to 75 percent. The vegetation on this site could be mistaken for mosses or lichens at first glance because of the extremely compact and prostrate growth form of this plant community. Common plant species include dwarf alpine paintbrush (*Castilleja nana*), fewseed draba (*Draba oligosperma*), rosy buckwheat (*Eriogonum rosense*), dwarf phlox (*Phlox condensata*), Nevada podistera (*Podistera nevadensis*), timberline bluegrass (*Poa glauca*), squirreltail grass (*Elymus elymoides* spp. *californicus*), and needlegrass (*Achnatherum* spp). The vegetation is patchy with open, non-vegetated rubble land in between. The whitebark pine community intermingles with this community at the lower elevations. The soils associated with this site are very shallow to moderately deep, are somewhat excessively drained or excessively

Figure 26.—An area of ecological site R022AY032NV, Alpine Ridge.

drained, and formed in residuum and colluvium derived from granodiorite. The surface layer is very gravelly loamy coarse sand or gravel. Permeability is rapid. The surface runoff class is high or very high. The available water capacity is very low (0.19 inch to 2.20 inches) in the upper 60 inches.

Numerical List of Rangeland Ecological Sites

An asterisk (*) in the following list indicates Nevada ecological sites that are only minor components in this survey area and are not described in this survey. For more information, see the NRCS Ecological Site Information System Web site (http://esis.sc.egov.usda.gov).

Recreation

The soils of the survey area are rated in tables 15a and 15b according to limitations that affect their suitability for recreation. The ratings are both verbal and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect the recreational uses. A rating of *no limitations* indicates

that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. *Limitations* with numerical ratings between 0.00 and 1.00 can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. *Limitations* with a numerical rating of 1.00 indicate that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00).

The ratings in the tables are based on restrictive soil features, such as wetness, slope, and texture of the surface layer. Susceptibility to flooding is considered. Not considered in the ratings, but important in evaluating a site, are the location and accessibility of the area, the size and shape of the area and its scenic quality, vegetation, access to water, potential water impoundment sites, and access to public sewer lines. The capacity of the soil to absorb septic tank effluent and the ability of the soil to support vegetation also are important. Soils that are subject to flooding are limited for recreational uses by the duration and intensity of flooding and the season when flooding occurs. In planning recreational facilities, onsite assessment of the height, duration, intensity, and frequency of flooding is essential.

The information in tables 15a and 15b can be supplemented by other information in this survey, for example, interpretations for building site development, construction materials, sanitary facilities, and water management.

Camp areas require site preparation, such as shaping and leveling the tent and parking areas, stabilizing roads and intensively used areas, and installing sanitary facilities and utility lines. Camp areas are subject to heavy foot traffic and some vehicular traffic. The ratings are based on the soil properties that affect the ease of developing camp areas and the performance of the areas after development. Slope, stoniness, and depth to bedrock or a cemented pan are the main concerns affecting the development of camp areas. The soil properties that affect the performance of the areas after development are those that influence trafficability and promote the growth of vegetation, especially in heavily used areas. For good trafficability, the surface of camp areas should absorb rainfall readily, remain firm under heavy foot traffic, and not be dusty when dry. The soil properties that influence trafficability are texture of the surface layer, depth to a water table, ponding, flooding, permeability, and large stones. The soil properties that affect the growth of plants are depth to bedrock or a cemented pan, permeability, and toxic substances in the soil.

Picnic areas are subject to heavy foot traffic. Most vehicular traffic is confined to access roads and parking areas. The ratings are based on the soil properties that affect the ease of developing picnic areas and that influence trafficability and the growth of vegetation after development. Slope and stoniness are the main concerns affecting the development of picnic areas. For good trafficability, the surface of picnic areas should absorb rainfall readily, remain firm under heavy foot traffic, and not be dusty when dry. The soil properties that influence trafficability are texture of the surface layer, depth to a water table, ponding, flooding, permeability, and large stones. The soil properties that affect the growth of plants are depth to bedrock or a cemented pan, permeability, and toxic substances in the soil.

Playgrounds require soils that are nearly level, are free of stones, and can withstand intensive foot traffic. The ratings are based on the soil properties that affect the ease of developing playgrounds and that influence trafficability and the growth of vegetation after development. Slope and stoniness are the main concerns affecting the development of playgrounds. For good trafficability, the surface of the

playgrounds should absorb rainfall readily, remain firm under heavy foot traffic, and not be dusty when dry. The soil properties that influence trafficability are texture of the surface layer, depth to a water table, ponding, flooding, permeability, and large stones. The soil properties that affect the growth of plants are depth to bedrock or a cemented pan, permeability, and toxic substances in the soil.

Paths and trails for hiking and horseback riding should require little or no slope modification through cutting and filling. The ratings are based on the soil properties that affect trafficability and erodibility. These properties are stoniness, depth to a water table, ponding, flooding, slope, and texture of the surface layer.

Off-road motorcycle trails require little or no site preparation. They are not covered with surfacing material or vegetation. Considerable compaction of the soil material is likely. The ratings are based on the soil properties that influence erodibility, trafficability, dustiness, and the ease of revegetation. These properties are stoniness, slope, depth to a water table, ponding, flooding, and texture of the surface layer.

Golf fairways are subject to heavy foot traffic and some light vehicular traffic. Cutting or filling may be required. Irrigation is not considered in the ratings. The ratings are based on the soil properties that affect plant growth and trafficability after vegetation is established. The properties that affect plant growth are reaction; depth to a water table; ponding; depth to bedrock or a cemented pan; the available water capacity in the upper 40 inches; the content of salts, sodium, or calcium carbonate; and sulfidic materials. The properties that affect trafficability are flooding, depth to a water table, ponding, slope, stoniness, and the amount of sand, clay, or organic matter in the surface layer. The suitability of the soil for traps, tees, roughs, and greens is not considered in the ratings.

Engineering

This section provides information for planning land uses related to urban development and to water management. Soils are rated for various uses, and the most limiting features are identified. Ratings are given for building site development, sanitary facilities, construction materials, and water management. The ratings are based on observed performance of the soils and on the data in the tables described under the heading “Soil Properties.”

Information in this section is intended for land use planning, for evaluating land use alternatives, and for planning site investigations prior to design and construction. The information, however, has limitations. For example, estimates and other data generally apply only to that part of the soil between the surface and a depth of 5 to 7 feet. Because of the map scale, small areas of different soils may be included within the mapped areas of a specific soil.

The information is not site specific and does not eliminate the need for onsite investigation of the soils or for testing and analysis by personnel experienced in the design and construction of engineering works.

Government ordinances and regulations that restrict certain land uses or impose specific design criteria were not considered in preparing the information in this section. Local ordinances and regulations should be considered in planning, in site selection, and in design.

Soil properties, site features, and observed performance were considered in determining the ratings in this section. During the fieldwork for this soil survey, determinations were made about particle-size distribution, liquid limit, plasticity index, soil reaction, depth to bedrock, hardness of bedrock within 5 to 7 feet of the surface, soil wetness, depth to a water table, ponding, slope, likelihood of flooding, natural soil structure aggregation, and soil density. Data were collected about kinds of clay minerals, mineralogy of the sand and silt fractions, and the kinds of adsorbed cations.

Estimates were made for erodibility, permeability, corrosivity, shrink-swell potential, available water capacity, and other behavioral characteristics affecting engineering uses.

This information can be used to evaluate the potential of areas for residential, commercial, and industrial uses; make preliminary estimates of construction conditions; evaluate alternative routes for roads, streets, highways, pipelines, and underground cables; evaluate alternative sites for sanitary landfills, septic tank absorption fields, and sewage lagoons; plan detailed onsite investigations of soils and geology; locate potential sources of gravel, sand, earthfill, and topsoil; plan drainage systems, irrigation systems, ponds, terraces, and other structures for soil and water conservation; and predict performance of proposed small structures and pavements by comparing the performance of existing similar structures on the same or similar soils.

The information in the tables, along with the soil maps, the soil descriptions, and other data provided in this survey, can be used to make additional interpretations.

Some of the terms used in this soil survey have a special meaning in soil science and are defined in the Glossary.

Building Site Development

Soil properties influence the development of building sites, including the selection of the site, the design of the structure, construction, performance after construction, and maintenance. Tables 16a and 16b show the degree and kind of soil limitations that affect dwellings with and without basements, small commercial buildings, local roads and streets, shallow excavations, and lawns and landscaping.

The ratings in the tables are both verbal and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect building site development. A rating of *no limitations* indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. *Limitations* with numerical ratings between 0.00 and 1.00 can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. *Limitations* with a numerical rating of 1.00 indicate that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00).

Dwellings are single-family houses of three stories or less. For dwellings without basements, the foundation is assumed to consist of spread footings of reinforced concrete built on undisturbed soil at a depth of 2 feet or at the depth of maximum frost penetration, whichever is deeper. For dwellings with basements, the foundation is assumed to consist of spread footings of reinforced concrete built on undisturbed soil at a depth of about 7 feet. The ratings for dwellings are based on the soil properties that affect the capacity of the soil to support a load without movement and on the properties that affect excavation and construction costs. The properties that affect the load-supporting capacity include depth to a water table, ponding, flooding, subsidence, linear extensibility (shrink-swell potential), and compressibility. Compressibility is inferred from the Unified classification. The properties that affect the ease and amount of excavation include depth to a water table, ponding, flooding, slope, depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, and the amount and size of rock fragments.

Small commercial buildings are structures that are less than three stories high and do not have basements. The foundation is assumed to consist of spread footings of reinforced concrete built on undisturbed soil at a depth of 2 feet or at the depth of maximum frost penetration, whichever is deeper. The ratings are based on the soil properties that affect the capacity of the soil to support a load without movement and on the properties that affect excavation and construction costs. The properties that affect the load-supporting capacity include depth to a water table, ponding, flooding, subsidence, linear extensibility (shrink-swell potential), and compressibility (which is inferred from the Unified classification). The properties that affect the ease and amount of excavation include flooding, depth to a water table, ponding, slope, depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, and the amount and size of rock fragments.

Local roads and streets have an all-weather surface and carry automobile and light truck traffic all year. They have a subgrade of cut or fill soil material; a base of gravel, crushed rock, or soil material stabilized by lime or cement; and a surface of flexible material (asphalt), rigid material (concrete), or gravel with a binder. The ratings are based on the soil properties that affect the ease of excavation and grading and the traffic-supporting capacity. The properties that affect the ease of excavation and grading are depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, depth to a water table, ponding, flooding, the amount of large stones, and slope. The properties that affect the traffic-supporting capacity are soil strength (as inferred from the AASHTO group index number), subsidence, linear extensibility (shrink-swell potential), the potential for frost action, depth to a water table, and ponding.

Shallow excavations are trenches or holes dug to a maximum depth of 5 or 6 feet for graves, utility lines, open ditches, or other purposes. The ratings are based on the soil properties that influence the ease of digging and the resistance to sloughing. Depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, the amount of large stones, and dense layers influence the ease of digging, filling, and compacting. Depth to the seasonal high water table, flooding, and ponding may restrict the period when excavations can be made. Slope influences the ease of using machinery. Soil texture, depth to the water table, and linear extensibility (shrink-swell potential) influence the resistance to sloughing.

Sanitary Facilities

Tables 17a and 17b show the degree and kind of soil limitations that affect septic tank absorption fields, sewage lagoons, sanitary landfills, and daily cover for landfill. The ratings are both verbal and numerical. A rating of *no limitations* indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. *Limitations* with numerical ratings between 0.00 and 1.00 can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. *Limitations* with a numerical rating of 1.00 indicate that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00).

Septic tank absorption fields are areas in which effluent from a septic tank is distributed into the soil through subsurface tiles or perforated pipe. Only that part of the soil between depths of 24 and 60 inches is evaluated. The ratings are based on the soil properties that affect absorption of the effluent, construction and maintenance

of the system, and public health. Permeability, depth to a water table, ponding, depth to bedrock or a cemented pan, and flooding affect absorption of the effluent. Stones and boulders, ice, and bedrock or a cemented pan interfere with installation. Subsidence interferes with installation and maintenance. Excessive slope may cause lateral seepage and surfacing of the effluent in downslope areas.

Some soils are underlain by loose sand and gravel or fractured bedrock at a depth of less than 4 feet below the distribution lines. In these soils the absorption field may not adequately filter the effluent, particularly when the system is new. As a result, the ground water may become contaminated.

Sewage lagoons are shallow ponds constructed to hold sewage while aerobic bacteria decompose the solid and liquid wastes. Lagoons should have a nearly level floor surrounded by cut slopes or embankments of compacted soil. Nearly impervious soil material for the lagoon floor and sides is required to minimize seepage and contamination of ground water. Considered in the ratings are slope, permeability, depth to a water table, ponding, depth to bedrock or a cemented pan, flooding, large stones, and content of organic matter.

Soil permeability is a critical property affecting the suitability for sewage lagoons. Most porous soils eventually become sealed when they are used as sites for sewage lagoons. Until sealing occurs, however, the hazard of pollution is severe. Soils that have a permeability rate of more than 2 inches per hour are too porous for the proper functioning of sewage lagoons. In these soils, seepage of the effluent can result in contamination of the ground water. Ground-water contamination is also a hazard if fractured bedrock is within a depth of 40 inches, if the water table is high enough to raise the level of sewage in the lagoon, or if floodwater overtops the lagoon.

A high content of organic matter is detrimental to proper functioning of the lagoon because it inhibits aerobic activity. Slope, bedrock, and cemented pans can cause construction problems, and large stones can hinder compaction of the lagoon floor. If the lagoon is to be uniformly deep throughout, the slope must be gentle enough and the soil material must be thick enough over bedrock or a cemented pan to make land smoothing practical.

A *trench sanitary landfill* is an area where solid waste is placed in successive layers in an excavated trench. The waste is spread, compacted, and covered daily with a thin layer of soil excavated at the site. When the trench is full, a final cover of soil material at least 2 feet thick is placed over the landfill. The ratings in the table are based on the soil properties that affect the risk of pollution, the ease of excavation, trafficability, and revegetation. These properties include permeability, depth to bedrock or a cemented pan, depth to a water table, ponding, slope, flooding, texture, stones and boulders, highly organic layers, soil reaction, and content of salts and sodium. Unless otherwise stated, the ratings apply only to that part of the soil within a depth of about 6 feet. For deeper trenches, onsite investigation may be needed.

Hard, nonrippable bedrock, creviced bedrock, or highly permeable strata in or directly below the proposed trench bottom can affect the ease of excavation and the hazard of ground-water pollution. Slope affects construction of the trenches and the movement of surface water around the landfill. It also affects the construction and performance of roads in areas of the landfill.

Soil texture and consistence affect the ease with which the trench is dug and the ease with which the soil can be used as daily or final cover. They determine the workability of the soil when dry and when wet. Soils that are plastic and sticky when wet are difficult to excavate, grade, or compact and are difficult to place as a uniformly thick cover over a layer of refuse.

The soil material used as the final cover for a trench landfill should be suitable for plants. It should not have excess sodium or salts and should not be too acid. The surface layer generally has the best workability, the highest content of organic matter,

and the best potential for plants. Material from the surface layer should be stockpiled for use as the final cover.

In an *area sanitary landfill*, solid waste is placed in successive layers on the surface of the soil. The waste is spread, compacted, and covered daily with a thin layer of soil from a source away from the site. A final cover of soil material at least 2 feet thick is placed over the completed landfill. The ratings in the table are based on the soil properties that affect trafficability and the risk of pollution. These properties include flooding, permeability, depth to a water table, ponding, slope, and depth to bedrock or a cemented pan.

Flooding is a serious problem because it can result in pollution in areas downstream from the landfill. If permeability is too rapid or if fractured bedrock, a fractured cemented pan, or the water table is close to the surface, the leachate can contaminate the water supply. Slope is a consideration because of the extra grading required to maintain roads in the steeper areas of the landfill. Also, leachate may flow along the surface of the soils in the steeper areas and cause difficult seepage problems.

Daily cover for landfill is the soil material that is used to cover compacted solid waste in an area sanitary landfill. The soil material is obtained offsite, transported to the landfill, and spread over the waste. The ratings in the table also apply to the final cover for a landfill. They are based on the soil properties that affect workability, the ease of digging, and the ease of moving and spreading the material over the refuse daily during wet and dry periods. These properties include soil texture, depth to a water table, ponding, rock fragments, slope, depth to bedrock or a cemented pan, reaction, and content of salts, sodium, or lime.

Loamy or silty soils that are free of large stones and excess gravel are the best cover for a landfill. Clayey soils may be sticky and difficult to spread; sandy soils are subject to wind erosion.

Slope affects the ease of excavation and of moving the cover material. Also, it can influence runoff, erosion, and reclamation of the borrow area.

After soil material has been removed, the soil material remaining in the borrow area must be thick enough over bedrock, a cemented pan, or the water table to permit revegetation. The soil material used as the final cover for a landfill should be suitable for plants. It should not have excess sodium, salts, or lime and should not be too acid.

Construction Materials

Tables 18a and 18b give information about the soils as potential sources of gravel, sand, topsoil, reclamation material, and roadfill. Normal compaction, minor processing, and other standard construction practices are assumed.

Sand and *gravel* are natural aggregates suitable for commercial use with a minimum of processing. They are used in many kinds of construction. Specifications for each use vary widely. In table 18A, only the likelihood of finding material in suitable quantity is evaluated. The suitability of the material for specific purposes is not evaluated, nor are factors that affect excavation of the material. The properties used to evaluate the soil as a source of sand or gravel are gradation of grain sizes (as indicated by the Unified classification of the soil), the thickness of suitable material, and the content of rock fragments. If the bottom layer of the soil contains sand or gravel, the soil is considered a likely source regardless of thickness. The assumption is that the sand or gravel layer below the depth of observation exceeds the minimum thickness.

The soils are rated *good, fair,* or *poor* as potential sources of sand and gravel. A rating of *good* or *fair* means that the source material is likely to be in or below the soil. The bottom layer and the thickest layer of the soils are assigned numerical ratings.

These ratings indicate the likelihood that the layer is a source of sand or gravel. The numbers 0.00 to 0.07 indicate that the layer is a poor source. The numbers 0.75 to 1.00 indicate that the layer is a good source. The numbers 0.08 to 0.74 indicate the degree to which the layer is a likely source.

The soils are rated *good, fair,* or *poor* as potential sources of topsoil, reclamation material, and roadfill. The features that limit the soils as sources of these materials are specified in the tables. The numerical ratings given after the specified features indicate the degree to which the features limit the soils as sources of topsoil, reclamation material, or roadfill. The lower the number, the greater the limitation.

Topsoil is used to cover an area so that vegetation can be established and maintained. The upper 40 inches of a soil is evaluated for use as topsoil. Also evaluated is the reclamation potential of the borrow area. The ratings are based on the soil properties that affect plant growth; the ease of excavating, loading, and spreading the material; and reclamation of the borrow area. Toxic substances, soil reaction, and the properties that are inferred from soil texture, such as available water capacity and fertility, affect plant growth. The ease of excavating, loading, and spreading is affected by rock fragments, slope, depth to a water table, soil texture, and thickness of suitable material. Reclamation of the borrow area is affected by slope, depth to a water table, rock fragments, depth to bedrock or a cemented pan, and toxic material.

The surface layer of most soils is generally preferred for topsoil because of its organic matter content. Organic matter greatly increases the absorption and retention of moisture and nutrients for plant growth.

Reclamation material is used in areas that have been drastically disturbed by surface mining or similar activities. When these areas are reclaimed, layers of soil material or unconsolidated geological material, or both, are replaced in a vertical sequence. The reconstructed soil favors plant growth. The ratings in the table do not apply to quarries and other mined areas that require an offsite source of reconstruction material. The ratings are based on the soil properties that affect erosion and stability of the surface and the productive potential of the reconstructed soil. These properties include the content of sodium, salts, and calcium carbonate; reaction; available water capacity; erodibility; texture; content of rock fragments; and content of organic matter and other features that affect fertility.

Roadfill is soil material that is excavated in one place and used in road embankments in another place. In this table, the soils are rated as a source of roadfill for low embankments, generally less than 6 feet high and less exacting in design than higher embankments.

The ratings are for the whole soil, from the surface to a depth of about 5 feet. It is assumed that soil layers will be mixed when the soil material is excavated and spread.

The ratings are based on the amount of suitable material and on soil properties that affect the ease of excavation and the performance of the material after it is in place. The thickness of the suitable material is a major consideration. The ease of excavation is affected by large stones, depth to a water table, and slope. How well the soil performs in place after it has been compacted and drained is determined by its strength (as inferred from the AASHTO classification of the soil) and linear extensibility (shrink-swell potential).

Water Management

Tables 19a and 19b provide information on the soil properties and site features that affect water management. The degree and kind of soil limitations are given for pond reservoir areas; embankments, dikes, and levees; and various irrigation systems. The ratings are both verbal and numerical. A rating of *no limitations*

indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. *Limitations* with numerical ratings between 0.00 and 1.00 can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. *Limitations* with a numerical rating of 1.00 indicate that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00).

Pond reservoir areas hold water behind a dam or embankment. Soils best suited to this use have low seepage potential in the upper 60 inches. The seepage potential is determined by the permeability of the soil and the depth to fractured bedrock or other permeable material. Excessive slope can affect the storage capacity of the reservoir area.

Embankments, dikes, and levees are raised structures of soil material, generally less than 20 feet high, constructed to impound water or to protect land against overflow. Embankments that have zoned construction (core and shell) are not considered. In this table, the soils are rated as a source of material for embankment fill. The ratings apply to the soil material below the surface layer to a depth of about 5 feet. It is assumed that soil layers will be uniformly mixed and compacted during construction.

The ratings do not indicate the ability of the natural soil to support an embankment. Soil properties to a depth even greater than the height of the embankment can affect performance and safety of the embankment. Generally, deeper onsite investigation is needed to determine these properties.

Soil material in embankments must be resistant to seepage, piping, and erosion and have favorable compaction characteristics. Unfavorable features include less than 5 feet of suitable material and a high content of stones or boulders, organic matter, or salts or sodium. A high water table affects the amount of usable material. It also affects trafficability.

Sprinkler irrigation systems vary in shape, size, and design depending on the needs of the crop grown and the soil type. These systems can be used on a wider range of soils than can border systems. Most sprinkler systems can be used on slopes of as much as 15 percent. Ponding, surface erodibility, and depth to a cemented pan or bedrock typically limit design and performance.

Drip (or trickle) irrigation systems are very efficient and are most economical for wide-spaced crops, such as trees and vines. Slope generally is not a limitation, and the movement of water through the soil can be controlled by the application rate. Soil texture, movement of water through the soil, surface coarse fragments, and available water capacity are less limiting with these systems than with other irrigation systems.

Furrow irrigation systems are some of the oldest irrigation methods. They require efficient management. A furrow is a small, shallow channel that is installed down the slope or across the slope of a field. The length of the furrow should be determined by soil type and slope. Furrows extending downslope contribute to soil erosion. Soil texture, erodibility, and depth to a cemented pan or bedrock typically limit performance and affect maintenance.

Soil Properties

Data relating to soil properties are collected during the course of the soil survey.

Soil properties are ascertained by field examination of the soils and by laboratory index testing of some benchmark soils. Established standard procedures are followed. During the survey, many shallow borings are made and examined to identify and classify the soils and to delineate them on the soil maps. Samples are taken from some typical profiles and tested in the laboratory to determine particle-size distribution, plasticity, and compaction characteristics.

Estimates of soil properties are based on field examinations, on laboratory tests of samples from the survey area, and on laboratory tests of samples of similar soils in nearby areas. Tests verify field observations, verify properties that cannot be estimated accurately by field observation, and help to characterize key soils.

The estimates of soil properties are shown in tables. They include engineering index properties, physical and chemical properties, and pertinent soil and water features.

Engineering Index Properties

Table 20 gives the engineering classifications and the range of index properties for the layers of each soil in the survey area.

Depth to the upper and lower boundaries of each layer is indicated.

Texture is given in abbreviations for the standard terms used by the U.S. Department of Agriculture. These terms are defined according to percentages of sand, silt, and clay in the fraction of the soil that is less than 2 millimeters in diameter. “Loam,” for example, is soil that is 7 to 27 percent clay, 28 to 50 percent silt, and less than 52 percent sand. If the content of particles coarser than sand is 15 percent or more, an appropriate modifier is added, for example, “gravelly.” Textural terms are defined in the Glossary.

Classification of the soils is determined according to the Unified soil classification system (ASTM, 2005) and the system adopted by the American Association of State Highway and Transportation Officials (AASHTO, 2004).

The Unified system classifies soils according to properties that affect their use as construction material. Soils are classified according to particle-size distribution of the fraction less than 3 inches in diameter and according to plasticity index, liquid limit, and organic matter content. Sandy and gravelly soils are identified as GW, GP, GM, GC, SW, SP, SM, and SC; silty and clayey soils as ML, CL, OL, MH, CH, and OH; and highly organic soils as PT. Soils exhibiting engineering properties of two groups can have a dual classification, for example, CL-ML.

The AASHTO system classifies soils according to those properties that affect roadway construction and maintenance. In this system, the fraction of a mineral soil that is less than 3 inches in diameter is classified in one of seven groups from A-1 through A-7 on the basis of particle-size distribution, liquid limit, and plasticity index. Soils in group A-1 are coarse grained and low in content of fines (silt and clay). At the other extreme, soils in group A-7 are fine grained. Highly organic soils are classified in group A-8 on the basis of visual inspection.

If laboratory data are available, the A-1, A-2, and A-7 groups are further classified as A-1-a, A-1-b, A-2-4, A-2-5, A-2-6, A-2-7, A-7-5, or A-7-6. As an additional refinement, the suitability of a soil as subgrade material can be indicated by a group index number. Group index numbers range from 0 for the best subgrade material to 20 or higher for the poorest.

Rock fragments larger than 10 inches in diameter and 3 to 10 inches in diameter are indicated as a percentage of the total soil on a dry-weight basis. The percentages are estimates determined mainly by converting volume percentage in the field to weight percentage.

Percentage (of soil particles) passing designated sieves is the percentage of the soil fraction less than 3 inches in diameter based on an ovendry weight. The sieves, numbers 4, 10, 40, and 200 (USA Standard Series), have openings of 4.76, 2.00, 0.420, and 0.074 millimeters, respectively. Estimates are based on laboratory tests of soils sampled in the survey area and in nearby areas and on estimates made in the field.

Liquid limit and *plasticity index* (Atterberg limits) indicate the plasticity characteristics of a soil. The estimates are based on test data from the survey area or from nearby areas and on field examination.

Physical Properties

Table 21 shows estimates of some physical characteristics and features that affect soil behavior. These estimates are given for the layers of each soil in the survey area. The estimates are based on field observations and on test data for these and similar soils.

Depth to the upper and lower boundaries of each layer is indicated.

Clay as a soil separate consists of mineral soil particles that are less than 0.002 millimeter in diameter. In table 21, the estimated clay content of each soil layer is given as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The amount and kind of clay affect the fertility and physical condition of the soil and the ability of the soil to adsorb cations and to retain moisture. They influence shrink-swell potential, permeability, plasticity, the ease of soil dispersion, and other soil properties. The amount and kind of clay in a soil also affect tillage and earth-moving operations.

Moist bulk density is the weight of soil (ovendry) per unit volume. Volume is measured when the soil is at field moisture capacity, that is, the moisture content at $^1/_3$- or $^1/_{10}$-bar (33kPa or 10kPa) moisture tension. Weight is determined after the soil is dried at 105 degrees C. In the table, the estimated moist bulk density of each soil horizon is expressed in grams per cubic centimeter of soil material that is less than 2 millimeters in diameter. Bulk density data are used to compute shrink-swell potential, available water capacity, total pore space, and other soil properties. The moist bulk density of a soil indicates the pore space available for water and roots. Depending on soil texture, a bulk density of more than 1.4 can restrict water storage and root penetration. Moist bulk density is influenced by texture, kind of clay, content of organic matter, and soil structure.

Saturated hydraulic conductivity refers to the ability of a soil to transmit water or air. The term “permeability,” as used in soil surveys, indicates saturated hydraulic conductivity (Ksat). The estimates in the table indicate the rate of water movement, in micrometers per second (um/sec), when the soil is saturated. They are based on field measurements and on soil characteristics observed in the field, particularly structure, porosity, and texture. Permeability is considered in the design of soil drainage systems and septic tank absorption fields.

Available water capacity refers to the quantity of water that the soil is capable of storing for use by plants. The capacity for water storage is given in inches of water per inch of soil for each soil layer. The capacity varies, depending on soil properties that affect retention of water. The most important properties are the content of organic matter, soil texture, bulk density, and soil structure. Available water capacity is an important factor in the choice of plants or crops to be grown and in the design and management of irrigation systems. Available water capacity is not an estimate of the quantity of water actually available to plants at any given time.

Linear extensibility refers to the change in length of an unconfined clod as moisture content is decreased from a moist to a dry state. It is an expression of the volume change between the water content of the clod at 1/3- or 1/10-bar tension (33kPa or 10kPa tension) and oven dryness. The volume change is reported in the table as percent change for the whole soil. Volume change is influenced by the amount and type of clay minerals in the soil.

Linear extensibility is used to determine the shrink-swell potential of soils. The shrink-swell potential is low if the soil has a linear extensibility of less than 3 percent; moderate if 3 to 6 percent; high if 6 to 9 percent; and very high if more than 9 percent. If the linear extensibility is more than 3, shrinking and swelling can cause damage to buildings, roads, and other structures and to plant roots. Special design commonly is needed.

Organic matter is the plant and animal residue in the soil at various stages of decomposition. In table 21, the estimated content of organic matter is expressed as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The content of organic matter in a soil can be maintained by returning crop residue to the soil. Organic matter has a positive effect on available water capacity, water infiltration, soil organism activity, and tilth. It is a source of nitrogen and other nutrients for crops and soil organisms. The estimates in table 21 are based on laboratory analyses of total carbon.

Erosion Properties

Erosion factors are shown in table 22 as the K factor (Kw and Kf) and the T factor. Erosion factor K indicates the susceptibility of a soil to sheet and rill erosion by water. Factor K is one of several factors used in the Universal Soil Loss Equation (USLE) and the Revised Universal Soil Loss Equation (RUSLE) to predict the average annual rate of soil loss by sheet and rill erosion in tons per acre per year. The estimates are based primarily on percentage of silt, sand, and organic matter and on soil structure and permeability. Values of K range from 0.02 to 0.69. Other factors being equal, the higher the value, the more susceptible the soil is to sheet and rill erosion by water.

Depth to the upper and lower boundaries of each layer is indicated.

Erosion factor Kw indicates the erodibility of the whole soil. The estimates are modified by the presence of rock fragments.

Erosion factor Kf indicates the erodibility of the fine-earth fraction, or the material less than 2 millimeters in size.

The Kw and KF factors were modified by determinations of the “profile permeability class” for each horizon. The slowest Ksat within 50 centimeters of the top of the horizon being rated was used when these determinations were made.

Erosion factor T is an estimate of the maximum average annual rate of soil erosion by wind or water that can occur without affecting crop productivity over a sustained period. The rate is in tons per acre per year.

Wind erodibility groups are made up of soils that have similar properties affecting their susceptibility to wind erosion in cultivated areas. The soils assigned to group 1 are the most susceptible to wind erosion, and those assigned to group 8 are the least

susceptible. A description of the wind erodibility groups is available in the “National Soil Survey Handbook” (http://soils.usda.gov/technical/handbook/).

Wind erodibility index is a numerical value indicating the susceptibility of soil to wind erosion, or the tons per acre per year that can be expected to be lost to wind erosion. There is a close correlation between wind erosion and the texture of the surface layer, the size and durability of surface clods, rock fragments, organic matter, and a calcareous reaction. Soil moisture and frozen soil layers also influence wind erosion.

Chemical Properties

Table 23 shows estimates of some chemical characteristics and features that affect soil behavior. These estimates are given for the layers of each soil in the survey area. The estimates are based on field observations and on test data for these and similar soils.

Depth to the upper and lower boundaries of each layer is indicated.

Cation-exchange capacity is the total amount of extractable bases that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated pH value. Soils having a low cation-exchange capacity hold fewer cations and may require more frequent applications of fertilizer than soils having a high cation-exchange capacity. The ability to retain cations reduces the hazard of ground-water pollution.

Effective cation-exchange capacity refers to the sum of extractable bases plus aluminum expressed in terms of milliequivalents per 100 grams of soil. It is determined for soils that have pH of less than 5.5.

Soil reaction is a measure of acidity or alkalinity. The pH of each soil horizon is based on many field tests. For many soils, values have been verified by laboratory analyses. Soil reaction is important in selecting crops and other plants, in evaluating soil amendments for fertility and stabilization, and in determining the risk of corrosion.

Water Features

Table 24 gives estimates of various water features. The estimates are used in land use planning that involves engineering considerations.

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The four hydrologic soil groups are:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near

the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas.

The criteria for hydrologic soil groups are available in the "National Engineering Handbook," Title 210-VI, Part 630, Chapter 7 (http://directives.sc.egov.usda.gov/media/pdf/H_210_630_7.pdf.)

The *months* in the table indicate the portion of the year in which the feature is most likely to be a concern.

Water table refers to a saturated zone in the soil. Table 24 indicates, by month, depth to the top (*upper limit*) and base (*lower limit*) of the saturated zone in most years. Estimates of the upper and lower limits are based mainly on observations of the water table at selected sites and on evidence of a saturated zone, namely grayish colors or mottles (redoximorphic features) in the soil. A saturated zone that lasts for less than a month is not considered a water table.

Ponding is standing water in a closed depression. Unless a drainage system is installed, the water is removed only by percolation, transpiration, or evaporation. Table 24 indicates *surface water depth* and the *duration* and *frequency* of ponding. Duration is expressed as *very brief* if less than 2 days, *brief* if 2 to 7 days, *long* if 7 to 30 days, and *very long* if more than 30 days. Frequency is expressed as none, rare, occasional, and frequent. *None* means that ponding is not probable; *rare* that it is unlikely but possible under unusual weather conditions (the chance of ponding is nearly 0 percent to 5 percent in any year); *occasional* that it occurs, on the average, once or less in 2 years (the chance of ponding is 5 to 50 percent in any year); and *frequent* that it occurs, on the average, more than once in 2 years (the chance of ponding is more than 50 percent in any year).

Flooding is the temporary inundation of an area caused by overflowing streams, by runoff from adjacent slopes, or by tides. Water standing for short periods after rainfall or snowmelt is not considered flooding, and water standing in swamps and marshes is considered ponding rather than flooding.

Duration and *frequency* are estimated. Duration is expressed as *extremely brief* if 0.1 hour to 4 hours, *very brief* if 4 hours to 2 days, *brief* if 2 to 7 days, *long* if 7 to 30 days, and *very long* if more than 30 days. Frequency is expressed as none, very rare, rare, occasional, frequent, and very frequent. *None* means that flooding is not probable; *very rare* that it is very unlikely but possible under extremely unusual weather conditions (the chance of flooding is less than 1 percent in any year); *rare* that it is unlikely but possible under unusual weather conditions (the chance of flooding is 1 to 5 percent in any year); *occasional* that it occurs infrequently under normal weather conditions (the chance of flooding is 5 to 50 percent in any year); *frequent* that it is likely to occur often under normal weather conditions (the chance of flooding is more than 50 percent in any year but is less than 50 percent in all months in any year); and *very frequent* that it is likely to occur very often under normal weather conditions (the chance of flooding is more than 50 percent in all months of any year).

The information is based on evidence in the soil profile, namely thin strata of gravel, sand, silt, or clay deposited by floodwater; irregular decrease in organic matter content with increasing depth; and little or no horizon development.

Also considered are local information about the extent and levels of flooding and the relation of each soil on the landscape to historic floods. Information on the extent of flooding based on soil data is less specific than that provided by detailed engineering surveys that delineate flood-prone areas at specific flood frequency levels.

Soil Features

Table 25 gives estimates of various soil features. The estimates are used in land use planning that involves engineering considerations.

A *restrictive layer* is a nearly continuous layer that has one or more physical, chemical, or thermal properties that significantly impede the movement of water and air through the soil or that restrict roots or otherwise provide an unfavorable root environment. Examples are bedrock, cemented layers, dense layers, and frozen layers. The table indicates the hardness and thickness of the restrictive layer, both of which significantly affect the ease of excavation. *Depth to top* is the vertical distance from the soil surface to the upper boundary of the restrictive layer.

Subsidence is the settlement of organic soils or of saturated mineral soils of very low density. Subsidence generally results from either desiccation and shrinkage or oxidation of organic material, or both, following drainage. Subsidence takes place gradually, usually over a period of several years. The table shows the expected initial subsidence, which usually is a result of drainage, and total subsidence, which results from a combination of factors.

Potential for frost action is the likelihood of upward or lateral expansion of the soil caused by the formation of segregated ice lenses (frost heave) and the subsequent collapse of the soil and loss of strength on thawing. Frost action occurs when moisture moves into the freezing zone of the soil. Temperature, texture, density, permeability, content of organic matter, and depth to the water table are the most important factors considered in evaluating the potential for frost action. It is assumed that the soil is not insulated by vegetation or snow and is not artificially drained. Silty and highly structured, clayey soils that have a high water table in winter are the most susceptible to frost action. Well drained, very gravelly, or very sandy soils are the least susceptible. Frost heave and low soil strength during thawing cause damage to pavements and other rigid structures.

Risk of corrosion pertains to potential soil-induced electrochemical or chemical action that corrodes or weakens uncoated steel or concrete. The rate of corrosion of uncoated steel is related to such factors as soil moisture, particle-size distribution, acidity, and electrical conductivity of the soil. The rate of corrosion of concrete is based mainly on the sulfate and sodium content, texture, moisture content, and acidity of the soil. Special site examination and design may be needed if the combination of factors results in a severe hazard of corrosion. The steel or concrete in installations that intersect soil boundaries or soil layers is more susceptible to corrosion than the steel or concrete in installations that are entirely within one kind of soil or within one soil layer.

For uncoated steel, the risk of corrosion, expressed as *low, moderate,* or *high,* is based on soil drainage class, total acidity, electrical resistivity near field capacity, and electrical conductivity of the saturation extract.

For concrete, the risk of corrosion also is expressed as *low, moderate,* or *high*. It is based on soil texture, acidity, and amount of sulfates in the saturation extract.

Classification of the Soils

The system of soil classification used by the National Cooperative Soil Survey has six categories (Soil Survey Staff, 1999 and 2006). Beginning with the broadest, these categories are the order, suborder, great group, subgroup, family, and series. Classification is based on soil properties observed in the field or inferred from those observations or from laboratory measurements. Table 26 shows the classification of the soils in the survey area. The categories are defined in the following paragraphs.

ORDER. Twelve soil orders are recognized. The differences among orders reflect the dominant soil-forming processes and the degree of soil formation. Each order is identified by a word ending in *sol*. An example is Alfisol.

SUBORDER. Each order is divided into suborders primarily on the basis of properties that influence soil genesis and are important to plant growth or properties that reflect the most important variables within the orders. The last syllable in the name of a suborder indicates the order. An example is Xeralf (*Xer*, meaning dry, plus *alf*, from Alfisol).

GREAT GROUP. Each suborder is divided into great groups on the basis of close similarities in kind, arrangement, and degree of development of pedogenic horizons; soil moisture and temperature regimes; type of saturation; and base status. Each great group is identified by the name of a suborder and by a prefix that indicates a property of the soil. An example is Haploxeralfs (*Hapl*, meaning minimal horizonation, plus *xeralf*, the suborder of the Alfisols that has a xeric moisture regime).

SUBGROUP. Each great group has a typic subgroup. Other subgroups are intergrades or extragrades. The typic subgroup is the central concept of the great group; it is not necessarily the most extensive. Intergrades are transitions to other orders, suborders, or great groups. Extragrades have some properties that are not representative of the great group but do not indicate transitions to any other taxonomic class. Each subgroup is identified by one or more adjectives preceding the name of the great group. An example is Ultic Haploxeralfs.

FAMILY. Families are established within a subgroup on the basis of physical and chemical properties and other characteristics that affect management. Generally, the properties are those of horizons below plow depth where there is much biological activity. Among the properties and characteristics considered are particle-size class, mineralogy class, cation-exchange activity class, soil temperature regime, soil depth, and reaction class. A family name consists of the name of a subgroup preceded by terms that indicate soil properties. An example is fine-loamy, isotic, frigid Ultic Haploxeralfs.

SERIES. The series consists of soils within a family that have horizons similar in color, texture, structure, reaction, consistence, mineral and chemical composition, and arrangement in the profile. An example is the Tahoma series.

Soil Series and Their Morphology

In this section, each soil series recognized in the survey area is described. Characteristics of the soil and the material in which it formed are identified for each series. A pedon, a small three-dimensional area of soil, that is typical of the series in

the survey area is described. The detailed description of each soil horizon follows standards in the “Soil Survey Manual” (Soil Survey Division Staff, 1993). Many of the technical terms used in the descriptions are defined in “Soil Taxonomy” (Soil Survey Staff, 1999) and in “Keys to Soil Taxonomy” (Soil Survey Staff, 2006). Unless otherwise indicated, colors in the descriptions are for dry soil. Following the pedon description is the range of important characteristics of the soils in the series.

Aquic Xerorthents

The Aquic Xerorthents in this survey area consist of very deep, poorly drained soils that formed in alluvium and colluvium in riparian corridors. Slopes range from 0 to 15 percent. The mean annual precipitation is about 750 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Coarse-loamy, mixed, superactive, frigid Aquic Xerorthents

Reference pedon

Aquic Xerorthents, on a south-facing (190-degree) slope of 7 percent, at an elevation of 2,352 meters, in an area of Oxyaquic Cryorthents-Aquic Xerorthents-Tahoe complex, 0 to 15 percent slopes.

When described on 6/15/1999, the soil was moist throughout. Colors are for dry soil unless otherwise indicated.

Oe—0 to 1 centimeter; moderately decomposed plant material.

Oa—1 to 3 centimeters; very dark grayish brown (10YR 3/2), highly decomposed plant material, very dark gray (10YR 3/1) moist; strongly acid (pH 5.5); gradual smooth boundary. (Laboratory sample number 00P2515)

A1—3 to 10 centimeters; dark grayish brown (10YR 4/2) sandy loam, very dark grayish brown (10YR 3/2) moist; 73 percent sand; 10 percent clay; weak fine subangular blocky and moderate fine granular structure; slightly sticky and nonplastic; common very fine, fine, and medium roots; 5 percent gravel; moderately acid (pH 5.6); gradual smooth boundary. (Laboratory sample number 00P2516)

A2—10 to 23 centimeters; dark grayish brown (10YR 4/2) sandy loam, very dark grayish brown (10YR 3/2) moist; 72 percent sand; 16 percent clay; moderate coarse and weak fine and medium subangular blocky structure; slightly sticky and nonplastic; common very fine, fine, and medium roots; 6 percent gravel; moderately acid (pH 5.6); gradual smooth boundary.

C1—23 to 36 centimeters; brown (10YR 5/3) coarse sandy loam, grayish brown (10YR 5/2) moist; 70 percent sand; 18 percent clay; massive; moderately sticky and slightly plastic; common very fine, fine, medium, coarse, and very coarse roots; 7 percent gravel; moderately acid (pH 5.7); clear wavy boundary. (Laboratory sample number 00P2517)

C2—36 to 74 centimeters; brown (10YR 5/3) sandy loam, grayish brown (10YR 5/2) moist; 73 percent sand; 17 percent clay; massive; moderately sticky and slightly plastic; few very fine and fine and common coarse and very coarse roots; 9 percent gravel; slightly acid (pH 6.2); gradual smooth boundary. (Laboratory sample number 00P2518)

C3—74 to 104 centimeters; brownish yellow (10YR 6/6) gravelly sandy loam, grayish brown (10YR 5/2) moist; 70 percent sand; 18 percent clay; massive; moderately sticky and slightly plastic; strong brown (7.5YR 5/6 moist) masses of oxidized iron throughout; 33 percent gravel; slightly acid (pH 6.2). (Laboratory sample number 00P2519)

C4—104 to 114 centimeters; yellowish brown (10YR 5/4) loamy coarse sand, brown (10YR 5/3) moist; 79 percent sand; 14 percent clay; massive; slightly sticky and nonplastic; 10 percent dark greenish gray (5GY 4/1 moist) iron depletions throughout and 30 percent strong brown (7.5YR 5/8 moist) masses of oxidized iron throughout; 5 percent gravel; slightly acid (pH 6.3). (Laboratory sample number 00P2520)

C5—114 to 122 centimeters; brownish yellow (10YR 6/6) sandy loam, brown (10YR 5/3) moist; 64 percent sand; 20 percent clay; massive; 25 percent greenish gray (5G 5/1 moist) iron depletions throughout and 50 percent strong brown (7.5YR 5/8 moist) masses of oxidized iron throughout; slightly acid (pH 6.4). (Laboratory sample number 00P2521)

This reference pedon is an example of the soils within this category. Because of the highly variable nature of these soils, this pedon is not necessarily representative of the Aquic Xerorthents throughout the survey area. The soils have a coarse-loamy particle-size control section in some areas and a loamy-skeletal one in others.

Type location: Douglas County, Nevada; 720 meters west and 80 meters north of the southeast corner of sec. 7, T. 14 N., R. 19 E.; 39 degrees 5 minutes 5 seconds north latitude and 119 degrees 53 minutes 21 seconds west longitude; NAD83; USGS quadrangle: Glenbrook, Nevada.

Range in characteristics

These soils are dry in all parts of the soil moisture control section for 45 or more consecutive days in the 4 months following the summer solstice and moist in all parts for 45 or more consecutive days in the 4 months following the winter solstice in most years. The soils have an aquic xeric moisture regime.

Depth to a seasonal high water table: 50 to 100 centimeters
Flooding: Frequently flooded
Ponding: None
Content of organic matter: 2 to 15 percent in the A horizons and less than 3 percent (typically about 0.5 percent) in the C horizons
Reaction: Strongly acid to slightly acid
Depth to redoximorphic features: 50 to 100 centimeters

Particle-size control section:
- Content of rock fragments—0 to 60 percent
- Mineralogy—mixed

A horizons:
- Hue—10YR
- Value—3 or 4 dry or moist
- Chroma—2 or 3 dry, 1 or 2 moist
- Texture of the fine-earth fraction—sandy loam or coarse sandy loam
- Content of clay—0 to 20 percent
- Content of rock fragments—0 to 60 percent
- Reaction—pH of 5.1 to 6.5

C horizons:
- Hue—10YR
- Value—4 to 6 dry, 4 or 5 moist
- Chroma—3 to 6 dry, 2 to 4 moist
- Texture of the fine-earth fraction—loamy coarse sand, coarse sandy loam, or sandy loam
- Content of clay—averages just under 18 percent

Content of rock fragments—0 to 35 percent
Reaction—pH of 5.1 to 6.5

Bidart Series

The Bidart series consists of very deep, very poorly drained soils that formed in alluvium derived from mixed sources. These soils are on flood plains in the mountains. Slopes are 0 to 2 percent. The mean annual precipitation is about 1,295 millimeters, and the mean annual air temperature is about 3 degrees C.

Taxonomic classification: Coarse-loamy, mixed, superactive, acid Fluvaquentic Cryaquepts

Typical pedon

Bidart mucky silt loam, on a slope of 0 percent, at an elevation of 2,548 meters, in an area of Bidart complex, 0 to 2 percent slopes.

When described on 9/16/2002, the soil was dry to a depth of 41 centimeters and moist from 41 centimeters to the water table, which was at a depth of 145 centimeters. Colors are for dry soil unless otherwise indicated.

Oa—0 to 7 centimeters; muck; abrupt smooth boundary.
A—7 to 22 centimeters; grayish brown (10YR 5/2) (interior) mucky silt loam, dark brown (10YR 3/3) rubbed and moist; 35 percent sand; 62 percent silt; 3 percent clay; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few fine and few very fine roots throughout; 5 percent prominent yellowish red (5YR 5/8 moist) masses of oxidized iron; 1 percent 2- to 5-millimeter pebbles and 2 percent 5- to 75-millimeter pebbles; strongly acid (pH 5.4) by chlorophenol red; abrupt smooth boundary.
Bg—22 to 40 centimeters; grayish brown (10YR 5/2) (interior) silt loam, dark brown (10YR 3/3) rubbed and moist; 35 percent sand; 62 percent silt; 3 percent clay; moderate fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few fine and few very fine roots throughout; common very fine dendritic tubular pores; 10 percent prominent strong brown (7.5YR 5/8 moist) masses of oxidized iron; 1 percent 5- to 75-millimeter pebbles and 1 percent 2- to 5-millimeter pebbles; strongly acid (pH 5.4) by chlorophenol red; abrupt smooth boundary.
C—40 to 43 centimeters; extremely gravelly coarse sand; 95 percent sand; 5 percent silt; single grained; loose, nonsticky and nonplastic; many fine interstitial pores; 80 percent 2- to 75-millimeter pebbles; abrupt smooth boundary.
2Bg1—43 to 100 centimeters; very fine sandy loam, grayish brown (10YR 5/2) (interior) moist; 60 percent sand; 38 percent silt; 2 percent clay; moderate medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; few fine and few very fine roots throughout; many very fine tubular pores; 10 percent prominent strong brown (7.5YR 5/8 moist) masses of oxidized iron; 1 percent 5- to 75-millimeter pebbles and 1 percent 2- to 5-millimeter pebbles; strongly acid (pH 5.4) by chlorophenol red; gradual smooth boundary.
2Bg2—100 to 150 centimeters; sandy loam, grayish brown (10YR 5/2) (interior) moist; 70 percent sand; 27 percent silt; 3 percent clay; soft, very friable, nonsticky and nonplastic; 5 percent 5- to 75-millimeter pebbles and 5 percent 2- to 5-millimeter pebbles; strongly acid (pH 5.4) by chlorophenol red.

Type location: El Dorado County, California; in a meadow south of Meiss Lake, 789 feet east and 1,213 feet south of sec. 9, T. 10 N., R. 18 E.; 38 degrees 43 minutes 50 seconds north latitude and 120 degrees 0 minutes 51 seconds west longitude; NAD83; USGS quadrangle: Caples Lake, California.

Range in characteristics

These soils are usually saturated in some part of the moisture control section during winter, spring, and early summer and are usually dry in the upper part during summer and fall, when the water table drops to a depth of 100 to 200 centimeters. The soils have a typic aquic moisture regime.

Depth to a seasonal high water table: 0 to 25 centimeters
Flooding: Occasional or frequent
Ponding: Occasional or frequent
Mean annual soil temperature: 5 to 6 degrees C at a depth of 50 centimeters
Percentage of the surface covered by rock fragments: 0 to 5 percent by gravel
Reaction: Strongly acid
Base saturation: Very low, 5 to 15 percent, where the influence of volcanic parent material is strong and ranging to 50 percent where the parent material is more commonly granodiorite
Depth to redoximorphic features: 0 to 25 centimeters

Particle-size control section: 25 to 100 centimeters
Content of rock fragments—0 to 15 percent gravel
Content of clay—averages 2 to 15 percent
Mineralogy—mixed

A horizon:
Hue—10YR
Value—5 dry, 3 moist
Chroma—2 dry, 3 moist
Content of organic matter—10 to 20 percent
Redoximorphic features—masses of oxidized iron
Texture of the fine-earth fraction—mucky silt loam
Content of clay—1 to 15 percent
Content of rock fragments—0 to 25 percent, mostly 2 to 5 millimeters in size
Reaction—pH of 4.5 to 6.0

C horizon:
Content of organic matter—0 to 2 percent
Texture of the fine-earth fraction—coarse sand
Content of clay—0 to 3 percent
Content of rock fragments—35 to 90 percent, mostly 2 to 5 millimeters in size
Reaction—pH of 4.5 to 6.0

2Bg horizons:
Hue—10YR
Value—4 to 6 dry, 2 to 6 moist
Chroma—2 or 3 dry or moist
Content of organic matter—1 to 10 percent
Redoximorphic features—masses of oxidized iron
Texture of the fine-earth fraction—coarse sandy loam, sandy loam, very fine sandy loam, or silt loam
Content of clay—0 to 15 percent
Content of rock fragments—0 to 15 percent, mostly 2 to 5 millimeters in size
Reaction—pH of 4.5 to 6

The C horizon described above is typical of deposition in the meadows from high flood events. Colors are typically those of the sand grains or small pebbles. In some areas, this material is on the surface and is thought to be from the rain on snow event of 1996.

Burnlake Series

The Burnlake series consists of very deep, well drained soils that formed in till derived from mixed rocks. These soils are on moraines. Slopes range from 8 to 30 percent. The mean annual precipitation is about 890 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Loamy-skeletal, mixed, superactive, frigid Humic Dystroxerepts

Typical pedon

Burnlake extremely gravelly sandy loam, in a forested area of a Burnlake-Roadcat association.

The percentage of the surface covered by rock fragments is as follows: 45 percent by gravel, 5 percent by cobbles, 5 percent by stones, and 5 percent by boulders. Colors are for dry soil unless otherwise indicated.

A1—0 to 6 centimeters; dark grayish brown (10YR 4/2) extremely gravelly sandy loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and common fine roots; common very fine interstitial and tubular pores; 50 percent gravel, 5 percent cobbles, and 5 percent stones; slightly acid; clear wavy boundary.

A2—6 to 43 centimeters; brown (10YR 5/3) extremely gravelly sandy loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and common fine roots; common very fine interstitial and tubular pores; 55 percent gravel, 10 percent cobbles, and 5 percent stones; slightly acid; clear wavy boundary.

Bw—43 to 66 centimeters; pale brown (10YR 6/3) extremely gravelly coarse sandy loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, common fine, common medium, and common coarse roots; common very fine interstitial and tubular pores; 65 percent gravel and 10 percent cobbles; slightly acid; clear wavy boundary.

C—66 to 152 centimeters; pale brown (10YR 6/3) extremely gravelly loamy sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine, common fine, and common medium roots; common very fine interstitial and common fine tubular pores; 70 percent gravel and 10 percent cobbles; slightly acid.

Type location: Alpine County, California; in the Toiyabe National Forest, about 1 mile southwest of Pickett Peak; approximately 4,100 feet north and 2,275 feet west of the southeast corner of sec. 5, T. 10 N., R. 19 E.; 38 degrees 44 minutes 46.1 seconds north latitude and 119 degrees 54 minutes 46.7 seconds west longitude; NAD27; USGS quadrangle: Carson Pass, California.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July through September. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 7 to 8 degrees C
Mean summer soil temperature: 15 to 17 degrees C
Thickness of the umbric epipedon: 25 to 50 centimeters.
Depth to the base of the cambic horizon: 60 to 100 centimeters.

Particle-size control section:
Content of clay—averages 8 to 15 percent
Content of rock fragments—averages 60 to 80 percent, mainly gravel
Lithology of the rock fragments—granitic rocks, such as granodiorite; volcanic rocks, such as andesite; and minor metamorphic rocks, such as quartzite

A horizons:
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Content of organic matter—2 to 4 percent
Reaction—slightly acid or neutral

Bw horizon:
Value—5 or 6 dry
Chroma—3 or 4 dry or moist
Texture of the fine-earth fraction—coarse sandy loam or sandy loam
Content of clay—8 to 15 percent
Content of rock fragments—50 to 80 percent
Reaction—slightly acid or neutral

C horizon:
Value—6 or 7 dry
Chroma—2 or 3 dry or moist
Texture of the fine-earth fraction—loamy sand or loamy coarse sand
Content of clay—3 to 10 percent
Content of rock fragments—50 to 80 percent
Reaction—slightly acid or neutral

Cagwin Series

The Cagwin series consists of moderately deep, somewhat excessively drained soils that formed in material weathered from granitic rocks. These soils are on mountain side slopes. Slopes range from 5 to 75 percent. The mean annual precipitation is about 1,016 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Mixed, frigid Dystric Xeropsamments

Typical pedon

Cagwin loamy coarse sand, in an area of woodland on a southwest-facing slope of 40 percent, under a cover of Jeffrey pine, white fir, and manzanita, at an elevation of 1,981 meters; in an area of Cagwin-Rock outcrop complex, 15 to 30 percent slopes, extremely stony.

When described on 8/8/1968, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 3 centimeters; pine litter and duff; abrupt smooth boundary.
A1—3 to 13 centimeters; dark grayish brown (10YR 4/2) loamy coarse sand, very dark brown (10YR 2/2) moist; massive; soft, very friable; common very fine and fine roots; many very fine and fine interstitial pores; strongly acid (pH 5.5); clear smooth boundary.
A2—13 to 23 centimeters; grayish brown (10YR 5/2) loamy coarse sand, very dark brown (10YR 2/2) moist; massive; soft, very friable; common very fine and fine and few medium and coarse roots; many very fine and fine interstitial pores; moderately acid (pH 5.7); clear wavy boundary.
AC—23 to 33 centimeters; grayish brown (10YR 5/2) loamy coarse sand, brown

(10YR 4/3) moist; massive; soft, very friable; common very fine and fine and few medium and coarse roots; many very fine and fine interstitial pores; moderately acid (pH 5.8); clear wavy boundary.

C—33 to 69 centimeters; pale brown (10YR 6/3) coarse sand, brown (10YR 4/3) moist; massive; soft, very friable; common very fine and few fine and medium roots; many very fine and fine interstitial pores; moderately acid (pH 5.9); clear smooth boundary.

Cr—69 to 150 centimeters; white (10YR 8/1) and gray (10YR 5/1), weathered bedrock; very few very fine roots; strongly acid (pH 5.5).

Type location: El Dorado County, California; about 0.8 mile east of a National Forest boundary on High Meadow Road; approximately 0.7 mile east and 0.2 mile north of the southwest corner of sec. 12, T. 12 N., R. 18 E.; Mount Diablo Base and Meridian.

Range in characteristics

The soil moisture control section (from 30 to 89 centimeters or to paralithic contact) is usually moist, but it is dry from mid-July to October 1 (75 days). The soils have a typic xeric moisture regime.

Mean annual soil temperature: 4.4 to 8.3 degrees C
Mean summer soil temperature: 10 to 15 degrees C in areas where the O horizon is less than 5 centimeters thick
Depth to paralithic contact: 50 to 100 centimeters from the mineral soil surface
Texture of the particle-size control section: Coarse sand, sand, loamy coarse sand, or loamy sand

These soils have an ochric epipedon with mollic colors in the upper 13 to 23 centimeters.

A horizon:
Hue—10YR
Value—4 to 6 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture of the fine-earth fraction—loamy coarse sand or coarse sand
Reaction—slightly acid to strongly acid

C horizon:
Hue—10YR
Value—6 or 7 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture of the fine-earth fraction—loamy coarse sand or coarse sand
Content of rock fragments—5 to 40 percent gravel
Reaction—slightly acid to strongly acid

Callat Series

The Callat series consists of moderately deep, well drained soils that formed in colluvium over glacial till derived from volcanic rocks. These soils are on mountains. Slopes range from 9 to 50 percent. The mean annual precipitation is about 1,295 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Loamy-skeletal, isotic Xeric Humicryepts

Typical pedon

Callat gravelly coarse sandy loam, on a southwest-facing (210-degree) slope of 12 percent, at an elevation of 2,533 meters, in an area of Callat gravelly coarse sandy loam, 9 to 30 percent slopes, very stony.

Colors are for dry soil unless otherwise indicated.

Oi—0 to 1 centimeter; slightly decomposed plant material; abrupt smooth boundary.
A1—1 to 10 centimeters; dark brown (10YR 3/3) gravelly coarse sandy loam, very dark brown (10YR 2/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many roots; many pores; 2 percent subangular stones, 3 percent subangular cobbles, and 25 percent subangular gravel; moderately acid (pH 6.0); clear smooth boundary.
A2—10 to 25 centimeters; dark grayish brown (10YR 4/2) very gravelly coarse sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many roots; many pores; 5 percent subangular cobbles, 5 percent subangular stones, and 30 percent subangular gravel; strongly acid (pH 5.4); clear smooth boundary.
AC—25 to 38 centimeters; brown (10YR 4/3) very stony coarse sandy loam, very dark grayish brown (10YR 3/2) moist; massive; soft, very friable, nonsticky and nonplastic; many roots; many pores; 10 percent subangular cobbles, 10 percent subangular stones, and 30 percent subangular gravel; strongly acid (pH 5.4); clear smooth boundary.
C—38 to 64 centimeters; pale brown (10YR 6/3) very stony coarse sandy loam, dark yellowish brown (10YR 4/4) moist; massive; soft, friable, nonsticky and nonplastic; many roots; many pores; 10 percent subangular cobbles, 10 percent subangular stones, and 30 percent subangular gravel; moderately acid (pH 5.8); abrupt wavy boundary.
Cd—64 to 150 centimeters; pale olive (5Y 6/3) extremely stony coarse sandy loam, olive (5Y 4/3) moist; massive; very hard, very firm, nonsticky and nonplastic; few fine roots in cracks; 10 percent subangular stones, 15 percent subangular cobbles, and 35 percent subangular gravel; moderately acid (pH 5.9).

Type location: El Dorado County, California; NW1/4 sec. 16, T. 12 N., R. 17 E.; 38 degrees 53 minutes 22 seconds north latitude and 120 degrees 6 minutes 32 seconds west longitude; NAD83; USGS quadrangle: Emerald Bay, California.

Range in characteristics

These soils are usually dry for 45 to 75 consecutive days in late summer and moist the rest of the year. They have a typic xeric moisture regime.

Percentage of the surface covered by rock fragments: 0 to 30 percent, mainly by gravel and cobbles
Content of organic matter: As high as 10 percent in the surface layer and dropping to less than 1 in the C horizon
Reaction: Strongly acid to slightly acid
Base saturation: Averages less than 50 percent in the A horizons but may be higher in individual horizons; typically higher in the surface layer, dropping off lower in the profile, then jumping back up in the less weathered Cd horizon, which typically has a base saturation of 75 to 95 percent (by ammonium acetate)

Particle-size control section:
Content of rock fragments: 35 to 65 percent (20 to 35 percent gravel, 15 to 30 percent cobbles, and 0 to 5 percent stones)
Content of clay—averages 0.5 to 10 percent
Mineralogy—isotic

A horizons:
Hue—10YR
Value—3 to 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture of the fine-earth fraction—coarse sandy loam or sandy loam

Content of rock fragments—23 to 50 percent (20 to 35 percent gravel, 1 to 15 percent cobbles, and 0 to 5 percent stones)

C horizon(s):
Hue—10YR or 2.5Y
Value—4 to 6 dry, 3 to 6 moist
Chroma—3 or 4 dry or moist
Texture of the fine-earth fraction—coarse sandy loam
Content of rock fragments—35 to 65 percent (20 to 35 percent gravel, 5 to 30 percent cobbles, and 5 to 15 percent stones)

Cd horizon(s):
Hue—5Y, 2.5Y, or 10YR
Value—4 to 6 dry, 4 moist
Chroma—3 or 4 dry or moist
Texture of the fine-earth fraction—coarse sandy loam
Content of rock fragments—40 to 80 percent (25 to 45 percent gravel, 10 to 35 percent cobbles, and 5 to 15 percent stones)

Cassenai Series

The Cassenai series consists of very deep, somewhat excessively drained soils that formed in colluvium over residuum weathered from granodiorite. These soils are on side slopes in the mountains. Slopes range from 5 to 70 percent. The mean annual precipitation is about 1,000 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Mixed, frigid Dystric Xeropsamments

Typical pedon

Cassenai gravelly loamy sand, on a northwest-facing (290-degree) slope of 26 percent, at an elevation of 1, 956 meters, in an area of Cassenai gravelly loamy coarse sand, 15 to 30 percent slopes, very stony.

When described on 6/03/2004, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 2 centimeters; slightly decomposed pine needles.
A1—2 to 7 centimeters; brown (10YR 4/3) gravelly loamy coarse sand, very dark grayish brown (10YR 3/2) moist; 85 percent sand; 14 percent silt; 1 percent clay; weak very fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine roots throughout; many very fine interstitial pores; 20 percent gravel; slightly acid (pH 6.2); abrupt smooth boundary.
A2—7 to 16 centimeters; grayish brown (10YR 5/2) loamy coarse sand, very dark grayish brown (10YR 3/2) moist; 85 percent sand; 14 percent silt; 1 percent clay; moderate medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine roots throughout; many very fine interstitial pores; 12 percent gravel; slightly acid (pH 6.2); abrupt smooth boundary.
Bw1—16 to 34 centimeters; pale brown (10YR 6/3) loamy coarse sand, yellowish brown (10YR 5/4) moist; 85 percent sand; 12 percent silt; 3 percent clay; moderate medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, medium, and coarse roots throughout; many very fine interstitial pores; 12 percent gravel; slightly acid (pH 6.2); gradual smooth boundary.
Bw2—34 to 59 centimeters; pale brown (10YR 6/3) gravelly loamy coarse sand, brown (10YR 5/3) moist; 85 percent sand; 12 percent silt; 3 percent clay; weak

medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine, medium, and very coarse and many coarse roots throughout; many very fine interstitial pores; 20 percent gravel; slightly acid (pH 6.4); gradual smooth boundary.

Bw3—59 to 110 centimeters; light gray (10YR 7/2) gravelly loamy coarse sand, dark yellowish brown (10YR 4/4) moist; 85 percent sand; 12 percent silt; 3 percent clay; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, medium, and coarse roots throughout; many very fine interstitial pores; 30 percent gravel; slightly acid (pH 6.2); gradual smooth boundary.

C—110 to 200 centimeters; very pale brown (10YR 7/3) gravelly loamy coarse sand, dark yellowish brown (10YR 4/4) moist; 85 percent sand; 12 percent silt; 3 percent clay; massive; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots throughout; many very fine interstitial pores; 25 percent gravel; moderately acid (pH 6.0).

Type location: Douglas County, Nevada; 1,000 feet south and 2,000 feet west of the northeast corner of sec. 3, T. 13 N., R. 18 E.; 39 degrees 1 minute 23 seconds north latitude and 119 degrees 56 minutes 36 seconds west longitude; NAD83; USGS quadrangle: Glenbrook, Nevada.

Range in characteristics

These soils are usually dry for 45 to 75 consecutive days in late summer and moist the rest of the year. They have a typic xeric moisture regime.

Percentage of the surface covered by rock fragments: 0 to 5 percent by cobbles, stones, and boulders

Particle-size control section:

Content of rock fragments—15 to 35 percent, including 10 to 35 percent gravel (mainly 2 to 5 millimeters in size), 0 to 5 percent cobbles, 0 to 5 percent stones, and 0 to 5 percent boulders
Content of clay—averages 1 to 5 percent
Mineralogy—mixed

A horizons:

Hue—10YR
Value—4 or 5 dry, 3 or 4 moist
Chroma—2 to 4 dry, 2 or 3 moist
Texture of the fine-earth fraction—loamy coarse sand, loamy sand, or coarse sandy loam
Content of clay—0 to 5 percent
Content of rock fragments—5 to 35 percent
Content of organic matter—5 to 12 percent
Reaction—moderately acid to neutral

Bw horizons:

Hue—10YR
Value—5 to 7 dry, 4 or 5 moist
Chroma—2 to 4 dry, 3 or 4 moist
Texture of the fine-earth fraction—loamy coarse sand, loamy sand, or coarse sandy loam
Content of clay—0 to 5 percent
Content of rock fragments—15 to 35 percent
Content of organic matter—1 to 5 percent
Reaction—moderately acid to neutral

C horizon:
Hue—10YR
Value—6 or 7 dry, 4 or 5 moist
Chroma—2 to 4 dry, 3 to 5 moist
Texture of the fine-earth fraction—loamy sand, loamy coarse sand, or coarse sandy loam
Content of clay—0 to 5 percent
Content of rock fragments—15 to 35 percent
Content of organic matter—0 to 1 percent
Reaction—moderately acid to neutral

Caverock Series

The Caverock series consists of moderately deep, somewhat excessively drained soils that formed in colluvium over residuum weathered from latite. These soils are on the side slopes of hills. Slopes range from 9 to 50 percent. The mean annual precipitation is about 686 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Coarse-loamy, isotic, frigid Humic Dystroxerepts

Typical pedon

Caverock sandy loam, on a north-facing (360-degree) slope of 11 percent, at an elevation of 2,273 meters, in an area of Caverock sandy loam, 9 to 50 percent slopes.

When described on 7/15/2004, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 2 centimeters; slightly decomposed plant material.
Oe—2 to 5 centimeters; moderately decomposed plant material.
A—5 to 10 centimeters; grayish brown (10YR 5/2) sandy loam, very dark brown (10YR 2/2) moist; 5 percent clay; weak fine and very fine granular structure; soft, very friable, nonsticky and nonplastic; few fine and common very fine roots throughout; many fine and very fine irregular pores; 10 percent gravel; slightly acid (pH 6.2) by bromthymol blue; clear smooth boundary.
BA—10 to 27 centimeters; brown (10YR 5/3) sandy loam, dark brown (10YR 3/3) moist; 7 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots throughout; many very fine and fine irregular pores; 10 percent gravel; slightly acid (pH 6.2) by bromthymol blue; gradual smooth boundary.
Bw1—27 to 47 centimeters; brown (10YR 5/3) cobbly sandy loam, brown (10YR 4/3) moist; 10 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, medium, and coarse roots throughout; many very fine and fine irregular pores; 5 percent gravel, 5 percent stones, and 10 percent cobbles; slightly acid (pH 6.5) by bromthymol blue; gradual smooth boundary.
Bw2—47 to 67 centimeters; brown (10YR 5/3) sandy loam, light brownish gray (10YR 6/2) moist; 12 percent clay; weak coarse and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium and few coarse roots throughout; many very fine and fine irregular pores; 10 percent gravel; slightly acid (pH 6.5) by bromthymol blue; abrupt wavy boundary.

Cr—67 to 150 centimeters; moderately cemented latite bedrock; few fine and medium roots in cracks more than 10 centimeters apart; neutral (pH 7.0) by bromthymol blue.

Type location: Douglas County, Nevada; on the ridge south of Captain Pomin Rock; 1,715 feet south and 978 feet west of the northeast corner of sec. 11, T. 14 N., R. 18 E.; 39 degrees 5 minutes 37 seconds north latitude and 119 degrees 55 minutes 15 seconds west longitude; NAD83; USGS quadrangle: Glenbrook, Nevada.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July to early October. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Depth to paralithic contact: 50 to 100 centimeters from the mineral soil surface
Percentage of the surface covered by rock fragments: 0 to 5 percent (0 to 5 percent by cobbles and 0 to 5 percent by stones)
Content of organic matter: As high as 8 percent in the surface layer and dropping to less than 1 percent in the lower part of the Bw horizon
Reaction: Moderately acid to neutral
Base saturation: 35 to 60 percent (by ammonium acetate)

Particle-size control section:
- Content of rock fragments—5 to 25 percent (2 to 20 percent gravel, 0 to 15 percent cobbles, and 0 to 10 percent stones)
- Content of clay—averages 5 to 18 percent
- Mineralogy—isotic

A horizon:
- Hue—10YR
- Value—4 or 5 dry, 2 or 3 moist
- Chroma—2 or 3 dry or moist
- Texture of the fine-earth fraction—coarse sandy loam or sandy loam
- Content of clay—5 to 18 percent
- Content of rock fragments—5 to 15 percent (2 to 20 percent gravel and 0 to 10 percent cobbles)
- Reaction—moderately acid to neutral

BA horizon:
- Hue—10YR
- Value—4 or 5 dry, 2 or 3 moist
- Chroma—2 or 3 dry or moist
- Texture of the fine-earth fraction—coarse sandy loam or sandy loam
- Content of clay—5 to 18 percent
- Content of rock fragments—5 to 20 percent (2 to 20 percent gravel and 0 to 10 percent cobbles)
- Reaction—moderately acid to neutral

Bw horizons:
- Hue—10YR
- Value—4 to 6 dry, 3 to 6 moist
- Chroma—3 or 4 dry, 2 to 4 moist
- Texture of the fine-earth fraction—sandy loam
- Content of clay—5 to 18 percent
- Content of rock fragments—5 to 35 percent (2 to 20 percent gravel, 0 to 15 percent cobbles, and 0 to 10 percent stones)

Reaction—moderately acid to neutral

Celio Series

The Celio series consists of deep, somewhat poorly drained soils that formed in glacial outwash. These soils are on outwash terraces. Slopes range from 0 to 9 percent. The mean annual precipitation is about 890 millimeters, and the mean annual air temperature is 6 degrees c.

Taxonomic classification: Sandy-skeletal, mixed, frigid Oxyaquic Dystroxerepts

Typical pedon

Celio gravelly loamy coarse sand, on a slope of less than 1 percent, under a cover of lodgepole pine, juniper, squirreltail, and big sagebrush, at an elevation of 1,932 meters; in an area of Celio loamy coarse sand, 0 to 5 percent slopes.

When described on 10/25/1967, the soil was moist to a depth of 142 centimeters and near field capacity below that depth. Colors are for dry soil unless otherwise indicated.

A1—0 to 20 centimeters; brown (10YR 4/3) loamy coarse sand, very dark grayish brown (10YR 3/2) moist; weak medium granular structure; loose, very friable, nonsticky and nonplastic; many very fine, fine, medium, and coarse roots; many very fine interstitial pores; thin gravel pavement on the surface; hydrophobic; moderately acid (pH 6.0); diffuse wavy boundary.

A2—20 to 41 centimeters; brown (7.5YR 4/4) gravelly loamy coarse sand, dark reddish brown (5YR 3/3) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine, fine, medium, and coarse roots; many very fine interstitial pores; 20 percent gravel and 10 percent cobbles; moderately acid (pH 6.0); diffuse wavy boundary.

BA—41 to 58 centimeters; strong brown (7.5YR 5/8) gravelly loamy coarse sand, dark reddish brown (5YR 3/4) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine and fine and common medium roots; many very fine and fine interstitial pores; 20 percent gravel and 10 percent cobbles; slightly acid (pH 6.2); clear wavy boundary.

2Bw—58 to 114 centimeters; variegated reddish yellow (7.5YR 6/8) and strong brown (7.5YR 5/6) extremely gravelly coarse sand, variegated brownish yellow (10YR 6/6) and yellowish brown (10YR 5/6) moist; single grained; loose; many very fine roots; many very fine interstitial pores; many large prominent dark brown (10YR 3/3) redoximorphic concentrations; 60 percent gravel and 10 percent cobbles; slightly acid (pH 6.4); clear wavy boundary.

2Bqm—114 to 142 centimeters; variegated reddish yellow (7.5YR 6/8) and strong brown (7.5YR 5/8), strongly cemented material, reddish yellow (7.5YR 6/6) moist; massive, extremely hard, very firm; roots matted on the surface; common very fine pores; many medium prominent yellowish red (5YR 5/6) redoximorphic concentrations, dark reddish brown (2.5YR 3/4) moist; 60 percent gravel and 10 percent cobbles; slightly acid (pH 6.4); abrupt wavy boundary.

2Bg1—142 to 170 centimeters; white (N 8/, 10YR 8/1) extremely gravelly coarse sand, light gray (10YR 7/2) moist; single grained; loose; many very fine interstitial pores; few fine prominent redoximorphic concentrations, yellowish brown (10YR 5/6) moist; 60 percent gravel and 2 percent cobbles; slightly acid (pH 6.5); abrupt wavy boundary.

2Bg2—170 to 203 centimeters; white (N 8/, 10YR 8/1) coarse sand, light gray (N 7/) moist; thin horizontal black (N 2/ dry and moist) bands; single grained; loose;

many very fine interstitial pores; horizon becoming very gravelly with increasing depth; neutral (pH 6.6).

Type location: El Dorado County, California, Lake Tahoe; 0.25 mile west of Meyers checking station, west side of Highway 89 extension; 0.1 mile north of the southeast corner of sec. 30, T. 12 N., R. 18 E.; Mount Diablo Base and Meridian; 38 degrees 51 minutes 8 seconds north latitude and 120 degrees 1 minute 22 seconds west longitude; NAD27; USGS quadrangle: Echo Lake, California.

Range in characteristics

Because of moisture movement above the cemented layer, these soils are never dry in all horizons between depths of 30 and 89 centimeters for as much as 45 to 60 consecutive days.

Mean annual soil temperature: 5 to 8 degrees C
Mean summer soil temperature: 13 to 15 degrees C
Depth to the silica-cemented horizon: 100 to 150 centimeters
Depth to redoximorphic features: 53 to 76 centimeters
Thickness of the O horizon (where present): 3 to 8 centimeters

A horizon:
- Hue—10YR, 7.5YR, or 5YR
- Value—3 to 5 dry, 3 moist
- Chroma—2 to 4 dry, 2 or 3 moist
- Content of organic matter—2 to 8 percent
- Texture of the fine-earth fraction—loamy coarse sand, loamy sand, or coarse sandy loam
- Content of rock fragments—15 to 40 percent gravel and/or cobbles
- Reaction—slightly acid or moderately acid

BA horizon:
- Hue—10YR or 7.5YR
- Value—5 or 6 dry or moist
- Chroma—3 to 8 dry or moist
- Texture of the fine-earth fraction—coarse sand, loamy coarse sand, or loamy sand
- Content of rock fragments—35 to 70 percent gravel and/or cobbles
- Reaction—moderately acid to neutral

2Bqm horizon:
- Hue—10YR or 7.5YR
- Value—4 to 6 moist or dry
- Chroma—4 to 8 moist or dry
- Cementation—weakly cemented to strongly cemented with silica; very firm or extremely firm in place but ruptures under pressure

2Bg horizons:
- Hue—10YR or N moist or dry
- Value—7 or 8 moist or dry
- Chroma (where it occurs)—1 or 2 moist or dry
- Texture—strata of coarse sand or gravel

Christopher Series

The Christopher series consists of very deep, somewhat excessively drained soils that formed in glacial outwash derived from granodiorite (fig. 27). These soils are on glacial outwash terraces in the Lake Tahoe Basin. Slopes range from 0 to 30 percent.

Figure 27.—Typical profile of a Christopher soil.

The mean annual precipitation is about 660 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Mixed, frigid Dystric Xeropsamments

Typical pedon

Christopher loamy coarse sand, on a southeast-facing (136-degree) slope of 3 percent, at an elevation of 1,981 meters, in an area of Christopher loamy coarse sand, 0 to 9 percent slopes.

When described on 8/09/2002, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 3 centimeters; pine litter.
A—3 to 20 centimeters; brown (10YR 5/3) loamy coarse sand, very dark grayish brown (10YR 3/2) moist; 85 percent sand; 14 percent silt; 1 percent clay; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine, fine, and medium roots throughout; many very fine interstitial pores; 9 percent gravel; moderately acid (pH 6.0); abrupt smooth boundary.
Bw1—20 to 66 centimeters; yellowish brown (10YR 5/4) loamy coarse sand, brown (10YR 4/3) moist; 85 percent sand; 14 percent silt; 1 percent clay; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few fine and common medium and very coarse roots throughout; many very fine interstitial pores; 2 percent cobbles and 6 percent gravel; moderately acid (pH 5.7); clear smooth boundary.
Bw2—66 to 107 centimeters; yellowish brown (10YR 5/4) loamy coarse sand, dark yellowish brown (10YR 4/4) moist; 80 percent sand; 17 percent silt; 3 percent clay; moderate medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; few fine and medium roots throughout; many very fine interstitial pores; 2 percent cobbles and 7 percent gravel; moderately acid (pH 5.9); clear wavy boundary.
Bw3—107 to 155 centimeters; yellowish brown (10YR 5/4) loamy coarse sand, dark yellowish brown (10YR 4/4) moist; 80 percent sand; 18 percent silt; 2 percent clay; moderate fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine, fine, and very coarse roots throughout; many very fine interstitial pores; 9 percent gravel and 5 percent paracobbles; slightly acid (pH 6.1).

Type location: El Dorado County, California; 2,418 feet south and 1,849 feet west of the northeast corner of sec. 21, T. 12 N., R. 18 E.; 38 degrees 52,minutes 28.97 seconds north latitude and 119 degrees 59 minutes 37.41 seconds west longitude; NAD83; USGS quadrangle: South Lake Tahoe, California and Nevada.

Range in characteristics

These soils are usually moist between depths of about 30 and 89 centimeters but are dry in all parts from late June until mid-October. They have a typic xeric moisture regime

Mean annual soil temperature: 5 to 8 degrees C

Particle-size control section:
- *Reaction—s*trongly acid to slightly acid
- Content of rock fragments—1 to 15 percent (2 to 15 percent gravel and 0 to 10 percent cobbles and paracobbles); a higher content in some individual horizons
- Content of clay—averages 0 to 7 percent
- Mineralogy—mixed

A horizon(s):
- Hue—10YR
- Value—4 or 5 dry, 3 or 4 moist
- Chroma—3 or 4 dry, 2 or 3 moist
- Content of organic matter—1 to 5 percent
- Texture of the fine-earth fraction—loamy coarse sand or loamy sand
- Content of clay—0 to 5 percent
- Content of rock fragments—1 to 30 percent (0 to 5 percent cobbles and 1 to 10 percent gravel)

Bw horizons:
Hue—10YR
Value—4 to 6 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Content of organic matter—0.25 to 1.25 percent
Texture of the fine-earth fraction—loamy coarse sand or loamy sand
Content of clay—0 to 7 percent
Content of rock fragments—1 to 30 percent (0 to 10 percent cobbles and 1 to 10 percent gravel)

C horizon (where present):
Hue—10YR
Value—4 to 6 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Content of organic matter—0.25 to 1 percent
Texture of the fine-earth fraction—loamy coarse sand
Content of clay—1 to 5 percent
Content of rock fragments—10 to 55 percent

Dagget Series

The Dagget series consists of deep, excessively drained soils that formed in colluvium over residuum derived from granodiorite over grus. These soils are on mountain flanks. Slopes range from 5 to 70 percent. The mean annual precipitation is about 965 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Sandy-skeletal, mixed Typic Cryorthents

Typical pedon

Dagget very gravelly loamy coarse sand, on a northwest-facing (295-degree) slope of 35 percent, at an elevation of 2,560 meters, in an area of Dagget very gravelly loamy coarse sand, 15 to 30 percent slopes, extremely bouldery.

When described on 11/18/1969, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 3 centimeters slightly decomposed plant material
A—3 to 23 centimeters; grayish brown (10YR 5/2) very gravelly loamy coarse sand, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, friable, nonsticky and nonplastic; many fine and very fine and few medium, coarse, and very coarse roots; many fine and very fine interstitial pores; 12 percent granodiorite cobbles, stones, and boulders and 31 percent granodiorite gravel; moderately acid (pH 6.0) by Hellige-Truog; abrupt wavy boundary.
C—23 to 125 centimeters; light brownish gray (10YR 6/2) very gravelly loamy coarse sand, dark grayish brown (10YR 4/2) moist; massive; soft, friable, nonsticky and nonplastic; common fine and very fine and few medium, coarse, and very coarse roots; many fine and very fine and few medium and coarse interstitial pores; 12 percent granodiorite cobbles, stones, and boulders and 35 percent granodiorite gravel; moderately acid (pH 6.0) by Hellige-Truog; abrupt wavy boundary.
Cr—125 to 181 centimeters; moderately cemented granodiorite bedrock.

Type location: Douglas County, Nevada; about 1 mile south of Genoa Peak; 1,000 feet east and 500 feet north of the southwest corner of sec. 31, T. 14 N., R. 19 E.; 39 degrees 1 minute 38 seconds north latitude and 119 degrees 53 minutes 43 seconds west longitude; NAD83; USGS quadrangle: Glenbrook, Nevada.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July to early October. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 2 to 5 degrees C
Depth to paralithic contact: 100 to 150 centimeters
Content of organic matter: 1 to 8 percent
Reaction: Moderately acid or slightly acid
Base saturation: 40 to 80 percent (by ammonium acetate)
Percentage of the surface covered by rock fragments: 20 to 60 percent (10 to 40 percent by gravel, 2 to 20 percent by cobbles, 2 to 20 percent by stones, and 2 to 20 percent by boulders)

Particle-size control section:
- Content of rock fragments—35 to 75 percent (20 to 40 percent gravel, 5 to 20 percent cobbles, 5 to 20 percent stones, and 5 to 20 percent boulders)
- Content of clay—averages 1 to 5 percent
- Mineralogy—mixed

A horizon(s):
- Hue—10YR
- Value—4 or 5 dry, 3 to 5 moist
- Chroma—2 to 6 dry, 2 to 4 moist
- Note—horizons more than 25 centimeters thick have value of more than 3 moist or 5 dry or chroma of more than 3 moist.
- Texture of the fine-earth fraction—loamy coarse sand, coarse sand, or sand
- Content of rock fragments—35 to 70 percent (20 to 40 percent gravel and 10 to 30 percent cobbles, stones, and boulders)
- Reaction—pH of 5.6 to 6.5

C horizon(s):
- Hue—10YR
- Value—5 or 6 dry, 4 or 5 moist
- Chroma—2 to 6 dry, 2 to 4 moist
- Texture of the fine-earth fraction—loamy coarse sand, coarse sand, or sand
- Content of rock fragments—35 to 70 percent (20 to 40 percent gravel and 10 to 30 percent cobbles, stones, and boulders)
- Reaction—pH of 5.6 to 6.5

Deerhill Series

The Deerhill series consists of very deep, well drained soils that formed in colluvium over residuum weathered from metamorphic rocks (fig. 28). These soils are on mountain flanks and hillsides. Slopes range from 9 to 50 percent. The mean annual precipitation is about 686 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Fine-loamy, isotic, frigid Ultic Palexeralfs

Typical pedon

Deerhill gravelly fine sandy loam, on a southwest-facing (230-degree) slope of 37 percent, at an elevation of 2,191 meters, in an area of Deerhill fine sandy loam, 9 to 30 percent slopes, very stony.

Figure 28.—Typical profile of a Deerhill soil.

When described on 6/08/2004, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 3 centimeters; slightly decomposed plant material; abrupt smooth boundary.
A1—3 to 12 centimeters; brown (10YR 4/3) gravelly fine sandy loam, very dark brown (10YR 2/2) moist; weak very fine granular structure; loose, very friable, nonsticky and nonplastic; common very fine, fine, medium, and coarse roots throughout; common fine interstitial pores; 15 percent gravel; slightly acid (pH 6.6); clear smooth boundary.
A2—12 to 24 centimeters; brown (10YR 4/3) fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak very fine granular structure; loose, very friable, nonsticky and nonplastic; common very fine, fine, medium, coarse, and very coarse roots throughout; common fine interstitial pores; 7 percent gravel; slightly acid (pH 6.6); clear smooth boundary.
Bw1—24 to 51 centimeters; brown (10YR 4/3) gravelly fine sandy loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; common very fine, fine, medium, coarse, and very coarse roots throughout; common fine interstitial pores; 15 percent gravel, 5 percent cobbles, and 1 percent stones; slightly acid (pH 6.6); clear wavy boundary.
Bw2—51 to 90 centimeters; dark yellowish brown (10YR 4/4) fine sandy loam, dark grayish brown (10YR 4/2) moist; weak medium and fine subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; common very fine, fine, medium, coarse, and very coarse roots throughout; common fine interstitial pores; 8 percent gravel; slightly acid (pH 6.6); abrupt irregular boundary.
2Bt1—90 to 130 centimeters; yellowish brown (10YR 5/4) loam, brown (10YR 5/3) moist; fine distinct brown (7.5YR 4/4) mottles; moderate medium and fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, medium, coarse, and very coarse roots throughout; few very fine tubular pores; 20 percent distinct clay films on all faces of peds; 1 percent gravel; moderately acid (pH 6.0); gradual smooth boundary.
2Bt2—130 to 166 centimeters; light yellowish brown (10YR 6/4) extremely paragravelly loam, yellowish brown (10YR 5/4) moist; common medium prominent red (2.5YR 4/6) mottles; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common medium and coarse roots throughout; few very fine tubular pores; 10 percent faint clay films on all faces of peds; 75 percent paragravel; slightly acid (pH 6.2).

Type location: Douglas County, Nevada; east of Highway 28, about 970 meters north-northeast of Captain Pomin Rock; 640 meters east and 640 meters north of the southwest corner of sec. 2, T. 14 N., R. 18 E.; 39 degrees 6 minutes 14 seconds north latitude and 119 degrees 55 minutes 41 seconds west longitude; NAD83; USGS quadrangle: Glenbrook, Nevada.

Range in characteristics

These soils are usually moist between depths of 38 and 91 centimeters and are dry in all parts from early August until early October. They have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 8 degrees C
Mean summer soil temperature: 11 to 13 degrees C
Percentage of the surface covered by rock fragments: 0 to 5 percent (0 to 5 percent by gravel, 0 to 5 percent by cobbles, and 0 to 5 percent by stones)
Reaction: Moderately acid to neutral
Base saturation: 35 to 75 percent (by ammonium acetate)

Particle-size control section:
- Content of rock fragments—mainly 1 to 25 percent (1 to 20 percent gravel, 0 to 8 percent cobbles, and 0 to 3 percent stones); 60 to 90 percent paragravel in the lower part of the 2Bt horizon
- Content of clay—averages 18 to 27 percent
- Mineralogy—isotic

A horizons:
- Hue—10YR
- Value—3 to 5 dry, 2 to 4 moist
- Chroma—3 or 4 dry, 2 to 4 moist
- Content of organic matter—3 to 8 percent
- Texture of the fine-earth fraction—fine sandy loam, sandy loam, or loam
- Content of clay—4 to 10 percent
- Content of rock fragments—5 to 20 percent (5 to 15 percent gravel, 0 to 5 percent cobbles, and 0 to 5 percent stones)
- Reaction—pH of 5.6 to 7.0

Bw horizons:
- Hue—10YR
- Value—4 or 5 dry, 3 to 5 moist
- Chroma—3 to 4 dry, 2 to 5 moist
- Content of organic matter—0.5 to 3 percent
- Texture of the fine-earth fraction—fine sandy loam, sandy loam, or loam
- Content of clay—7 to 13 percent
- Content of rock fragments—5 to 25 percent (5 to 15 percent gravel, 0 to 5 percent cobbles, and 0 to 5 percent stones)
- Reaction—pH of 5.6 to 7.0

2Bt horizons:
- Hue—10YR or 7.5YR
- Value—4 to 6 dry, 4 or 5 moist
- Chroma—3 or 4 dry or moist
- Content of organic matter—0.5 to 3 percent
- Texture of the fine-earth fraction—loam
- Content of clay—15 to 27 percent
- Content of rock fragments—0 to 10 percent paragravel in the upper part and 60 to 90 percent paragravel in the lower part
- Reaction—pH of 5.6 to 6.5

Ellispeak Series

The Ellispeak series consists of shallow, excessively drained soils that formed in colluvium derived from andesitic lahar. These are on the side slopes of ridges and mountains. Slopes range from 9 to 70 percent. The mean annual precipitation is about 1,778 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Loamy-skeletal, isotic, frigid Lithic Haploxerolls

Typical pedon

Ellispeak stony fine sandy loam, on a southwest-facing (205-degree) slope of 49 percent, at an elevation of 2,134 meters, in an area of Ellispeak-Rock outcrop complex, 30 to 50 percent slopes.

When described on 6/21/1999, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

A1—0 to 5 centimeters; grayish brown (10YR 5/2) stony fine sandy loam, very dark grayish brown (10YR 3/2) moist; moderate fine granular structure; soft, friable, nonsticky and nonplastic; common fine and very fine roots throughout; many very fine interstitial pores; 5 percent cobbles, 5 percent stones, and 15 percent gravel; moderately acid (pH 6.1) by pH meter 1:1 water; clear smooth boundary. (Laboratory sample number 00P2505)

A2—5 to 15 centimeters; brown (10YR 5/3) very cobbly sandy loam, dark brown (10YR 3/3) moist; massive; soft, very friable, nonsticky and nonplastic; many fine and very fine and common medium roots throughout; common very fine interstitial pores; 5 percent stones, 10 percent cobbles, and 20 percent gravel; moderately acid (pH 6.0) by pH meter 1:1 water; clear smooth boundary. (Laboratory sample number 00P2506)

Bw—15 to 30 centimeters; brown (10YR 5/3) extremely gravelly fine sandy loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; common fine and very fine roots throughout; 10 percent stones, 15 percent cobbles, and 50 percent gravel; slightly acid (pH 6.2) by pH meter 1:1 water; abrupt smooth boundary. (Laboratory sample number 00P2507)

R—30 centimeters; very strongly cemented andesitic lahar.

Type location: Placer County, California; on a hillside north of the road in Blackwood Canyon; 567 meters west and 274 meters north of the southeast corner of sec. 27, T. 14 N., R. 16 E.; 39 degrees 6 minutes 51 seconds north latitude and 120 degrees 11 minutes 49 seconds west longitude; NAD83; USGS quadrangle: Homewood, California.

Range in characteristics

These soils are usually dry for 45 to 75 consecutive days in late summer and moist the rest of the year. They have a typic xeric moisture regime.

Depth to lithic contact: 25 to 50 centimeters

Percentage of the surface covered by rock fragments: 15 to 40 percent (5 to 15 percent by gravel, 5 to 15 percent by cobbles, 2 to 10 percent by stones, and 2 to 10 percent by boulders)

Content of organic matter: 2 to 6 percent

Reaction: Moderately acid or slightly acid

Base saturation: 50 to 75 percent (by ammonium acetate)

Particle-size control section:

- Content of rock fragments—35 to 75 percent (10 to 60 percent gravel, 2 to 20 percent cobbles, and 2 to 15 percent stones)
- Content of clay—averages 8 to 18 percent
- Mineralogy—isotic

A horizons:

- Hue—10YR or 7.5YR
- Value—4 or 5 dry, 2 or 3 moist
- Chroma—2 or 3 dry or moist
- Texture of the fine-earth fraction—sandy loam or fine sandy loam
- Content of clay—8 to 18 percent
- Content of rock fragments—25 to 45 percent (10 to 20 percent gravel, 5 to 15 percent cobbles, and 2 to 10 percent stones)
- Reaction—pH of 5.6 to 6.5

Bw horizon:

- Hue—10YR or 7.5YR
- Value—4 or 5 dry, 2 or 3 moist

Chroma—2 or 3 dry or moist
Texture of the fine-earth fraction—sandy loam or fine sandy loam
Content of clay—8 to 18 percent
Content of rock fragments—35 to 80 percent (30 to 60 percent gravel, 10 to 20 percent cobbles, and 5 to 15 percent stones)
Reaction—pH of 5.6 to 6.5

Fishsnooze Series

The Fishsnooze series consists of moderately deep, well drained soils that formed in colluvium and residuum derived from andesite, tuff, and tuff breccia. These soils are on mountains. Slopes range from 8 to 50 percent. The mean annual precipitation is about 1,143 millimeters, and the mean annual air temperature is about 3 degrees C.

Taxonomic classification: Loamy-skeletal, isotic Xeric Humicryepts

Typical pedon

Fishsnooze very gravelly peaty coarse sandy loam, in a forested area of a Florand-Lostridge-Fishsnooze association.

The surface is covered by 5 centimeters of undecomposed forest duff. The percentage of the surface covered by rock fragments is as follows: 35 percent by gravel and 5 percent by cobbles. Colors are for dry soil unless otherwise indicated.

A1—0 to 3 centimeters; dark grayish brown (10YR 4/2) very gravelly peaty coarse sandy loam, very dark brown (10YR 2/2) moist; moderate medium platy structure; soft, very friable, slightly sticky and nonplastic; common very fine and fine roots; common fine interstitial pores; 35 percent gravel and 5 percent cobbles; very strongly acid; abrupt wavy boundary.
A2—3 to 23 centimeters; brown (10YR 5/3) very gravelly coarse sandy loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine and many medium and coarse roots; common very fine interstitial and tubular pores; 45 percent gravel; very strongly acid; clear wavy boundary.
A3—23 to 33 centimeters; brown (10YR 5/3) extremely gravelly coarse sandy loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and many medium and coarse roots; common very fine interstitial and tubular pores; 50 percent gravel and 15 percent cobbles; very strongly acid; clear wavy boundary.
Bw—33 to 89 centimeters; brown (10YR 5/3) extremely cobbly coarse sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and many fine, medium, and coarse roots; common very fine interstitial and tubular pores; 45 percent gravel and 40 percent cobbles; strongly acid; clear wavy boundary.
R—89 centimeters; hard andesite.

Type location: Alpine County, California; in the Toiyabe National Forest, about 1.5 miles northwest of Lost Lakes; approximately 2,250 feet south and 150 feet east of the northwest corner of sec. 36, T. 10 N., R. 18 E.; 38 degrees 40 minutes 11.7 seconds north latitude and 119 degrees 57 minutes 39.0 seconds west longitude; NAD27; USGS quadrangle: Carson Pass, California.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July through September. They are dry

for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 7 degrees C
Mean summer soil temperature: 7 to 8 degrees C
Thickness of the umbric epipedon: 18 to 41 centimeters.
Depth to bedrock: 50 to 100 centimeters to lithic contact
Sodium fluoride pH: 10.0 to 11.5.

Particle-size control section:
- Content of clay—averages 12 to 18 percent
- Content of rock fragments—averages 60 to 80 percent, dominantly gravel and cobbles
- Lithology of the rock fragments—andesite, tuff, or tuff breccia

A1 horizon:
- Content of organic matter—generally 10 to 18 percent; less than 10 percent where the horizon is not peaty
- Reaction—very strongly acid or strongly acid

A2 and A3 horizons:
- Hue—10YR or 7.5YR
- Value—4 or 5 dry, 2 or 3 moist
- Chroma—2 or 3 dry or moist
- Texture of the fine-earth fraction—coarse sandy loam or sandy loam
- Content of organic matter—2 to 10 percent
- Reaction—very strongly acid or strongly acid

Bw horizon:
- Hue—10YR or 7.5YR
- Value—5 or 6 dry, 3 or 4 moist
- Chroma—3 or 4 dry or moist
- Texture of the fine-earth fraction—coarse sandy loam or sandy loam
- Content of clay—12 to 18 percent
- Content of rock fragments—60 to 85 percent
- Reaction—very strongly acid or strongly acid

Florand Series

The Florand series consists of deep, well drained soils that formed in colluvium over residuum derived from andesitic tuff and tuff breccia. These soils are on mountains. Slopes range from 15 to 50 percent. The mean annual precipitation is about 1,143 millimeters, and the mean annual air temperature is about 3 degrees C.

Taxonomic classification: Loamy-skeletal, isotic Xeric Humicryepts

Typical pedon

Florand very gravelly peaty sandy loam, in a forested area of a Florand-Lostridge-Fishsnooze association.

The surface is covered by 3 centimeters of undecomposed conifer duff. The percentage of the surface covered by rock fragments is as follows: 35 percent by gravel and 1 percent by stones. Colors are for dry soil unless otherwise indicated.

A1—0 to 3 centimeters; dark grayish brown (10YR 4/2) very gravelly peaty sandy loam, very dark brown (10YR 2/2) moist; moderate medium platy structure; soft, very friable, slightly sticky and nonplastic; common fine interstitial pores; 35 percent gravel and 1 percent stones; strongly acid; clear wavy boundary.

A2—3 to 10 centimeters; dark grayish brown (10YR 4/2) very gravelly sandy loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular and interstitial pores; 35 percent gravel; strongly acid; clear wavy boundary.
A3—10 to 30 centimeters; grayish brown (10YR 5/2) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; common very fine interstitial and tubular pores; 25 percent gravel; very strongly acid; clear wavy boundary.
A4—30 to 46 centimeters; brown (10YR 5/3) gravelly sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; common very fine and fine interstitial and tubular pores; 25 percent gravel; moderately acid; clear wavy boundary.
Bw1—46 to 71 centimeters; dark yellowish brown (10YR 4/4) very gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; massive; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; common very fine and fine interstitial and tubular pores; 35 percent gravel; moderately acid; clear wavy boundary.
Bw2—71 to 97 centimeters; yellowish brown (10YR 5/4) very gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; massive; soft, very friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine and fine interstitial and tubular pores; 35 percent gravel and 10 percent cobbles; moderately acid; clear wavy boundary.
2Bw3—97 to 119 centimeters; yellowish brown (10YR 5/4) gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; massive; platy rock structure; soft, very friable, slightly sticky and slightly plastic; common fine and medium and few coarse roots; common very fine and fine interstitial and tubular pores; 15 percent gravel, 15 percent paragravel, and 5 percent cobbles; moderately acid; clear wavy boundary.
2Cr—119 centimeters; weathered and fractured tuff breccia.

Type location: Alpine County, California; in the Toiyabe National Forest, about 0.75 mile northeast of The Nipple peak; approximately 2,100 feet south and 450 feet west of the northeast corner of sec. 7, T. 9 N., R. 19 E.; 38 degrees 38 minutes 51.9 seconds north latitude and 119 degrees 55 minutes 29.0 seconds west longitude; NAD27; USGS quadrangle: Carson Pass, California.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July through September. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 7 degrees C
Mean summer soil temperature: 7 to 8 degrees C
Thickness of the umbric epipedon: 25 to 50 centimeters.
Depth to the base of the cambic horizon: 89 to 114 centimeters.
Depth to bedrock: 100 to 150 centimeters to paralithic contact (contact with weathered andesitic tuff or tuff breccia)
Sodium fluoride pH: 9.5 to 11.5.

Particle-size control section:
Content of clay—averages 12 to 18 percent
Content of rock fragments—averages 35 to 50 percent, dominantly gravel

Lithology of the rock fragments—volcanic rocks, such as tuff, tuff breccia, and andesite

A1 horizon:

Content of organic matter—10 to 18 percent; less than 10 percent where the A1 horizon is not peaty

Reaction—strongly acid or moderately acid

A2, A3, and A4 horizons:

Value—4 or 5 dry, 2 or 3 moist

Chroma—2 or 3 dry or moist

Content of organic matter—2 to 10 percent

Reaction—very strongly acid to moderately acid

Other features—in some pedons, base saturation is more than 50 percent, by the ammonium acetate method, and the A horizons constitute a mollic epipedon rather than an umbric epipedon.

Bw horizons:

Value—4 to 6 dry, 3 or 4 moist

Texture of the fine-earth fraction—coarse sandy loam or sandy loam

Content of clay—12 to 20 percent

Content of rock fragments—35 to 50 percent

Content of pararock fragments—10 to 25 percent paragravel or parachanners in the lower subhorizons

Reaction—strongly acid or moderately acid

Freelpeak Series

The Freelpeak series consists of moderately deep, excessively drained soils that formed in colluvium over residuum derived from granodiorite. These soils are on the summits and shoulders of mountains. Slopes range from 30 to 75 percent. The mean annual precipitation is about 1,016 millimeters, and the mean annual air temperature is about 2 degrees C.

Taxonomic classification: Sandy-skeletal, mixed Typic Cryorthents

Typical pedon

Freelpeak gravel, on a north-facing (4-degree) slope of 50 percent, at an elevation of 3,231 meters, in an area of Freelpeak-Windyridge-Rock outcrop complex, 15 to 75 percent slopes.

When described on 9/19/2002, the soil was dry throughout. Colors are for dry soil unless otherwise noted. Rock fragments cover about 95 percent of soil surface (80 percent covered by gravel and 15 percent covered by cobbles).

C—0 to 4 centimeters; gravel; 50 percent 2- to 5-millimeter pebbles, 30 percent 5- to 75-millimeter pebbles, and 15 percent cobbles; abrupt smooth boundary.

2A—4 to 9 centimeters; brown (10YR 5/3) (crushed) extremely gravelly coarse sand, dark yellowish brown (10YR 3/4) crushed and moist; 90 percent sand; 10 percent silt; single grained; loose, nonsticky and nonplastic; common fine and common very fine roots throughout; many medium interstitial pores; 35 percent pebbles ranging from 2 to 5 millimeters in size, 35 percent pebbles ranging from 5 to 75 millimeters in size, 5 percent cobbles, and 5 percent stones; strongly acid (pH 5.4) by chlorophenol red; abrupt smooth boundary.

2Bw—9 to 21 centimeters; pale brown (10YR 6/3) (crushed) very gravelly sand, dark yellowish brown (10YR 3/4) crushed and moist; 92 percent sand; 8 percent silt; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic;

common fine and common very fine roots throughout; many very fine interstitial pores; 15 percent pebbles ranging from 2 to 5 millimeters in size, 15 percent pebbles ranging from 5 to 75 millimeters in size and 5 percent cobbles; strongly acid (pH 5.4) by chlorophenol red; clear smooth boundary.

2C—21 to 91 centimeters; very pale brown (10YR 7/3) (crushed) very cobbly loamy fine sand, brown (10YR 5/3) crushed and moist; 85 percent sand; 14 percent silt; single grained; loose, nonsticky and nonplastic; few fine and few very fine roots throughout; many very fine interstitial pores; 8 percent pebbles ranging from 5 to 75 millimeters in size, 12 percent pebbles ranging from 2 to 5 millimeters in size, 12 percent cobbles, and 8 percent stones; strongly acid (pH 5.4) by chlorophenol red; abrupt wavy boundary.

3Cr—91 to 150 centimeters; moderately cemented granodiorite bedrock.

Type location: El Dorado County, California; on Freel Peak, 787.5 meters north and 44.5 meters east of the southwest corner of sec. 31, T. 12 N., R. 19 E.; 38 degrees 51 minutes 35 seconds north latitude and 119 degrees 53 minutes 58 seconds west longitude; NAD83; USGS quadrangle: Freel Peak, California.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July to early October. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Percentage of the surface covered by rock fragments: 75 to 100 percent (25 to 75 percent by gravel, 15 to 50 percent by cobbles, 5 to 25 percent by stones, and 0 to 5 percent by boulders)

Depth to bedrock: 50 to 100 centimeters to paralithic contact

Reaction: Strongly acid or moderately acid

Particle-size control section:

- Content of rock fragments—35 to 75 percent (35 to 65 percent gravel, 5 to 15 percent cobbles, and 5 to 15 percent stones)
- Content of clay—averages 0 to 6 percent
- Mineralogy—mixed

C horizon:

- Content of rock fragments (occurring as a rock veneer)—80 to 100 percent (30 to 75 percent pebbles 2 to 5 millimeters in size, 20 to 50 percent pebbles 5 to 75 millimeters in size, 10 to 25 percent cobbles, and 0 to 5 percent stones

2A horizon:

- Hue—10YR
- Value—5 or 6 dry, 3 or 4 moist
- Chroma—3 or 4 dry or moist
- Content of organic matter—1 to 5 percent
- Texture of the fine-earth fraction—coarse sand, sand, or loamy coarse sand
- Content of clay—0 to 6 percent
- Content of rock fragments—35 to 80 percent (30 to 85 percent gravel, 1 to 20 percent cobbles, and 0 to 20 percent stones)
- Reaction—pH of 5.1 to 6.0

2Bw horizon:

- Hue—10YR
- Value—4 to 6 dry, 3 or 4 moist
- Chroma—3 or 4 dry or moist
- Content of organic matter—0.5 to 1 percent

Texture of the fine-earth fraction—coarse sand, sand, or loamy coarse sand
Content of clay—0 to 6 percent
Content of rock fragments—35 to 65 percent (25 to 60 percent gravel and 1 to 15 percent cobbles)
Reaction—pH of 5.1 to 6.0

2C horizon(s):
Hue—10YR
Value—7 dry, 5 moist
Chroma—3 dry, 3 moist
Content of organic matter—0.25 to 1 percent
Texture of the fine-earth fraction—coarse sand, loamy coarse sand, sand, or loamy fine sand
Content of clay—0 to 6 percent
Content of rock fragments—35 to 60 percent (20 to 35 percent gravel, 5 to 20 percent cobbles, and 3 to 15 percent stones)
Reaction—pH of 5.1 to 6.0

Gefo Series

The Gefo series consists of very deep, somewhat excessively drained soils that formed in glacial outwash derived mainly from granitic rocks (fig. 29). These soils are on outwash terraces and alluvial fans. Slopes range from 0 to 30 percent. The mean annual precipitation is 762 millimeters, and the mean annual air temperature is 6 degrees C.

Taxonomic classification: Sandy, mixed, frigid Humic Dystroxerepts

Typical pedon

Gefo gravelly loamy coarse sand, under a cover of Jeffrey pine, sagebrush, bitterbrush, and perennial grasses, in an area of Christopher-Gefo complex, 0 to 5 percent slopes.

Colors are for dry soil unless otherwise indicated.

A1—0 to 18 centimeters; brown (10YR 4/3) gravelly loamy coarse sand, very dark grayish brown (10YR 3/2) moist; weak fine and medium granular structure; soft, very friable; common very fine and few fine roots; many very fine and fine interstitial pores; moderately acid (pH 5.8); clear wavy boundary.
A2—18 to 38 centimeters; brown (10YR 5/3) gravelly loamy coarse sand, dark brown (10YR 3/3) moist; weak fine and medium granular structure; soft, very friable; few very fine and fine roots; many very fine and fine interstitial pores; moderately acid (pH 5.8); clear wavy boundary.
C1—38 to 91 centimeters; light yellowish brown (10YR 6/4) gravelly coarse sand, brown (10YR 4/3) moist; massive; soft, very friable; few very fine and fine roots; many very fine and fine interstitial pores; moderately acid (pH 6.0); gradual smooth boundary.
C2—91 to 165 centimeters; very pale brown (10YR 7/4) gravelly coarse sand, yellowish brown (10YR 5/4) moist; massive; soft, very friable; few fine roots; many very fine and fine interstitial pores; moderately acid (pH 6.0); gradual smooth boundary.
C3—165 to 191 centimeters; light gray (10YR 7/2) gravelly coarse sand, yellowish brown (10YR 5/4) moist; massive; soft, very friable; many very fine and fine interstitial pores; moderately acid (pH 6.0).

Figure 29.—Typical profile of a Gefo soil.

Type location: El Dorado County, California; 1 mile south of Al Tahoe; 213 meters west and 152 meters south of Rubicon and Brockway intersection, lot 13, sec. 4, T. 12 N., R. 18 E.; USGS quadrangle: Bijou, California and Nevada.

Range in characteristics

These soils are usually moist between depths of about 30 and 89 centimeters but are dry in all parts from late June until mid-October. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 7 to 8 degrees C at a depth of 50 centimeters
Mean summer soil temperature: About 17 degrees C
Reaction: Strongly acid to slightly acid throughout the profile, generally becoming more acid with increasing depth
Base saturation: About 5 to 15 percent, decreasing with increasing depth
Content of gravel: Averages 5 to 35 percent throughout the profile

A horizons:
Hue—10YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Texture of the fine-earth fraction—coarse sand, sand, loamy coarse sand, or loamy sand
Structure—dominantly weak or moderate granular structure; single grained at the surface in some pedons

C horizons:
Hue—10YR
Value—6 or 7 dry, 4 or 5 moist
Chroma—2 to 4 dry or moist
Texture of the fine-earth fraction—coarse sand, sand, or loamy sand

Genoapeak Series

The Genoapeak series consists of very deep, excessively drained soils that formed in colluvium over highly fractured trachyte bedrock (fig. 30). These soils are on hillslopes. Slopes range from 9 to 70 percent. The mean annual precipitation is about 700 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Fragmental, mixed, frigid Dystric Xerorthents

Typical pedon

Genoapeak extremely gravelly sandy loam, on a south-facing (180-degree) slope of 51 percent, at an elevation of 2,115 meters, in an area of Zephyrcove-Southcamp-Genoapeak complex, 30 to 70 percent slopes.

When described on 7/14/2004, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 4 centimeters; slightly decomposed plant material; abrupt smooth boundary.
A—4 to 10 centimeters; dark grayish brown (10YR 4/2) very gravelly sandy loam, very dark brown (10YR 2/2) moist; 2 percent clay; weak very fine granular structure; soft, very friable, nonsticky and nonplastic; common very fine roots throughout; many fine and very fine irregular pores; 50 percent gravel; slightly acid (pH 6.5) by bromthymol blue; abrupt smooth boundary.
Bw—10 to 19 centimeters; pale brown (10YR 6/3) very gravelly coarse sandy loam, brown (10YR 4/3) moist; 8 percent clay; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and very fine and few medium roots throughout; many fine and very fine irregular pores; 15 percent cobbles and 40 percent gravel; slightly acid (pH 6.6) by bromthymol blue; gradual smooth boundary.
C1—19 to 40 centimeters; cobbles; structureless; common very fine, fine, medium, and coarse roots throughout; many fine, medium, and coarse irregular pores; 30 percent gravel and 60 percent cobbles; gradual wavy boundary.
C2—40 to 152 centimeters; cobbles; highly fractured bedrock with fractures less than 10 centimeters apart; few very fine, fine, and medium roots in cracks.

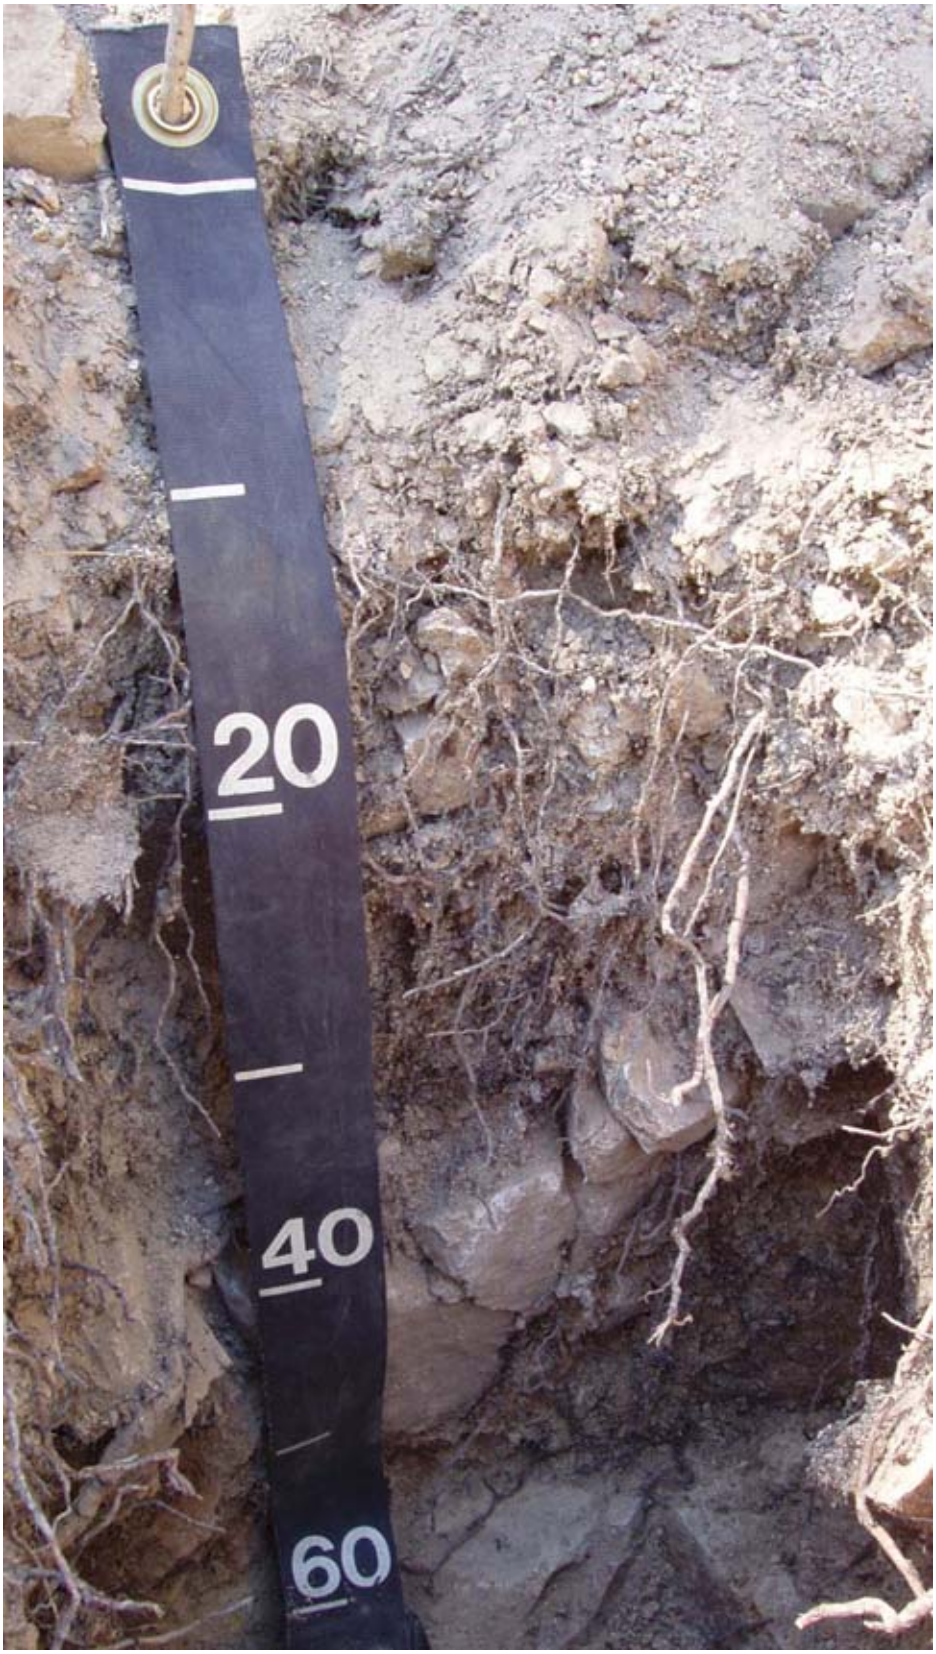

Figure 30.—Typical profile of a Genoapeak soil.

Type location: Douglas County, Nevada; about 0.44 mile south of Highway 50 on Forest Service Road 1451 and about 60 meters west of the road; 738 meters south and 323 meters east of the northwest corner of sec. 12, T. 14 N., R. 18 E.; 39 degrees 5 minutes 29 seconds north latitude and 119 degrees 54 minutes 50 seconds west longitude; NAD83; USGS quadrangle: Glenbrook, Nevada.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July to early October. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Depth to highly fractured bedrock: 25 to 50 centimeters
Mean annual soil temperature: 17.2 degrees C at a depth of 41 centimeters
Percentage of the surface covered by rock fragments: 50 to 90 percent (2 to 10 percent by cobbles and 50 to 85 percent by gravel)
Reaction: Slightly acid or neutral

Particle-size control section:
- Content of rock fragments—90 to 100 percent
- Content of clay—averages 0 to 10 percent
- Mineralogy—mixed

A horizon:
- Hue—10YR
- Value—3 to 5 dry, 2 to 4 moist
- Chroma—2 to 4 dry or moist
- Content of organic matter—3 to 8 percent
- Texture of the fine-earth fraction—coarse sandy loam or sandy loam
- Content of clay—1 to 5 percent
- Content of rock fragments—35 to 60 percent (30 to 60 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones)
- Reaction—pH of 6.1 to 6.8

Bw horizon:
- Hue—10YR
- Value—5 or 6 dry, 4 or 5 moist
- Chroma—3 or 4 dry or moist
- Content of organic matter—1 to 3 percent
- Texture of the fine-earth fraction—coarse sandy loam or sandy loam
- Content of clay—3 to 10 percent
- Content of rock fragments—35 to 60 percent (20 to 50 percent gravel, 5 to 30 percent cobbles, and 0 to 10 percent stones)
- Reaction—pH of 6.1 to 6.8

C1 horizon:
- Hue—10YR
- Value—5 or 6 dry, 4 or 5 moist
- Chroma—3 or 4 dry or moist
- Content of organic matter—0 to 0.25 percent
- Texture of the fine-earth fraction—coarse sandy loam or sandy loam
- Content of clay—0 to 1 percent
- Content of rock fragments—90 to 100 percent (20 to 40 percent gravel, 50 to 80 percent cobbles, and 0 to 5 percent stones)
- Reaction—pH of 6.1 to 6.8

C2 horizon:
Bedrock fractures—less than 10 centimeters apart
Hue—10YR
Value—5 or 6 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Content of organic matter—0 to 0.25 percent
Fine-earth fraction—making up less than 5 percent of the total volume of the horizon
Texture of the fine-earth fraction—coarse sandy loam or sandy loam
Content of clay—0 to 1 percent
Content of rock fragments—95 to 100 percent (20 to 40 percent gravel, 50 to 80 percent cobbles, and 0 to 5 percent stones)
Reaction—pH of 6.1 to 6.8

Glenalpine Series

The Glenalpine series consists of deep, excessively drained soils that formed in colluvium derived from volcanic and metamorphic rocks. These soils are on mountainsides and glacial valley walls. Slopes range from 50 to 90 percent. The mean annual precipitation is about 1,143 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Loamy-skeletal, isotic, frigid Humic Dystroxerepts

Typical pedon

Glenalpine very cobbly fine sandy loam, on a south-facing (173-degree) slope of 70 percent, at an elevation of 7,457 meters , in an area of Rubble land-Glenalpine complex, 50 to 90 percent slopes.

When described on 6/24/2002, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

A—0 to 29 centimeters; light olive brown (2.5Y 5/4) very cobbly fine sandy loam, dark olive brown (2.5Y 3/3) moist; moderate fine granular structure; soft, very friable, slightly sticky and nonplastic; common very fine, fine, and medium roots throughout; many very fine interstitial pores; 20 percent cobbles, 15 percent gravel, and 5 percent stones; neutral (pH 7.0) by bromthymol blue; clear irregular boundary.

Bw1—29 to 65 centimeters; light yellowish brown (2.5Y 6/4) extremely cobbly fine sandy loam, olive brown (2.5Y 4/4) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine, fine, medium, and coarse roots throughout; many very fine interstitial pores; 40 percent cobbles and 30 percent gravel; neutral (pH 7.0) by bromthymol blue; clear wavy boundary.

Bw2—65 to 102 centimeters; light yellowish brown (2.5Y 6/4) extremely cobbly fine sandy loam, olive brown (2.5Y 4/4) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common medium and few very fine roots throughout; many very fine interstitial pores; 50 percent cobbles and 10 percent gravel; neutral (pH 6.8) by bromthymol blue; gradual smooth boundary.

C—102 to 128 centimeters; light yellowish brown (2.5Y 6/4) extremely cobbly fine sandy loam, light olive brown (2.5Y 5/4) moist; single grained; loose when dry, loose when moist, nonsticky and nonplastic when wet; common fine roots throughout; 50 percent cobbles and 10 percent gravel; neutral (pH 7.0) by bromthymol blue; abrupt smooth boundary.

Cd—128 to 150 centimeters; dense glacial till.

Type location: El Dorado County, California; 282 meters east and 463 meters north of the southwest corner of sec. 15, T. 12 N., R. 17 E.; 38 degrees 52 minutes 58 seconds north latitude and 120 degrees 5 minutes 25 seconds west longitude; NAD27; USGS quadrangle: Emerald Bay, California.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July to early October. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Percentage of the surface covered by rock fragments: 50 to 90 percent (5 to 20 percent by stones, 15 to 45 percent by cobbles, and 15 to 45 percent by gravel)
Depth to dense glacial till: 100 to 150 centimeters
Reaction: Slightly acid or neutral
Base saturation: 35 to 60 percent (by ammonium acetate)

Particle-size control section:
- Content of rock fragments—50 to 80 percent (5 to 35 percent gravel, 35 to 60 percent cobbles, and 0 to 10 percent stones)
- Content of clay—averages 5 to 15 percent
- Mineralogy—isotic

A horizon(s):
- Hue—2.5Y or 10YR
- Value—4 or 5 dry, 2 or 3 moist
- Chroma—4 dry, 2 or 3 moist
- Content of organic matter—3 to 8 percent
- Texture of the fine-earth fraction—fine sandy loam
- Content of clay—5 to 15 percent
- Content of rock fragments—30 to 60 percent (10 to 30 percent gravel, 10 to 40 percent cobbles, and 0 to 15 percent stones)
- Reaction—slightly acid or neutral

Bw horizons:
- Hue—2.5Y or 10YR
- Value—5 or 6 dry, 4 or 5 moist
- Chroma—3 or 4 dry or moist
- Content of organic matter—1 to 5 percent
- Texture of the fine-earth fraction—fine sandy loam
- Content of clay—5 to 15 percent
- Content of rock fragments—50 to 80 percent (10 to 40 percent gravel and 30 to 60 percent cobbles)
- Reaction—slightly acid or neutral

C horizon(s):
- Hue—2.5Y or 10YR
- Value—5 or 6 dry, 4 or 5 moist
- Chroma—4 dry or moist
- Content of organic matter—0.5 to 2 percent
- Texture of the fine-earth fraction—fine sandy loam
- Content of clay—2 to 10 percent
- Content of rock fragments—50 to 80 percent (4 to 30 percent gravel and 30 to 60 percent cobbles)
- Reaction—slightly acid or neutral

Hawkinspeak Series

The Hawkinspeak series consists of moderately deep, well drained soils that formed in colluvium and residuum derived from tuff, tuff breccia, and andesite. These soils are on mountains. Slopes range from 15 to 50 percent. The mean annual precipitation is about 762 millimeters, and the mean annual air temperature is about 3 degrees C.

Taxonomic classification: Loamy-skeletal, mixed, superactive Pachic Argicryolls

Typical pedon

Hawkinspeak very gravelly sandy loam, in an area of rangeland in a Hawkpeak-Hawkinspeak association.

The percentage of the surface covered by rock fragments is as follows: 45 percent by gravel, 5 percent by cobbles, 3 percent by stones, and 1 percent by boulders. Colors are for dry soil unless otherwise indicated.

A1—0 to 8 centimeters; grayish brown (10YR 5/2) very gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine roots; common very fine interstitial and tubular pores; 30 percent gravel, 5 percent cobbles, and 5 percent stones; slightly acid; clear wavy boundary.

A2—8 to 23 centimeters; brown (10YR 5/3) very gravelly sandy loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and common fine roots; common very fine interstitial and common very fine tubular pores; 45 percent gravel and 5 percent cobbles; slightly acid; clear wavy boundary.

Bt1—23 to 38 centimeters; brown (10YR 5/3) very gravelly sandy clay loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; common very fine, common fine, and common medium roots; common very fine interstitial and tubular pores; few faint clay bridges on sand grains; 45 percent gravel and 5 percent cobbles; slightly acid; clear wavy boundary.

Bt2—38 to 84 centimeters; brown (10YR 5/3) very gravelly sandy clay loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; common very fine, common fine, and common medium roots; common very fine interstitial and common tubular pores; common faint clay bridges on sand grains; 50 percent gravel and 5 percent cobbles; slightly acid; abrupt irregular boundary.

R—84 centimeters; fractured, hard tuff.

Type location: Alpine County, California; in the Toiyabe National Forest, southwest of Hawkins Peak; approximately 675 feet north and 2,450 feet west of the southeast corner of sec. 3, T. 10 N., R. 19 E.; 38 degrees 44 minutes 3.8 seconds north latitude and 119 degrees 52 minutes 31.5 seconds west longitude; NAD27; USGS quadrangle: Carson Pass, California.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July through September. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 6 to 8 degrees C
Mean summer soil temperature: 10 to 12 degrees C

Mollic epipedon: 50 to 100 centimeters thick; includes the Bt1 horizon or both the Bt1 and Bt2 horizons in some pedons
Depth to bedrock: 50 to 100 centimeters to lithic contact
Sodium fluoride pH: 8.5 to 9.0.

Particle-size control section:
Content of clay—averages 18 to 27 percent
Content of rock fragments—averages 35 to 60 percent, mainly gravel
Lithology of the rock fragments—volcanic rocks, such as tuff, tuff breccia, and andesite

A horizons:
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Content of organic matter—2 to 5 percent
Reaction—slightly acid or neutral

Bt horizons:
Hue—10YR or 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture of the fine-earth fraction—sandy loam, loam, or sandy clay loam
Content of clay—18 to 27 percent
Content of rock fragments—35 to 60 percent
Reaction—slightly acid or neutral

Hellhole Series

The Hellhole series consists of very deep, very poorly drained soils that formed in mossy organic material. These soils are on fens in the mountains. Slopes are 0 to 2 percent. The mean annual precipitation is about 1,165 millimeters, and the mean annual air temperature is about 3 degrees C.

Taxonomic classification: Euic, frigid Typic Sphagnofibrists

Typical pedon

Hellhole peat, on a slope of 0 percent, at an elevation of 2,551 meters, in an area of Hellhole peat, 0 to 2 percent slopes.

When described on 7/02/2002, the soil was wet throughout. Colors are for moist soil unless otherwise indicated.

Oi1—0 to 29 centimeters; peat, very dark gray (10YR 3/1) rubbed, pressed, and moist; about 95 percent fiber, 80 percent rubbed; massive; nonplastic and nonsticky; primarily sphagnum fibers; strongly acid (pH 5.4) by chlorophenol red; gradual smooth boundary.
Oi2—29 to 150 centimeters; peat, very dark grayish brown (10YR 3/2) rubbed, pressed, and moist; about 95 percent fiber, 80 percent rubbed; massive; nonplastic and nonsticky; primarily sphagnum fibers; strongly acid (pH 5.4) by chlorophenol red; clear smooth boundary.
Oe—150 to 300 centimeters; mucky peat, very dark gray (10YR 3/1) rubbed, pressed, and moist; about 70 percent fiber, 60 percent rubbed; massive; nonplastic and nonsticky; primarily sphagnum fibers; strongly acid (pH 5.4) by chlorophenol red.

Type location: El Dorado County, California; 291 meters east and 363 meters north of the southwest corner of sec. 1, T. 11 N., R. 18 E.; 38 degrees 49 minutes 30

seconds north latitude and 119 degrees 56 minutes 44 seconds west longitude; NAD83; USGS quadrangle: Freel Peak, California.

Range in characteristics

These soils are wet in all of the soil moisture control section in most years. They have a typic aquic moisture regime.

Content of organic matter: 70 to 90 percent
Reaction: Strongly acid to slightly acid

Oi horizons:
Hue—10YR
Value—3 or 4 moist
Chroma—1 to 3 moist
In-lieu-of texture—peat
Reaction—strongly acid to slightly acid

Oe horizon:
Hue—10YR or 7.5YR
Value—3 or 4 moist
Chroma—1 to 4 moist
In-lieu-of texture—mucky peat
Reaction—strongly acid to slightly acid

Inville Series

The Inville series consists of very deep, well drained soils that formed in mixed alluvium and outwash. These soils are on alluvial fans, outwash terraces, and hillslopes. Slopes range from 2 to 30 percent. The mean annual precipitation is about 635 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Loamy-skeletal, isotic, frigid Ultic Haploxeralfs

Typical pedon

Inville gravelly coarse sandy loam, 2 to 9 percent slopes, stony, in a forested area.

Colors are for dry soil unless otherwise indicated.

Oi—0 to 5 centimeters; litter of conifer needles.
A1—5 to 8 centimeters; brown (10YR 4/3) gravelly coarse sandy loam, very dark brown (10YR 2/2) moist; moderate fine and medium granular structure; soft, very friable, nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; 20 percent gravel; moderately acid (pH 6.0); abrupt smooth boundary.
A2—8 to 15 centimeters; brown (10YR 5/3) gravelly coarse sandy loam, dark brown (10YR 3/3) moist; weak medium subangular blocky and moderate fine granular structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots; many very fine interstitial and few very fine tubular pores; 20 percent gravel; moderately acid (pH 6.0); clear smooth boundary.
Bw—15 to 30 centimeters; brown (10YR 5/3) gravelly coarse sandy loam, variegated with about equal amounts of dark brown (10YR 3/3) and dark yellowish brown (10YR 3/4) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, medium, and coarse roots; many fine interstitial and common very fine tubular pores; few thin clay films in pores; 20 percent gravel; moderately acid (pH 6.0); clear wavy boundary.

Bt1—30 to 71 centimeters; reddish brown (5YR 5/3) extremely cobbly sandy loam, reddish brown (5YR 4/3) moist; weak medium subangular blocky structure; hard, very friable, slightly sticky and slightly plastic; many very fine, fine, medium, and coarse roots; many very fine interstitial and common very fine tubular pores; common thin clay films in pores and few thin clay films on faces of peds; 25 percent cobbles and 35 percent gravel; moderately acid (pH 6.0); clear wavy boundary.

Bt2—71 to 94 centimeters; brown (10YR 5/3) extremely cobbly sandy loam, brown (10YR 4/3) moist; clay coatings, dark yellowish brown (10YR 4/4) moist; weak medium and coarse subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; few very fine and fine and common medium roots; many very fine interstitial and few very fine tubular pores; few thin clay films coating and bridging sand grains; 35 percent gravel and 35 percent cobbles; moderately acid (pH 6.0); clear wavy boundary.

C—94 to 142 centimeters; extremely gravelly loamy coarse sand, brown (10YR 5/3) dry and moist; massive; soft, very friable, nonsticky and nonplastic; few very fine, fine, and medium roots; many fine and medium interstitial pores; 25 percent cobbles and 50 percent gravel; moderately acid (pH 6.0).

Type location: Washoe County, Nevada; in Incline Village; approximately 671 meters east and 671 meters south of the northwest corner of sec. 15, T. 16 N., R. 18 E.; Mount Diablo Base and Meridian; USGS quadrangle: Martis Peak, Nevada.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July to early October. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 6 to 8 degrees C
Mean summer soil temperature: 15 to 18 degrees C
Reaction: Moderately acid or slightly acid
Content of rock fragments in the particle-size control section: 45 to 75 percent

A horizons:
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist

B horizons:
Hue—7.5YR, 5YR, or 10YR
Value—4 to 6 dry, 3 or 4 moist
Chroma—3 or 4 in the matrix, 4 to 6 on faces
Texture of the fine-earth fraction—sandy loam, coarse sandy loam, or loam

Jabu Series

The Jabu series consists of very deep, well drained soils that formed in outwash and alluvium derived from granitic sources. These soils are on glacial outwash terraces and moraines. Slopes range from 0 to 30 percent. The mean annual precipitation is about 760 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Coarse-loamy, mixed, superactive, frigid Ultic Haploxeralfs

Typical pedon

Jabu coarse sandy loam, 9 to 30 percent slopes, in a forested area.

Colors are for dry soil unless otherwise indicated.

Oi—0 to 3 centimeters; slightly decomposed plant material consisting of pine and fir needles.

A1—3 to 8 centimeters; brown (7.5YR 5/4) coarse sandy loam, dark brown (7.5YR 3/2) moist; weak thick platy structure; soft, very friable, nonsticky and nonplastic; many very fine and few fine roots; common very fine interstitial pores; 13 percent gravel; moderately acid (pH 5.6); clear smooth boundary.

A2—8 to 18 centimeters; brown (7.5YR 5/4) coarse sandy loam, reddish brown (5YR 4/4) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and common fine, medium, and coarse roots; common very fine interstitial and few fine tubular pores; 14 percent gravel; moderately acid (pH 6.0); clear smooth boundary.

Bt1—18 to 28 centimeters; brown (7.5YR 5/4) coarse sandy loam, reddish brown (5YR 4/4) moist; weak medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; many very fine, fine, medium, and coarse roots; common thin clay films bridging and coating sand grains; 14 percent gravel; moderately acid (pH 5.8); clear smooth boundary.

Bt2—28 to 53 centimeters; strong brown (7.5YR 5/6) coarse sandy loam, dark reddish brown (5YR 3/4) moist; massive; hard, friable, nonsticky and nonplastic; many very fine, fine, medium, and coarse roots; common very fine tubular and interstitial pores; many thin clay films bridging and coating sand grains; moderately thick clay films in places; 14 percent gravel; strongly acid (pH 5.5); abrupt wavy boundary.

Bt3—53 to 76 centimeters; strong brown (7.5YR 5/6) gravelly coarse sandy loam, yellowish red (5YR 4/6) moist; brown (7.5YR 5/4) coatings; massive; hard, firm, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; common very fine tubular and interstitial and few fine tubular pores; many thin and few moderately thick clay films bridging and coating sand grains; few cobbles at the upper boundary of the horizon; 27 percent gravel; strongly acid (pH 5.5); gradual smooth boundary.

Bt4—76 to 97 centimeters; strong brown (7.5YR 5/6, 5/8) gravelly coarse sandy loam, yellowish red (5YR 5/6) moist; brown (7.5YR 5/4) coatings; massive; hard, firm, slightly sticky and slightly plastic; few fine, medium, and coarse roots; common very fine interstitial and tubular and few fine tubular pores; continuous thin and few moderately thick clay films bridging and coating sand grains; 26 percent gravel; strongly acid (pH 5.5); gradual wavy boundary.

Bt5—97 to 117 centimeters; strong brown (7.5YR 5/6, 5/8) gravelly coarse sandy loam, yellowish red (5YR 4/8) moist; massive; hard, firm, slightly sticky and slightly plastic; very few fine, medium, and coarse roots; common very fine interstitial pores; continuous moderately thick yellowish red (5YR 4/6) clay films bridging and coating sand grains; 44 percent gravel; strongly acid (pH 5.5); abrupt wavy boundary.

Bx1—117 to 135 centimeters; variegated reddish yellow (7.5YR 6/6) and strong brown (7.5YR 5/6) loamy coarse sand, strong brown (7.5YR 5/6, 5/8) and brownish yellow (10YR 6/6) moist; massive; hard, firm; common very fine interstitial pores; common thin clay films lining pores; 7 percent gravel; strongly acid (pH 5.5); clear wavy boundary.

Bx2—135 to 170 centimeters; light gray (2.5Y 7/2) coarse sandy loam, olive gray (5Y 5/2) moist; dark grayish brown (2.5Y 4/2) bands; massive; extremely hard,

extremely firm; few very fine interstitial pores; 10 percent gravel; strongly acid (pH 5.5); clear wavy boundary.

C—170 to 185 centimeters; white (N 8/), finely stratified fine sandy loam and silty clay, light gray (N 7/) moist; black (dry and moist) coatings; strong medium platy structure; slightly hard, firm, nonsticky and plastic; in the entire horizon, horizontal bands of clay and silt with black coatings between the plates; 6 percent gravel; strongly acid (pH5.5); abrupt smooth boundary.

Cd—185 to 257 centimeters; light gray (2.5Y 7/2), compacted till with a texture of coarse sandy loam, grayish brown (2.5Y 5/2) moist; horizon was augered; 10 to 20 percent gravel.

Type location: El Dorado County, California; 4.5 meters north of Fountain Place Road, 5 1/2 miles south of Bijou, California; 0.2 mile east of the southwest corner of sec. 23, T. 12 N., R. 18 E.; USGS quadrangle: Freel Peak, California.

Range in characteristics

These soils are usually moist in some part between depths of 20 and 61 centimeters most of the year, but they are dry in all parts from early July until early October. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 7 to 8 degrees C at a depth of 50 centimeters
Mean summer soil temperature: 15.5 to 17.2 degrees C
Depth to fragic soil properties: 100 to 200 centimeters
Depth to compact till: More than 150 centimeters
Content of stones and cobbles: 0 to 20 percent
Base saturation: Between 35 and 75 percent in the argillic horizon
Reaction: Slightly acid or moderately acid

A horizons:
- Hue—10YR or 7.5YR dry; 10YR, 7.5YR, or 5YR moist
- Value—4 or 5 dry
- Chroma—2 to 4 dry or moist
- Structure—weak platy to strong granular structure

Bt horizons:
- Hue—10YR or 7.5YR dry; 10YR, 7.5YR, or 5YR moist
- Value—4 to 8
- Chroma—3 to 8 dry and moist
- Texture of the fine-earth fraction—loamy coarse sand or coarse sandy loam
- Content of gravel—0 to 20 percent
- Content of clay—3 to 6 percent more clay than the A horizon
- Structure—weak blocky structure or massive
- Reaction—moderately acid or strongly acid

The Bx horizons are massive, have bleached seams, and are hard to extremely hard when dry and firm to extremely firm when moist.

Jobsis Series

The Jobsis series consists of shallow, somewhat excessively drained soils that formed in colluvium and residuum derived from granitic rocks. These soils are on mountains. Slopes range from 8 to 75 percent. The mean annual precipitation is about 1,143 millimeters, and the mean annual air temperature is about 2 degrees C.

Taxonomic classification: Sandy-skeletal, mixed, shallow Typic Cryorthents

Typical pedon

Jobsis very gravelly loamy coarse sand, in a forested area of Jobsis-Whittell-Rock outcrop complex, cool, 8 to 30 percent slopes.

The percentage of the surface covered by rock fragments is as follows: 25 percent by gravel, 5 percent by stones, and 15 percent by boulders. Colors are for dry soil unless otherwise indicated.

A1—0 to 1 centimeter; dark grayish brown (10YR 4/2) very gravelly loamy coarse sand, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; 50 percent gravel and 5 percent boulders; strongly acid; clear wavy boundary.

A2—1 to 13 centimeters; grayish brown (10YR 5/2) very gravelly loamy coarse sand, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, common fine, common medium, and common coarse roots; many very fine interstitial pores; 50 percent gravel and 5 percent boulders; strongly acid; clear wavy boundary.

Bw1—13 to 23 centimeters; pale brown (10YR 6/3) very gravelly loamy coarse sand, brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, common fine, common medium, and common coarse roots; many very fine interstitial pores; 55 percent gravel; strongly acid; clear wavy boundary.

Bw2—23 to 30 centimeters; pale brown (10YR 6/3) very gravelly loamy coarse sand, brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, common fine, common medium, and common coarse roots; many very fine interstitial pores; 50 percent gravel; strongly acid; clear wavy boundary.

Bw3—30 to 43 centimeters; pale brown (10YR 6/3) very gravelly loamy coarse sand, brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; common very fine and few fine roots; many very fine interstitial and tubular pores; 45 percent gravel; strongly acid; clear wavy boundary.

2C—43 to 50 centimeters; pale brown (10YR 6/3) very gravelly coarse sand, brown (10YR 4/3) moist; massive-rock structure; slightly hard, very friable, nonsticky and nonplastic; few very fine and few fine roots; many very fine interstitial pores; 50 percent gravel; strongly acid; clear wavy boundary.

2Cr—50 to 75 centimeters; soft, weathered granodiorite.

Type location: Alpine County, California; in the Toiyabe National Forest, about 1 mile southeast of Hawkins Peak; approximately 2,200 feet north and 1,825 feet east of the southwest corner of sec. 11, T. 10 N., R. 19 E.; 38 degrees 43 minutes 34.9 seconds north latitude and 119 degrees 51 minutes 42.0 seconds west longitude; NAD27; USGS quadrangle: Markleeville, California.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July to early October. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 3 to 4 degrees C
Mean summer soil temperature: 7 to 8 degrees C
Thickness of the ochric epipedon: 8 to 23 centimeters

Depth to bedrock: 25 to 50 centimeters to paralithic contact (contact with weathered granitic rock, such as granodiorite)

Particle-size control section:
Content of clay—averages less than 10 percent
Content of rock fragments—averages 35 to 60 percent, mainly fine gravel
Lithology of the rock fragments—granitic rocks, such as granodiorite

A horizons:
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 or 3 dry or moist
Content of organic matter—1 to 3 percent
Reaction—very strongly acid or strongly acid

Bw and 2C horizons:
Chroma—3 or 4 dry or moist
Texture—very gravelly loamy coarse sand or very gravelly coarse sand
Content of clay—4 to 10 percent
Content of rock fragments—35 to 60 percent, mainly fine gravel (2 to 5 millimeters in diameter)
Reaction—very strongly acid or strongly acid

Jorge Series

The Jorge series consists of deep or very deep, well drained soils that formed in material weathered from basic volcanic rocks (fig. 31). These soils are on hillslopes and mountain slopes. Slopes range from 2 to 75 percent. The mean annual precipitation is 1,015 millimeters, and the mean annual air temperature is 5 degrees C.

Taxonomic classification: Loamy-skeletal, isotic, frigid Andic Haploxeralfs

Typical pedon

Jorge stony sandy loam, on a northeast-facing slope of 20 percent, under a cover of mixed conifers, at an elevation of 1,951 meters, in an area of Jorge-Tahoma complex, 15 to 30 percent slopes.

Colors are for dry soil unless otherwise indicated.

Oi—0 to 4 centimeters; litter and duff, mainly from manzanita.
A1—4 to 27 centimeters; brown (7.5YR 5/4) stony sandy loam, brown (7.5YR 4/4) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine and common medium and coarse roots; many very fine and fine interstitial pores; 10 percent gravel, 5 percent stones, and 1 percent cobbles; moderately acid (pH 5.6); clear smooth boundary.
A2—27 to 60 centimeters; brown (7.5YR 5/4) very gravelly sandy loam, brown (7.5YR 4/4) moist; weak very fine and fine subangular blocky structure; soft, friable, nonsticky and slightly plastic; many very fine and fine and common medium and coarse roots; many very fine and fine interstitial pores; 40 percent gravel and 4 percent cobbles; moderately acid (pH 5.6); clear wavy boundary.
BA—60 to 85 centimeters; brown (7.5YR 5/4) very gravelly loam, brown (7.5YR 4/4) moist; weak fine subangular blocky structure; soft, friable, nonsticky and slightly plastic; common very fine, fine, medium, and coarse roots; many very fine and fine interstitial and common very fine vesicular pores; 35 percent gravel and 3 percent cobbles; moderately acid (pH 5.6); clear wavy boundary.
Bt—85 to 126 centimeters; brown (7.5YR 5/4) very gravelly loam, brown (7.5YR 4/4) moist; weak fine and medium subangular blocky structure; slightly hard, friable,

Figure 31.—Typical profile of a Jorge soil.

slightly sticky and slightly plastic; few very fine and fine and common medium and coarse roots; many very fine and fine interstitial and few very fine vesicular pores; few thin clay films occurring as bridges; 40 percent gravel and 2 percent cobbles; moderately acid (pH 5.8); gradual wavy boundary.

C—126 to 217 centimeters; dark yellowish brown (10YR 4/4) very gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; common very fine and fine interstitial pores; 45 percent gravel and 2 percent cobbles; moderately acid (pH 5.8); gradual wavy boundary.

Cr—217 centimeters; weathered vesicular andesitic agglomerate.

Type location: Placer County, California; 4 miles north of Tahoe City; 366 meters west of the northeast corner of sec. 19, T. 16 N., R. 17 E.; Mount Diablo Base and Meridian; USGS quadrangle: Tahoe City, California.

Range in characteristics

These soils are moist between depths of 23 and 86 centimeters during late fall and during winter and spring and are dry in all parts from late July until early October. They have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 8 degrees C at a depth of 50 centimeters
Mean summer temperature 10 to 12 degrees C
Thickness of the solum: 100 to 165 centimeters
Depth to weathered bedrock: 127 to 254 centimeters
Percentage of the surface covered by cobbles, stones, and rock outcrop: 5 to 15 percent
Mineralogy: Influenced by vitric pyroclastic material
Thickness of the O horizon: 3 to 8 centimeters
Base saturation: Less than 50 percent; typically less than 30 percent because of a high amount of aluminum in the parent material

A horizons:
- Hue—10YR, 7.5YR, or 5YR
- Value—4 to 6 dry, 2 to 4 moist
- Chroma—2 to 4 dry or moist
- Texture of the fine-earth fraction—coarse sandy loam, sandy loam, or loam
- Content of organic matter—2 to 15 percent
- Content of rock fragments—15 to 45 percent gravel, cobbles, and stones
- Structure—single grained, weak granular, or weak subangular blocky
- Reaction—neutral to moderately acid

BA or Bw horizons:
- Hue—10YR or 7.5YR
- Value—5 to 7 dry, 3 or 4 moist
- Chroma—3 or 4 dry or moist
- Texture of the fine-earth fraction—sandy loam, loam, sandy clay loam, or clay loam
- Content of rock fragments—35 to 65 percent
- Content of clay—5 to 13 percent
- Reaction—neutral to strongly acid

Bt horizon:
- Hue—10YR or 7.5YR
- Value—5 to 7 dry, 3 or 4 moist
- Chroma—3 or 4 dry or moist
- Texture of the fine-earth fraction—sandy loam, loam, sandy clay loam, or clay loam

Content of rock fragments—35 to 65 percent
Content of clay—15 to 35 percent; averages 4 to 12 percent more than the content in the A horizon
Reaction—slightly acid to very strongly acid

C horizon:
Hue—10YR
Value—5 to 7 dry, 3 or 4 moist
Chroma—3 to 6 dry or moist
Texture of the fine-earth fraction—loamy sand or sandy loam
Content of rock fragments—35 to 65 percent
Content of clay—11 to 27 percent
Reaction—slightly acid to very strongly acid

Kingsbeach Series

The Kingsbeach series consists of very deep, moderately well drained soils that formed in alluvium and/or colluvium derived from andesite over lacustrine deposits. These soils are on alluvial fans. Slopes range from 2 to 15 percent. The mean annual precipitation is about 635 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Fine-loamy, isotic, frigid Ultic Palexeralfs

Typical pedon

Kingsbeach stony sandy loam, on a south-facing (170-degree) slope of 4 percent, at an elevation of 1,914 meters, in an area of Kingsbeach stony sandy loam, 2 to 15 percent slopes.

Colors are for dry soil unless otherwise indicated.

Oi—0 to 3 centimeters; slightly decomposed plant material.
A—3 to 15 centimeters; dark yellowish brown (10YR 4/4) stony sandy loam, dark brown (7.5YR 3/2) moist; moderate fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many fine and very fine and few coarse roots throughout; common very fine interstitial pores; 5 percent stones, 5 percent cobbles, and 10 percent gravel; moderately acid (pH 5.6); clear smooth boundary.
Bt1—15 to 51 centimeters; brown (10YR 5/3) loam, dark reddish brown (5YR 3/4) moist; weak fine and medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; many fine and very fine and common medium and coarse roots throughout; common very fine interstitial pores; 15 percent clay bridges; moderately acid (pH 5.6); abrupt wavy boundary.
2Bt2—51 to 76 centimeters; strong brown (7.5YR 5/6) sandy clay loam, brown (7.5YR 4/4) moist; massive; hard, firm, slightly sticky and moderately plastic; few fine and very fine roots throughout; common very fine interstitial and tubular pores; 20 percent clay films on surfaces along pores and 20 percent clay bridges; moderately acid (pH 5.6); abrupt wavy boundary.
2C—76 to 152 centimeters; light gray (10YR 7/2) clay loam; massive; hard, firm, slightly sticky and moderately plastic; 25 percent medium light olive brown (2.5Y 5/3) masses of reduced iron at the top of the horizon; moderately acid (pH 5.6).

Type location: Placer County, California; 1 mile west of Kings Beach; 305 meters east and 91 meters north of the southwest corner of sec. 12, T. 16 N., R. 17 E.; 39 degrees 14 minutes 38 seconds north latitude and 120 degrees 2 minutes 42 seconds west longitude; NAD83; USGS quadrangle: Kings Beach, California.

Range in characteristics

These soils are usually dry for 45 to 75 consecutive days in late summer and are moist the rest of the year. They have a typic xeric moisture regime

Seasonal high water table: During spring runoff, water movement is slowed at the lithologic discontinuity.
Percentage of the surface covered by rock fragments: 0 to 10 percent (0 to 5 percent by gravel, 0 to 5 percent by cobbles, and 0 to 3 percent by stones)
Content of organic matter: As high as 5 percent in the A horizon and dropping to less than 1 percent in the 2C horizon
Reaction: Strongly acid to slightly acid
Base saturation: 35 to 75 percent (by ammonium acetate)
Depth to redoximorphic features: 50 to 100 centimeters

Particle-size control section: 15 to 65 centimeters
- Content of rock fragments—0 to 35 percent above the discontinuity (0 to 15 percent gravel, 0 to 10 percent cobbles, and 0 to 10 percent stones)
- Content of clay—averages 20 to 35 percent
- Mineralogy—isotic

A horizon(s):
- Hue—7.5YR or 10YR
- Value—4 or 5 dry, 3 or 4 moist
- Chroma—3 or 4 dry, 2 to 4 moist
- Texture of the fine-earth fraction—sandy loam
- Content of rock fragments—2 to 35 percent (2 to 15 percent gravel, 0 to 10 percent cobbles, and 0 to 10 percent stones)

Bt1 horizon:
- Hue—10YR, 7.5YR, or 5YR
- Value—4 or 5 dry, 3 or 4 moist
- Chroma—3 or 4 dry or moist
- Texture of the fine-earth fraction—loam, clay loam, or sandy clay loam
- Content of rock fragments—0 to 35 percent (0 to 15 percent gravel, 0 to 10 percent cobbles, and 0 to 10 percent stones)

2Bt2 horizon:
- Hue—10YR or 7.5YR
- Value—4 or 5 dry, 4 moist
- Chroma—4 or 6 dry, 4 moist
- Texture of the fine-earth fraction—sandy clay loam

2C horizon(s):
- Hue—10YR
- Value—6 to 8 dry
- Chroma—1 to 3 dry
- Redoximorphic features—masses of reduced iron
- Texture of the fine-earth fraction—clay loam or clay

Klauspeak Series

The Klauspeak series consists of very deep, somewhat excessively drained soils that formed in colluvium derived from granitic rocks. These soils are on mountains. Slopes range from 15 to 50 percent. The mean annual precipitation is about 1,143 millimeters, and the mean annual air temperature is about 3 degrees C.

Taxonomic classification: Sandy-skeletal, mixed Xeric Humicryepts

Typical pedon

Klauspeak gravelly loamy sand, in a forested area of Sofgran-Klauspeak-Temo association, 15 to 50 percent slopes.

The percentage of the surface covered by rock fragments is as follows: 15 percent by gravel, 5 percent by stones, and 5 percent by boulders. Colors are for dry soil unless otherwise indicated.

A1—0 to 13 centimeters; dark grayish brown (10YR 4/2) gravelly loamy sand, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine roots; common very fine interstitial and few very fine tubular pores; 10 percent gravel and 5 percent stones; strongly acid; clear wavy boundary.

A2—13 to 41 centimeters; grayish brown (10YR 5/2) gravelly loamy sand, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, medium, and coarse roots; common very fine interstitial and tubular pores; 15 percent gravel and 5 percent stones; strongly acid; clear wavy boundary.

Bw1—41 to 56 centimeters; pale brown (10YR 6/3) very stony loamy sand, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, common fine, common medium, and common coarse roots; common very fine interstitial and tubular pores; 15 percent gravel, 10 percent cobbles, and 10 percent stones; strongly acid; clear wavy boundary.

Bw2—56 to 102 centimeters; olive yellow (2.5Y 6/6) very stony loamy coarse sand, olive brown (2.5Y 4/4) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine and common very coarse roots; common very fine interstitial and tubular pores; 20 percent gravel, 10 percent cobbles, and 10 percent stones; strongly acid; clear wavy boundary.

C—102 to 152 centimeters; light yellowish brown (2.5Y 6/4) very cobbly coarse sand, olive brown (2.5Y 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common medium and coarse and few fine roots; many very fine interstitial pores; 30 percent gravel and 25 percent cobbles; strongly acid.

Type location: Alpine County, California; in the Toiyabe National Forest, about 1 mile southwest of Luther Pass and about 2,200 feet west-northwest of Waterhouse Peak; approximately 400 feet south and 1,800 feet west of the northeast corner of sec. 26, T. 10 N., R. 18 E.; 38 degrees 46 minutes 37.5 seconds north latitude and 119 degrees 57 minutes 19.4 seconds west longitude; NAD27; USGS 7.5 minute topographic quadrangle: Freel Peak, California.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July through September. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 7 degrees C
Mean summer soil temperature: 7 to 8 degrees C
Thickness of the umbric epipedon: 64 to 127 centimeters
Depth to bedrock: 152 to 200 centimeters to paralithic contact (contact with weathered granitic rock, such as granodiorite)

Particle-size control section:
Content of clay—averages 3 to 10 percent

Content of rock fragments—averages 35 to 50 percent, mainly stones and cobbles
Lithology of the rock fragments—granitic rocks, such as granodiorite

A horizons:
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Content of organic matter—2 to 4 percent
Reaction—strongly acid or moderately acid

Bw horizons:
Hue—10YR or 2.5Y
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 to 6 dry or moist
Texture of the fine-earth fraction—loamy coarse sand or loamy sand
Content of clay—3 to 10 percent
Content of rock fragments—35 to 50 percent
Reaction—strongly acid or moderately acid

C horizon:
Hue—10YR or 2.5Y
Chroma—3 or 4 dry or moist
Texture of the fine-earth fraction—coarse sand or loamy coarse sand
Content of clay—3 to 10 percent
Content of rock fragments—35 to 60 percent
Reaction—strongly acid or moderately acid

Kneeridge Series

The Kneeridge series consists of very deep, moderately well drained or well drained soils that formed in colluvium and/or till derived from andesite and andesitic lahar. These soils are on the footslopes and side slopes of glaciated valleys in the mountains. Slopes range from 2 to 15 percent. The mean annual precipitation is about 1,194 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Medial, mixed, frigid Humic Vitrixerands

Typical pedon

Kneeridge gravelly medial sandy loam, on a southeast-facing (150-degree) slope of 14 percent, at an elevation of 1,948 meters, in an area of Kneeridge gravelly medial sandy loam, 5 to 15 percent slopes, very stony.

When described on 8/05/2003, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 6 centimeters; slightly decomposed plant material consisting of pine and fir needles.
A—6 to 40 centimeters; olive brown (2.5Y 4/3) (crushed) gravelly medial sandy loam, very dark grayish brown (10YR 3/2) crushed and moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; few very fine and fine and common medium roots throughout; common fine interstitial pores; 10 percent subrounded pebbles 2 to 5 millimeters in size and 10 percent subrounded pebbles 5 to 75 millimeters in size; slightly alkaline (pH 7.4); gradual smooth boundary.
Bw—40 to 100 centimeters; light olive brown (2.5Y 5/3) (crushed) gravelly medial sandy loam, dark olive brown (2.5Y 3/3) crushed and moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; few fine,

many medium, and common coarse roots throughout; common medium tubular pores; 8 percent subrounded pebbles 5 to 75 millimeters in size and 9 percent subrounded pebbles 2 to 5 millimeters in size; neutral (pH 7.2); gradual smooth boundary.

C—100 to 200 centimeters; brown (10YR 5/3) (crushed) gravelly sandy loam, dark brown (10YR 3/3) crushed and moist; massive; soft, very friable, nonsticky and nonplastic; few fine and common medium and coarse roots throughout; 1 percent subrounded cobbles, 6 percent subrounded pebbles 5 to 75 millimeters in size, and 10 percent subrounded pebbles 2 to 5 millimeters in size; slightly alkaline (pH 7.6).

Type location: Placer County, California; north of the road before the bridge in Blackwood Canyon; 232.5 meters east and 83.2 meters north of the southwest corner of sec. 26, T. 15 N., R. 16 E.; 39 degrees 6 minutes 44 seconds north latitude and 120 degrees 11 minutes 16 seconds west longitude; NAD83; USGS quadrangle: Homewood, California.

Range in characteristics

These soils are usually dry for 45 to 75 consecutive days in late summer and early fall and are moist the rest of the year. They have a typic xeric moisture regime.

Seasonal high water table: At a depth of 100 to 200 centimeters; in the form of lateral flow in the lower part of the profile during spring snowmelt

Percentage of the surface covered by rock fragments: 10 to 40 percent (5 to 25 percent by gravel, 2 o 10 percent by cobbles, and 0 to 5 percent by stones)

Content of organic matter: 8 to 15 percent in the A horizons and dropping to 0.5 to 1 percent in the C horizon

Reaction: Slightly acid to slightly alkaline

Acid-oxalate extractable Al plus ½ Fe: 2 to 3 percent (by weight) to a depth of 36 centimeters below the bottom of any O horizon occurring in the profile

Particle-size control section:

- Content of rock fragments—10 to 35 percent (10 to 30 percent gravel, 0 to 5 percent cobbles, and 0 to 5 percent stones)
- Mineralogy—amorphic

A horizon:

- Hue—10YR or 2.5Y
- Value—3 to 5 dry, 2 or 3 moist
- Chroma—2 or 3 dry or moist
- Content of organic matter—8 to 15 percent
- Texture of the fine-earth fraction—medial loamy coarse sand, medial coarse sandy loam, or medial sandy loam
- Content of clay—3 to 13 percent
- Content of rock fragments—10 to 35 percent
- Reaction—slightly acid to slightly alkaline

Bw horizon:

- Hue—10YR or 2.5Y
- Value—4 or 5 dry, 3 or 4 moist
- Chroma—3 or 4 dry or moist
- Content of organic matter—2 to 8 percent
- Texture of the fine-earth fraction—medial coarse sandy loam or medial sandy loam
- Content of clay—3 to 15 percent
- Content of rock fragments—10 to 35 percent

Reaction—slightly acid to slightly alkaline

C horizon(s):
Hue—10YR or 2.5Y
Value—4 or 5 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Content of organic matter—0.5 to 1 percent
Texture of the fine-earth fraction—loamy coarse sand, coarse sandy loam, or sandy loam
Content of clay—1 to 10 percent
Content of rock fragments—10 to 35 percent
Reaction—slightly acid to slightly alkaline

Lithnip Series

The Lithnip series consists of very shallow, somewhat excessively drained soils that formed in residuum and colluvium derived from tuff, tuff breccia, and andesite. These soils are on mountains. Slopes range from 8 to 75 percent. The mean annual precipitation is about 1,143 millimeters, and the mean annual air temperature is about 3 degrees C.

Taxonomic classification: Loamy-skeletal, isotic, nonacid Lithic Cryorthents

Typical pedon

Lithnip extremely gravelly sandy loam, in an area of rangeland.

The percentage of the surface covered by rock fragments is as follows: 60 percent by gravel and less than 1 percent by stones. Colors are for dry soil unless otherwise indicated.

A—0 to 5 centimeters; light yellowish brown (10YR 6/4) extremely gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine roots; common very fine interstitial pores; 70 percent gravel; slightly acid; clear wavy boundary.
C—5 to 13 centimeters; light yellowish brown (10YR 6/4) very gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine roots; common very fine interstitial pores; 55 percent gravel; slightly acid; abrupt wavy boundary.
R—13 centimeters; hard tuff.

Type location: Alpine County, California; in the Toiyabe National Forest, about 0.9 mile northeast of The Nipple peak; approximately 750 feet south and 1,250 feet west of the northeast corner of sec. 7, T. 9 N., R. 19 E.; 38 degrees 39 minutes 10.0 seconds north latitude and 119 degrees 55 minutes 41.6 seconds west longitude; NAD27; USGS quadrangle: Carson Pass, California.

Range in characteristics

These soils are usually moist in the moisture control section in fall, winter, and spring and are dry from July through September. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 3 to 7 degrees C
Mean summer soil temperature: 7 to 13 degrees C
Depth to bedrock: 10 to 25 centimeters to lithic contact
Sodium fluoride pH: 8.5 to 9.5.

Particle-size control section:
Content of clay—averages 12 to 18 percent
Content of rock fragments—averages 60 to 80 percent, dominantly gravel
Lithology of the rock fragments—volcanic rocks, such as tuff, tuff breccia, and andesite

A horizon:
Hue—10YR or 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist
Content of organic matter—1 or 2 percent
Content of clay—10 to 18 percent
Content of rock fragments—60 to 80 percent, dominantly gravel
Reaction—slightly acid or neutral

C horizon:
Hue—10YR or 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture of the fine-earth fraction—sandy loam
Content of clay—12 to 18 percent
Content of rock fragments—50 to 80 percent
Reaction—slightly acid or neutral

Lostridge Series

The Lostridge series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from andesitic tuff and tuff breccia. These soils are on mountains. Slopes range from 15 to 50 percent. The mean annual precipitation is about 1,143 millimeters, and the mean annual air temperature is about 3 degrees C.

Taxonomic classification: Loamy-skeletal, isotic Xeric Humicryepts

Typical pedon

Lostridge very gravelly coarse sandy loam, in a forested area.

The percentage of the surface covered by rock fragments is as follows: 35 percent by gravel and less than 1 percent by stones. Colors are for dry soil unless otherwise indicated.

A1—0 to 8 centimeters; grayish brown (10YR 5/2) very gravelly coarse sandy loam, very dark grayish brown (10YR 3/2) moist; moderate medium granular structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common very fine interstitial and tubular pores; 35 percent gravel; strongly acid; clear wavy boundary.

A2—8 to 28 centimeters; brown (10YR 5/3) very gravelly coarse sandy loam, dark brown (10YR 3/3) moist; moderate medium granular structure; soft, very friable, nonsticky and nonplastic; many fine, medium, and coarse roots; common very fine interstitial and tubular pores; 45 percent gravel; strongly acid; clear wavy boundary.

Bw—28 to 58 centimeters; light yellowish brown (10YR 6/4) very gravelly coarse sandy loam, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine, medium, and coarse roots; common very fine interstitial and tubular pores; 45 percent gravel; strongly acid; clear wavy boundary.

C—58 to 74 centimeters; light yellowish brown (10YR 6/4) very gravelly coarse sandy loam, dark yellowish brown (10YR 4/4) moist; massive; soft, very friable, nonsticky and nonplastic; common fine, medium, and coarse roots; common very fine interstitial and tubular pores; 50 percent gravel; strongly acid; clear wavy boundary.
Cr—74 centimeters; weathered tuff.

Type location: Alpine County, California; in the Toiyabe National Forest, about 0.75 mile northeast of The Nipple peak; approximately 1,400 feet south and 1,375 feet west of the northeast corner of sec. 7, T. 9 N., R. 19 E.; 38 degrees 39 minutes 3.9 seconds north latitude and 119 degrees 55 minutes 47.1 seconds west longitude; NAD27; USGS quadrangle: Carson Pass, California.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July through September. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 7 degrees C
Mean summer soil temperature: 7 to 8 degrees C
Thickness of the umbric epipedon: 18 to 41 centimeters.
Depth to bedrock: 50 to 100 centimeters to paralithic contact (contact with weathered tuff or tuff breccia)
Sodium fluoride pH: 10.0 to 11.5.

Particle-size control section:
- Content of clay—averages 12 to 18 percent
- Content of rock fragments—averages 35 to 60 percent, mainly gravel
- Lithology of the rock fragments—volcanic rocks, such as tuff, tuff breccia, and andesite

A horizons:
- Hue—10YR or 7.5YR
- Value—4 or 5 dry, 2 or 3 moist
- Chroma—2 or 3 dry or moist
- Content of organic matter—2 to 10 percent
- Reaction—very strongly acid or strongly acid

Bw horizon:
- Hue—10YR or 7.5YR
- Value—5 or 6 dry, 3 or 4 moist
- Chroma—3 or 4 dry or moist
- Texture of the fine-earth fraction—coarse sandy loam or sandy loam
- Content of clay—12 to 18 percent
- Content of rock fragments—35 to 60 percent
- Structure—weak or moderate subangular blocky
- Reaction—very strongly acid or strongly acid

C horizon (where present):
- Hue—10YR or 7.5YR
- Value—5 or 6 dry, 3 or 4 moist
- Chroma—3 or 4 dry or moist
- Texture of the fine-earth fraction—coarse sandy loam or sandy loam
- Content of clay—10 to 18 percent

Content of rock fragments—35 to 60 percent.
Content of pararock fragments—10 to 25 percent paragravel or parachanners
Reaction—very strongly acid or strongly acid

Marla Series

The Marla series consists of very deep, poorly drained soils that formed in alluvium derived from mostly granitic rocks. These soils are on outwash terraces. Slopes range from 0 to 8 percent. The mean annual precipitation is about 1,016 millimeters, and the mean annual air temperature is about 5 degrees c.

Taxonomic classification: Sandy, mixed, frigid Aquic Dystroxerepts

Typical pedon

Marla loamy coarse sand, 0 to 5 percent slopes, in a wooded area.

Colors are for dry soil unless otherwise indicated.

Oi—0 to 8 centimeters; mat of decomposing lodgepole pine needles.
A1—8 to 18 centimeters; brown (10YR 5/3) loamy coarse sand, dark brown (10YR 3/3) moist; weak thick platy structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium and common coarse roots; common very fine tubular and interstitial pores; strongly acid (pH 5.2); clear smooth boundary.
A2—18 to 36 centimeters; brown (10YR 5/3) loamy coarse sand, dark brown (10YR 3/3) moist; massive; slightly hard, very friable, nonsticky and nonplastic; many very fine, fine, medium, and coarse roots; common very fine tubular and interstitial pores; moderately acid (pH 6.0); gradual smooth boundary.
C1—36 to 79 centimeters; pale brown (10YR 6/3) loamy coarse sand, brown (10YR 4/3) moist; many medium prominent mottles, dark brown (7.5YR 3/2) moist; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine, fine, medium, and coarse roots; common very fine tubular and interstitial pores; moderately acid (pH 5.8); gradual smooth boundary.
C2—79 to 119 centimeters; pale brown (10YR 6/3) loamy coarse sand with common medium prominent reddish yellow (5YR 6/8) mottles, brown (10YR 4/3) with many coarse distinct brown (7.5YR 4/4) mottles moist; massive; slightly hard, friable, brittle, nonsticky and nonplastic; very few fine and medium roots; many very fine tubular and interstitial pores; moderately acid (pH 6.0); clear smooth boundary.
2Cg1—119 to 150 centimeters; light gray (10YR 7/1) clay loam with many medium prominent mottles, reddish yellow (7.5YR 6/8) and dark grayish brown (2.5Y 4/2) with many medium prominent strong brown (7.5YR 5/6) mottles moist; weak thick platy structure; very hard, firm, sticky and slightly plastic; very few fine and medium roots; common very fine tubular pores; moderately acid (pH 6.0); clear smooth boundary.
2Cg2—150 to 175 centimeters; variegated light gray (5Y 7/2), pale yellow (2.5Y 8/2), and reddish yellow (5YR 6/8), stratified fine sandy loam and sandy loam, greenish gray (5G 5/1) with strong brown (7.5YR 5/6) strata moist; massive; hard, friable, slightly sticky and slightly plastic; no roots; common very fine tubular pores; slightly acid (pH 6.5).

Type location: El Dorado, California; about 1 mile south of Tahoe Keys; 21 meters east of California Street, between lots 9 and 10; 1,524 meters north and 975 meters west of the southeast corner of sec. 4., T. 12 N., R. 18 E.; 119 degrees 59 minutes 46.95 seconds west longitude and 38 degrees 55 minutes 21.95 seconds north latitude; NAD27.

Range in characteristics

These soils are never dry in all horizons between depths of 30 and 89 centimeters for as long as 60 consecutive days. They are saturated from a depth of 30 to 61 centimeters during spring and early summer. The soils have an aquic xeric moisture regime.

Mean annual soil temperature: 4 to 8 degrees C
Mean summer soil temperature: 5 to 11 degrees C

Particle-size control section:
Texture of the fine-earth fraction—loamy coarse sand or loamy sand
Content of rock fragments—0 to 15 percent fine gravel

Depth to a gleyed substratum: 100 to 150 centimeters

A horizons:
Value—4 or 5 dry
Chroma—2 or 3 dry or moist
Texture of the fine-earth fraction—loamy coarse sand, loamy sand, or sandy loam
Structure—either platy or granular structure or massive
Reaction—strongly acid to neutral
Base saturation—estimated range of 30 to 50 percent

C horizons:
Hue—10YR or 7.5YR
Value—4 or 6 dry or moist
Chroma—3 to 6 dry or moist
Texture of the fine-earth fraction—loamy sand to coarse sand

2Cg horizons:
Hue—10YR, 7.5YR, 5YR, 5Y, or 2.5Y
Value—6 to 8 dry or moist
Chroma—1 or 2 dry or moist
Texture of the fine-earth fraction—loamy coarse sand to stratified clay loam

Meeks Series

The Meeks series consists of well drained or somewhat excessively drained soils that formed in glacial till and outwash. These soils are deep or very deep to weakly cemented glacial till. They are on moraines. Slopes range from 2 to 70 percent. The mean annual precipitation is about 1,270 millimeters, and the mean annual air temperature is about 4 degrees C.

Taxonomic classification: Sandy-skeletal, mixed, frigid Humic Dystroxerepts

Typical pedon

Meeks gravelly loamy coarse sand, on a southeast-facing slope of 30 percent, under a cover of mixed conifers, at an elevation of 1,951 meters, in an area of Meeks gravelly loamy coarse sand, 15 to 30 percent slopes, extremely bouldery.

Colors are for dry soil unless otherwise indicated.

Oi—0 to 5 centimeters; litter and duff, mainly from shrubs.
A1—5 to 13 centimeters; grayish brown (10YR 5/2) gravelly loamy coarse sand, dark brown (10YR 3/3) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine and fine interstitial pores; 5 percent stones and 10 percent gravel; slightly acid (pH 6.2); clear smooth boundary.

A2—13 to 33 centimeters; brown (10YR 5/3) gravelly loamy coarse sand, dark brown (10YR 3/3) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine, fine, medium, and coarse roots; many very fine and fine interstitial pores; 15 percent gravel and 5 percent cobbles; slightly acid (pH 6.5); gradual smooth boundary.

Bw1—33 to 69 centimeters; pale brown (10YR 6/3) extremely stony loamy coarse sand, brown (10YR 4/3) moist; massive, soft, very friable, nonsticky and nonplastic; many fine, medium, and coarse roots; many very fine and fine interstitial pores; 30 percent gravel and 40 percent cobbles and stones; slightly acid (pH 6.2); clear smooth boundary.

Bw2—69 to 160 centimeters; pale brown (10YR 6/3) extremely stony loamy coarse sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine, medium, and coarse roots; many very fine and fine interstitial pores; 40 percent gravel and 40 percent cobbles and stones; moderately acid (pH 6.0); clear smooth boundary.

Bqm—160 to 185 centimeters; light gray (5Y 7/1) gravelly loamy coarse sand, olive (5Y 5/3) moist; massive; hard, firm; weakly cemented; very few pores; on sand grains, very pale brown (10YR 7/4) films that seem to be silica coatings and bridges; strongly acid (pH 5.5).

Type location: El Dorado County, California; Tahoe Basin; 0.5 mile north of Meeks Bay in the Glenridge subdivision; 0.25 mile east of the center of sec. 20, T. 14 N., R. 17 E.; Mount Diablo Base and Meridian; USGS quadrangle: Homewood, California.

Range in characteristics

These soils are usually moist between depths of 36 and 155 centimeters and are dry in all parts of the moisture control section from late June until early October. They have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 7 degrees C
Mean summer soil temperature: 11 to 13 degrees C
Thickness of the umbric epipedon: 10 to 17 centimeters
Depth to the Bqm horizon: More than 100 centimeters

Particle-size control section: 25 to 100 centimeters
- Content of rock fragments—average of 40 to 80 percent, by volume, gravel, cobbles, stones, and boulders

Thickness of the O horizon: 3 to 8 centimeters

A horizons:
- Value—4 or 5 dry, 3 moist
- Chroma—1 to 3 dry, 2 or 3 moist
- Texture of the fine-earth fraction—loamy sand or loamy coarse sand
- Content of rock fragments—average of 5 to 30 percent, by volume, mainly gravel, with some cobbles and stones
- Structure—single grain, massive, or weak granular structure
- Reaction—slightly acid or moderately acid
- Content of organic matter—2 to 8 percent

Bw horizons:
- Value—4 to 6 dry and moist
- Chroma—2 or 3 dry, 3 moist
- Texture of the fine-earth fraction—loamy coarse sand or sand
- Content of rock fragments—40 to 80 percent gravel, cobbles, stones, or boulders, by volume
- Reaction—slightly acid or moderately acid

Bqm horizon:
Cementation—weakly cemented to strongly cemented glacial till; hard or very hard when dry and firm or very firm when moist
Reaction—moderately acid or strongly acid
Other features—discontinuous to continuous lamina about 1 to 2 millimeters thick coating the surface of the horizon

Meiss Series

The Meiss series consists of shallow, somewhat excessively drained soils that formed in material weathered from andesitic rocks (fig. 32). These soils are on mountains. Slopes range from 2 to 75 percent. The mean annual precipitation is 1,450 millimeters, and the mean annual air temperature is about 4 degrees C.

Taxonomic classification: Loamy, isotic Lithic Humicryepts

Typical pedon

Meiss gravelly ashy loam, on a southwest-facing slope of 45 percent, under a cover of sagebrush, wyethia, and grasses, at an elevation of 2,728 meters; in an area of Lithnip-Meiss-Hawkinspeak association, 30 to 75 percent slopes.

When described on 6/18/68, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

A1—0 to 15 centimeters; brown (10YR 5/3) gravelly ashy loam, dark brown (10YR 3/3) moist; moderate fine granular structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine roots; many very fine interstitial pores; 10 percent cobbles and 20 percent gravel; slightly acid (pH 6.5); clear smooth boundary.
A2—15 to 33 centimeters; yellowish brown (10YR 5/4) gravelly ashy loam, dark yellowish brown (10YR 3/4) moist; moderate fine granular structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine and few medium and coarse roots; many very fine interstitial pores; 5 percent cobbles and 20 percent gravel; moderately acid (pH 6.0); abrupt wavy boundary.
R—33 centimeters; hard, fractured andesitic bedrock; fractures more than 10 centimeters apart.

Type location: Alpine County, California; Lake Tahoe Basin; 1 mile southeast of Meiss Lake; NW$^1/_4$NW$^1/_4$ sec. 10, T. 10 N., R. 18 E.; Mount Diablo Base and Meridian; USGS quadrangle: Carson Pass, California.

Range in characteristics

Soil moisture regime: Typic xeric
Mean annual soil temperature: 4 to 7 degrees C
Mean summer soil temperature: 12 to 15 degrees C
Depth to bedrock: 25 to 50 centimeters to hard andesitic bedrock
Base saturation: Less than 50 percent throughout the upper 18 to 25 centimeters of the soils
Content of organic matter: As high as 12 percent, decreasing regularly with increasing depth
Bulk density: 0.85 to 1.0; however, the exchange complex is dominated by amorphous material.
Glass content: 5 to 10 percent in the fraction less than 2 millimeters in size
15-bar water retention: About 14 to 20 percent

Figure 32.—Typical profile of a Meiss soil.

A horizons:

Hue—10YR or 7.5YR

Value—4 or 5 dry; when moist, 3 in the upper 17 centimeters after mixing and 3 or 4 below 17 centimeters

Chroma—2 to 4 dry; when moist, 3 in the upper part and 3 or 4 in the lower part

Texture of the fine-earth fraction—loam or sandy loam
Content of rock fragments—15 to 30 percent gravel, cobbles, or stones
Reaction—neutral to moderately acid

Melody Series

The Melody series consists of shallow, excessively drained soils that formed in colluvium over residuum weathered from volcanic rocks. These soils are on shoulders and the tops of ridges in the mountains. Slopes range from 9 to 70 percent. The mean annual precipitation is about 1,000 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Ashy-skeletal, mixed Lithic Vitricryands

Typical pedon

Melody very cobbly ashy sandy loam, on a northeast-facing (25-degree) slope of 43 percent, at an elevation of 2,270 meters, in an area of Melody-Rock outcrop complex, 30 to 50 percent slopes.

When described on 7/21/1999, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 3 centimeters; moderately decomposed plant material
A—3 to 8 centimeters; grayish brown (10YR 5/2) very cobbly ashy sandy loam, very dark grayish brown (10YR 3/2) moist; 70 percent sand; 7 percent clay; weak fine granular and weak fine subangular blocky structure; friable; common very fine and fine roots and few medium and coarse roots; common very fine and fine interstitial pores; 14 percent gravel and 30 percent cobbles; strongly acid (pH 5.4); gradual smooth boundary. (Laboratory sample number 00P02502)
AC—8 to 23 centimeters; yellowish brown (10YR 5/4) very cobbly ashy sandy loam, dark brown (10YR 3/3) moist; 75 percent sand; 6 percent clay; weak very fine subangular blocky and weak fine and medium granular structure; friable; common very fine, fine, medium, and coarse roots; common very fine and fine interstitial pores; 12 percent gravel and 45 percent cobbles; strongly acid (pH 5.4); gradual smooth boundary. (Laboratory sample number 00P02503)
C—23 to 38 centimeters; brownish yellow (10YR 6/6) very cobbly ashy sandy loam, dark brown (10YR 3/3) moist; 75 percent sand; 6 percent clay; massive; common very fine and fine interstitial pores; very friable; common very fine, fine, and medium roots; 13 percent gravel and 45 percent cobbles; strongly acid (pH 5.4). (Laboratory sample number 00P02504)
R—38 centimeters; strongly cemented andesitic lahar.

Type location: Placer County, California; on the east-facing slope of Barker Peak; 427 meters west and 271 meters south of the northeast corner of sec. 8, T. 14 N., R. 16 E.; 39 degrees 4 minutes 47 seconds north latitude and 120 degrees 13 minutes 59 seconds west longitude; NAD83; USGS quadrangle: Homewood, California.

Range in characteristics

These soils are usually moist in the moisture control section. They are moist in fall, winter, and spring and are usually dry from July to early October. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 2 to 5 degrees C
Depth to lithic contact: 25 to 50 centimeters

Content of rock fragments: 35 to 60 percent (10 to 35 percent gravel, 20 to 50 percent cobbles, 0 to 5 percent stones, and 0 to 2 percent boulders)
Content of clay: Averages 0 to 5 percent
Mineralogy: Mixed

A horizon:
Hue—10YR
Value—4 or 5 dry, 2 to 4 moist
Chroma—2 to 4 dry or moist
Texture of the fine-earth fraction—ashy sandy loam
Content of clay—2 to 18 percent
Content of organic matter—8 to 20 percent
Content of rock fragments—35 to 60 percent (10 to 35 percent gravel, 20 to 40 percent cobbles, and 0 to 2 percent stones)
Reaction—strongly acid to slightly acid

AC horizon:
Hue—10YR
Value—4 or 5 dry, 2 to 4 moist
Chroma—3 or 4 dry, 2 to 4 moist
Texture of the fine-earth fraction—ashy sandy loam
Content of clay—2 to 18 percent
Content of organic matter—4 to 10 percent
Content of rock fragments—35 to 60 percent (15 to 35 percent gravel, 12 to 35 percent cobbles, and 0 to 2 percent stones)
Reaction—strongly acid to slightly acid

C horizon(s):
Hue—10YR
Value—5 or 6 dry, 3 to 5 moist
Chroma—4 or 6 dry, 3 or 4 moist
Texture of the fine-earth fraction—ashy sandy loam
Content of clay—2 to 18 percent
Content of organic matter—2 to 8 percent
Content of rock fragments—35 to 65 percent (10 to 35 percent gravel and 25 to 55 percent cobbles)
Reaction—strongly acid to slightly acid

Mountrose Series

The Mountrose series consists of very deep, well drained soils that formed in colluvium derived from volcanic rocks. These soils are on shoulders and side slopes in the mountains. Slopes range from 30 to 70 percent. The mean annual precipitation is about 1,200 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Medial-skeletal, amorphic Xeric Vitricryands

Typical pedon

Mountrose medial loamy coarse sand, on a southeast-facing (140-degree) slope of 40 percent, at an elevation of 2,766 meters, in an area of Mountrose-Wardcreek-Melody complex, 50 to 70 percent slopes.

When described on 9/19/2003, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

A—0 to 9 centimeters; pale brown (10YR 6/3) medial loamy coarse sand, very dark

grayish brown (10YR 3/2) moist; 85 percent sand; 12 percent silt; 3 percent clay; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many fine and very fine roots throughout; many very fine interstitial pores; 10 percent gravel; slightly acid (pH 6.4) by chlorophenol red; abrupt smooth boundary.

Bw1—9 to 38 centimeters; dark yellowish brown (10YR 4/4) gravelly medial coarse sandy loam, brown (7.5YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots throughout; common very fine interstitial pores; 10 percent gravel and 5 percent cobbles; slightly acid (pH 6.4) by chlorophenol red; abrupt smooth boundary.

Bw2—38 to 74 centimeters; yellowish brown (10YR 5/4) extremely cobbly medial sandy loam, dark yellowish brown (10YR 3/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few medium and common coarse roots throughout; 10 percent gravel and 50 percent cobbles; slightly acid (pH 6.4) by chlorophenol red; clear smooth boundary.

Bw3—74 to 150 centimeters; yellowish brown (10YR 5/4) extremely gravelly medial sandy loam, dark yellowish brown (10YR 3/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few medium roots throughout; 15 percent cobbles and 50 percent gravel; slightly acid (pH 6.2) by chlorophenol red.

Type location: Washoe County, Nevada; on the south side of Mt. Baldy; 573 meters north and 377 meters west of the southeast corner of sec. 6, T. 16 N., R. 18 E., 39 degrees 16 minutes 41 seconds north latitude and 119 degrees 59 minutes 54.9 seconds west longitude; NAD83; USGS quadrangle: Mount Rose, Nevada.

Range in characteristics

These soils are usually moist in the moisture control section. They are moist in fall, winter, and spring and usually are dry from July to early October. The soils have a typic xeric moisture regime.

Base saturation: Less than 35 percent (by sum of cations); typically, 5 to 25 percent

Particle-size control section: 0 to 100 centimeters
- Content of rock fragments—10 to 75 percent (10 to 60 percent gravel, 0 to 60 percent cobbles, and 0 to 5 percent stones)
- Content of clay—averages 2 to 15 percent
- Mineralogy—amorphic

NZ phosphorus retention: 85 to 100 percent throughout most of the profile

Al + ½ Fe percentages (by ammonium oxalate): 2 to 4 percent throughout most of the profile

A horizon:
- Hue—10YR or 7.5YR
- Value—6 dry, 3 moist
- Chroma—3 dry, 2 moist
- Texture of the fine-earth fraction—loamy coarse sand, coarse sandy loam, sandy loam, or loam
- Content of clay—2 to 10 percent
- Content of organic matter—5 to 17 percent
- Content of rock fragments—0 to 35 percent (5 to 35 percent gravel and 0 to 15 percent cobbles)
- Reaction—pH of 5.6 to 7.3

Bw horizons:
- Hue—7.5YR or 10YR

Value—4 or 5 dry, 3 to 5 moist
Chroma—4 dry, 3 or 4 moist
Texture of the fine-earth fraction—coarse sandy loam, sandy loam, or loam
Content of clay—2 to 10 percent
Content of organic matter—1 to 10 percent
Content of rock fragments—15 to 75 percent (0 to 60 percent cobbles and 10 to 60 percent gravel)
Reaction—pH of 5.6 to 7.3

C horizon (where present):
Hue—10YR
Value—4 to 6 dry, 3 to 5 moist
Chroma—4 dry, 3 or 4 moist
Texture of the fine-earth fraction—coarse sandy loam, sandy loam, or loam
Content of clay—2 to 10 percent
Content of organic matter—0.5 to 8 percent
Content of rock fragments—15 to 75 percent (0 to 60 percent cobbles 10 to 60 percent gravel)
Reaction—pH of 5.6 to 7.3

Oneidas Series

The Oneidas series consists of very deep, poorly drained soils that formed in outwash derived from mixed materials. These soils are on outwash terraces. Slopes range from 0 to 15 percent. The mean annual precipitation is about 800 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Coarse-loamy, mixed, active, frigid Fragiaquic Haploxeralfs

Typical pedon

Oneidas coarse sandy loam, on a northwest-facing (315-degree) slope of 1 percent, at an elevation of 1,957 meters, in an area of Oneidas coarse sandy loam, 0 to 5 percent slopes.

When described on 8/15/1968, the soil was dry above 190 centimeters and moist below that depth. Colors are for dry soil unless otherwise indicated.

Oi—0 to 3 centimeters; slightly decomposed plant material. (Laboratory sample number 68C0627)
A1—3 to 10 centimeters; brown (7.5YR 5/4) coarse sandy loam, dark brown (7.5YR 3/2) moist; weak thin and medium platy structure; slightly hard, very friable, nonsticky and nonplastic; common very fine roots; few very fine and fine interstitial pores; 8 percent gravel; moderately acid (pH 5.7) by Hellige-Truog; abrupt wavy boundary. (Laboratory sample number 68C0628)
A2—10 to 23 centimeters; brown (7.5YR 5/4) coarse sandy loam, dark brown (7.5YR 3/2) moist; weak medium and coarse subangular blocky structure; soft, very friable, nonsticky and nonplastic; few fine and medium and common very fine roots; few fine tubular and very fine interstitial pores; 5 percent gravel; moderately acid (pH 5.8) by Hellige-Truog; clear wavy boundary. (Laboratory sample number 68C0629)
Bt—23 to 30 centimeters; reddish yellow (7.5YR 6/6) coarse sandy loam, reddish brown (5YR 4/4) moist; weak medium and coarse subangular blocky structure; soft, very friable, nonsticky and nonplastic; many fine, medium, and coarse roots; few fine tubular and medium interstitial pores; clay bridges and few clay films in

root channels and pores; 10 percent gravel; moderately acid (pH 5.8) by Hellige-Truog; abrupt wavy boundary. (Laboratory sample number 68C0630)

Btx1—30 to 38 centimeters; reddish yellow (7.5YR 6/6) coarse sandy loam, reddish brown (5YR 4/4) moist; massive; hard, very friable, brittle, nonsticky and nonplastic; many fine, medium, and coarse roots; few fine tubular and very fine interstitial pores; clay bridges in root channels and pores and many strong brown (7.5YR 5/6 dry) clay films; medium very pale brown (10YR 8/2 dry) iron depletions; 10 percent gravel; strongly acid (pH 5.6) by Hellige-Truog; abrupt wavy boundary. (Laboratory sample number 68C0631)

Btx2—38 to 51 centimeters; light brown (7.5YR 6/3) coarse sandy loam, brown (7.5YR 4/4) moist; massive; hard, friable, brittle, nonsticky and nonplastic; many fine and few very fine and medium roots; many very fine and few fine interstitial pores; common clay films and bridges; few strong brown (7.5YR 5/6 dry) masses of oxidized iron; 10 percent gravel; strongly acid (pH 5.6) by Hellige-Truog; clear wavy boundary. (Laboratory sample number 68C0632)

Btx3—51 to 76 centimeters; light yellowish brown (10YR 6/4) sandy loam, strong brown (7.5YR 4/6) moist; massive; hard, friable, brittle, moderately sticky and moderately plastic; few very fine and fine roots; few fine interstitial and common very fine tubular pores; very few clay films and bridges; few strong brown (7.5YR 5/6 dry) masses of oxidized iron; very pale brown (10YR 8/3 dry) iron depletions; 1 percent stones and 10 percent gravel; moderately acid (pH 5.8) by Hellige-Truog; abrupt wavy boundary. (Laboratory sample number 68C0633)

Btx4—76 to 114 centimeters; pale brown (10YR 6/3) coarse sandy loam, brown (10YR 4/3) moist; massive; very hard, friable, brittle, moderately sticky and moderately plastic; few very fine and fine roots; few fine and common very fine interstitial pores; common reddish yellow (7.5YR 6/8) iron stains; reddish yellow (7.5YR 6/8 dry) masses of oxidized iron and very pale brown (10YR 7/3 moist) iron depletions; 10 percent gravel; moderately acid (pH 5.8) by Hellige-Truog; clear wavy boundary. (Laboratory sample number 68C0634)

Btx5—114 to 165 centimeters; strong brown (7.5YR 5/6) gravelly coarse sandy loam, dark yellowish brown (10YR 4/4) moist; massive; very hard, friable, brittle, slightly sticky and moderately plastic; few fine and medium roots; common very fine and fine interstitial pores; many thin and few moderately thick dark reddish brown (5YR 3/3) clay films occurring as bridges; few reddish brown (5YR 4/4 moist) and prominent yellowish red (5YR 5/8 moist) iron stains; many very pale brown (10YR 8/2 dry) iron depletions and reddish brown (5YR 4/4 moist) and yellowish red (5YR 5/8 moist) masses of oxidized iron; 20 percent gravel; moderately acid (pH 5.8) by Hellige-Truog; diffuse smooth boundary. (Laboratory sample number 68C0635)

BC—165 to 193 centimeters; reddish yellow (7.5YR 6/6) gravelly coarse sandy loam, brown (7.5YR 4/4) moist; massive; very hard, friable, slightly sticky and moderately plastic; few fine and medium roots; common very fine and fine interstitial pores; common moderately thick and few thin clay films occurring as bridges and on sand grains; few coarse and common fine strong brown (7.5YR 5/8 moist) iron stains; many very pale brown (10YR 8/2 dry) iron depletions and common medium and prominent reddish yellow (5YR 6/6 dry) masses of oxidized iron; 20 percent indurated, 2- to 75-millimeter pebbles that are not flat; moderately acid (pH 6.0) by Hellige-Truog; gradual irregular boundary. (Laboratory sample number 68C0636)

C1—193 to 234 centimeters; brown (7.5YR 4/4) gravelly coarse sandy loam, yellowish brown (10YR 5/6) moist; massive; very hard, very friable, nonsticky and slightly plastic; few fine and medium roots; few fine and many very fine interstitial pores; many clay bands with hue of 7.5YR; common very pale brown (10YR 8/2 dry) iron depletions and common moderately thick dark reddish brown (5YR 3/3

moist) masses of oxidized iron; many medium distinct (7.5YR) redoximorphic concentrations; 10 percent gravel and 10 percent cobbles; slightly acid (pH 6.2) by Hellige-Truog; gradual wavy boundary. (Laboratory sample number 68C0637)

C2—234 to 292 centimeters; very pale brown (10YR 8/3) loamy coarse sand, brown (10YR 5/3) moist; massive; hard, very friable, nonsticky and nonplastic; few fine and many very fine interstitial pores; common yellowish brown (10YR 5/6) and many dark reddish brown (5YR 3/4) lamellae; many very pale brown (10YR 8/2 moist) iron depletions; slightly acid (pH 6.3) by Hellige-Truog; abrupt wavy boundary. (Laboratory sample number 68C0638)

C3—292 to 450 centimeters; very pale brown (10YR 8/2), stratified stony coarse sand to loamy coarse sand, brown (10YR 4/3) moist; massive; slightly hard, very friable; few fine and many very fine interstitial pores; few yellowish brown (10YR 5/6) lamellae; 10 percent gravel; slightly acid (pH 6.3) by Hellige-Truog; gradual wavy boundary. (Laboratory sample number 68C0639)

C4—450 to 495 centimeters; very pale brown (10YR 7/4) loamy sand, yellowish brown (10YR 5/4) moist; massive; slightly hard, very friable, nonsticky and nonplastic; few fine and many very fine interstitial pores; many faint yellowish brown (10YR 5/8 moist) iron stains; slightly acid (pH 6.3) by Hellige-Truog; clear smooth boundary. (Laboratory sample number 68C0640)

C5—495 to 511 centimeters; yellowish brown (10YR 5/6) coarse sand, yellowish brown (10YR 5/4) moist; massive; soft, very friable, nonsticky and nonplastic; few fine and many very fine interstitial pores; many faint yellowish brown (10YR 5/8 moist) iron stains; slightly acid (pH 6.3) by Hellige-Truog. (Laboratory sample number 68C0641)

Type location: El Dorado County, California; 100 feet south of a dirt road extension of Oneidas Street, 1.3 miles northeast of Meyers, and 3 meters east of sample site S67Calif-9-13; 823 meters east and 61 meters south of the northwest corner of sec. 28, T. 12 N., R. 18 E.; 38 degrees 51 minutes 52 seconds north latitude and 119 degrees 59 minutes 36 seconds west longitude; NAD83; USGS quadrangle: Freel Peak, California.

Range in characteristics

These soils are usually moist in some part between depths of 20 and 61 centimeters most of the year, but they are dry in all parts from July until October. The soils are commonly saturated on top of the Btx horizons during spring snowmelt. They have an aquic xeric moisture regime.

Depth to a seasonal high water table: Zones of saturation beginning at a depth of 25 to 50 centimeters (in the horizons with fragic properties)

Percentage of the surface covered by rock fragments: 0 to 25 percent (0 to 15 percent by gravel, 0 to 5 percent by cobbles, and 0 to 5 percent by stones)

Base saturation: 35 to 100 percent (by ammonium acetate)

Depth to redoximorphic features: 25 to 50 centimeters

Content of rock fragments: 0 to 20 percent (0 to 20 percent gravel, 0 to 15 percent cobbles, and 0 to 5 percent stones)

Content of clay: Averages 5 to 18 percent

Mineralogy: Mixed

A horizons:

Hue—7.5YR or 10YR

Value—4 or 5 dry, 3 or 4 moist

Chroma—3 or 4 dry, 2 to 4 moist

Content of organic matter—2 to 6 percent

Texture of the fine-earth fraction—coarse sandy loam or sandy loam
Content of rock fragments—0 to 15 percent, mostly gravel
Reaction—strongly acid to slightly acid

Bt horizon:
Hue—7.5YR or 5YR
Value—4 to 6 dry, 4 or 5 moist
Chroma—4 to 6 dry, 4 or 5 moist
Content of organic matter—0.5 to 2 percent
Texture of the fine-earth fraction—coarse sandy loam
Content of rock fragments—0 to 15 percent, mostly gravel
Reaction—strongly acid to slightly acid

Btx horizons:
Hue—7.5YR, 5YR, or 10YR
Value—4 to 6 dry, 4 or 5 moist
Chroma—3 to 6 dry or moist
Content of organic matter—0.05 to 0.4 percent
Iron depletions—hue of 10YR, value of 4 to 8, and chroma of 1 to 3
Masses of oxidized iron—hue of 7.5YR, 5YR, or 10YR; value of 4 to 6; and chroma of 4 to 8
Texture of the fine-earth fraction—coarse sandy loam, sandy loam, or sandy clay loam
Content of rock fragments—0 to 20 percent (0 to 20 percent gravel and 0 to 15 percent cobbles and stones)
Reaction—strongly acid to slightly acid

C horizons:
Hue—10YR
Value—6 to 8 dry, 4 to 6 moist
Chroma—2 to 6 dry, 2 to 6 moist
Content of organic matter—0.05 to 0.4 percent
Iron depletions—hue of 10YR, value of 4 to 8, and chroma of 1 to 3
Masses of oxidized iron—hue of 5YR, 7.5YR, or 10YR; value of 3 to 6; and chroma of 3 to 8
Texture of the fine-earth fraction—coarse sand, loamy coarse sand, coarse sandy loam, or sandy loam
Content of rock fragments—0 to 20 percent (0 to 20 percent gravel and 0 to 5 percent cobbles and stones)
Reaction—slightly acid or neutral

Oxyaquic Cryorthents

The Oxyaquic Cryorthents in this survey area consist of very deep, somewhat poorly drained soils that formed in alluvium and colluvium derived from mixed sources. These soils are in riparian corridors. Slopes range from 0 to 15 percent. The mean annual precipitation is about 750 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Oxyaquic Cryorthents

Reference pedon

Oxyaquic Cryorthents, on a west-facing (290-degree) slope of 9 percent, at an elevation of 2,323 meters, in an area of Oxyaquic Cryorthents-Aquic Xerorthents-Tahoe complex, 0 to 15 percent slopes.

When described on 11/03/1999, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

O—0 to 2 centimeters; slightly decomposed plant material.

A1—2 to 5 centimeters; brown (7.5YR 5/4) gravelly loamy coarse sand, dark brown (7.5YR 3/2) moist; 81 percent sand; 6 percent clay; weak thick platy and fine granular structure; many very fine roots; 21 percent gravel and 5 percent cobbles; strongly acid (pH 5.5); clear smooth boundary. (Laboratory sample number 00P2234)

A2—5 to 13 centimeters; dark yellowish brown (10YR 4/4) gravelly loamy coarse sand, dark brown (7.5YR 3/3) moist; 82 percent sand; 5 percent clay; weak fine, medium, and very fine subangular blocky and weak fine granular structure; soft, very friable; common very fine, fine, medium, and coarse roots; 21 percent gravel; strongly acid (pH 5.5); clear smooth boundary. (Laboratory sample number 00P2235)

Bw—13 to 23 centimeters; brown (7.5YR 4/4) gravelly loamy coarse sand, dark brown (7.5YR 3/4) moist; 83 percent sand; 5 percent clay; weak fine, medium, and coarse subangular blocky and weak fine granular structure; slightly hard, friable; common very fine, fine, medium, and very coarse roots; 18 percent gravel; moderately acid (pH 5.7); clear smooth boundary. (Laboratory sample number 00P2236)

C1—23 to 51 centimeters; strong brown (7.5YR 5/6) gravelly loamy coarse sand, reddish brown (5YR 4/4) moist; 83 percent sand; 5 percent clay; weak medium, coarse, and fine subangular blocky and weak very fine granular structure; soft, friable, nonsticky and nonplastic; few fine, common medium and coarse, and few very coarse roots; common fine discontinuous and common very fine discontinuous tubular pores; 22 percent gravel and 5 percent cobbles; moderately acid (pH 5.7); clear smooth boundary. (Laboratory sample number 00P2237)

C2—51 to 81 centimeters; strong brown (7.5YR 4/6) gravelly loamy coarse sand, reddish brown (5YR 4/4) moist; 85 percent sand; 4 percent clay; weak fine and medium subangular blocky and weak very fine granular structure; slightly hard, friable, nonsticky and nonplastic; few fine, common medium and coarse, and few very coarse roots; common fine discontinuous and common very fine discontinuous tubular pores; 26 percent gravel and 10 percent cobbles; moderately acid (pH 5.7); clear smooth boundary. (Laboratory sample number 00P2238)

C3—81 to 132 centimeters; very pale brown (10YR 7/4) very gravelly coarse sand, brown (10YR 4/3) moist; 91 percent sand; 1 percent clay; weak very fine granular structure and single grained; slightly hard; few fine and medium roots; 28 percent gravel and 20 percent cobbles; moderately acid (pH 5.7); clear smooth boundary. (Laboratory sample number 00P2239)

C4—132 to 203 centimeters; very pale brown (10YR 8/3) and yellow (10YR 7/6) gravelly coarse sand, brown (10YR 5/3) and yellowish brown (10YR 5/6) moist; 87 percent sand; 1 percent clay; massive parting to single grained; loose when dry, loose when moist, nonsticky and nonplastic when wet; 7 percent gravel; slightly acid (pH 6.1); clear smooth boundary. (Laboratory sample number 00P2240)

C5—203 to 284 centimeters; brownish yellow (10YR 6/6) coarse sand, yellowish brown (10YR 5/4) moist; massive parting to single grained; loose, nonsticky and nonplastic; 5 percent gravel; moderately acid (pH 5.8). (Laboratory sample number 00P2241)

This reference pedon is an example of the soils within this category. Because of the highly variable nature of these soils, this pedon is not necessarily representative of the Oxyaquic Cryorthents throughout the survey area. The soils have a coarse-loamy particle-size control section in some areas and a loamy-skeletal one in others.

Type location: Carson City Rural Area, Nevada; 50 meters south and 50 meters west of the northeast corner of sec. 25, T. 15 N., R. 18 E.; 39 degrees 8 minutes 29 seconds north latitude and 119 degrees 53 minutes 57 seconds west longitude; NAD83; USGS quadrangle: Marlette Lake, Nevada

Range in characteristics

These soils are dry in all parts of the soil moisture control section for 45 or more consecutive days in the 4 months following the summer solstice and are moist in all parts for 45 or more consecutive days in the 4 months following the winter solstice in most years. The soils have an aquic xeric moisture regime.

Mean annual soil temperature: 2 to 8 degrees C
Depth to a seasonal high water table: 50 to 100 centimeters
Flooding: Frequent
Ponding: None
Depth to redoximorphic features: 50 to 150 centimeters

Particle-size control section:
- Content of rock fragments—5 to 60 percent, dominantly gravel
- Mineralogy—mixed

A horizons:
- Hue—7.5YR
- Value—4 or 5 dry, 3 moist
- Chroma—4 dry, 2 or 3 moist
- Content of organic matter—3 to 12 percent
- Texture of the fine-earth fraction—loamy coarse sand
- Content of clay—3 to 8 percent
- Content of rock fragments—20 to 30 percent
- Reaction—strongly acid to slightly acid

Bw horizon:
- Hue—7.5YR
- Value—4 dry, 3 moist
- Chroma—4 dry or moist
- Content of organic matter—0.5 to 3 percent
- Texture of the fine-earth fraction—loamy coarse sand
- Content of clay—10 percent
- Content of rock fragments—15 to 25 percent
- Reaction—strongly acid to slightly acid

C horizons:
- Hue—10YR, 7.5YR, or 5YR
- Value—4 to 8 dry, 4 or 5 moist
- Chroma—3 to 6 dry or moist
- Content of organic matter—0 to 1.5 percent
- Texture of the fine-earth fraction—loamy coarse sand or coarse sand
- Content of clay—7 percent
- Content of rock fragments—5 to 50 percent
- Reaction—strongly acid to slightly acid

Oxyaquic Xerorthents

The Oxyaquic Xerorthents in this survey area consist of very deep, well drained soils that formed in earthy fill derived from granodiorite. These soils are on filled marshland. Slopes range from 0 to 5 percent. The mean annual precipitation is about 580 millimeters, and the mean annual air temperature is about 6.5 degrees C.

Taxonomic classification: Oxyaquic Xerorthents

Reference pedon

Oxyaquic Xerorthents, on a slope of 0 percent, at an elevation of 1,899 meters, in an area of Oxyaquic Xerorthents-Water association, 0 to 5 percent slopes.

When described on 7/31/2003, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

C—0 to 91 centimeters; yellowish brown (10YR 5/6) very gravelly coarse sand; massive parting to single grained; 50 percent gravel; abrupt smooth boundary.

Ab1—91 to 111 centimeters; mucky silt loam, black (10YR 2/1) rubbed and moist; 13 percent clay; weak fine subangular blocky and moderate fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium roots throughout; 2 percent strong brown (7.5YR 5/6 moist) masses of oxidized iron; slightly acid (pH 6.2) by bromthymol blue; abrupt smooth boundary.

Ab2—111 to 121 centimeters; mucky silt loam, very dark grayish brown (10YR 3/2) rubbed and moist; 13 percent clay; moderate medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine and many medium roots throughout; common very fine tubular pores; 5 percent dark red (2.5YR 3/6 moist) masses of oxidized iron; slightly acid (pH 6.4) by bromthymol blue; abrupt smooth boundary.

Ab3—121 to 134 centimeters; gravelly coarse sand, very dark grayish brown (10YR 3/2) rubbed and moist; 95 percent sand; single grained; loose when dry, loose when moist, nonsticky and nonplastic when wet; common fine and medium roots throughout; many fine interstitial pores; 3 percent 5- to 75-millimeter pebbles and 30 percent 2- to 5-millimeter pebbles; neutral (pH 7.2) by bromthymol blue; abrupt smooth boundary.

Ab4—134 to 159 centimeters; mucky silt loam, black (10YR 2/1) rubbed and moist; 13 percent clay; moderate medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and very fine roots throughout; neutral (pH 7.0) by bromthymol blue.

This reference pedon is an example of the soils within this category. Because of the highly variable nature of these soils, this pedon is not necessarily representative of the Oxyaquic Xerorthents throughout the survey area. The soils have a coarse-loamy particle-size control section in some areas and a loamy-skeletal one in others.

Type location: El Dorado County, California; by the tennis court at the intersection of Venice Drive and Emerald Road, in the Tahoe Keys in South Lake Tahoe, California; 2,256 meters north and 589 meters east of the southwest corner of sec. 5, T. 12 N., R. 18 E.; 38 degrees 55 minutes 45 seconds north latitude and 120 degrees 0 minutes 58 seconds west longitude; NAD83; USGS quadrangle: Emerald Bay, California.

Range in characteristics

These soils are usually dry for 45 to 75 consecutive days in late summer and early fall and are moist the rest of the year. They have a typic xeric moisture regime.

Depth to a seasonal high water table: 30 to 183 centimeters, depending on the lake level
Content of organic matter: 0 to 1 percent
Reaction: Strongly acid to slightly acid

Particle-size control section:
Content of rock fragments—0 to 55 percent gravel
Content of clay—averages 0 to 5 percent
Mineralogy—mixed

Paige Series

The Paige series consists of very deep, well drained soils that formed in colluvium over till derived from volcanic rocks (fig. 33). These soils are on moraines. Slopes range from 5 to 60 percent. The mean annual precipitation is about 1,372 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Medial, mixed, frigid Humic Vitrixerands

Typical pedon

Paige medial sandy loam, on an east-facing (80-degree) slope of 8 percent, at an elevation of 2,136 meters, in an area of Paige medial sandy loam, 5 to 15 percent slopes.

When described on 10/19/2001, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 8 centimeters; slightly decomposed plant material.
A1—8 to 25 centimeters; brown (10YR 5/3) medial sandy loam, very dark brown (10YR 2/2) moist; 70 percent sand; 26 percent silt; 4 percent clay; moderate medium angular blocky structure; soft, very friable; few fine and very fine roots throughout; many very fine interstitial pores; 5 percent gravel and 1 percent cobbles; slightly acid (pH 6.6); clear smooth boundary.
A2—25 to 51 centimeters; brown (10YR 5/3) medial sandy loam, very dark brown (10YR 2/2) moist; 70 percent sand; 26 percent silt; 4 percent clay; moderate medium granular structure; soft, very friable; common fine, medium, and coarse roots throughout; common very fine interstitial pores; 5 percent gravel and 1 percent cobbles; slightly acid (pH 6.6); clear smooth boundary.
Bw1—51 to 91 centimeters; pale brown (10YR 6/3) cobbly medial sandy loam, dark yellowish brown (10YR 4/4) moist; 70 percent sand; 24 percent silt; 6 percent clay; weak medium subangular blocky structure; soft, very friable; common fine, many medium, and few coarse roots throughout; few very fine interstitial and few very fine dendritic tubular pores; 5 percent gravel and 10 percent cobbles; slightly acid (pH 6.2); clear smooth boundary.
Bw2—91 to 122 centimeters; very pale brown (10YR 7/3) cobbly medial sandy loam, dark yellowish brown (10YR 4/4) moist; 70 percent sand; 24 percent silt; 6 percent clay; moderate medium subangular blocky structure; soft, very friable; common fine and medium roots throughout; few very fine dendritic tubular pores; 5 percent gravel and 10 percent cobbles; slightly acid (pH 6.2); clear smooth boundary.
2Bw3—122 to 157 centimeters; light gray (10YR 7/2) cobbly loam, yellowish brown (10YR 5/4) moist; 50 percent sand; 35 percent silt; 15 percent clay; strong medium angular blocky structure; soft, very friable; few fine and medium roots throughout; common very fine dendritic tubular pores; yellowish red (5YR 4/6)

Figure 33.—Typical profile of a Paige soil.

and yellowish brown (10YR 5/6) redoximorphic concentrations; 5 percent gravel and 10 percent cobbles; moderately acid (pH 6.0); abrupt smooth boundary.
3Cd—157 centimeters; dense glacial till; hard, very firm.

Type location: Placer County, California; 685 meters west and 573 meters south of the northeast corner of sec. 15, T. 15 N., R. 16 E.; 39 degrees 8 minutes 60 seconds north latitude and 120 degrees 11 minutes 52 seconds west longitude; NAD27; USGS quadrangle: Tahoe City, California.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July to early October. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Percentage of the surface covered by rock fragments: 0 to 5 percent by gravel and cobbles
Base saturation: Less than 60 percent (by ammonium acetate); typically very low because of high amounts of aluminum
Content of rock fragments: 2 to 20 percent (0 to 15 percent gravel and 0 to 15 percent cobbles)
Mineralogy: Mixed

A horizons:
- Hue—10YR
- Value—4 or 5 dry, 2 or 3 moist
- Chroma—3 or 4 dry, 2 or 3 moist
- Content of organic matter—5 to 10 percent
- Texture of the fine-earth fraction—sandy loam
- Content of clay—2 to 8 percent
- Content of rock fragments—2 to 15 percent (2 to 15 percent gravel and 0 to 5 percent cobbles)
- Reaction—moderately acid to neutral

Bw horizons:
- Hue—10YR
- Value—5 to 7 dry, 3 to 5 moist
- Chroma—3 or 4 dry or moist
- Content of organic matter—2 to 5 percent
- Texture of the fine-earth fraction—sandy loam
- Content of clay—3 to 10 percent
- Content of rock fragments—10 to 25 percent (2 to 10 percent gravel and 5 to 15 percent cobbles)
- Reaction—moderately acid to neutral

2Bw3 horizon:
- Hue—10YR
- Value—6 or 7 dry, 4 to 6 moist
- Chroma—2 or 3 dry, 3 to 6 moist
- Content of organic matter—1 to 2 percent
- Iron-manganese masses—hue of 10YR, 7.5YR, or 5YR; value of 4 or 5; and chroma of 6
- Texture of the fine-earth fraction—loam
- Content of clay—5 to 20 percent
- Content of rock fragments—10 to 20 percent (2 to 10 percent gravel and 5 to 15 percent cobbles)
- Reaction—moderately acid to neutral

Roadcat Series

The Roadcat series consists of very deep, somewhat excessively drained soils that formed in till derived mainly from granitic rocks. These soils are on moraines. Slopes range from 4 to 30 percent. The mean annual precipitation is about 890 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Sandy-skeletal, mixed, frigid Typic Haploxerepts

Typical pedon

Roadcat extremely gravelly loamy coarse sand, in a forested area of Burnlake-Roadcat association, 4 to 30 percent slopes.

The percentage of the surface covered by rock fragments is as follows: 35 percent by gravel, 5 percent by cobbles, 5 percent by stones, and 5 percent by boulders. Colors are for dry soil unless otherwise indicated.

A—0 to 20 centimeters; brown (10YR 5/3) extremely gravelly loamy coarse sand, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and common fine roots; common very fine interstitial and tubular pores; 60 percent gravel, 5 percent cobbles, and 5 percent stones; slightly acid; clear wavy boundary.

Bw—20 to 48 centimeters; brown (10YR 5/3) extremely gravelly coarse sandy loam, brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and common fine roots; common very fine interstitial and tubular pores; 55 percent gravel and 5 percent cobbles; slightly acid; clear wavy boundary.

C1—48 to 91 centimeters; light brownish gray (10YR 6/2) extremely gravelly loamy coarse sand, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine and fine roots; common very fine interstitial and tubular pores; 55 percent gravel and 5 percent cobbles; neutral; clear wavy boundary.

C2—91 to 152 centimeters; light brownish gray (10YR 6/2) extremely gravelly loamy coarse sand, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine and fine roots; many very fine and fine interstitial pores; 70 percent gravel and 5 percent cobbles; neutral.

Type location: Alpine County, California; in the Toiyabe National Forest, in Hope Valley, about 30 feet east of Highway 88; approximately 1,550 feet south and 200 feet east of the northwest corner of sec. 6, T. 10 N., R. 19 E.; 38 degrees 45 minutes 51.4 seconds north latitude and 119 degrees 56 minutes 23.3 seconds west longitude; NAD27; USGS quadrangle: Freel Peak, California.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July through September. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 7 to 8 degrees C
Mean summer soil temperature: 15 to 17 degrees C
Thickness of the ochric epipedon: 10 to 23 centimeters.
Depth to the base of the cambic horizon: 25 to 53 centimeters.

Particle-size control section:
Content of clay—averages 5 to 10 percent
Content of sand—more than 35 percent medium sand and coarser sand

Content of rock fragments—averages 60 to 80 percent, dominantly gravel
Lithology of the rock fragments—mainly granitic rocks, such as granodiorite

A horizon:
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Reaction—moderately acid or slightly acid
Content of organic matter—2 to 4 percent
Base saturation by ammonium acetate—30 to 50 percent

Bw horizon:
Value—5 to 7 dry, 4 or 5 moist
Chroma—2 or 3 dry or moist
Content of clay—8 to 12 percent
Content of rock fragments—60 to 80 percent, dominantly gravel
Reaction—moderately acid to neutral
Base saturation by ammonium acetate—60 to 90 percent

C horizons:
Hue—10YR or 2.5Y
Value—6 or 7 dry, 4 or 5 moist
Chroma—2 or 3 dry or moist
Content of clay—3 to 10 percent
Content of rock fragments—60 to 80 percent, dominantly gravel
Reaction—moderately acid to neutral.
Base saturation by ammonium acetate—60 to 90 percent

Rockbound Series

The Rockbound series consists of shallow or very shallow, excessively drained soils that formed in drift, slope alluvium, and colluvium derived dominantly from granodiorite. Because of glaciation, some areas have a mixture of rock types. These soils are on glacial valley floors and walls in the mountains. Slopes range from 5 to 70 percent. The mean annual precipitation is about 1,499 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Sandy-skeletal, mixed, frigid Lithic Xerorthents

Typical pedon

Rockbound very gravelly loamy sand, on an east-facing (100-degree) slope of 15 percent, at an elevation of 2,134 meters, in an area of Rock outcrop-Rockbound complex, 5 to 30 percent slopes.

When described on 6/18/2002, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

A—0 to 15 centimeters; brown (10YR 4/3) very gravelly loamy sand, very dark brown (10YR 2/2) rubbed and moist; weak fine granular structure; many very fine roots throughout; 35 percent gravel; moderately acid (pH 5.8); abrupt smooth boundary.
Bw—15 to 20 centimeters; brown (10YR 5/3) very gravelly loamy sand, dark brown (10YR 3/3) rubbed and moist; weak fine granular structure; many very fine roots throughout; 35 percent gravel; moderately acid (pH 5.8); abrupt smooth boundary.
R—20 centimeters; indurated granodiorite bedrock.

Type location: El Dorado County, California; between Grass Lake and Angora Peak; 38 degrees 52 minutes 23 seconds north latitude and 120 degrees 6 minutes 0 seconds west longitude; NAD83; USGS quadrangle: Echo Lake, California.

Range in characteristics

These soils are usually moist but are dry in all parts from mid-July until early October. They have a typic xeric moisture regime.

Depth to lithic contact: 18 to 50 centimeters
Percentage of the surface covered by rock fragments: 20 to 60 percent (5 to 25 percent by boulders, 5 to 20 percent by gravel, 5 to 30 percent by cobbles, and 5 to 30 percent by stones)
Reaction: Strongly acid to slightly acid

Particle-size control section: Consisting of the entire soil minus any organic material on the surface
Content of rock fragments—35 to 60 percent (35 to 60 percent gravel, 0 to 50 percent cobbles, 0 to 50 percent stones, and 0 to 50 percent boulders)
Content of clay—averages 3 to 12 percent
Mineralogy—mixed

A horizon:
Hue—10YR
Value—3 to 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Content of organic matter—3 to 12 percent
Texture of the fine-earth fraction—loamy sand or loamy coarse sand
Content of rock fragments—35 to 60 percent (5 to 60 percent gravel, 0 to 40 percent cobbles, 0 to 35 percent stones, and 0 to 40 percent boulders)

Bw horizon:
Hue—10YR
Value—4 or 5 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Content of organic matter—2 to 5 percent
Texture of the fine-earth fraction—loamy sand or loamy coarse sand
Content of rock fragments—35 to 60 percent (25 to 60 percent gravel, 0 to 10 percent cobbles, and 0 to 10 percent stones)

Shakespeare Series

The Shakespeare series consists of very deep, well drained soils that formed in colluvium over residuum derived from metamorphic rocks. These soils are on mountain flanks. Slopes range from 9 to 50 percent. The mean annual precipitation is about 850 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Loamy-skeletal, mixed, superactive Xeric Haplocryalfs

Typical pedon

Shakespeare silt loam, 9 to 30 percent slopes, in a forested area.

Colors are for dry soil unless otherwise indicated.

Oi—0 to 3 centimeters; litter of conifer needles.
A1—3 to 5 centimeters; brown (10YR 4/3) silt loam, very dark brown (10YR 2/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic;

few very fine roots; many very fine interstitial pores; moderately acid (pH 6.0); clear wavy boundary.

A2—5 to 13 centimeters; brown (10YR 5/3) very gravelly loam, dark brown (10YR 3/3) moist; weak fine granular structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and common fine and medium roots; many very fine interstitial and common very fine tubular pores; 35 percent gravel; moderately acid (pH 6.0); clear wavy boundary.

AB—13 to 25 centimeters; pale brown (10YR 6/3) very gravelly loam, brown (10YR 4/3) moist; weak very fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine interstitial and common very fine and few fine tubular pores; 40 percent gravel; moderately acid (pH 6.0); clear wavy boundary.

Bt1—25 to 53 centimeters; pale brown (10YR 6/3) very gravelly loam, brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; few very fine interstitial and common very fine and few fine tubular pores; few thin clay films in pores and on faces of peds; 35 percent gravel and 5 percent cobbles; moderately acid (pH 6.0); clear wavy boundary.

Bt2—53 to 86 centimeters; grayish brown (10YR 5/2) very gravelly clay loam, brown (7.5YR 4/2) moist; fine distinct brown (7.5YR 4/4) mottles; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; common very fine and few fine tubular pores; common thin and few moderately thick clay films on faces of peds and in pores; 25 percent gravel and 10 percent cobbles; moderately acid (pH 5.8); clear wavy boundary.

C—86 to 155 centimeters; yellowish red (5YR 5/6) silty clay loam, yellowish red (5YR 4/6) moist; common medium faint red (2.5YR 4/6) mottles; massive; very hard, friable, sticky and plastic; few very fine, fine, medium, and coarse roots; strongly acid (pH 5.5).

Type location: Douglas County, Nevada; 4 miles northeast of Zepher Cove, near Genoa Peak; approximately 152 meters west and 305 meters north of S$^{1}/_{4}$ corner sec. 30, T. 14 N., R. 19 E.; Mount Diablo Base and Meridian; USGS quadrangle: Glenbrook, Nevada.

Range in characteristics

These soils have a typic xeric moisture regime.

Mean annual soil temperature: m 6 to 8 degrees C

Mean summer soil temperature: 12 to 15 degrees C.

Content of rock fragments: 25 to 75 percent in any one horizon; average of 35 to 50 percent in the 25- to 75-centimeter section; dominantly gravel and cobbles, but ranging from gravel to boulders

A1 horizon:

Hue—10YR or 2.5Y
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3
Texture of the fine-earth fraction—sandy loam, loam, or silt loam
Reaction—strongly acid to slightly acid

A2 horizon:

Hue—10YR or 2.5Y
Value—6 or 7 dry, 3 or 4 moist
Chroma—2 or 3 moist or dry
Texture of the fine-earth fraction—sandy loam, loam, or silt loam

Reaction—strongly acid to slightly acid
Other features—in some pedons mottles that have hue of 5YR or 10YR, value of 5 to 7, and chroma of 6 to 8 and that are inherited from the parent material and are not the result of pedogenic processes

Bt horizons:
Hue—2.5Y to 7.5YR
Value—5 or 6 dry, 4 or 5 moist
Chroma—2 to 4 dry and moist
Texture of the fine-earth fraction—sandy clay loam, clay loam, or clay
Content of clay—averages 25 to 35 percent
Other features—few or common fine or medium mottles that have hue of 5YR to 10YR, value of 2 to 6, and chroma of 2 to 8 and that are inherited from the parent material and are not the result of pedogenic processes

C horizon:
Hue—5YR to 10YR
Value—5 or 6 dry, 4 or 5 moist
Chroma—4 to 6 dry and moist
Texture of the fine-earth fraction—silty clay loam
Content of clay—averages 27 to 40 percent
Content of rock fragments—0 to 10 percent gravel and 0 to 5 percent cobbles
Other features—few or common fine or medium mottles that have hue of 5YR to 10YR, value of 2 to 6, and chroma of 2 to 8 and that are inherited from the parent material and are not the result of pedogenic processes

Shalgran Series

The Shalgran series consists of shallow, somewhat excessively drained soils that formed in colluvium and residuum derived from granitic rocks. These soils are on mountains. Slopes range from 15 to 75 percent. The mean annual precipitation is about 1,143 millimeters, and the mean annual air temperature is about 3 degrees C.

Taxonomic classification: Sandy-skeletal, mixed, frigid, shallow Dystric Xerorthents

Typical pedon

Shalgran very bouldery coarse sand, in a forested area.

The percentage of the surface covered by rock fragments is as follows: 25 percent by gravel, 5 percent by stones, and 15 percent by boulders. Colors are for dry soil unless otherwise indicated.

A—0 to 8 centimeters; grayish brown (10YR 5/2) very bouldery coarse sand, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and common fine roots; common very fine interstitial pores; 35 percent gravel, 10 percent stones, and 10 percent boulders; slightly acid; clear wavy boundary.
C1—8 to 15 centimeters; light brownish gray (10YR 6/2) very bouldery coarse sand, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, common fine, common medium, and common coarse roots; common very fine interstitial pores; 35 percent gravel, 10 percent stones, and 10 percent boulders; slightly acid; clear wavy boundary.
C2—15 to 36 centimeters; light brownish gray (10YR 6/2) very bouldery coarse sand, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and

nonplastic; many very fine, many fine, common medium, and common coarse roots; many very fine interstitial pores; 35 percent gravel, 10 percent stones, and 10 percent boulders; slightly acid; clear wavy boundary.
Cr—36 to 61 centimeters; soft, weathered granodiorite with some roots in fractures.

Type location: Alpine County, California; in the Toiyabe National Forest, about 1.5 miles northeast of Luther Pass; approximately 200 feet south and 6,150 feet east of the northwest corner of sec. 13, T. 11 N., R. 18 E.; 38 degrees 48 minutes 26.0 seconds north latitude and 119 degrees 55 minutes 33.2 seconds west longitude; NAD27; USGS quadrangle: Freel Peak, California.

Range in characteristics

These soils are usually moist in the moisture control section. They are moist in fall, winter, and spring and usually are dry from July to early October. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 7 degrees C
Mean summer soil temperature: 15 to 18 degrees C
Thickness of the ochric epipedon: 8 to 23 centimeters
Depth to bedrock: 25 to 50 centimeters to paralithic contact (contact with weathered granitic bedrock)

Particle-size control section:
Content of clay—averages less than 10 percent
Content of rock fragments—averages 35 to 60 percent
Lithology of the rock fragments—granitic rocks, such as granodiorite

A horizon:
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Content of organic matter—2 to 4 percent
Reaction—strongly acid to slightly acid

C horizons:
Value—3 or 4 moist
Chroma—2 or 3 dry or moist
Texture of the fine-earth fraction—coarse sand or loamy coarse sand
Content of clay—3 to 10 percent
Content of rock fragments—35 to 60 percent
Reaction—strongly acid to slightly acid

Sky Series

The Sky series consists of moderately deep, well drained soils that formed in colluvium over residuum weathered from andesitic tuff (fig. 34). These soils are on the upper third of mountain slopes. Slopes range from 9 to 70 percent. The mean annual precipitation is about 1,400 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Medial-skeletal, amorphic Humic Xeric Vitricryands

Typical pedon

Sky gravelly medial sandy loam, on a north-facing (354-degree) slope of 20 percent, at an elevation of 2,390 meters, in an area of Sky gravelly sandy loam, 9 to 30 percent slopes.

Figure 34.—Typical profile of a Sky soil.

When described on 6/19/2002, the soil was moist throughout. Colors are for moist soil unless otherwise indicated.

Oi—0 to 3 centimeters; slightly decomposed plant material.
Oa—3 to 5 centimeters; highly decomposed plant material.
A—5 to 8 centimeters; gravelly medial sandy loam, very dark gray (7.5YR 3/1) broken face and moist; massive; soft, friable, slightly sticky and slightly plastic; common fine and medium roots throughout; common very fine irregular pores; 5 percent

cobbles and 15 percent subangular pebbles that are not flat; very strongly acid (pH 5.0) by pH meter 1:1 water; abrupt smooth boundary.

E—8 to 13 centimeters; cobbly medial sandy loam, dark grayish brown (10YR 4/2) broken face and moist; weak medium and fine subangular blocky structure; soft, friable, nonsticky and nonplastic; common fine and many medium roots throughout; common very fine irregular pores; 20 percent gravel and 10 percent cobbles; strongly acid (pH 5.3) by pH meter 1:1 water; abrupt smooth boundary.

Bw1—13 to 38 centimeters; very stony medial sandy loam, dark brown (10YR 3/3) broken face and moist; moderate medium and fine subangular blocky structure; soft, friable, slightly sticky and slightly plastic; common fine and medium roots throughout; 5 percent gravel, 20 percent cobbles, and 25 percent stones; strongly acid (pH 5.3) by pH meter 1:1 water; gradual smooth boundary.

Bw2—38 to 61 centimeters; very stony medial sandy loam, dark yellowish brown (10YR 3/6) broken face and moist; moderate fine and medium subangular blocky structure; slightly hard, firm, slightly sticky and slightly plastic; common fine, medium, and coarse roots throughout; 5 percent gravel, 20 percent cobbles, and 25 percent stones; strongly acid (pH 5.4) by pH meter 1:1 water; abrupt wavy boundary.

Cr—61 to 152 centimeters; moderately cemented andesite, dark brown (7.5YR 3/3) broken face and moist.

Type location: Placer County, California; 39 degrees 4 minutes 20 seconds north latitude and 120 degrees 13 minutes 30 seconds west longitude; NAD27; USGS quadrangle: Homewood, California.

Range in characteristics

These soils are usually moist but are dry in all parts from mid-July until early October. They have a typic xeric moisture regime.

Mean annual soil temperature: 3 to 6 degrees C

Percentage of the surface covered by rock fragments (gravel, cobbles, and stones): 0 to 15 percent

Depth to paralithic contact: 50 to 100 centimeters

Reaction: Very strongly acid to moderately acid

Base saturation: Commonly 15 to 30 percent but ranges from 3 to 50 percent

Particle-size control section:

- Content of rock fragments—averaging more than 35 percent throughout the control section but ranging from 15 to 70 percent in individual horizons
- Content of clay—averages 2 to 10 percent
- Mineralogy—amorphic

A horizon:

- Hue—10YR or 7.5YR
- Value—2 or 3 moist
- Chroma—1 to 3 moist
- Content of organic matter—7 to 34 percent
- Texture of the fine-earth fraction—coarse sandy loam or sandy loam
- Content of rock fragments—15 to 35 percent (5 to 30 percent gravel and 0 to 20 percent cobbles)

E horizon (where present):

- Hue—10YR
- Value—4 or 5 moist
- Chroma—2 to 4 moist

Content of organic matter—1 to 8 percent
Texture of the fine-earth fraction—coarse sandy loam or sandy loam
Content of rock fragments—20 to 40 percent (10 to 30 percent gravel and 5 to 25 percent cobbles)

Bw horizons:
Hue—10YR
Value—3 or 4 moist
Chroma—3 to 6 moist
Content of organic matter—1 to 8 percent
Texture of the fine-earth fraction—coarse sandy loam or sandy loam
Content of rock fragments—35 to 60 percent (5 to 35 percent gravel, 5 to 35 percent cobbles, and 5 to 35 percent stones)

Sofgran Series

The Sofgran series consists of very deep, somewhat excessively drained soils that formed in colluvium and residuum derived from granitic rocks. These soils are on mountains. Slopes range from 8 to 50 percent. The mean annual precipitation is about 1,143 millimeters, and the mean annual air temperature is about 3 degrees C.

Taxonomic classification: Sandy-skeletal, mixed Typic Cryorthents

Typical pedon

Sofgran gravelly loamy coarse sand, in a forested area of Sofgran-Klauspeak-Temo association, 15 to 50 percent slopes.

The surface is covered by 1 inch of forest duff consisting of undecomposed pine needles. The percentage of the surface covered by rock fragments is as follows: 20 percent by gravel, 5 percent by cobbles, 1 percent by stones, and 3 percent by boulders. Colors are for dry soil unless otherwise indicated.

A1—0 to 8 centimeters; brown (10YR 5/3) gravelly loamy coarse sand, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and common fine roots; common very fine interstitial pores; 25 percent gravel and 5 percent boulders; very strongly acid; clear wavy boundary.

A2—8 to 15 centimeters; brown (10YR 5/3) gravelly loamy coarse sand, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and common fine roots; common very fine interstitial and tubular pores; 25 percent gravel; strongly acid; clear wavy boundary.

Bw1—15 to 23 centimeters; pale brown (10YR 6/3) very gravelly loamy coarse sand, brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, medium, and coarse roots; common very fine interstitial and tubular pores; 35 percent gravel; strongly acid; clear wavy boundary.

Bw2—23 to 48 centimeters; pale brown (10YR 6/3) very gravelly loamy coarse sand, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, many fine, many medium, and many coarse roots; common very fine interstitial and tubular pores; 25 percent gravel and 10 percent cobbles; strongly acid; clear irregular boundary.

Bw3—48 to 69 centimeters; light yellowish brown (10YR 6/4) very gravelly coarse sand, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine,

fine, medium, and coarse roots; common very fine interstitial pores; 30 percent gravel and 5 percent cobbles; strongly acid; clear irregular boundary.

Bw4—69 to 114 centimeters; light yellowish brown (10YR 6/4) extremely gravelly loamy coarse sand, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and common fine roots; common very fine and common fine interstitial pores; 55 percent gravel and 20 percent cobbles; strongly acid; clear wavy boundary.

Bw5—114 to 152 centimeters; light yellowish brown (10YR 6/4) very gravelly loamy coarse sand, yellowish brown (10YR 5/4) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, few fine, and few medium roots; common very fine interstitial pores; 40 percent gravel and 15 percent cobbles; strongly acid.

Type location: Alpine County, California; in the Toiyabe National Forest, about 0.3 mile southeast of Horse Meadow; approximately 1,500 feet south and 2,550 feet west of the northeast corner of sec. 7, T. 11 N., R. 19 E.; 38 degrees 50 minutes 2.9 seconds north latitude and 119 degrees 53 minutes 24.1 seconds west longitude; NAD27; USGS quadrangle: Freel Peak, California.

Range in characteristics

These soils are usually moist in the moisture control section. They are moist in fall, winter, and spring and usually are dry from July to early October. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 7 degrees C
Mean summer soil temperature: 7 to 8 degrees C
Thickness of the ochric epipedon: 16 to 23 centimeters
Depth to bedrock: 152 to 200 centimeters to paralithic contact (contact with weathered granitic bedrock, such as granodiorite)

Particle-size control section:
- Content of clay—averages less than 10 percent
- Content of rock fragments—averages 35 to 60 percent, mainly gravel; typically 35 to 50 percent in the upper part and 60 to 80 percent in the lower part
- Lithology of the rock fragments—granitic rocks, such as granodiorite

A horizons:
- Value—4 or 5 dry, 2 or 3 moist
- Chroma—2 or 3 dry or moist
- Content of organic matter—2 to 4 percent
- Reaction—very strongly acid or strongly acid

Bw1, Bw2, and Bw3 horizons:
- Value—4 or 5 moist
- Chroma—3 or 4 dry or moist
- Texture of the fine-earth fraction—coarse sand or loamy coarse sand
- Content of clay—3 to 10 percent
- Content of rock fragments—25 to 40 percent, mainly gravel
- Reaction—very strongly acid or strongly acid

Bw4, Bw5, and C horizons (where present):
- Value—4 or 5 moist
- Chroma—1 or 2 dry or moist
- Texture—very gravelly loamy coarse sand or extremely gravelly loamy coarse sand

Content of clay—3 to 10 percent
Content of rock fragments—50 to 80 percent, mainly gravel

Southcamp Series

The Southcamp series consists of very deep, well drained soils that formed in colluvium over residuum weathered from porphyritic trachyte flows (fig. 35). These soils are on hillslopes and ridgetops. Slopes range from 9 to 70 percent. The mean annual precipitation is about 660 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Loamy-skeletal, isotic, frigid Ultic Palexeralfs

Typical pedon

Southcamp very gravelly fine sandy loam, on a north-facing (10-degree) slope of 70 percent, at an elevation of 2,137 meters, in an area of Southcamp very gravelly fine sandy loam, 50 to 70 percent slopes.

When described on 6/14/2004, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 3 centimeters; slightly decomposed plant material; abrupt smooth boundary.
Oe—3 to 5 centimeters; moderately decomposed plant material; abrupt smooth boundary.
A—5 to 10 centimeters; grayish brown (10YR 5/2) very gravelly fine sandy loam, very dark grayish brown (10YR 3/2) moist; 13 percent clay; weak very fine granular structure; soft, very friable; many very fine roots throughout; many very fine to very coarse irregular pores; 35 percent gravel; neutral (pH 7.0) by bromthymol blue; clear smooth boundary.
E—10 to 38 centimeters; very pale brown (10YR 8/2) extremely cobbly loam, grayish brown (10YR 5/2) moist; 23 percent clay; moderate fine granular structure; soft, very friable, moderately sticky and moderately plastic; many fine and very fine and common medium, coarse, and very coarse and roots throughout; many very fine to coarse irregular pores; 25 percent gravel, 40 percent cobbles, and 10 percent stones; neutral (pH 6.8) by bromthymol blue; gradual smooth boundary.
Bt1—38 to 87 centimeters; light yellowish brown (10YR 6/4) extremely cobbly clay loam, yellowish brown (10YR 5/4) moist; 29 percent clay; moderate fine granular structure; soft, very friable, moderately sticky and moderately plastic; many fine and very fine and common medium, coarse, and very coarse roots throughout; many very fine to very coarse irregular pores; 70 percent distinct clay films; 18 percent gravel, 20 stones, and 50 percent cobbles; slightly acid (pH 6.5) by bromthymol blue; clear smooth boundary.
Bt2—87 to 152 centimeters; brownish yellow (10YR 6/6) extremely stony clay loam, yellowish brown (10YR 5/6) moist; 33 percent clay; moderate fine subangular blocky structure; soft, very friable, moderately sticky and moderately plastic; common very fine to very coarse roots throughout; common very fine, fine, and medium irregular and tubular pores; 70 percent distinct clay films; 18 percent gravel, 20 percent cobbles, and 50 percent stones; slightly acid (pH 6.5) by bromthymol blue.

Type location: Douglas County, Nevada; above the big road cuts on Highway 50 between Spooner Summit and Shakespeare Rock; 132 meters west and 25 meters south of the northeast corner of sec. 14, T. 14 N., R. 18 E.; 39 degrees 5 minutes 0 seconds north latitude and 119 degrees 55 minutes 8 seconds west longitude; NAD83; USGS quadrangle: Glenbrook, Nevada.

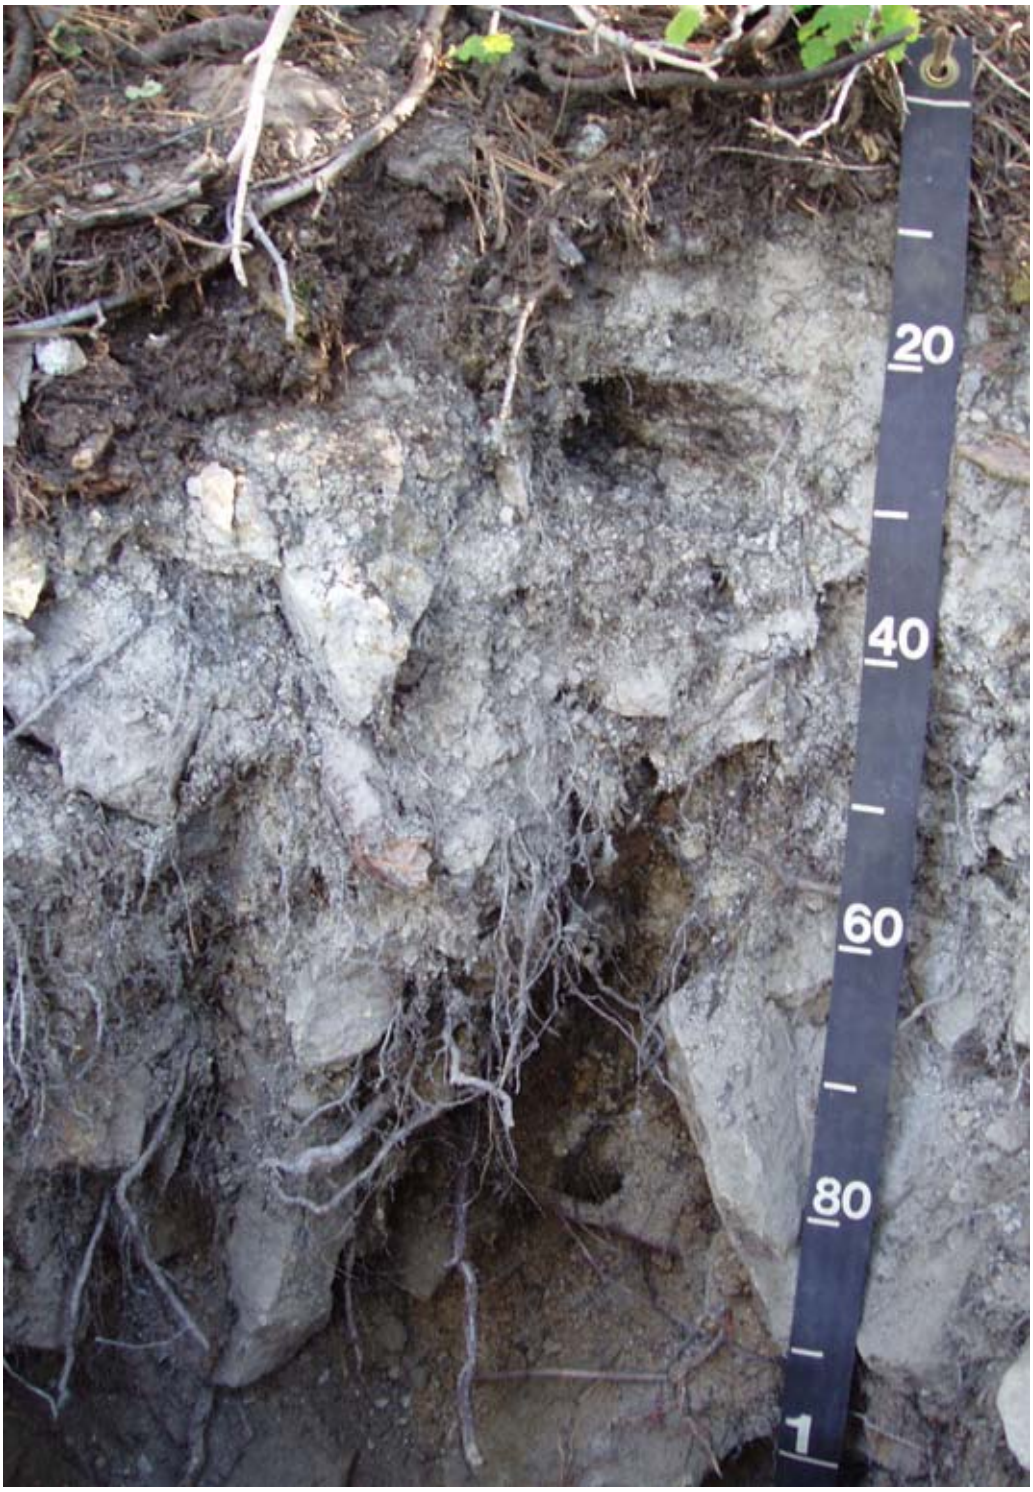

Figure 35.—Typical profile of a Southcamp soil.

Range in characteristics

These soils are usually moist between depths of 38 and 91 centimeters and are dry in all parts only from early August until early October. They have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 8 degrees C
Mean summer soil temperature: 10 to 13 degrees C
Percentage of the surface covered by rock fragments: 0 to 5 percent (mainly by cobbles but by a few stones in some areas)
Reaction: Slightly acid or neutral
Base saturation: 35 to 75 percent (by ammonium acetate)

Particle-size control section:
- Content of rock fragments—35 to 90 percent (10 to 40 percent gravel, 10 to 60 percent cobbles, and 10 to 60 percent stones)
- Content of clay—averages 18 to 35 percent
- Mineralogy—isotic

A horizon:
- Hue—10YR
- Value—5 to 7 dry, 3 to 5 moist
- Chroma—2 to 4 dry or moist
- Content of organic matter—4 to 10 percent
- Texture of the fine-earth fraction—sandy loam, fine sandy loam, or loam
- Content of clay—7 to 20 percent
- Content of rock fragments—20 to 50 percent (20 to 50 percent gravel and 0 to 15 percent cobbles)
- Reaction—pH of 6.1 to 7.3

E horizon:
- Hue—10YR
- Value—6 to 8 dry, 4 to 7 moist
- Chroma—2 dry, 3 moist
- Content of organic matter—0.25 to 1 percent
- Texture of the fine-earth fraction—sandy loam, fine sandy loam, or loam
- Content of clay—10 to 27 percent
- Content of rock fragments—60 to 90 percent (15 to 35 percent gravel, 25 to 60 percent cobbles, and 5 to 20 percent stones)
- Reaction—pH of 6.1 to 7.3

Bt horizons:
- Hue—10YR
- Value—5 to 7 dry, 4 to 7 moist
- Chroma—4 to 6 dry, 4 to 6 moist
- Content of organic matter—0.2 to 2 percent
- Texture of the fine-earth fraction—sandy loam, sandy clay loam, or clay loam
- Content of clay—27 to 35 percent
- Content of rock fragments—60 to 90 percent (10 to 35 percent gravel, 15 to 60 percent cobbles, and 15 to 60 percent stones)
- Reaction—pH of 6.1 to 7.3

Tahoe Series

The Tahoe series consists of very deep, very poorly drained soils that formed in alluvium derived from mixed sources, dominantly andesitic lahar and granodiorite (fig. 36). These soils are on flood plains. Slopes range from 0 to 5 percent. The mean

Figure 36.—Typical profile of a Tahoe soil.

annual precipitation is about 1,245 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Coarse-loamy, mixed, superactive, acid, frigid Cumulic Humaquepts

Typical pedon

Tahoe mucky silt loam, on a slope of 0 percent, at an elevation of 2,158 meters, in an area of Tahoe complex, 0 to 2 percent slopes.

When described on 7/10/2003, the soil was moist throughout. Colors are for moist soil unless otherwise indicated.

Oe—0 to 8 centimeters; moderately decomposed plant material; abrupt smooth boundary.

A1—8 to 28 centimeters; mucky silt loam, black (10YR 2/1) rubbed and moist; 13 percent clay; weak fine subangular blocky and moderate fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium roots throughout; 2 percent strong brown (7.5YR 5/6 moist) masses of oxidized iron; slightly acid (pH 6.2) by bromthymol blue; abrupt smooth boundary.
A2—28 to 38 centimeters; mucky silt loam, very dark grayish brown (10YR 3/2) rubbed and moist; 13 percent clay; moderate medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine and many medium roots throughout; common very fine tubular pores; 5 percent dark red (2.5YR 3/6 moist) masses of oxidized iron; slightly acid (pH 6.4) by bromthymol blue; abrupt smooth boundary.
A3—38 to 51 centimeters; gravelly coarse sand, very dark grayish brown (10YR 3/2) rubbed and moist; 95 percent sand; single grained; loose when dry, loose when moist, nonsticky and nonplastic when wet; common fine and medium roots throughout; many fine interstitial pores; 3 percent 5- to 75-millimeter pebbles and 30 percent 2- to 5-millimeter pebbles; neutral (pH 7.2) by bromthymol blue; abrupt smooth boundary.
A4—51 to 76 centimeters; mucky silt loam, black (10YR 2/1) rubbed and moist; 13 percent clay; moderate medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and very fine roots throughout; neutral (pH 7.0) by bromthymol blue; abrupt smooth boundary.
Cg1—76 to 125 centimeters; loam, dark grayish brown (10YR 4/2) rubbed and moist; 44 percent sand; 10 percent clay; slightly hard, nonsticky and nonplastic; 2 percent olive gray (5Y 5/2 moist) masses of reduced iron and 15 percent yellowish red (5YR 5/6 moist) masses of oxidized iron; 2 percent 2- to 5-millimeter pebbles; neutral (pH 7.0) by bromthymol blue; clear smooth boundary.
Cg2—125 to 150 centimeters; loamy sand, dark grayish brown (10YR 4/2) rubbed and moist; nonsticky and nonplastic; 2 percent yellowish red (5YR 5/6 moist) masses of oxidized iron; 3 percent 2- to 5-millimeter pebbles; neutral (pH 7.0) by bromthymol blue.

Type location: El Dorado County, California; inside the bend of Highway 89, in the meadow along Big Meadow Creek; 480 meters west and 92 meters south of the northeast corner of sec. 20, T. 11 N., R. 18 E.; 38 degrees 47 minutes 29 seconds north latitude and 120 degrees 0 minutes 32 seconds west longitude; NAD83; USGS quadrangle: Echo Lake, California.

Range in characteristics

These soils are usually moist throughout. The surface horizons occasionally dry out late in summer and early in fall as the water table drops to a depth of 76 to 203 centimeters. The soils have a typic aquic moisture regime.

Depth to a seasonal high water table: 0 to 25 centimeters
Flooding: Frequent
Ponding: Frequent
Reaction: Strongly acid to neutral
Base saturation (by ammonium acetate): Very low (less than 10 percent) when the influence of the andesitic lahar is strong and as high as 60 percent in the lower horizons when the influence of the granodiorite is stronger; less than 50 percent in the A horizons
Depth to redoximorphic features: 0 to 50 centimeters; the features typically occurring in the first mineral horizon

Particle-size control section: 25 to 100 centimeters
Content of rock fragments—0 to 35 percent gravel, dominantly 2 to 5 millimeters in size

Content of clay—averages 8 to 18 percent
Mineralogy—mixed

A horizons:
Hue—10YR
Value—2 or 3 moist
Chroma—1 to 3 moist
Content of organic matter—5 to 20 percent
Redoximorphic features—masses of oxidized iron with hue of 2.5YR, 5YR, 7.5YR, or 10YR; value of 3 to 6, and chroma of 4 to 8
Texture of the fine-earth fraction—sandy loam, loam, or silt loam; can be coarse sand or sand with small pebbles in thin horizons of higher energy material, such as that in the A3 horizon
Content of clay—0 to 25 percent (typically less than 5 in the higher energy horizons, such as the A3 horizon)

Cg horizons:
Hue—10YR
Value—4 to 6 moist
Chroma—2 to 4 moist
Content of organic matter—0.25 to 5 percent
Redoximorphic features—masses of oxidized iron and masses of reduced iron
Texture of the fine-earth fraction—coarse sand, loamy sand, loamy fine sand, fine sand, or loam
Content of clay—0 to 15 percent
Content of rock fragments—0 to 35 percent gravel

Tahoma Series

The Tahoma series consists of deep or very deep, well drained soils that formed in material weathered from basic volcanic rocks. These soils are on mountainsides. Slopes range from 2 to 50 percent. The mean annual precipitation is about 1,016 millimeters, and the mean annual air temperature is about 4 degrees C.

Taxonomic classification: Fine-loamy, isotic, frigid Ultic Haploxeralfs

Typical pedon

Tahoma very cobbly sandy loam, forested, on a southeast-facing, convex slope of 10 percent, under a cover of red fir, at an elevation of 7,100 feet, in an area of Tahoma very cobbly sandy loam, 2 to 15 percent slopes, very stony.

Colors are for dry soil unless otherwise indicated.

Oi—0 to 8 centimeters; red fir litter.
A1—8 to 36 centimeters; brown (7.5YR 5/4) very cobbly sandy loam, brown (7.5YR 4/4) moist; strong fine granular structure; soft, friable, nonsticky and nonplastic; many very fine, fine, and medium roots; few very fine tubular and interstitial pores; 30 percent gravel, 15 percent cobbles, and 5 percent stones; moderately acid (pH 6.0); clear wavy boundary.
A2—36 to 56 centimeters; brown (7.5YR 5/4) very cobbly sandy loam, brown (7.5YR 4/4) moist; moderate medium granular structure; slightly hard, friable, slightly sticky and nonplastic; many very fine, fine, medium, and coarse roots; many very fine interstitial and common very fine tubular pores; 30 percent gravel and 15 percent cobbles; strongly acid (pH 5.5); clear wavy boundary.

BA—56 to 97 centimeters; brown (7.5YR 5/4) gravelly loam, brown (7.5YR 4/4) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine tubular pores; common thin clay films lining pores and coating sand grains; 20 percent gravel and 10 percent cobbles; very strongly acid (pH 5.0); clear wavy boundary.

Bt1—97 to 150 centimeters; brown (7.5YR 5/4) gravelly clay loam, brown (7.5YR 4/4) moist; weak fine subangular blocky structure; hard, firm, sticky and slightly plastic; few very fine, fine, medium, and coarse roots; common very fine tubular pores; thin clay films lining pores and on faces of peds; 15 percent gravel and 5 percent cobbles; very strongly acid (pH 5.0); gradual wavy boundary.

Bt2—150 to 180 centimeters; brown (7.5YR 5/4) clay loam, dark brown (7.5YR 3/4) moist; moderate medium subangular blocky structure; hard, firm, sticky and slightly plastic; few very fine, fine, medium, and coarse roots; common very fine and fine tubular pores; many thin clay films lining pores and on faces of peds; 5 percent gravel; very strongly acid (pH 4.7); gradual wavy boundary.

R—180 centimeters; coarse vesicular olivine latite.

Type location: Placer County, California; 1.5 miles north of Tahoe City; about 20 feet south of an old road; 760 meters north and 170 meters east of the southwest corner of sec. 36, T. 16 N., R. 16 E.; Mount Diablo Base and Meridian; USGS quadrangle: Tahoe City, California.

Range in characteristics

These soils are usually moist between depths of 38 and 91 centimeters and are dry in all parts only from early August until early October. They have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 8 degrees C
Mean summer soil temperature: 10 to 13 degrees C
Depth to weathered bedrock: More than 100 centimeters
Mineralogy: Influenced by vitric pyroclastic material
Base saturation: 25 to 35 percent
Reaction: Slightly acid to very strongly acid
Percentage of the surface covered by rock fragments: 1 to 25 percent by stones
Thickness of the Oi horizon: 3 to 8 centimeters

A horizons:
- Hue—10YR, 7.5YR, or 5YR
- Value—2 to 5 dry or moist; moist value of 2 or 3 occurring only in the upper 8 to 13 centimeters
- Chroma—2 to 6 dry or moist
- Texture of the fine-earth fraction—sandy loam or loam
- Content of rock fragments—15 to 60 percent
- Structure—weak to strong granular
- Content of organic matter—5 to 7 percent

Bt horizon:
- Hue—10YR, 7.5YR, 5YR, or 2.5YR
- Value—4 to 6 dry, 2 to 6 moist
- Chroma—2 to 6 dry or moist
- Texture of the fine-earth fraction—loam, clay loam, or sandy clay loam
- Content of rock fragments—average of less than 35 percent; 5 to 35 percent gravel and 0 to 15 percent cobbles in the upper 50 centimeters; 5 to 50 percent gravel and 0 to 20 percent cobbles and stones in the lower part

Tallac Series

The Tallac series consists of deep or very deep, moderately well drained or well drained soils that formed in glacial deposits. These soils are on glacial moraines and outwash plains. Slopes range from 0 to 75 percent. The mean annual precipitation is 1,270 millimeters, and the mean annual air temperature is 5 degrees C.

Taxonomic classification: Loamy-skeletal, mixed, superactive, frigid Humic Dystroxerepts

Typical pedon

Tallac gravelly coarse sandy loam, on an east-facing, undulating slope of 5 percent, under a cover of mixed conifers, at an elevation of 1,975 meters, in an area of Tallac gravelly coarse sandy loam, moderately well drained, 0 to 5 percent slopes.

When described on 10/26/1967, the soil was slightly moist throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 3 centimeters; fresh and decomposed conifer needles.

A1—3 to 41 centimeters; dark grayish brown (10YR 4/2) gravelly coarse sandy loam, very dark brown (10YR 2/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, medium, and coarse roots; many very fine interstitial pores; 15 percent gravel; moderately acid (pH 6.0); diffuse wavy boundary.

A2—41 to 56 centimeters; brown (10YR 4/3) very gravelly coarse sandy loam, very dark grayish brown (10YR 3/2) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine, fine, medium, and coarse roots; many very fine interstitial pores; 35 percent gravel and a few cobbles; moderately acid (pH 6.0); diffuse wavy boundary.

Bw1—56 to 81 centimeters; yellowish brown (10YR 5/4) very cobbly coarse sandy loam, dark brown (10YR 3/3) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium and few coarse roots; many very fine interstitial pores; 40 percent gravel and 10 percent cobbles; moderately acid (pH 6.0); diffuse wavy boundary.

Bw2—81 to 109 centimeters; yellowish brown (10YR 5/6) very gravelly coarse sandy loam, dark yellowish brown (10YR 4/4) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium and few coarse roots; many very fine interstitial pores; 40 percent gravel and 1 percent cobbles; moderately acid (pH 5.8); abrupt smooth boundary.

Bqm—109 to 168; yellowish brown (10YR 5/4) and brown (7.5YR 5/4) very gravelly coarse sandy loam, brown (10YR 4/3 and 7.5YR 4/4) moist; massive; hard, firm, nonsticky and nonplastic; weakly cemented; few fine, medium, and coarse roots, most of which are matted at the top of the horizon; 50 percent gravel and 1 percent cobbles; strongly acid (pH 5.5).

Type location: El Dorado County, California; Tahoe Basin; 2 miles west of Camp Richardson, Lot 28 of the Forest Service Spring Creek Tract; 322 meters north and 161 meters west of the southeast corner of sec. 34, T. 13 N., R. 17 E.; Mount Diablo Base and Meridian; 38 degrees 55 minutes 33 seconds north latitude and 120 minutes 4 degrees 43 seconds west longitude; USGS quadrangle: Emerald Bay, California.

Range in characteristics

These soils are usually moist between depths of 20 and 61 centimeters and are dry in all parts only from late July until early October. They have a typic xeric moisture regime.

Mean annual soil temperature: 5 to 8 degrees C
Mean summer soil temperature: 10 to 13 degrees C
Depth to a cemented or compacted layer: More than 100 centimeters from the mineral surface
Umbric epipedon: 50 to 89 centimeters thick and includes the upper part of the C horizon in most pedons
Base saturation: 10 and 50 percent, decreasing with increasing depth
Texture of the fine-earth fraction: Coarse sandy loam, sandy loam, or loam in the A and Bw horizons; coarse sandy loam or loamy sand in the Bqm horizon
Content of rock fragments: 15 to 75 percent, by volume, in the upper 25 centimeters; averages 35 to 65 percent below a depth of 25 centimeters; mainly gravel, cobbles, or both but stones and boulders in some pedons
Reaction: Mainly slightly acid or moderately acid; can be strongly acid in the Bqm horizon

A horizons:
Hue—10YR
Value—3 to 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Content of organic matter—3 to 10 percent

Bw horizons:
Hue—10YR or 2.5Y
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 to 6 dry or moist
Content of organic matter—less than 1 percent to 3 percent

Bqm horizon:
Hue—5Y, 2.5Y, 10YR, or 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 to 6 dry or moist
Cementation and compaction—continuous, weakly cemented to strongly cemented layers of dense, brittle material that restrict root development and water movement

Temo Series

The Temo series consists of very shallow or shallow, excessively drained soils that formed in residuum and colluvium derived from granitic rocks. These soils are on mountains. Slopes range from 5 to 75 percent. The mean annual precipitation is about 1,016 millimeters, and the mean annual air temperature is about 3 degrees C.

Taxonomic classification: Mixed, shallow Typic Cryopsamments

Typical pedon

Temo gravelly coarse sand, in a forested area.

The surface has about 1 centimeter of undecomposed forest duff consisting of pine and fir needles. Colors are for dry soil unless otherwise indicated.

A1—0 to 5 centimeters; grayish brown (10YR 5/2) gravelly coarse sand, very dark brown (10YR 2/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many fine and very fine roots; many fine and very fine interstitial pores; 25 percent fine gravel and 1 percent boulders; moderately acid (pH 6.0); clear wavy boundary.
A2—5 to 25 centimeters; grayish brown (10YR 5/2) gravelly loamy coarse sand, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very

friable, nonsticky and nonplastic; many fine and very fine roots; few medium and coarse roots; many fine and very fine interstitial pores; 25 percent fine gravel; slightly acid (pH 6.4); abrupt wavy boundary.

C—25 to 41 centimeters; pale brown (10YR 6/3) gravelly loamy coarse sand, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; few fine, medium, and coarse roots; many very fine and fine interstitial pores; 30 percent gravel; moderately acid (pH 6.0); clear wavy boundary.

Cr—41 centimeters; weathered granodiorite.

Type location: Washoe County, Nevada; in Lake Tahoe State Park, about 0.75 mile east of Tunnel Creek Station; about 610 meters east and 518 meters south of the northwest corner of sec. 30, T. 16 N., R. 19 E.; 39 degrees 13 minutes 30 seconds north latitude and 119 degrees 53 minutes 36 seconds west longitude; NAD27; USGS quadrangle: Marlett Lake, Nevada.

Range in characteristics

These soils are usually moist, but they are dry in all parts from some time in July until early October. They have a typic aquic moisture regime.

Mean annual soil temperature: 4 to 7 degrees C
Mean summer soil temperature: 6 to 8 degrees C
Thickness of the ochric epipedon: 15 to 25 centimeters
Depth to bedrock: 20 to 50 centimeters to paralithic contact (contact with weathered granitic bedrock, such as granodiorite)
Reaction: Strongly acid to slightly acid.

Particle-size control section:
- Content of clay—2 to 8 percent
- Content of rock fragments—10 to 35 percent, mainly fine gravel
- Lithology of the rock fragments—granitic rocks, such as granodiorite

A horizons:
- Value—4 or 5 dry, 2 or 3 moist
- Chroma—2 or 3 dry or moist
- Texture of the fine-earth fraction—coarse sand or loamy coarse sand
- Content of organic matter—0.5 to 8 percent

C horizon:
- Value—5 to 7 dry, 3 to 5 moist
- Chroma—2 to 4 dry or moist
- Texture—Coarse sand or loamy coarse sand
- Content of rock fragments—10 to 35 percent

Toem Series

The Toem series consists of shallow, excessively drained soils that formed in colluvium and residuum derived from granitic rocks. These soils are on mountains. Slopes range from 5 to 75 percent. The mean annual precipitation is about 1,015 millimeters, and the mean annual air temperature is about 4.4 degrees C.

Taxonomic classification: Mixed, frigid, shallow Dystric Xeropsamments

Typical pedon

Toem gravelly coarse sand, on a convex, south-facing slope of 35 percent under a cover of Jeffrey pine, white fir, and greenleaf manzanita, at an elevation of 2,134 meters; in an area of Toem-Rock outcrop complex, 9 to 30 percent slopes.

Colors are for dry soil unless otherwise indicated.

O—0 to 3 centimeters; pine litter.
A1—3 to 8 centimeters; grayish brown (10YR 5/2) gravelly coarse sand, very dark brown (10YR 2/2) moist; very dark grayish brown (10YR 3/2) pockets; weak very fine and fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine and fine interstitial pores; moderately acid (pH 6.0); clear wavy boundary.
A2—8 to 25 centimeters; grayish brown (10YR 5/2) gravelly coarse sand, very dark grayish brown (10YR 3/2) moist; dark gray and very dark grayish brown (10YR 4/1, 3/2) pockets and seams adjacent to coarse roots or old root channels; weak fine and medium granular structure; soft, very friable, nonsticky and nonplastic; many very fine and few coarse roots; many very fine and fine interstitial pores; slightly acid (pH 6.5); abrupt wavy boundary.
C—25 to 46 centimeters; pale brown (10YR 6/3) gravelly coarse sand, dark grayish brown (10YR 4/2) moist; massive, soft, very friable, nonsticky and nonplastic; many very fine and few fine, medium, and coarse roots; many very fine and fine interstitial pores; moderately acid (pH 6.0); clear wavy boundary.
Cr—46 to 81 centimeters; weathered granodiorite; roots limited to cracks in the weathered rock.

Type location: El Dorado County, California, Lake Tahoe Basin; 100 feet north of High Meadow Road, 4 miles south of State line; SW¼SE¼ sec. 12, T. 12 N., R. 18 E.; Mount Diablo Base and Meridian; 38 degrees 53 minutes 52 seconds north latitude and 119 degrees 56 minutes 4 seconds west longitude; USGS quadrangle: South Lake Tahoe, California.

Range in characteristics

These soils are usually moist, but they are dry in all parts from mid-July until early October. They have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 47 degrees C
Mean summer soil temperature: 10 to 12 degrees C
Depth to paralithic contact: 20 to 50 centimeters
Texture of the fine-earth fraction: Loamy coarse sand or coarse sand
Content of rock fragments: 5 to 35 percent gravel
Base saturation: 20 to 60 percent between a depth of 25 centimeters and the paralithic contact; generally less than 50 percent in the lower part of the profile
Reaction: Slightly acid or moderately acid throughout the profile
Thickness of the O horizon: 3 to 8 centimeters

A horizons:
Hue—10YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist

C horizon:
Hue—10YR, 2.5Y, or 5Y
Value—4 to 7 dry or moist
Chroma—1 to 3 dry or moist

Ubaj Series

The Ubaj series consists of very deep, moderately well drained soils that formed in colluvium and/or outwash derived from granodiorite over lacustrine deposits. These soils are on lake terraces. Slopes range from 0 to 9 percent. The mean annual

precipitation is about 685 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Fine-loamy, mixed, superactive, frigid Ultic Haploxeralfs

Typical pedon

Ubaj sandy loam, on a south-facing (180-degree) slope of 6 percent, at an elevation of 1,936 meters, in an area of Ubaj sandy loam, 0 to 9 percent slopes.

When described on 9/16/1968, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 1 centimeter; slightly decomposed plant material.

A1—1 to 6 centimeters; grayish brown (2.5Y 5/2) sandy loam, dark brown (10YR 3/3) moist; moderate medium platy structure; soft, very friable, nonsticky and nonplastic; many very fine roots throughout; few very fine tubular and many micro interstitial and tubular pores; strongly acid (pH 5.5) by Hellige-Truog; abrupt smooth boundary.

A2—6 to 19 centimeters; brown (10YR 5/3) sandy loam, dark brown (10YR 3/3) moist; moderate medium platy structure; slightly sticky and slightly plastic; many very fine, fine, medium, and coarse roots throughout; few very fine tubular and common micro tubular and interstitial pores; moderately acid (pH 5.7) by Hellige-Truog; clear smooth boundary.

BA—19 to 44 centimeters; pale brown (10YR 6/3) sandy loam, dark yellowish brown (10YR 3/4) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots throughout; few fine and common micro tubular pores; strongly acid (pH 5.5) by Hellige-Truog; gradual smooth boundary.

Bt1—44 to 70 centimeters; pale brown (10YR 6/3) sandy clay loam, brown (10YR 4/3) moist; massive; hard, friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots throughout; common micro tubular and interstitial pores; clay bridges on surfaces along pores; moderately acid (pH 5.7) by Hellige-Truog; clear wavy boundary.

2Bt2—70 to 108 centimeters; pale brown (10YR 6/3) clay loam, yellowish brown (10YR 5/4) moist; moderate thick platy structure parting to moderate fine angular blocky; very hard, firm, moderately sticky and moderately plastic; few very fine, fine, medium, and coarse roots throughout; few very fine and common micro tubular pores; prominent clay films on all faces of peds; few fine prominent yellowish red (5YR 5/6 dry and 5YR 4/6 moist) and strong brown (7.5YR 5/6 dry and 7.5YR 5/6 moist) masses of oxidized iron; strongly acid (pH 5.5) by Hellige-Truog; clear wavy boundary.

2Bt3—108 to 126 centimeters; light gray (10YR 7/2) clay, pale brown (10YR 6/3) moist; moderate coarse prismatic structure; extremely hard, very firm, slightly sticky and moderately plastic; few very fine, fine, medium, and coarse roots throughout; few micro tubular pores; prominent clay films on all faces of peds; strong brown (7.5YR 5/6 moist) and yellowish red (5YR 5/8 dry) and yellowish red (5YR 5/6 moist) and strong brown (7.5YR 5/6 dry) masses of oxidized iron; strongly acid (pH 5.6) by Hellige-Truog; abrupt wavy boundary.

2C—126 to 306 centimeters; white (N 8/) clay, light gray (10YR 7/2) moist; massive; extremely hard, very firm; few faint yellowish brown (10YR 5/4 moist) and brown (10YR 5/3 dry) masses of oxidized iron; slightly acid (pH 6.5) by Hellige-Truog.

Type location: El Dorado County, California; 792 meters east and 183 meters south of the northwest corner of sec. 15, T. 12 N., R. 18 E.; 38 degrees 53 minutes 33 seconds north latitude and 119 degrees 58 minutes 35 seconds west longitude; NAD83; USGS quadrangle: South Lake Tahoe, California.

Range in characteristics

These soils are usually dry for 45 to 75 consecutive days in late summer and are moist the rest of the year. They have a typic xeric moisture regime.

Seasonal high water table: In spring, runoff water moving through the profile is slowed down on top of the lacustrine sediments, which are at a depth of 50 to 100 centimeters.

Base saturation: 35 to 55 percent (by ammonium acetate)

Particle-size control section:

- Content of rock fragments—as much as 14 percent above the discontinuity; 0 percent below the discontinuity
- Content of clay—averages 25 to 35 percent
- Mineralogy—mixed

A horizons:

- Hue—10YR or 2.5Y
- Value—5 or 6 dry, 3 or 4 moist
- Chroma—2 or 3 dry, 3 or 4 moist
- Content of organic matter—2 to 8 percent
- Texture of the fine-earth fraction—sandy loam
- Reaction—strongly acid or moderately acid

Bt1 horizon:

- Hue—10YR
- Value—6 dry, 4 moist
- Chroma—3 dry, 3 moist
- Content of organic matter—0.5 to 2 percent
- Texture of the fine-earth fraction—sandy clay loam
- Reaction—strongly acid or moderately acid

2Bt2 horizon:

- Hue—10YR
- Value—6 dry, 5 moist
- Chroma—3 dry, 4 moist
- Content of organic matter—0.25 to 1.5 percent
- Redoximorphic features—masses of oxidized iron
- Texture of the fine-earth fraction—clay loam
- Reaction—strongly acid or moderately acid

2Bt3 horizon:

- Hue—10YR
- Value—7 dry, 6 moist
- Chroma—2 dry, 3 moist
- Content of organic matter—0.1 to 1 percent
- Redoximorphic features—masses of oxidized iron
- Texture of the fine-earth fraction—clay
- Reaction—strongly acid or moderately acid

2C horizon(s):

- Hue—N or 10YR
- Value—8 dry, 7 moist
- Chroma—0 dry, 2 moist
- Content of organic matter—0 to 0.75 percent
- Redoximorphic features—masses of oxidized iron
- Texture of the fine-earth fraction—clay
- Reaction—slightly acid or neutral

Waca Series

The Waca series consists of moderately deep, well drained soils that formed in material weathered from andesitic tuff. These soils are on mountains. Slopes range from 5 to 75 percent. The mean annual precipitation is 1,270 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Medial-skeletal, amorphic, frigid Humic Vitrixerands

Typical pedon

Waca very gravelly medial coarse sandy loam, on a northwest-facing, concave slope, under a cover of mixed conifers, at an elevation of 2,073 meters, in an area of Waca very gravelly medial coarse sandy loam, 9 to 30 percent slopes.

Colors are for dry soil unless otherwise indicated.

Oi—0 to 5 centimeters; slightly decomposed plant material.
A1—5 to 28 centimeters; brown (10YR 5/3) very gravelly medial coarse sandy loam, very dark grayish brown (10YR 3/2) moist; massive; soft, very friable, nonsticky and nonplastic; few fine roots; 30 percent gravel and 14 percent cobbles; slightly acid (pH 6.2); abrupt smooth boundary.
A2—28 to 41 centimeters; brown (10YR 5/3) very gravelly medial coarse sandy loam, dark brown (10YR 3/3) moist; massive, soft, very friable, nonsticky and nonplastic; common very fine and fine and many medium roots; many very fine and fine interstitial pores; 35 percent gravel and 3 percent cobbles; moderately acid (pH 6.0); diffuse wavy boundary.
A3—41 to 58 centimeters; brown (10YR 5/3) very gravelly medial coarse sandy loam, dark brown (10YR 3/3) moist; weak medium granular structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, medium, and coarse roots; many very fine and fine interstitial pores; 35 percent gravel and 2 percent cobbles; moderately acid (pH 5.8); diffuse wavy boundary.
Bw—58 to 97 centimeters; pale brown (10YR 6/3) very gravelly medial coarse sandy loam, brown (10YR 4/3) moist; weak medium granular structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, medium, and coarse roots; many very fine and fine interstitial pores; 45 percent gravel and 3 percent cobbles; moderately acid (pH 5.6); diffuse wavy boundary.
Cr—97 centimeters; weathered andesitic tuff with fractures more than 10 centimeters apart and some roots and soil in the cracks.

Type location: Placer County, California; Lake Tahoe Basin, 30 meters south of Blackwood Canyon Road; 800 meters west and 150 meters north of the southeast corner of sec. 34, T. 15 N., R. 16 E.; Mount Diablo Base and Meridian; 39 degrees 5 minutes 54 seconds north latitude and 120 degrees 11 minutes 55 seconds west longitude; USGS quadrangle: Homewood, California.

Range in characteristics

These soils are usually moist between depths of 25 and 84 centimeters and are dry in all parts for about 55 days between late August and early October. They have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 8 degrees C
Mean summer soil temperature: 10 to 13 degrees C
Umbric epipedon: 25 to 61 centimeters thick, though the dark colors normally extend to only 50 centimeters.
Depth to paralithic contact: 50 to 100 centimeters
Texture of the fine-earth fraction: Coarse sandy loam, sandy loam, or loam with less than 18 percent clay

Content of rock fragments: Average of more than 35 percent throughout the control section but 15 to 70 percent in individual horizons; mainly gravel but including cobbles and stones
Content of ash: Less than 60 percent vitric pyroclastic material in the upper 36 centimeters
Bulk density: 0.70 to 0.95 gm/cc
Base saturation: Commonly 15 to 30 percent but ranging from 3 to 50 percent

A horizons:
Hue—10YR or 7.5YR
Value—3 to 5 dry, 2 to 4 moist
Chroma—2 to 4 dry or moist
Content of organic matter—2 to 34 percent
Reaction—strongly acid to slightly acid

Bw horizon:
Hue—10YR or 7.5YR
Value—4 to 7 dry, 3 to 5 moist
Chroma—3 to 8 dry, 2 to 4 moist
Reaction—moderately acid or strongly acid

Wardcreek Series

The Wardcreek series consists of moderately deep, well drained soils that formed in colluvium over residuum weathered from volcanic rocks (fig. 37). These soils are on the upper third of mountains. Slopes range from 30 to 70 percent. The mean annual precipitation is about 1,000 millimeters, and the mean annual air temperature is about 4 degrees C.

Taxonomic classification: Ashy-skeletal, amorphic Xeric Vitricryands

Typical pedon

Wardcreek very stony ashy loam, on a northeast-facing (40-degree) slope of 65 percent, at an elevation of 3,078 meters, in an area of Mountrose-Wardcreek-Melody complex, 50 to 70 percent slopes.

When described on 8/6/2002, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

A—0 to 9 centimeters; pale brown (10YR 6/3)(broken face) very stony ashy loam, brown (10YR 4/3) rubbed and moist; 50 percent sand; 35 percent silt; 15 percent clay; weak very fine granular structure; soft, very friable, moderately sticky and slightly plastic; common very fine and fine roots throughout; many very fine interstitial pores; 30 percent gravel, 10 percent cobbles, and 10 percent stones; strongly acid (pH 5.4) by chlorophenol red; clear smooth boundary.
AB—9 to 30 centimeters; yellowish brown (10YR 5/4) (broken face) very stony ashy sandy loam, dark yellowish brown (10YR 3/4) broken face and moist; 70 percent sand; 20 percent silt; 10 percent clay; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine roots throughout; many very fine interstitial pores; 20 percent gravel, 10 percent cobbles, and 10 percent stones; strongly acid (pH 5.4) by chlorophenol red; clear smooth boundary.
Bt—30 to 45 centimeters; light yellowish brown (10YR 6/4) (broken face) very stony ashy sandy loam, dark yellowish brown (10YR 4/6) broken face and moist; 70 percent sand; 18 percent silt; 12 percent clay; moderate medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; few very fine,

Figure 37.—Typical profile of a Wardcreek soil.

fine, and medium roots throughout; few fine tubular, common medium interstitial, and many very fine interstitial pores; 2 percent clay films on rock fragments and 5 percent clay bridges between sand grains; 25 percent gravel, 10 percent cobbles, and 10 percent stones; strongly acid (pH 5.4) by chlorophenol red; abrupt wavy boundary.

BC—45 to 64 centimeters; light yellowish brown (10YR 6/4) (broken face) very stony ashy sandy loam, dark yellowish brown (10YR 4/4) broken face and moist; 70 percent sand; 20 percent silt; 10 percent clay; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; few very fine and fine roots throughout; many fine and medium interstitial pores; 25 percent gravel,

10 percent cobbles, and 10 percent stones; strongly acid (pH 5.4) by chlorophenol red; abrupt wavy boundary.
R—64 centimeters; very strongly cemented volcanic bedrock.

Type location: Washoe County, Nevada; 562 meters west and 330 meters south of the northeast corner of sec. 27, T. 17 N., R. 18 E.; 39 degrees 18 minutes 48.2 seconds north latitude and 119 degrees 56 minutes 41.7 seconds west longitude; NAD83; USGS quadrangle: Mount Rose, Nevada.

Range in characteristics

These soils are usually moist in the moisture control section. They are moist in fall, winter, and spring and usually are dry from July to early October. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 3 to 6 degrees C
Depth to lithic contact: 50 to 100 centimeters
Reaction: Strongly acid to slightly acid
Base saturation: 5 to 35 percent (by sum of cations)

Particle-size control section:
- Content of rock fragments—35 to 60 percent (15 to 35 percent gravel, 5 to 20 percent cobbles, 5 to 20 percent stones, and 0 to 5 percent boulders)
- Mineralogy—amorphic

A horizon(s):
- Hue—10YR
- Value—4 to 6 dry, 3 or 4 moist
- Chroma—3 or 4 dry or moist
- Texture of the fine-earth fraction—sandy loam or loam
- Content of clay—5 to 20 percent
- Content of organic matter—2 to 8 percent
- Content of rock fragments—35 to 60 percent (15 to 35 percent gravel, 5 to 15 percent cobbles, and 5 to 15 percent stones)
- Reaction—strongly acid to slightly acid

Bt or Bw horizon:
- Hue—10YR
- Value—5 or 6 dry, 3 to 6 moist
- Chroma—4 or 6 dry, 4 or 6 moist
- Texture of the fine-earth fraction—sandy loam or loam
- Content of clay—5 to 20 percent
- Content of organic matter—0.5 to 2 percent
- Content of rock fragments—35 to 60 percent (15 to 35 percent gravel, 5 to 15 percent cobbles, and 5 to 15 percent stones)
- Reaction—strongly acid to slightly acid

BC horizon:
- Hue—10YR
- Value—6 dry, 4 moist
- Chroma—4 dry or moist
- Texture of the fine-earth fraction—sandy loam or loam
- Content of clay—5 to 20 percent
- Content of organic matter—0.1 to 1 percent
- Content of rock fragments—35 to 60 percent (15 to 35 percent gravel, 5 to 15 percent cobbles, and 5 to 15 percent stones)
- Reaction—strongly acid to slightly acid

Watah Series

The Watah series consists of very deep, very poorly drained soils that formed in organic material over alluvium. These soils are on flood plains. Slopes are 0 to 2 percent. The mean annual precipitation is about 580 millimeters, and the mean annual air temperature is about 6 degrees C.

Taxonomic classification: Coarse-loamy, mixed, superactive, acid, frigid Histic Humaquepts

Typical pedon

Watah peat, on a slope of 0 percent, at an elevation of 1,906 meters, in an area of Watah peat, 0 to 2 percent slopes.

When described on 7/16/2002, the soil was moist to a depth of 100 centimeters and saturated below that depth. Colors are for moist soil unless otherwise indicated.

Oi—0 to 8 centimeters; black (10YR 2/1) peat; about 85 percent fibers rubbed; nonsticky and nonplastic; common fine and medium and many very fine roots throughout; abrupt smooth boundary.

Oe—8 to 20 centimeters; black (10YR 2/1) mucky peat; about 25 percent fibers rubbed; nonsticky and nonplastic; many very fine, fine, and medium roots throughout; 5 percent rounded gravel; abrupt smooth boundary.

A—20 to 38 centimeters; very dark brown (10YR 2/2) gravelly mucky coarse sandy loam; 5 percent clay; massive; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots throughout; many very fine interstitial pores; 25 percent rounded gravel; strongly acid (pH 5.2) by chlorophenol red; clear smooth boundary.

C—38 to 73 centimeters; brown (10YR 4/3) gravelly loamy coarse sand; 2 percent clay; massive; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots throughout; many very fine interstitial pores; 30 percent rounded gravel; strongly acid (pH 5.2) by chlorophenol red; clear smooth boundary.

Cg—73 to 160 centimeters; white (10YR 8/1) gravelly coarse sand; massive; soft, very friable, nonsticky and nonplastic; many very fine interstitial pores; 30 percent rounded gravel; strongly acid (pH 5.2) by chlorophenol red.

Type location: El Dorado County, California; in the Truckee Marsh between Pope Beach and the Tahoe Keys; 548 feet south and 749 feet east of the northwest corner of sec. 5, T. 12 N., R. 18 E.; 38 degrees 56 minutes 7 seconds north latitude and 120 degrees 1 minute 14 seconds west longitude; NAD83; USGS quadrangle: Emerald Bay, California.

Range in characteristics

These soils are usually moist throughout the year. The water table fluctuates between the surface and a depth of 152 centimeters. The soils have a typic aquic moisture regime.

Reaction: Strongly acid to slightly acid
Redoximorphic feature: A histic epipedon at the surface

Particle-size control section: 25 to 100 centimeters
- Content of rock fragments—0 to 35 percent gravel, dominantly 2 to 5 millimeters in size
- Content of clay—averages 0 to 8 percent
- Mineralogy—mixed

A horizon(s):
- Hue—10YR
- Value—2 or 3 moist
- Chroma—1 to 3 moist
- Content of organic matter—10 to 20 percent
- Texture of the fine-earth fraction—coarse sandy loam, sandy loam, fine sandy loam, silt loam, or loam
- Content of rock fragments—0 to 35 percent gravel
- Reaction—strongly acid or moderately acid

C horizons:
- Hue—10YR
- Value—3 to 6 moist
- Chroma—3 to 5 moist
- Content of organic matter—0 to 1 percent
- Texture of the fine-earth fraction—coarse sand, loamy coarse sand, or coarse sandy loam
- Content of rock fragments—0 to 35 percent gravel
- Reaction—strongly acid or moderately acid

Waterpeak Series

The Waterpeak series consists of very deep, somewhat excessively drained soils that formed in colluvium and residuum derived from granitic rocks. These soils are on mountains. Slopes range from 4 to 75 percent. The mean annual precipitation is about 890 millimeters, and the mean annual air temperature is about 3 degrees C.

Taxonomic classification: Sandy-skeletal, mixed Pachic Haplocryolls

Typical pedon

Waterpeak very bouldery coarse sand, in an area of rangeland in the Waterpeak-Rock outcrop complex, 30 to 75 percent slopes.

The percentage of the surface covered by rock fragments is as follows: 25 percent by gravel, 5 percent by stones, and 5 percent by boulders. Colors are for dry soil unless otherwise indicated.

A1—0 to 13 centimeters; dark grayish brown (10YR 4/2) very bouldery coarse sand, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine roots; common very fine interstitial pores; 25 percent gravel, 5 percent cobbles, 5 percent stones, and 5 percent boulders; slightly acid; clear wavy boundary.

A2—13 to 46 centimeters; brown (10YR 5/3) very stony coarse sand, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and common fine roots; common very fine interstitial and tubular pores; 25 percent gravel and 20 percent stones; slightly acid; clear wavy boundary.

A3—46 to 69 centimeters; brown (10YR 5/3) very stony loamy coarse sand, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine, common fine, and common medium roots; common very fine interstitial and tubular pores; 25 percent gravel, 5 percent cobbles, and 20 percent stones; neutral; clear wavy boundary.

Bw—69 to 152 centimeters; pale brown (10YR 6/3) very stony sandy loam, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine, few fine, and few medium roots; common very fine interstitial and tubular pores; 20 percent gravel, 5 percent cobbles, and 20 percent stones; neutral.

Type location: Alpine County, California; in the Toiyabe National Forest, about 1,100 feet southeast of Waterhouse Peak; approximately 1,850 feet south and 1,700 feet east of the northwest corner of sec. 26, T. 11 N., R. 18 E.; 38 degrees 46 minutes 22.1 seconds north latitude and 119 degrees 57 minutes 45.7 seconds west longitude; NAD27; USGS quadrangle: Freel Peak, California.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July through September. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 7 degrees C
Mean summer soil temperature: 8 to 12 degrees C
Thickness of the mollic epipedon: 50 to 100 centimeters
Depth to the base of the cambic horizon: More than 100 centimeters
Depth to bedrock: 152 to 200 centimeters to paralithic contact (contact with weathered granitic bedrock)

Particle-size control section:
- Content of clay—averages less than 10 percent
- Content of rock fragments—averages 35 to 60 percent, mainly stones
- Lithology of the rock fragments—granitic rocks, such as granodiorite

A horizons:
- Value—4 or 5 dry, 2 or 3 moist
- Chroma—2 or 3 dry or moist
- Texture of the fine-earth fraction—coarse sand or loamy coarse sand
- Content of organic matter—1 to 5 percent
- Reaction—slightly acid or neutral

Bw horizon:
- Chroma—3 or 4 dry or moist
- Texture—coarse sandy loam or sandy loam
- Content of clay—10 to 15 percent
- Content of rock fragments—35 to 60 percent
- Reaction—slightly acid or neutral

Watsonlake Series

The Watsonlake series consists of very deep, well drained soils that formed in colluvium over residuum weathered from andesite. These soils are on mountain slopes. Slopes range from 5 to 50 percent. The mean annual precipitation is about 940 millimeters, and the mean annual air temperature is about 5 degrees C.

Taxonomic classification: Loamy-skeletal, isotic Andic Haplocryalfs

Typical pedon

Watsonlake gravelly sandy loam, on a northeast-facing (45-degree) slope of 16 percent, at an elevation of 2,294 meters, in an area of Watsonlake gravelly sandy loam, 15 to 30 percent slopes, rubbly.

When described on 8/26/1969, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 5 centimeters; slightly decomposed plant material.

A1—5 to 20 centimeters; brown (10YR 5/3) gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots throughout; many very fine and fine interstitial pores; 20 percent gravel and 5 percent boulders; slightly acid (pH 6.2); clear smooth boundary.

A2—20 to 46 centimeters; light yellowish brown (10YR 6/4) gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine granular structure; slightly hard, friable, nonsticky and nonplastic; many very fine, fine, and medium roots throughout; many very fine and fine interstitial and tubular pores; 25 percent gravel and 5 percent boulders; moderately acid (pH 6.0); clear wavy boundary.

BA—46 to 69 centimeters; pale brown (10YR 6/3) very gravelly sandy clay loam, dark yellowish brown (10YR 4/4) moist; massive; slightly hard, friable, nonsticky and slightly plastic; many very fine, fine, and medium roots throughout; many very fine and fine interstitial and tubular pores; 40 percent gravel, 5 percent cobbles, and 5 percent boulders; moderately acid (pH 6.0); clear smooth boundary.

Bt1—69 to 89 centimeters; pale brown (10YR 6/3) very cobbly sandy clay loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; slightly hard, firm, nonsticky and slightly plastic; common very fine, fine, and medium roots throughout; common very fine and fine tubular pores; 10 percent clay films on surfaces along pores; 25 percent gravel, 10 percent cobbles, and 5 percent boulders; moderately acid (pH 6.0); clear smooth boundary.

Bt2—89 to 132 centimeters; very pale brown (10YR 7/4) very cobbly sandy clay loam, brown (10YR 4/3) moist; massive; slightly hard, firm, nonsticky and slightly plastic; few fine and medium roots throughout; common very fine and fine interstitial and tubular pores; 35 percent clay films on surfaces along pores and 35 percent clay films on all faces of peds; 30 percent gravel, 10 percent cobbles, and 5 percent boulders; moderately acid (pH 5.8); gradual wavy boundary.

Bt3—132 to 170 centimeters; very pale brown (10YR 7/4) stony loam, brown (10YR 4/3) moist; massive; hard, firm, slightly sticky and slightly plastic; few fine, few medium, and few very fine roots throughout; common fine and medium vesicular pores; 35 percent clay films on all faces of peds; 10 percent cobbles and 10 percent stones; moderately acid (pH 5.8); abrupt smooth boundary

R—170 centimeters; indurated andesite bedrock.

Type location: Placer County, California; 4 miles north of Tahoe City, 0.25 mile west and 400 feet south of the northeast corner of sec. 19, T. 16 N., R. 17 E.; 39 degrees 13 minutes 36 seconds north latitude and 120 degrees 7 minutes 40 seconds west longitude; NAD83; USGS quadrangle: Tahoe City, California.

Range in characteristics

These soils are usually dry for 45 to 75 consecutive days in late summer and early fall and moist the rest of the year. They have a typic xeric moisture regime.

Percentage of the surface covered by rock fragments: 7 percent
Reaction: Moderately acid or slightly acid
Base saturation: 35 to 60 percent (by ammonium acetate)
Acid-oxalate extractable Al plus ½ Fe: 1 to 2 percent (by weight) to a depth of 18 centimeters from the mineral soil surface

Particle-size control section:
Content of rock fragments—35 to 60 percent (20 to 50 percent gravel, 0 to 20 percent cobbles, 0 to 15 percent stones, and 1 to 5 percent boulders)
Content of clay—averages 20 to 30 percent
Mineralogy—isotic

A horizons:

Hue—10YR
Value—4 to 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture of the fine-earth fraction—coarse sandy loam or sandy loam
Content of rock fragments—20 to 50 percent (15 to 50 percent gravel, 0 to 15 percent cobbles, 0 to 15 percent stones, and 1 to 5 percent boulders)
Reaction—moderately to slightly acid

Bt horizons:

Hue—10YR or 7.5YR
Value—5 to 7 dry, 4 to 6 moist
Chroma—3 or 4 dry or moist
Texture of the fine-earth fraction—loam, sandy clay loam, or clay loam
Content of rock fragments—35 to 65 percent in the Bt1 and Bt2 horizons but can decrease to 15 percent in the Bt3 horizon; dominantly gravel in the Bt1 and Bt2 horizons and cobbles and stones in the Bt3 horizon
Reaction—strongly acid to slightly acid

Whittell Series

The Whittell series consists of moderately deep, somewhat excessively drained soils that formed in colluvium over residuum derived from granodiorite. These soils are on the upper third of mountain flanks. Slopes range from 8 to 75 percent. The mean annual precipitation is about 1,000 millimeters, and the mean annual air temperature is about 2 degrees C.

Taxonomic classification: Sandy-skeletal, mixed Typic Cryorthents

Typical pedon

Whittell very cobbly loamy coarse sand, on a northeast-facing (18-degree) slope of 45 percent, at an elevation of 2,877 meters, in an area of Whittell-Jobsis-Rock outcrop complex, cool, 30 to 75 percent slopes.

When described on 9/17/2002, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 1 centimeter; slightly decomposed plant material.
A—1 to 18 centimeters; brown (10YR 5/3) very cobbly loamy coarse sand, dark brown (10YR 3/3) moist; 85 percent sand; 13 percent silt; 2 percent clay; weak fine granular structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots throughout; 20 percent gravel, 15 percent cobbles, and 10 percent stones; strongly acid (pH 5.4) by chlorophenol red; clear smooth boundary.
Bw—18 to 50 centimeters; yellowish brown (10YR 5/4) very stony loamy coarse sand, dark yellowish brown (10YR 4/4) moist; 85 percent sand; 14 percent silt; 1 percent clay; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few fine and common medium and coarse roots throughout; 20 percent gravel, 15 percent cobbles, and 15 percent stones; strongly acid (pH 5.4) by chlorophenol red; clear smooth boundary.
C—50 to 82 centimeters; yellowish brown (10YR 5/4) extremely stony loamy coarse sand; 85 percent sand; 14 percent silt; 1 percent clay; single grained; loose when dry, loose when moist, nonsticky and nonplastic when wet; few fine and medium roots throughout; 30 percent gravel, 20 percent cobbles, and 20 percent stones; strongly acid (pH 5.4) by chlorophenol red; clear wavy boundary.

Cr—82 to 152 centimeters; moderately cemented granodiorite bedrock.

Type location: El Dorado County, California; on the north side of Waterhouse Peak; 1,482 feet east and 409 feet south of northwest corner sec. 26, T. 11 N., R. 18 E.; Mount Diablo Base and Meridian; 38 degrees 46 minutes 37.5 seconds latitude and 119 degrees 57 minutes 47.6 seconds longitude; NAD83; USGS quadrangle: Freel Peak, California.

Range in characteristics

These soils are usually moist in the moisture control section. They are moist in fall, winter, and spring and usually are dry from July to early October. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 2 to 5 degrees C
Depth to paralithic contact: 50 to 100 centimeters
Percentage of the surface covered by rock fragments: 20 to 70 percent (10 to 60 percent by gravel, 10 to 55 percent by cobbles, 0 to 45 percent by stones, and 0 to 45 percent by boulders)

Particle-size control section:
- Content of rock fragments—35 to 80 percent (15 to 60 percent gravel, 5 to 45 percent cobbles, 5 to 45 percent stones, and 0 to 45 percent boulders; typically gravel in the upper part of the profile and the larger fragments closer to the paralithic contact
- Mineralogy—mixed

A horizon(s):
- Hue—10YR
- Value—4 to 5 dry, 2 or 3 moist
- Chroma—2 or 3 dry or moist
- Content of organic matter—1 to 3 percent
- Texture of the fine-earth fraction—loamy coarse sand
- Content of clay—0 to 5 percent
- Content of rock fragments—20 to 65 percent (15 to 30 percent gravel, 5 to 20 percent cobbles, 2 to 15 percent stones, and 0 to 5 percent boulders)
- Reaction—strongly acid to slightly acid

Bw horizon(s):
- Hue—10YR
- Value—4 to 6 dry, 3 to 5 moist
- Chroma—3 or 4 dry or moist
- Content of organic matter—0.5 to 1 percent
- Texture of the fine-earth fraction—coarse sand or loamy coarse sand
- Content of clay—0 to 5 percent
- Content of rock fragments—35 to 80 percent (15 to 50 percent gravel, 5 to 25 percent cobbles, 5 to 20 percent stones, and 0 to 5 percent boulders)
- Reaction—strongly acid to slightly acid

C horizon(s):
- Hue—2.5Y or 10YR
- Value—5 or 6 dry, 3 or 4 moist
- Chroma—3 to 6 dry or moist
- Content of organic matter—0 to 0.5 percent
- Texture of the fine-earth fraction—coarse sand or loamy coarse sand
- Content of clay—0 to 5 percent
- Content of rock fragments—35 to 85 percent (15 to 50 percent gravel, 5 to 45 percent cobbles, 5 to 45 percent stones, and 0 to 45 percent boulders)

Reaction—strongly acid to slightly acid

Windyridge Series

The Windyridge series consists of very shallow, somewhat excessively drained soils that formed in residuum and colluvium derived from granodiorite. These soils are on mountains. Slopes range from 8 to 30 percent. The mean annual precipitation is about 1,143 millimeters, and the mean annual air temperature is about 2 degrees C.

Taxonomic classification: Sandy-skeletal, mixed, shallow Typic Cryorthents

Typical pedon

Windyridge very gravelly loamy coarse sand, in an area of rangeland in the Freelpeak-Windyridge-Rock outcrop complex, 15 to 75 percent slopes.

The percentage of the surface covered by rock fragments is as follows: 65 percent by gravel, 5 percent by cobbles, and 2 percent by stones. Colors are for dry soil unless otherwise indicated.

A—0 to 5 centimeters; brown (10YR 5/3) very gravelly loamy coarse sand, dark yellowish brown (10YR 3/4) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; common fine roots; many very fine interstitial pores; 50 percent gravel; very strongly acid; clear wavy boundary.

Bw—5 to 18 centimeters; brownish yellow (10YR 6/6) very gravelly loamy coarse sand, dark yellowish brown (10YR 4/6) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; many very fine interstitial and few very fine tubular pores; 50 percent gravel; very strongly acid; clear wavy boundary.

C—18 to 25 centimeters; very pale brown (10YR 7/4) very gravelly coarse sand, yellowish brown (10YR 5/4) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; 50 percent gravel; very strongly acid; clear wavy boundary.

Cr—25 to 152 centimeters; soft, weathered granodiorite.

Type location: Alpine County, California; in the Toiyabe National Forest, about 2,100 feet southwest of Jobs Sister; approximately 1,900 feet north and 3,000 feet east of the southwest corner of sec. 31, T. 12 N., R. 19 E.; 38 degrees 51 minutes 28.5 seconds north latitude and 119 degrees 53 minutes 19.7 seconds west longitude; NAD27; USGS quadrangle: Freel Peak, California.

Range in characteristics

These soils are usually moist in the moisture control section during late fall and during winter and spring and are dry from mid-July to early October. They are dry for 60 to 80 consecutive days in the 4 months following the summer solstice. The soils have a typic xeric moisture regime.

Mean annual soil temperature: 2 to 4 degrees C
Mean summer soil temperature: 7 to 8 degrees C
Depth to bedrock: 10 to 25 centimeters to paralithic contact (contact with weathered granitic bedrock, such as granodiorite)
Reaction: Very strongly acid to moderately acid

Particle-size control section:
Content of clay—averages less than 10 percent
Content of rock fragments—averages 35 to 60 percent, mainly fine gravel
Lithology of the rock fragments—granitic rocks, such as granodiorite

A horizon:
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 or 3 dry, 3 or 4 moist
Content of organic matter—1 to 3 percent

Bw horizon:
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 to 6 dry or moist
Texture of the fine-earth fraction—coarse sand or loamy coarse sand
Content of clay—4 to 10 percent
Content of rock fragments—35 to 60 percent, mainly fine gravel (2 to 5 millimeters in diameter)

C horizon (where present):
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 to 6 dry or moist
Texture of the fine-earth fraction—coarse sand or loamy coarse sand
Content of clay—4 to 10 percent
Content of rock fragments—35 to 60 percent, mainly fine gravel (2 to 5 millimeters in diameter)

Witefels Series

The Witefels series consists of moderately deep, somewhat excessively drained soils that formed in colluvium and residuum derived from granitic rocks. These soils are on mountains. Slopes range from 4 to 75 percent. The mean annual precipitation is about 1,015 millimeters, and the mean annual air temperature is about 4 degrees C.

Taxonomic classification: Mixed Typic Cryopsamments

Typical pedon

Witefels coarse sand, in a wooded area.

Colors are for dry soil unless otherwise indicated.

Oi—0 to 3 centimeters; fir needle duff.
A1—3 to 10 centimeters; dark grayish brown (10YR 4/2) coarse sand, very dark brown (10YR 2/2) moist; massive; soft, very friable, nonsticky and nonplastic; many fine and very fine roots; many very fine and fine pores; 5 percent gravel; moderately acid (pH 6.0); clear wavy boundary.
A2—10 to 23 centimeters; grayish brown (10YR 5/2) gravelly loamy coarse sand, very dark grayish brown (10YR 3/2) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine and fine and few medium and coarse roots; many very fine and fine interstitial pores; 20 percent gravel; moderately acid (pH 6.0); clear wavy boundary.
AC—23 to 36 centimeters; grayish brown (10YR 5/2) gravelly loamy coarse sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and fine and few medium and coarse roots; many very fine and fine interstitial pores; 25 percent gravel; moderately acid (pH 6.0); clear wavy boundary.
C1—36 to 66 centimeters; pale brown (10YR 6/3) gravelly loamy coarse sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and few medium and coarse roots; many fine and very fine interstitial pores; 25 percent gravel; moderately acid (pH 6.0); clear wavy boundary.

C2—66 to 91 centimeters; light gray (10YR 7/2) gravelly coarse sand, brown (10YR 5/3) moist; massive; soft, very friable, nonsticky and nonplastic; very few roots; many very fine and fine interstitial pores; 30 percent gravel; moderately acid (pH 6.0); clear wavy boundary.
Cr—91 centimeters; granitic saprolite with rock structure.

Type location: Washoe County, Nevada; about 805 meters east and 610 meters south of the northwest corner of sec. 30, T. 16 N., R. 19 E.

Range in characteristics

These soils are usually moist, but they are dry between depths of 30 and 89 centimeters from late July until October l. They have a typic xeric moisture regime.

Mean annual soil temperature: 4 to 7 degrees C
Mean summer soil temperature: 6 to 8 degrees C
Particle-size control section: Coarse sand or loamy coarse sand with 15 to 35 percent fine gravel
Depth to paralithic contact: 50 to 100 centimeters from the mineral soil surface

A horizons:
Value—4 or 5 dry, 2 to 4 moist
Chroma—2 or 3 dry or moist
Texture of the fine-earth fraction—coarse sand or loamy coarse sand
Reaction—slightly acid to strongly acid

C horizons:
Value—5 to 7 dry, 4 or 5 moist
Chroma—2 or 3 dry or moist
Texture of the fine-earth fraction—coarse sand or loamy coarse sand
Reaction—slightly acid to strongly acid

Zephyrcove Series

The Zephyrcove series consists of moderately deep, well drained soils that formed in colluvium over residuum weathered from trachyte. These soils are on side slopes and ridgetops in the mountains. Slopes range from 9 to 70 percent. The mean annual precipitation is about 700 millimeters, and the mean annual air temperature is about 5.5 degrees C.

Taxonomic classification: Coarse-loamy, isotic, frigid Ultic Haploxeralfs

Typical pedon

Zephyrcove stony sandy loam, on a southeast-facing (139-degree) slope of 27 percent, at an elevation of 2,198 meters, in an area of Zephyrcove-Southcamp-Genoapeak complex, 9 to 30 percent slopes.

When described on 7/12/2004, the soil was dry throughout. Colors are for dry soil unless otherwise indicated.

Oi—0 to 6 centimeters; slightly decomposed plant material; 10 percent stones; abrupt smooth boundary.
Oe—6 to 11 centimeters; moderately decomposed plant material; 10 percent stones; abrupt smooth boundary.
A—11 to 18 centimeters; grayish brown (10YR 5/2) stony sandy loam, very dark grayish brown (10YR 3/2) moist; 3 percent clay; weak very fine granular structure; soft, very friable, nonsticky and nonplastic; many fine and very fine and

common medium and coarse roots; common very fine and fine interstitial pores; 5 percent gravel and 10 percent stones; neutral (pH 6.8); abrupt smooth boundary.

Bw—18 to 30 centimeters; pale brown (10YR 6/3) stony sandy loam, brown (10YR 4/3) moist; 4 percent clay; moderate medium and fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many fine, few medium, and common very fine roots; common very fine and fine interstitial pores; 5 percent gravel and 10 percent stones; slightly acid (pH 6.5); clear smooth boundary.

Bt1—30 to 41 centimeters; very pale brown (10YR 7/3) gravelly sandy loam, brown (10YR 5/3) moist; 8 percent clay; moderate fine and medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many fine, few medium, and common very fine roots; few very fine and fine interstitial pores; 5 percent faint clay films; 15 percent gravel; neutral (pH 6.8); abrupt smooth boundary.

Bt2—41 to 64 centimeters; very pale brown (10YR 7/3) gravelly sandy loam, yellowish brown (10YR 5/4) moist; 13 percent clay; moderate fine and medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many fine, few medium, and common very fine roots; 50 percent continuous distinct clay films; 15 percent gravel; neutral (pH 6.7); clear smooth boundary.

Bt3—64 to 88 centimeters; very pale brown (10YR 7/4) sandy clay loam, yellowish brown (10YR 5/4) moist; 24 percent clay; strong medium and fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common fine and medium and few coarse roots; 50 percent continuous distinct clay films; slightly acid (pH 6.4); clear wavy boundary.

Cr—88 to 152 centimeters; moderately cemented trachyte bedrock; massive; few medium roots in cracks more than 10 centimeters apart; 10 percent prominent clay films on the bedrock; slightly acid (pH 6.2).

Type location: Douglas County, Nevada; 509 meters south and 551 meters east of the northwest corner of sec. 13, T. 14 N., R. 18 E.; 39 degrees 4 minutes 44 seconds north latitude and 119 degrees 54 minutes 41 seconds west longitude; NAD83; USGS quadrangle: Glenbrook, Nevada.

Range in characteristics

These soils are usually dry for 45 to 75 consecutive days in late summer and early fall and are moist the rest of the year. They have a typic xeric moisture regime

Percentage of the surface covered by rock fragments: 12 to 35 percent (5 to 15 percent by boulders, 5 to 15 percent by stones, and 2 to 10 percent by cobbles)

Base saturation: 35 to 75 percent (by ammonium acetate)

Particle-size control section:

- Content of rock fragments—5 to 25 percent (0 to 25 percent gravel and 0 to 10 percent cobbles
- Content of clay—averages 8 to 18 percent clay; as much as 30 percent in individual horizons
- Mineralogy—isotic

A horizon:

- Hue—10YR
- Value—4 to 6 dry, 3 or 4 moist
- Chroma—2 to 4 dry or moist
- Texture of the fine-earth fraction—sandy loam or loamy sand
- Content of rock fragments—5 to 25 percent (2 to 15 percent gravel, 2 to 15 percent cobbles, and 2 to 15 percent stones)
- Content of organic matter—5 to 10 percent
- Reaction—slightly acid or neutral

Bw horizon:

Hue—10YR
Value—5 to 7 dry, 3 to 6 moist
Chroma—2 to 4 dry or moist
Texture of the fine-earth fraction—sandy loam or loamy sand
Content of rock fragments—5 to 25 percent (2 to 15 percent gravel, 2 to 15 percent cobbles, and 2 to 15 percent stones
Content of organic matter—1 to 3 percent
Reaction—slightly acid or neutral

Bt horizons:

Hue—10YR
Value—6 or 7 dry, 4 to 6 moist
Chroma—3 or 4 dry or moist
Texture of the fine-earth fraction—loamy sand, sandy loam, or sandy clay loam
Content of rock fragments—5 to 25 percent, mostly gravel and paragravel
Content of organic matter—0.25 to 1 percent
Reaction—slightly acid or neutral

Formation of the Soils

Soil is a natural body that is made up of solids (minerals and organic matter), liquid, and gases and that occupies space on the land surface. It is characterized by one or both of the following: horizons, or layers, that are distinguishable from the initial material as a result of additions, losses, transfers, and transformations of energy and matter or the ability to support rooted plants in a natural environment (Soil Survey Staff, 2006). The characteristics and properties of soil are determined by physical and chemical processes that result from the interaction of five soil-forming factors. These factors are climate, mainly the temperature and kind and amount of precipitation since the accumulation or exposure of the parent material; living organisms, mainly the plant cover and the organisms living in and on the soil (including humans); the length of time that the soil-forming factors have been operating; parent material, including the texture and structure of the material and its mineralogical and chemical composition; and topography, mainly as it affects internal and external soil properties, such as drainage, aeration, susceptibility to erosion, and exposure to the sun and wind (Jenny, 1941). The influence of any one of these factors varies at each locality, and the soils may differ accordingly from place to place or within short distances.

Soils are classified, mapped, and interpreted on the basis of various kinds of soil horizons and the arrangement of those horizons. The degree of expression of the soil horizons reflects the extent of interaction of soil-forming factors with one or more soil-forming processes, including additions, removals, transfers, and transformations (Simonson, 1959). The important diagnostic surface horizons in this survey area are mollic, histic, and umbric epipedons, and the more important diagnostic subsurface horizons are argillic horizons, duripans, dense till, and weak fragic materials (Soil Survey Staff, 2006).

Climate

The climate in this survey area is characterized by warm, dry summers and cold, moist winters. Most of the precipitation falls in the period November through April in the form of snow. Warm temperatures and moist soil conditions in spring are conducive to rapid chemical reactions. During periods of rainfall, water carrying dissolved or suspended solids moves through the soil. Weathering is generally limited in the cold winter months, but leaching processes become active with the temperature increases in spring and early summer. Weathering is most active in spring and least active in late summer and in winter. The soils in the Tahoe Basin may or may not weather in fall, depending on the timing of rain and the onset of cold temperatures. In soils that have a high water table, weathering can occur in summer and fall.

Topography and relief affect present-day climate variations. As elevation increases, temperature generally decreases and precipitation generally increases. Fluctuations in temperature and moisture affect the rate at which organic matter decomposes and accumulates and the weathering of minerals.

Living Organisms

The activities of living organisms, including soil flora, fauna, and humans, influence the formation and morphology of soils. Flora, such as fungi, helps to decompose organic matter. Some bacteria add atmospheric nitrogen to the soil. Fauna, such as bacteria, earthworms, small insects, and rodents, mix soil material through burrowing and tunneling. Abandoned tunnels commonly are filled with loose material from the overlying horizons and transmit water more readily than the surrounding undisturbed soil material.

The vegetation in the survey area has helped to stabilize land surfaces by protecting the surfaces against erosion. This stability has allowed the other soil-forming factors to affect the soils. Also, plant roots help to develop soil structure and aggregate stability.

Human activities have influenced the formation of numerous soils in the survey area. The most prevalent examples of human-altered soils are Oxyaquic Xerorthents made up of fill material in the Tahoe Keys. This material was brought in to fill a portion of the wetlands of the Upper Truckee River area in order to make the area suitable for development. Another example of human activities is the alteration of stream systems and the creation of such soils as the drained phase of the Tahoe series. The drained phase of this series formed under the influence of a high water table, as evidenced in the soil profile.

Human activities have altered the hydrology of the basin by adding impermeable surfaces and thus increasing the volume and speed with which water reaches the stream systems. As a result, the streams be can overloaded and streambank erosion can occur. This impact occurs not only on the impermeable surfaces but also in the surrounding areas. Because of heavy traffic, soils around structures are subject to compaction and a lowering of Ksat. Alteration of the vegetation in urban and residential areas also affects the soils and hydrology.

Time

The influence of time on soil formation is expressed through soil characteristics displayed in soil horizons. Gefo and other young soils that formed in glacial outwash have few distinctive characteristics and no diagnostic subsurface horizons. Jorge and Tahoma soils, which have argillic horizons, are examples of soils on older surfaces that have had the time to develop distinctive profile characteristics. Jabu soils, which formed in glacial outwash, are thought to have weak argillic horizons because they date back to an older glacial event and were not obliterated by more recent glaciations.

The youngest geomorphic surfaces in the survey area are the alluvial fans, flood plains, and basin floors associated with the major rivers and streams. The soils at the lowest elevations are on alluvial flats and flood plains. Tahoe and Watah soils are on the flood plains and alluvial flats at the lower elevations, and Bidart soils are on the ones at the higher elevations.

Parent Material

The soils at the lowest elevations in the survey area formed primarily in alluvium derived from igneous rocks. They are on alluvial flats and flood plains. Tahoe, Marla, and Bidart soils are examples. Most of the alluvial soils have been influenced by both igneous intrusive rocks (mostly granodiorite) and igneous extrusive rocks (mostly andesitic lahar) from the watershed above.

Christopher, Gefo, Jabu, and Oneidas soils on outwash plains are examples of soils that formed in outwash derived primarily from granodiorite. Inville soils are examples of soils that formed in outwash and alluvium derived from a mixture of granodiorite and volcanic rocks. Some of the soils at the lower elevations, such as Ubaj and Kingsbeach soils, were influenced by higher lake levels and are thus underlain by lacustrine materials.

The mountains in the survey area are dominated by colluvium from either granodiorite or volcanic materials. Cassenai and Cagwin soils on mountain slopes are examples of colluvial soils that formed in material weathered from granodiorite. Jorge and Tahoma soils on mountain slopes are examples of colluvial soils that formed in volcanic materials. A small pocket of metamorphic rocks is near Spooner Summit. Deerhill and Shakespeare soils are examples of soils that formed in colluvium over residuum weathered from metamorphic rocks. Deerhill soils are at low elevations, and Shakespeare soils are at the higher elevations. Soils that formed in material weathered from metamorphic rocks also occur in the Desolation Wilderness Area. Because of to their extreme shallow nature, remote location, and limited extent, however, these soils are included with other soils, such as Rockbound and Glenalpine soils, in mapping. Spooner Summit also has a small area of unique volcanic materials, unlike the typical andesitic lahar throughout the rest of the survey area. Porphyritic trachyte and latite dominate this area. Southcamp, Zephyrcove, Caverock, and Genoapeak are examples of the soils in this area. Different soils commonly form in different kinds of parent materials even when the difference in parent material may appear to be quite insignificant.

Parent material commonly is a major factor affecting the soils and vegetation in an area. The Relay Peak and Mount Baldy areas have soils that favor shrubs and forbs rather than forest vegetation. Mountrose, Wardcreek, and other soils in these areas are deep enough and have an available water capacity high enough for tree growth. The results of laboratory tests, however, show that the andesitic parent material is low in available nutrients and that the soils are close to having aluminum toxicity. Similar soils that are at similar elevations and that formed in material weathered from granodiorite, such as Whittell, Jobsis, and Dagget soils, support red fir, whitebark pine, and mountain hemlock. Interestingly enough, though, this same andesitic parent material at the lower elevations does support healthy forests. For example, Sky soils are in healthy stands of red fir and Waca soils, a little lower in elevation, are in stands of white fir.

Glaciation strongly influenced the parent material in the Lake Tahoe Basin. One of the glacial events that occurred in the basin is glacial deposition. Meeks, Tallac, Roadcat, Burnlake, and other soils formed in glacial till derived dominantly from granodiorite. Kneeridge and Paige soils have similar glacial histories, but they formed in material derived from volcanic rocks. Most of the soils that formed in glacial till are underlain by dense till at some depth. In some cases the till is deeper than is described in this soil survey report.

Glacial erosion is another glacial event that occurred in the basin. It occurred, for example, in the Desolation Wilderness Area, which is dominated by Rockbound and other shallow soils that are intermingled with Rock outcrop. It also occurred on valley sidewalls. Glenalpine soils are examples of soils that formed in colluvium and talus collecting in the pockets left behind by glacial erosion.

In areas of glacial outwash, glaciers left large quantities of sediment at the lower elevations in the basin. Christoper and Jabu soils are examples of soils in these areas. Glaciers also left behind small lakes that have subsequently filled with organic matter. Hellhole and similar soils formed in these areas.

Topography and Relief

The overall landscape in the survey area, mainly mountains and valleys, is the result of erosional and constructional processes. Because of the steep nature of the survey area, most of the landforms in the basin are dominated by the erosional process.

Depositional areas consist of flood plains, alluvial flats, fens, and footslopes. Most of these areas occur at the lowest elevations in the basin. Tahoe and Watah soils are examples of soils in these areas. The fens are at mid elevations in the survey area and are dominated by organic soils, such as Hellhole soils. Kneeridge soils, which formed in a mixture of colluvium and glacial till, are examples of soils on footslopes.

The more stable of the erosional surfaces are the outwash plains and terraces. The gently sloping and moderately sloping soils on these surfaces typically are well drained and have a high saturated hydraulic conductivity (Ksat). They are among the main sites for urban or residential development in the Tahoe Basin.

The mountain slopes that dominate the landscape of the survey area are steeper than the outwash plains and terraces. They constantly lose sediment to the landscape below and receive deposits from the slopes above. Because of steep slopes, the risk of erosion is high. The soils on the mountain slopes tend to have high Ksat values in the soil layers but in some areas are shallow to bedrock, which has much lower Ksat values.

Soils at the top and shoulders of the mountains are very young. They are constantly being eroded onto the slopes below. Freelpeak, Windyridge, and similar soils owe their abundance of small pebbles and cobbles to the freshly exfoliated granodiorite in which they form.

Different aspects have unique plant communities and associated soils that are readily recognized. On the eastern side of the Tahoe Basin, for example Cassenai soils typically are on the northern side of ridges and Cagwin soils are on the southern side. Compared to south aspects, north aspects have deeper soils that are higher in content of organic matter and that produce a denser, more productive forest. The harsher south aspects have shallower, rockier soils dominated by shrubs, such as greenleaf manzanita. Because of the shape of the basin and the location of the parent material, most of the soils in the basin occur on a dominant aspect.

Glossary

AASHTO classification. A system for classifying soils specifically for geotechnical engineering purposes that is related to highway and airfield construction. It is based on particle-size distribution and Atterberg limits.

AASHTO group index (GI). An empirical index number used to evaluate clayey and silty clay material.

ABC soil. A soil having an A, a B, and a C horizon.

Ablation till. A general term for loose, relatively permeable material deposited during the downwasting of nearly static glacial ice. The material is either contained within the glacier or accumulated on the surface of the glacier.

AC soil. A soil having only an A and a C horizon. Commonly, such soil formed in recent alluvium or on steep, rocky slopes.

Aggregate, soil. Many fine particles held in a single mass or cluster. Natural soil aggregates, such as granules, blocks, or prisms, are called peds. Clods are aggregates produced by tillage or logging.

Alluvial fan. A low, outspread mass of loose material and/or rock material washed down the sides of mountains and hills. It commonly has gentle slopes and is shaped like an open fan or a segment of a cone. It is deposited by a stream at the place where the stream issues from a narrow mountain valley or where a tributary stream is near or at its junction with the main stream. An alluvial fan is steepest near its apex that points upstream, and it slopes gently and convexly outward with a gradual decrease in gradient.

Alluvium. Material, such as sand, silt, or clay, deposited on land by streams.

Alpha,alpha-dipyridyl. A dye that when dissolved in 1N ammonium acetate is used to detect the presence of reduced iron (Fe II) in the soil. A positive reaction indicates a type of redoximorphic feature.

Aquic conditions. Current soil wetness characterized by saturation, reduction, and redoximorphic features.

Argillic horizon. A subsoil horizon characterized by an accumulation of illuvial clay.

Aspect. The direction in which a slope faces.

Association, soil. A group of soils or miscellaneous areas geographically associated in a characteristic repeating pattern and defined and delineated as a single map unit.

Available water capacity (AWC) (available moisture capacity). The volume of water that should be available to plants if the soil, inclusive of fragments, were at field capacity. It is commonly estimated as the difference between the amount of water at field capacity and the amount at wilting point with adjustments for salinity, fragments, and rooting depth. It is commonly expressed as inches of water per inch of soil. The capacity, in inches, in a 60-inch profile or to a limiting layer is expressed as:

Very low	0 to 2.5
Low	2.5 to 5.0
Moderate	5.0 to 7.5
High	7.5 to 10.0
Very high	more than 10.0

AWC. See Available water capacity.

Backslope. The hillslope profile position that forms the steepest and generally linear, middle portion of the slope. In profile, backslopes commonly are bounded by a convex shoulder above and a concave footslope below. They may or may not include cliff segments, or free faces. Backslopes are commonly erosional forms produced by mass movement, colluvial action, and running water.

Basal area. The area of a cross section of a tree, generally referring to the section at breast height and measured outside the bark. It is a measure of stand density, commonly expressed in square feet.

Basal till. Compact glacial till deposited beneath the ice.

Base saturation. The degree to which material having cation-exchange properties is saturated with exchangeable bases (sum of Ca, Mg, Na, and K), expressed as a percentage of the total cation-exchange capacity.

Base slope. A geomorphic component of hills consisting of the concave to linear (perpendicular to the contour) slope that, regardless of the lateral shape, forms an apron or wedge at the bottom of a hillside dominated by colluvium and slope-wash sediments (for example, slope alluvium).

Basin. Nearly level to gently sloping bottom surface of a wide structural depression between mountain ranges.

Basin floor. A general term for the nearly level, lowermost part of intermontane basins, or bolsons and semibolsons. The floor includes all of the alluvial, eolian, and erosional landforms below the piedmont slope.

Batholith. A large body of igneous intrusive (plutonic) rock, commonly regional in extent, such as the Sierra Nevada batholith.

Beach terrace. A landform that consists of a wave-cut scarp and wave-built terrace of well-sorted marine and lacustrine sand and gravel. Colloquially, in the western United States, relict shoreline from pluvial lakes, generally restricted to valleysides.

Bedding planes. Fine strata, less than 5 millimeters thick, in unconsolidated alluvial, eolian, lacustrine, or marine sediment.

Bedding system. A drainage system made by plowing, grading, or otherwise shaping the surface of a flat field. It consists of a series of low ridges separated by shallow, parallel dead furrows.

Bedrock. A general term for the solid rock that underlies the soil and other unconsolidated material or that is exposed at the surface.

Bedrock-controlled topography. A landscape where the configuration and relief of the landforms are determined or strongly influenced by the underlying bedrock.

Bench terrace. A raised, level or nearly level strip of earth constructed on or nearly on a contour, supported by a barrier of rocks or similar material, and designed to make the soil suitable for tillage and to prevent accelerated erosion.

Bisequum. Two sequences of soil horizons, each of which consists of an illuvial horizon and the overlying eluvial horizons.

Bottom land. The normal flood plain of a stream, subject to flooding.

Boulders. Rock fragments larger than 2 feet (60 centimeters) in diameter.

Breaks. The steep and very steep broken land at the border of an upland summit that is dissected by ravines.

Breast height. An average height of 4.5 feet above the ground surface; the point on a tree where diameter measurements are ordinarily taken.

Brush management. Use of mechanical, chemical, or biological methods to make conditions favorable for reseeding or to reduce or eliminate competition from woody vegetation and thus allow understory grasses and forbs to recover. Brush management increases forage production and thus reduces the hazard of erosion. It can improve the habitat for some species of wildlife.

Bulk density. A measurement of the oven-dry weight of the soil material that is less than 2 millimeters in diameter per unit volume. Common measurements are taken at 1/3-, 1/10-, or 15-bar moisture tension. Bulk density influences plant growth and engineering applications. It is used to convert measurements from a weight basis to a volume basis. Within a family particle-size class, bulk density is an indicator of how well plant roots are able to extend into the soil. Bulk density is used to calculate porosity.

Cable yarding. A method of moving felled trees to a nearby central area for transport to a processing facility. Most cable yarding systems involve use of a drum, a pole, and wire cables in an arrangement similar to that of a rod and reel used for fishing. To reduce friction and soil disturbance, felled trees generally are reeled in while one end is lifted or the entire log is suspended.

Calcium carbonate equivalent. The amount of calcium carbonate in a soil measured by treating the soil sample with hydrochloric acid (HCL). The evolved carbon dioxide (CO_2) is measured, and the amount of carbonate is then calculated as calcium carbonate ($CaCO_3$).

California bearing ratio (CBR). The load-supporting capacity of a soil as compared to that of standard crushed limestone, expressed as a ratio. First standardized in California. A soil having a CBR of 16 supports 16 percent of the load that would be supported by standard crushed limestone, per unit area, with the same degree of distortion.

Cambic horizon. A mineral soil horizon that has the texture of loamy very fine sand or finer, has soil structure rather than rock structure, and contains some weatherable minerals. It is characterized by the alteration or removal of mineral material as indicated by mottling or gray color, stronger chroma or redder hue than the underlying horizons, or the removal of carbonates. The cambic horizon lacks cementation or induration and has too few evidences of illuviation to meet the requirements for an argillic horizon.

Canopy. The leafy crown of trees or shrubs. (See Crown.)

Canyon. A long, deep, narrow, very steep sided valley with high, precipitous walls in an area of high local relief.

Capillary water. Water held as a film around soil particles and in tiny spaces between particles. Surface tension is the adhesive force that holds capillary water in the soil.

Catena. A sequence of soils on a landscape that are about the same age and formed in similar kinds of parent material under similar climatic conditions but have different characteristics as a result of differences in relief and drainage.

Cathodic protection. Control of the electrolytic corrosion of an underground or underwater metallic structure, such as a pipeline, by the application of an electrical current in such a way that the structure acts as the cathode rather than the anode of an electrolytic cell. (See Coatings for pipelines.)

Cation. An ion carrying a positive charge of electricity. The common soil cations are calcium, potassium, magnesium, sodium, and hydrogen.

Cation-exchange capacity (CEC). The total amount of exchangeable cations that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated pH value. The term, as applied to soils, is synonymous with base-exchange capacity but is more precise in meaning.

CEC. See Cation-exchange capacity.

Chemical treatment. Control of unwanted vegetation through the use of chemicals.

Cinders. Uncemented vitric, vesicular, pyroclastic material more than 2 millimeters in at least one dimension with apparent specific gravity (including vesicles) of more than 1 and less than 2.

Cirque. A semicircular, concave, bowllike area that has steep faces primarily resulting from the erosiveness of a mountain glacier.

Clay. As a soil separate, the mineral soil particles less than 0.002 millimeter in diameter. As a soil textural class, soil material that is 40 percent or more clay, less than 45 percent sand, and less than 40 percent silt.

Clay depletions. Low-chroma zones having a low content of iron, manganese, and clay because of the chemical reduction of iron and manganese and the removal of iron, manganese, and clay. A type of redoximorphic depletion.

Clay film. A thin coating of oriented clay on the surface of a soil aggregate or lining pores or root channels. Synonyms: clay coating, clay skin.

Clayey. Sandy clay, silty clay, and clay soil textures.

Climax plant community. The stabilized plant community on a particular site. The plant cover reproduces itself and does not change so long as the environment remains the same.

Coarse fragments. See Rock fragments.

Coarse textured soil. Sand or loamy sand.

Coatings for pipelines. Coatings used as a barrier to the flow of electricity and moisture, thereby preventing the formation of corrosion cells.

Cobble (or cobblestone). A rounded or partly rounded fragment of rock 3 to 10 inches (7.6 to 25 centimeters) in diameter.

Cobbly soil material. Material that has 15 to 35 percent, by volume, rounded or partially rounded rock fragments 3 to 10 inches (7.6 to 25 centimeters) in diameter. Very cobbly soil material has 35 to 60 percent of these rock fragments, and extremely cobbly soil material has more than 60 percent.

COLE (coefficient of linear extensibility). See Linear extensibility.

Colluvium. Unconsolidated, unsorted earth material transported or deposited on side slopes and/or at the base of slopes by mass movement, or direct gravitational action, and by local unconcentrated runoff.

Compaction. The process by which the soil grains are rearranged to decrease void space and bring them into closer contact with one another, thereby increasing bulk density.

Complex slope. Irregular or variable slope. Planning or establishing terraces, diversions, and other water-control structures on a complex slope is difficult.

Complex, soil. A map unit of two or more kinds of soil or miscellaneous areas in such an intricate pattern or so small in area that it is not practical to map them separately at the selected scale of mapping. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas.

Concretions. Cemented bodies with crude internal symmetry organized around a point, a line, or a plane. They typically take the form of concentric layers visible to the naked eye. Calcium carbonate, iron oxide, and manganese oxide are common compounds making up concretions. If formed in place, concretions of iron oxide or manganese oxide are generally considered a type of redoximorphic concentration.

Conglomerate. A coarse grained, clastic sedimentary rock composed of rounded or subangular rock fragments more than 2 millimeters in diameter, commonly with a matrix of sand and finer textured material. Cementing agents include silica, calcium carbonate, and iron oxide. Conglomerate is the consolidated equivalent of gravel.

Consistence, soil. Refers to the degree of cohesion and adhesion of soil material and its resistance to deformation when ruptured. Consistence includes resistance of soil material to rupture and to penetration; plasticity, toughness, and stickiness of puddled soil material; and the manner in which the soil material behaves when subject to compression. Terms describing consistence are defined in the “Soil Survey Manual.”

Control section. The part of the soil on which classification is based. The thickness varies among different kinds of soil, but for many it is that part of the soil profile between depths of 10 inches and 40 or 80 inches.

Corrosion. Soil-induced electrochemical or chemical action that dissolves or weakens concrete or uncoated steel.

Crown. The upper part of a tree or shrub, including the living branches and their foliage.

Cryoturbation. A collective term used to describe all soil movement as a result of frost action, including the folding, breaking, and dislocating of beds and lenses of unconsolidated material.

Culmination of the mean annual increment (CMAI). The average annual increase per acre in the volume of a stand. Computed by dividing the total volume of the stand by its age. As the stand increases in age, the mean annual increment continues to increase until mortality begins to reduce the rate of increase. The point where the stand reaches its maximum annual rate of growth is called the culmination of the mean annual increment.

Debris flow (mass movement). The process, associated sediment (debris flow deposit), or resultant landform characterized by a very rapid type of flow dominated by sudden downslope movement of a mass of rock, soil, and mud (more than 50 percent particles that are more than 2 millimeters in size) that behaves much like viscous fluid whether it is saturated or relatively dry.

Deep soil. See Depth, soil.

Depth, soil. Generally, the thickness of the soil over bedrock. Very deep soils are more than 60 inches deep over bedrock; deep soils, 40 to 60 inches; moderately deep, 20 to 40 inches; shallow, 10 to 20 inches; and very shallow, less than 10 inches.

Depth to bedrock (in tables). Bedrock is too near the surface for the specified use.

Dip slope. A slope of the land surface, roughly determined by and approximately conforming to the dip of the underlying bedded rock (for example, the long, gently inclined surface of a cuesta).

Diversion (or diversion terrace). A ridge of earth, generally a terrace, built to protect downslope areas by diverting runoff from its natural course.

Drainage class (natural). Refers to the frequency and duration of wet periods under conditions similar to those under which the soil formed. Alterations of the water regime by human activities, either through drainage or irrigation, are not a consideration unless they have significantly changed the morphology of the soil. Seven classes of natural soil drainage are recognized—*excessively drained, somewhat excessively drained, well drained, moderately well drained, somewhat poorly drained, poorly drained,*and *very poorly drained*. These classes are defined in the "Soil Survey Manual."

Drainage, surface. Runoff, or surface flow of water, from an area.

Drainageway. A general term for a course or channel along which water moves in draining an area.

Drift. Pulverized and other rock material transported by glacial ice and then deposited. Also, the sorted and unsorted material deposited by streams flowing from glaciers.

Duff. A generally firm organic layer on the surface of mineral soils. It consists of fallen plant material that is in the process of decomposition and includes everything from the litter on the surface to underlying pure humus.

Dune. A low mound, ridge, bank, or hill of loose, windblown, granular material (generally sand), either barren or covered with vegetation, that is capable of movement from place to place but always retains its characteristic shape.

Duripan. A subsurface soil horizon that is cemented with illuvial silica, commonly opal or microcrystalline forms, to the degree that less than 50 percent of the volume of air-dry fragments will slake in water or hydrochloric acid.

EC. See Electrical conductivity.

Ecological site. An area where climate, soil, and relief are sufficiently uniform to produce a distinct natural plant community. An ecological site is the product of all the environmental factors responsible for its development. It is typified by an association of species that differ from those on other ecological sites in kind and/or proportion of species or in total production.

Electrical conductivity (EC). The electrolytic conductivity of an extract from saturated soil paste.

Eluviation. The movement of material in true solution or colloidal suspension from one place to another within the soil. Soil horizons that have lost material through eluviation are eluvial; those that have received material are illuvial.

Endosaturation. A type of saturation of the soil in which all horizons between the upper boundary of saturation and a depth of 2 meters are saturated.

Eolian material. Material transported and deposited by wind, including earth material such as dune sand, sand sheets, loess, and clay.

Ephemeral stream. A stream, or reach of a stream, that flows only in direct response to precipitation. It receives no long-continued supply from melting snow or other source, and its channel is above the water table at all times.

Episaturation. A type of saturation indicating a perched water table in a soil in which saturated layers are underlain by one or more unsaturated layers within 2 meters of the surface.

Erosion. The wearing away of the land surface by water, wind, ice, or other geologic agents and by such processes as gravitational creep.

Erosion (geologic). Erosion caused by geologic processes acting over long geologic periods and resulting in the wearing away of mountains and the building up of such landscape features as flood plains and coastal plains. Synonym: natural erosion.

Erosion (accelerated). Erosion much more rapid than geologic erosion, mainly as a result of human or animal activities or of a catastrophe in nature, such as a fire, that exposes the surface.

Erosion pavement. A concentration of gravel or coarser fragments that remains on the soil surface after finer particles have been removed by running water or wind.

Escarpment. A relatively continuous and steep slope or cliff breaking the general continuity of more gently sloping land surfaces and resulting from erosion or faulting. The term is most commonly applied to cliffs produced by differential erosion. Synonym: scarp.

Extrusive. Pertaining to igneous rock and sediment derived from deep-seated molten matter (magma) deposited and cooled on the earth's surface, including lava flows and tephra deposits.

Family, soil. The most specific hierarchical category in soil taxonomy.

Fan piedmont. The most extensive landform on piedmont slopes that is formed either by the lateral downslope coalescence of mountain-front alluvial fans into one generally smooth slope with or without the transverse undulations of the semiconical alluvial fans or by the accretion of fan aprons.

Fan remnant. A general term for landforms that are the remaining parts of older fan landforms, such as alluvial fans, fan aprons, inset fans, and fan skirts, that either have been dissected (erosional fan remnants) or partially buried (nonburied fan remnants). An erosional fan remnant has a relatively flat summit that is a relict fan surface. A nonburied fan remnant is a relict surface in its entirety.

Fan terrace. See Fan remnant.

Fertility, soil. The quality that enables a soil to provide plant nutrients, in adequate amounts and in proper balance, for the growth of specified plants when light, moisture, temperature, tilth, and other growth factors are favorable.

Fibric soil material (peat). The least decomposed of all organic soil material. Peat contains a large amount of well preserved fiber that is readily identifiable according to botanical origin. Peat has the lowest bulk density and the highest water content at saturation of all organic soil material.

Field moisture capacity. The moisture content of a soil, expressed as a percentage of the ovendry weight, after the gravitational, or free, water has drained away; the field moisture content 2 or 3 days after a soaking rain; also called *normal field capacity, normal moisture capacity,* or *capillary capacity*.

Fill slope. A sloping surface consisting of excavated soil material from a road cut. It commonly is on the downhill side of the road.

Fine textured soil. Sandy clay, silty clay, or clay.

Firebreak. Area cleared of flammable material to stop or help control creeping or running fires. It also serves as a line from which to work and to facilitate the movement of firefighters and equipment. Designated roads also serve as firebreaks.

First bottom. The normal flood plain of a stream, subject to frequent or occasional flooding.

Flaggy soil material. Material that has, by volume, 15 to 35 percent flagstones. Very flaggy soil material has 35 to 60 percent flagstones, and extremely flaggy soil material has more than 60 percent flagstones.

Flagstone. A thin fragment of sandstone, limestone, slate, shale, or (rarely) schist 6 to 15 inches (15 to 38 centimeters) long.

Flood plain. The nearly level plain that borders a stream and is subject to inundation under floodstage conditions unless protected artificially. It is commonly a constructional landform consisting of sediment deposited during overflow and lateral migration of a stream.

Fluvial. Of or pertaining to rivers; produced by river action.

Foothill. A steeply sloping upland that has relief of as much as 1,000 feet (300 meters) and fringes a mountain range or high-plateau escarpment.

Footslope. The position that forms the inner, gently inclined surface at the base of a hillslope. In profile, footslopes are commonly concave. A footslope is a transition zone between upslope sites of erosion and transport (shoulders and backslopes) and downslope sites of deposition (toeslopes).

Forb. Any herbaceous plant not a grass or a sedge.

Forest cover. All trees and other woody plants (underbrush) covering the ground in a forest.

Forest type. A stand of trees similar in composition and development because of given physical and biological factors by which it may be differentiated from other stands.

Fragipan. A loamy, brittle subsurface horizon low in porosity and content of organic matter and low or moderate in clay but high in silt or very fine sand. A fragipan appears cemented and restricts roots. When dry, it is hard or very hard and has a higher bulk density than the horizon or horizons above. When moist, it tends to rupture suddenly under pressure rather than to deform slowly.

Fragments. Unattached cemented pieces of bedrock, bedrocklike material, durinodes, concretions, and nodules 2 millimeters in diameter or larger in mineral soils; woody material 20 millimeters in diameter or larger in organic soils.

Genesis, soil. The mode of origin of the soil. Refers especially to the processes or soil-forming factors responsible for the formation of the solum, or true soil, from the unconsolidated parent material.

Glacial. Of or pertaining to the presence and activity of ice and glaciers, such as glacial erosion; pertaining to distinctive features and material produced by or derived from glaciers and ice sheets, such as glacial lakes; or pertaining to an ice age or region of glaciation.

Glacial drift. See Drift.

Glacial outwash. See Outwash.

Glacial till. See Till.

Glaciofluvial deposits. Material moved by glaciers and subsequently sorted and deposited by streams flowing from the melting ice. The deposits are stratified and occur as outwash plains, valley trains, deltas, kames, eskers, and kame terraces.

Glaciolacustrine deposits. Material ranging from fine clay to sand derived from glaciers and deposited in glacial lakes mainly by glacial meltwater. Many deposits are interbedded or laminated with varves or rhythmites.

Gleyed soil. Soil that formed under poor drainage, resulting in the reduction of iron and other elements in the profile and in gray colors.

Granite. A felsic igneous intrusive rock containing quartz and orthoclase with smaller amounts of sodic plagioclase and commonly muscovite.

Granitic. A textural term commonly pertaining to an igneous intrusive rock of felsic to intermediate composition. Referring to granitelike rock, but not necessarily true granite. Commonly applied to granite, quartz monzonite, granodiorite, and diorite.

Granodiorite. An igneous intrusive rock that is intermediate between felsic and mafic in composition and contains quartz and somewhat more plagioclase than orthoclase.

Grassed waterway. A natural or constructed waterway, typically broad and shallow, seeded to grass as protection against erosion. Conducts surface water away from cropland.

Gravel. Rounded or angular fragments of rock as much as 3 inches (2 millimeters to 7.6 centimeters) in diameter. An individual piece is a pebble.

Gravelly soil material. Material that has 15 to 35 percent, by volume, rounded or angular rock fragments, not prominently flattened, as much as 3 inches (7.6 centimeters) in diameter.

Ground water. Water filling all the unblocked pores of the material below the water table.

Gully. A small channel with steep sides cut by the concentrated, but intermittent, flow of water commonly during and immediately following heavy rainfall or following icemelt or snowmelt. A gully generally is an obstacle to wheeled vehicles and is too deep to be obliterated by ordinary tillage; a rill is of lesser depth and can be smoothed over by ordinary tillage.

Hard bedrock. Bedrock that cannot be excavated except by blasting or by the use of special equipment that is not commonly used in construction.

Hardpan. A hardened or cemented soil horizon, or layer. The soil material is sandy, loamy, or clayey and is cemented by iron oxide, silica, calcium carbonate, or other substance.

Head out. To form a flower head.

Hemic soil material (mucky peat). Organic soil material intermediate in degree of decomposition between the less decomposed fibric material and the more decomposed sapric material.

Hill. A generic term for an area of the land surface that rises as much as 1,000 feet (300 meters) above surrounding lowlands, commonly has restricted summit area relative to surrounding surfaces, and has a well-defined outline; hillsides generally have slopes of more than 15 percent. The distinction between a hill and a mountain is arbitrary and commonly is dependent on local usage.

Holocene. The epoch of the Quaternary period of geologic time that extends from the end of the Pleistocene (about 10 to 12 thousand years ago) to the present.

Horizon, soil. A layer of soil, approximately parallel to the surface, having distinct characteristics produced by soil-forming processes. In the identification of soil horizons, an uppercase letter represents the major horizons. Numbers or lowercase letters that follow represent subdivisions of the major horizons. An explanation of the subdivisions is given in the "Soil Survey Manual." The major horizons of mineral soil are as follows:

O horizon.—An organic layer of fresh and decaying plant residue.

A horizon.—The mineral horizon at or near the surface in which an accumulation of humified organic matter is mixed with the mineral material. Also, a plowed surface horizon, most of which was originally part of a B horizon.

E horizon.—The mineral horizon in which the main feature is loss of silicate clay, iron, aluminum, or some combination of these.

B horizon.—The mineral horizon below an A horizon. The B horizon is in part a layer of transition from the overlying A to the underlying C horizon. The B horizon also has distinctive characteristics, such as (1) accumulation of clay, sesquioxides, humus, or a combination of these; (2) prismatic or blocky structure; (3) redder or browner colors than those in the A horizon; or (4) a combination of these.

C horizon.—The mineral horizon or layer, excluding indurated bedrock, that is little affected by soil-forming processes and does not have the properties typical of the overlying soil material. The material of a C horizon may be either like or unlike that in which the solum formed. If the material is known to differ from that in the solum, an Arabic numeral, commonly a 2, precedes the letter C.

Cr horizon.—Soft, consolidated bedrock beneath the soil.

R layer.—Consolidated bedrock beneath the soil. The bedrock commonly underlies a C horizon, but it can be directly below an A or a B horizon.

Hummock. Rounded or conical mound or other small rise.

Humus. The well decomposed, more or less stable part of the organic matter in mineral soils.

Hydrologic soil groups. Refers to soils grouped according to their runoff potential. The soil properties that influence this potential are those that affect the minimum rate of water infiltration on a bare soil during periods after prolonged wetting when the soil is not frozen. These properties are depth to a seasonal high water table, the infiltration rate and permeability after prolonged wetting, and depth to a very slowly permeable layer. The slope and the kind of plant cover are not considered but are separate factors in predicting runoff.

Igneous rock. Rock formed by solidification from a molten or partially molten state. Major varieties include plutonic and volcanic rock. Examples are andesite, basalt, and granite.

Illuviation. The movement of soil material from one horizon to another in the soil profile. Generally, material is removed from an upper horizon and deposited in a lower horizon.

Impervious soil. A soil through which water, air, or roots penetrate slowly or not at all. No soil is absolutely impervious to air and water all the time.

Increasers. Species in the climax vegetation that increase in amount as the more desirable plants are reduced by close grazing. Increasers commonly are the shorter plants and the less palatable to livestock.

Infiltration. The downward entry of water into the immediate surface of soil or other material, as contrasted with percolation, which is movement of water through soil layers or material.

Infiltration capacity. The maximum rate at which water can infiltrate into a soil under a given set of conditions.

Infiltration rate. The rate at which water penetrates the surface of the soil at any given instant, usually expressed in inches per hour. The rate can be limited by the infiltration capacity of the soil or the rate at which water is applied at the surface.

Inset fan. Specific name for the flood plain of an ephemeral stream that is confined between fan remnants, ballenas, basin floor remnants, or closely opposed fan toeslopes of a basin.

Intermittent stream. A stream, or reach of a stream, that does not flow year-round (commonly is dry for 3 months or more annually), and its channel generally is below the local water table. It flows only when it receives baseflow during wet periods or when it receives ground-water discharge or long, continued contributions from melting snow or other surface and shallow subsurface sources.

Intrusive. Pertaining to igneous rock derived from molten matter (magma) that invaded pre-existing rock and cooled below the surface of the earth.

Invaders. On range, plants that encroach into an area and grow after the climax vegetation has been reduced by grazing. Generally, plants invade following disturbance of the surface.

Iron depletions. Low-chroma zones having a low content of iron and manganese oxide because of chemical reduction and removal, but having a clay content similar to that of the adjacent matrix. A type of redoximorphic depletion.

Irrigation. Application of water to soils to assist in production of crops. Methods of irrigation are:

Basin.—Water is applied rapidly to nearly level plains surrounded by levees or dikes.

Border.—Water is applied at the upper end of a strip in which the lateral flow of water is controlled by small earth ridges called border dikes, or borders.

Controlled flooding.—Water is released at intervals from closely spaced field ditches and distributed uniformly over the field.

Corrugation.—Water is applied to small, closely spaced furrows or ditches in fields of close-growing crops or in orchards so that it flows in only one direction.

Drip (or trickle).—Water is applied slowly and under low pressure to the surface of the soil or into the soil through such applicators as emitters, porous tubing, or perforated pipe.

Furrow.—Water is applied in small ditches made by cultivation implements. Furrows are used for tree and row crops.

Level basin (or paddy).—Water is applied to a level plain surrounded by levees or dikes.

Sprinkler.—Water is sprayed over the soil surface through pipes or nozzles from a pressure system.

Subirrigation.—Water is applied in open ditches or tile lines until the water table is raised enough to wet the soil.

Wild flooding.—Water, released at high points, is allowed to flow onto an area without controlled distribution.

K factor. A measurement of potential soil erodibility caused by detachment of soil particles by water.

Kame. A low mound, knob, hummock, or short irregular ridge of stratified sand and gravel deposited by a subglacial stream as a fan or delta at the margin of a melting glacier, by a supraglacial stream in a low place or hole on the surface of a glacier, or by a ponded area, some of which are at the margin of stagnant ice.

Knoll. A small, low, rounded hill rising above adjacent landforms.

Lacustrine deposit. Clastic sediment and chemical precipitates deposited in lakes.

Landslide. The rapid downhill movement of a mass of soil and loose rock, generally when wet or saturated. The speed and distance of movement, as well as the amount of soil and rock material, vary greatly.

Leaching. The removal of soluble material from soil or other material by percolating water.

LEP. See Linear extensibility percent.

Linear extensibility. Refers to the change in length of an unconfined clod as moisture content is decreased from a moist to a dry state. Linear extensibility is used to determine the shrink-swell potential of soils. It is an expression of the volume change between the water content of the clod at 1/3- or 1/10-bar tension (33kPa or 10kPa tension) and oven dryness. Volume change is influenced by the amount and type of clay minerals in the soil. The volume change is the percent change for the whole soil. If it is expressed as a fraction, the resulting value is COLE, coefficient of linear extensibility.

Linear extensibility percent (LEP). The linear expression of the volume difference between the water content of the natural soil fabric at 1/3-bar or 1/10-bar and oven dryness. The volume change is reported as a percent for the whole soil.

Liquid limit (LL). The moisture content at which the soil passes from a plastic to a liquid state.

LL. See Liquid limit.

Loam. Soil material that is 7 to 27 percent clay particles, 28 to 50 percent silt particles, and less than 52 percent sand particles.

Loamy. Coarse sandy loam, sandy loam, fine sandy loam, very fine sandy loam, loam, silt loam, silt, clay loam, sandy clay loam, and silty clay loam soil textures.

Low-residue crops. Such crops as corn used for silage, peas, beans, and potatoes. Residue from these crops is not adequate to control erosion until the next crop in the rotation is established. These crops return little organic matter to the soil.

Low strength. The soil is not strong enough to support loads.

Magma. Molten rock material that originates deep in the earth and solidifies to form igneous rock.

Masses. Concentrations of substances in the soil matrix that do not have a clearly defined boundary with the surrounding soil material and cannot be removed as a discrete unit. Common compounds making up masses are calcium carbonate, gypsum or other soluble salts, iron oxide, and manganese oxide. Masses consisting of iron oxide or manganese oxide generally are considered a type of redoximorphic concentration.

Mechanical treatment. Use of mechanical equipment for seeding, brush management, and other management practices.

Medium textured soil. Very fine sandy loam, loam, silt loam, or silt.

Metamorphic rock. Rock of any origin altered in mineralogical composition, chemical composition, or structure by heat, pressure, and movement in the earth's crust. Nearly all such rocks are crystalline. Examples are schist, gneiss, quartzite, slate, and marble.

Metasediment. A sediment or sedimentary rock that shows evidence of having been subjected to metamorphism.

Metavolcanic. A volcanic rock that shows evidence of metamorphism but has not been fully metamorphosed into metamorphic rock.

Mineral soil. Soil that is mainly mineral material and low in organic material. Its bulk density is more than that of organic soil.

Miscellaneous area. An area that has little or no natural soil and supports little or no vegetation.

Moderately coarse textured soil. Coarse sandy loam, sandy loam, or fine sandy loam.

Moderately deep soil. See Depth, soil.

Moderately fine textured soil. Clay loam, sandy clay loam, or silty clay loam.

Mollic epipedon. A thick, dark, humus-rich surface horizon (or horizons) that has high base saturation and pedogenic soil structure. It may include the upper part of the subsoil.

Moraine. A general term for a landform composed mainly of till deposited by either an active or extinct glacier. Some types are disintegration, end, lateral, recessional, and terminal.

Morainic material. A mound, ridge, or other distinct accumulation of unsorted, unstratified glacial drift, dominantly till, primarily from glacial ice.

Morphology, soil. The physical makeup of the soil, including the texture, structure, porosity, consistence, color, and other physical, mineral, and biological properties of the various horizons, and the thickness and arrangement of those horizons in the soil profile.

Mottling, soil. Irregular spots of different colors that vary in number and size. Descriptive terms are as follows: abundance—*few, common,* and *many;*size—*fine, medium,* and *coarse;*and contrast—*faint, distinct,* and *prominent*. The size measurements are of the diameter along the greatest dimension. *Fine*indicates less than 5 millimeters (about 0.2 inch); *medium,*from 5 to 15 millimeters (about 0.2 to 0.6 inch); and *coarse,*more than 15 millimeters (about 0.6 inch).

Mountain. A natural elevation of the land surface that rises more than 1,000 feet (300 meters) above surrounding lowlands, commonly has limited summit area relative to surrounding surfaces, and generally has steep sides (slopes of more than 25 percent) with or without considerable bare-rock surface. A mountain can occur as a single, isolated mass or in a group forming a chain or range. Mountains are formed primarily by tectonic and/or volcanic activity and by differential erosion.

Muck. Unconsolidated soil material consisting primarily of highly decomposed organic material in which the original plants are not recognizable. It generally contains more mineral material and is darker in color than peat. (See Sapric soil material.)

Munsell notation. A designation of color by degrees of three simple variables—hue, value, and chroma. For example, a notation of 10YR 6/4 is a color with hue of 10YR, value of 6, and chroma of 4.

Neutral soil. A soil having a pH value of 6.6 to 7.3. (See Reaction, soil.)

Nodules. Cemented bodies lacking visible internal structure. Calcium carbonate, iron oxide, and manganese oxide are common compounds making up nodules. If formed in place, nodules of iron oxide or manganese oxide are considered types of redoximorphic concentrations.

Nose slope. A geomorphic component of hills consisting of the projecting end (laterally convex area) of a hillside. The overland waterflow is predominantly divergent.

Nutrient, plant. Any element taken in by a plant essential to its growth. Plant nutrients are mainly nitrogen, phosphorus, potassium, calcium, magnesium, sulfur, iron, manganese, copper, boron, and zinc obtained from the soil and carbon, hydrogen, and oxygen obtained from the air and water.

OM. See Organic matter.

Organic matter (OM). Plant and animal residue in the soil in various stages of decomposition. The content of organic matter in the surface layer is described as follows:

Very low	less than 0.5 percent
Low	0.5 to 1.0 percent
Moderately low	1.0 to 2.0 percent
Moderate	2.0 to 4.0 percent
High	4.0 to 8.0 percent
Very high	more than 8.0 percent

Outwash. Gravel, sand, and silt, commonly stratified, deposited by glacial meltwater.

Outwash plain. An extensive lowland area of coarse textured glaciofluvial material. An outwash plain commonly is smooth; where pitted as a result of meltout of incorporated ice masses, it generally has low relief.

Pan. A compact, dense layer in a soil that impedes the movement of water and the growth of roots. For example, *hardpan, fragipan, claypan, plowpan,* and *traffic pan*.

Parent material. The unconsolidated and chemically weathered mineral and organic material in which the solum of a soil is formed as a result of pedogenic processes.

Peat. Unconsolidated soil material consisting largely of undecomposed or slightly decomposed organic matter that has accumulated under excessive moisture conditions. (See Fibric soil material.)

Ped. An individual natural soil aggregate, such as a granule, a prism, or a block.

Pediment. A gently sloping erosional surface at the foot of a receding hill or mountain slope. The surface may be essentially bare, exposing earth material that extends beneath adjacent uplands, or it may have a thin mantle of alluvium and colluvium, ultimately in transit from the upland front to the basin or valley lowland. On hill footslope terrain, the mantle is designated “pedisediment.” The term pediment is used in several geomorphic contexts: (1) landscape positions, for example, intermontane basin piedmont or valley border footslope surfaces, or respectively, apron and terrace pediments; (2) type of material eroded, either bedrock or regolith; or (3) a combination of these.

Pedisediment. A layer of sediment eroded from the shoulder and backslope of an erosional slope that is being transported or was transported across a pediment.

Pedon. The smallest volume that can be called “a soil.” A pedon is three dimensional and large enough to permit study of all horizons. Its area ranges from about 10 to 100 square feet (1 square meter to 10 square meters), depending on the variability of the soil.

Perched water table. The upper surface of unconfined ground water separated from an underlying main body of ground water by an unsaturated zone.

Percolation. The downward movement of water through the soil.

Permeability. The quality of the soil that enables water or air to move downward through the profile. The rate at which a saturated soil transmits water is accepted as a measure of this quality.

Phase, soil. A subdivision of a soil series based on features that affect its use and management, such as slope, stoniness, and flooding.

pH value. A numerical designation of acidity and alkalinity in soil. (See Reaction, soil.)

PI. See Plasticity index.

Plastic limit. The moisture content at which a soil changes from semisolid to plastic.

Plasticity index (PI). The numerical difference between the liquid limit and the plastic limit; the range of moisture content within which the soil remains plastic.

Plateau. A comparatively flat area of great extent and elevation. Specifically, an extensive land region considerably elevated (more than 100 meters) above adjacent lower lying terrain that is commonly limited on at least one side by an abrupt descent and has a flat or nearly level surface. A relatively large part of a plateau surface is near summit level.

Pleistocene. The epoch of the Quaternary period of geologic time following the Pliocene and preceding the Holocene (approximately 2 million to 10 thousand years ago). Also refers to the corresponding (time-stratigraphic) “series” of earth material.

Ponding. Standing water on soils in closed depressions. Unless the soils are artificially drained, the water can be removed only by percolation or evapotranspiration.

Poorly graded. Refers to a coarse grained soil or soil material consisting mainly of particles of nearly the same size. Because there is little difference in size of the particles, density can be increased only slightly by compaction.

Potential native plant community. See Climax plant community.

Potential rooting depth (effective rooting depth). Depth to which roots could penetrate if the content of moisture in the soil were adequate. The soil has no properties restricting the penetration of roots to this depth.

Prescribed burning. Deliberately burning an area for specific management purposes, under the appropriate conditions of weather and soil moisture and at the proper time of day.

Productivity, soil. The capability of a soil for producing a specified plant or sequence of plants under specific management.

Profile, soil. A vertical section of the soil extending through all its horizons and into the parent material.

Proper grazing use. Grazing at an intensity that maintains enough cover to protect the soil and maintain or improve the quantity and quality of the desirable vegetation. This practice increases the vigor and reproduction capacity of the key plants and promotes the accumulation of litter and mulch necessary to conserve soil and water.

Pyroclastic. Pertaining to fragmental material produced by commonly explosive aerial ejection of clastic particles from a volcanic vent. Such material may accumulate on land or under water.

Range condition. The present composition of the plant community on a range site in relation to the potential natural plant community for that site. Range condition is expressed as excellent, good, fair, or poor on the basis of how much the present plant community differs from the potential.

Range site. An area of rangeland where climate, soil, and relief are sufficiently uniform to produce a distinct natural plant community. A range site is the product of all the environmental factors responsible for its development. It is typified by an association of species that differ from those on other range sites in kind, proportion, and total production.

Rangeland. Land on which the potential natural vegetation is predominantly grasses, grasslike plants, forbs, or shrubs. It includes natural grasslands, savannas, many wetlands, some deserts, tundras, and areas that support certain forb and shrub communities.

Reaction, soil. A measure of acidity or alkalinity of a soil, expressed in pH values. A soil that tests to pH 7.0 is described as precisely neutral in reaction because it is neither acid nor alkaline. The degrees of acidity or alkalinity, expressed as pH values, are:

Ultra acid	less than 3.5
Extremely acid	3.5 to 4.4
Very strongly acid	4.5 to 5.0
Strongly acid	5.1 to 5.5
Moderately acid	5.6 to 6.0
Slightly acid	6.1 to 6.5
Neutral	6.6 to 7.3
Slightly alkaline	7.4 to 7.8
Moderately alkaline	7.9 to 8.4
Strongly alkaline	8.5 to 9.0
Very strongly alkaline	9.1 and higher

Redoximorphic concentrations. Nodules, concretions, soft masses, pore linings, and other features resulting from the accumulation of iron or manganese oxide. An indication of chemical reduction and oxidation resulting from saturation.

Redoximorphic depletions. Low-chroma zones from which iron and manganese oxide or a combination of iron and manganese oxide and clay has been removed. These zones are indications of the chemical reduction of iron resulting from saturation.

Redoximorphic features. Redoximorphic concentrations, redoximorphic depletions, reduced matrices, a positive reaction to alpha,alpha-dipyridyl, and other features indicating the chemical reduction and oxidation of iron and manganese compounds resulting from saturation.

Reduced matrix. A soil matrix that has low chroma in situ because of chemically reduced iron (Fe II). The chemical reduction results from nearly continuous wetness. The matrix undergoes a change in hue or chroma within 30 minutes after exposure to air as the iron is oxidized (Fe III). A type of redoximorphic feature.

Regolith. All unconsolidated earth material above the solid bedrock. It includes material weathered in place from all kinds of bedrock and alluvial, glacial, eolian, lacustrine, and pyroclastic deposits. Soil scientists regard as soil only that part of the regolith that has been modified by organisms and soil-forming processes. Most engineers describe the entire regolith, even to a great depth, as “soil.”

Relief. The elevations or inequalities of a land surface, considered collectively.

Remnant. The remaining part of a larger landform or land surface that has been dissected or partially buried.

Residuum (residual soil material). Unconsolidated, weathered or partly weathered mineral material that accumulated as consolidated rock disintegrated in place.

Rhyolite. Extrusive igneous rock, generally porphyritic and exhibiting flow texture, with phenocrysts of quartz and alkali feldspar in a glassy cryptocrystalline ground mass. The extrusive equivalent of granite.

Rill. A small steep-sided channel resulting from erosion. It is cut by a concentrated, but intermittent, flow of water, usually during and immediately following moderate rains or following icemelt or snowmelt. Generally, a rill is not an obstacle to wheeled vehicles and is shallow enough to be obliterated by ordinary tillage.

Riverwash. Barren alluvial areas of unstabilized sand, silt, clay, or gravel reworked frequently by stream activity.

Road cut. A sloping surface produced by mechanical means during road construction. It is commonly on the uphill side of the road.

Rock fragments. Rock or mineral fragments having a diameter of 2 millimeters or more; for example, pebbles, cobbles, stones, and boulders.

Rock outcrop. Exposures of bedrock, excluding lava and rock-lined pits.

Root zone. The part of the soil that can be penetrated by plant roots.

Runoff. The precipitation discharged into stream channels from an area. The water that flows off the surface of the land without sinking into the soil is called surface runoff. Water that enters the soil before reaching surface streams is called ground-water runoff or seepage flow from ground water.

Sand. As a soil separate, individual rock or mineral fragments from 0.05 millimeter to 2.0 millimeters in diameter. Most sand grains consist of quartz. As a soil textural class, a soil that is 85 percent or more sand and not more than 10 percent clay.

Sandstone. Sedimentary rock containing dominantly sand-sized particles.

Sandy. Sand and loamy sand soil textures.

Sapric soil material (muck). The most highly decomposed of all organic soil material. Muck has the least amount of plant fiber, the highest bulk density, and the lowest water content at saturation of all organic soil material.

Saprolite. Soft, friable, isovolumetrically weathered bedrock that retains the fabric and structure of the parent rock and exhibits extensive intercrystal and intracrystal weathering. In pedology, saprolite has been used to refer to any unconsolidated residual material that underlies the soil and grades to hard bedrock below.

SAR. See Sodium adsorption ratio.

Saturation. Wetness characterized by zero or positive pressure of the soil water. Under conditions of saturation, the water will flow from the soil matrix into an unlined auger hole.

Scarification. The act of abrading, scratching, loosening, crushing, or modifying the surface to increase water absorption or to provide a more tillable soil.

Second bottom. The first terrace above the normal flood plain (or first bottom) of a river.

Sedimentary rock. A consolidated deposit of clastic particles, chemical precipitates, or organic matter accumulated at or near the surface of the earth under “normal” low temperature and pressure conditions. Sedimentary rock includes the consolidated equivalents of alluvial, colluvial, drift, eolian, lacustrine, and marine deposits. Examples are sandstone, siltstone, mudstone, claystone, shale, conglomerate, limestone, dolomite, and coal.

Sequum. A sequence consisting of an illuvial horizon and the overlying eluvial horizon. (See Eluviation.)

Series, soil. A group of soils that have profiles that are almost alike, except for differences in texture of the surface layer. All the soils of a series have horizons that are similar in composition, thickness, and arrangement.

Shale. Sedimentary rock that formed as a result of the induration of a clay, silty clay, or silty clay loam deposit and has the tendency to split into thin layers (fissility).

Shallow soil. See Depth, soil.

Sheet erosion. The removal of a fairly uniform layer of soil material from the land surface by the action of rainfall and surface runoff.

Shoulder. The position that forms the uppermost inclined surface near the top of a hillslope. It is a transition from backslope to summit. The surface is dominantly convex in profile and erosional in origin.

Side slope. A geomorphic component of hills consisting of a laterally planar area of a hillside. The overland waterflow is predominantly parallel.

Silica. A combination of silicon and oxygen. The mineral form is called quartz.

Silica-sesquioxide ratio. The ratio of the number of molecules of silica to the number of molecules of alumina and iron oxide. The more highly weathered soils or their clay fractions in warm-temperate, humid regions, and especially those in the tropics, generally have a low ratio.

Silt. As a soil separate, individual mineral particles that range in diameter from the upper limit of clay (0.002 millimeter) to the lower limit of very fine sand (0.05 millimeter). As a soil textural class, soil that is 80 percent or more silt and less than 12 percent clay.

Siltstone. Sedimentary rock made up of dominantly silt-sized particles.

Similar soils. Soils that share limits of diagnostic criteria, behave and perform in a similar manner, and have similar conservation needs or management requirements for the major land uses in the survey area.

Sinkhole. A closed depression formed either by the solution of the surficial material, such as limestone, gypsum, and salt, or by the collapse of underlying caves. Complexes of sinkholes in carbonate-rich terrain are the main components of karst topography.

Site index. A designation of the quality of a forest site based on the height of the dominant stand at an arbitrarily chosen age. For example, if the average height

attained by dominant and codominant trees in a fully stocked stand at the age of 50 years is 75 feet, the site index is 75.

Site index (pinyon and juniper). A designation of the quality of a pinyon or juniper stand based on the basal area in square feet when the stand averages 5 inches in diameter 1 foot above the ground. A site index of 50 means that the stand will have a basal area of 50 square feet.

Slope. The inclination of the land surface from the horizontal. Percentage of slope is the vertical distance divided by horizontal distance, then multiplied by 100. Thus, a slope of 20 percent is a drop of 20 feet in 100 feet of horizontal distance.

Sodium adsorption ratio (SAR). A measure of the amount of sodium (Na) relative to calcium (Ca) and magnesium (Mg) in the water extract from saturated soil paste. It is the ratio of the Na concentration divided by the square root of one-half of the Ca + Mg concentration.

Soft bedrock. Bedrock that can be excavated with trenching machines, backhoes, small rippers, and other equipment commonly used in construction.

Soil. A natural, three-dimensional body at the earth's surface. It is capable of supporting plants and has properties resulting from the integrated effect of climate and living matter acting on earthy parent material, as conditioned by relief over periods of time.

Soil erodibility factors. The Kw and Kf factors quantify the susceptibility of soil to detachment by water. These erodibility factors predict the long-term average soil loss that results from sheet and rill erosion when various cropping systems and conservation techniques are used. The whole soil is considered in the Kw factor, but only the fine-earth fraction, which is the material less than 2 millimeters in diameter, is considered in the Kf factor.

Soil separates. Mineral particles less than 2 millimeters in equivalent diameter and ranging between specified size limits. The names and sizes, in millimeters, of separates recognized in the United States are as follows:

Very coarse sand	2.0 to 1.0
Coarse sand	1.0 to 0.5
Medium sand	0.5 to 0.25
Fine sand	0.25 to 0.10
Very fine sand	0.10 to 0.05
Silt	0.05 to 0.002
Clay	less than 0.002

Solum. The upper part of a soil profile, above the C horizon, in which the processes of soil formation are active. The solum in soil consists of the A, E, and B horizons. Generally, the characteristics of the material in these horizons are unlike those of the material below the solum. The living roots and plant and animal activities are largely confined to the solum.

Stone line. A sheetlike lag concentration of coarse fragments in surficial sediment. In cross section, the line may be marked only by scattered fragments or it may be a discrete layer of fragments. The fragments are more commonly pebbles or cobbles than stones. A stone line generally overlies material that was subject to weathering, soil formation, and erosion before deposition of the overlying material. Many stone lines appear to be buried erosion pavement originally formed by running water on the land surface and concurrently covered by surficial sediment.

Stones. Rock fragments 10 to 24 inches (25 to 60 centimeters) in diameter if rounded or 15 to 24 inches (38 to 60 centimeters) in length if flat.

Stony. Refers to a soil containing stones in numbers that interfere with or prevent tillage.

Stratified. Referring to geologic deposits that were formed, arranged, or laid down in layers. Layers in soils that are a result of the processes of soil formation are called horizons; those inherited from the parent material are called strata.

Stream terrace. One of a series of platforms in a stream valley that flanks and is more or less parallel to the stream channel, originally formed near the level of the stream, and represents the dissected remnants of an abandoned flood plain, streambed, or valley floor produced during an earlier period of erosion or deposition.

Structure, soil. The arrangement of primary soil particles into compound particles or aggregates. The principal forms of soil structure are—*platy* (laminated), *prismatic* (vertical axis of aggregates longer than horizontal), *columnar* (prisms with rounded tops), *blocky* (angular or subangular), and *granular*. *Structureless* soils are either *single grained* (each grain by itself, as in dune sand) or *massive* (the particles adhering without any regular cleavage, as in many hardpans).

Subsidence. The decrease in surface elevation as a result of the drainage of wet soils that have organic layers or semifluid mineral layers.

Subsoil. Technically, the B horizon; roughly, the part of the solum below plow depth.

Substratum. The part of the soil below the solum.

Subsurface layer. Any surface soil horizon (A, E, AB, or EB) below the surface layer.

Summit. The topographically highest position of a hillslope. It has a nearly level (planar or only slightly convex) surface.

Surface layer. The soil ordinarily moved in tillage, or its equivalent in uncultivated soil, ranging in depth from 4 to 10 inches (10 to 25 centimeters). Frequently designated as the “plow layer,” or the “Ap horizon.”

Surface soil. The A, E, AB, and EB horizons, considered collectively. It includes all subdivisions of these horizons.

T factor. The soil loss tolerance, which is defined as the maximum amount of erosion at which the quality of a soil as a medium for plant growth can be maintained. Maintaining the quality of the soil includes maintaining the surface soil as a seedbed for plants, maintaining the atmosphere-soil interface to allow the entry of air and water into the soil and still protect the underlying soil from wind and water erosion, and maintaining the total soil volume as a reservoir for water and plant nutrients, which is preserved by minimizing soil loss.

Talus. Rock fragments of any size or shape (commonly coarse and angular) at the base of a cliff or very steep rock slope; the accumulated mass of such loose, broken rock formed mainly by falling, rolling, or sliding.

Temperature regime, soil. A system that categorizes for taxonomic purposes general, long-term soil temperature conditions at the standard depth of 20 inches or at the surface of the bedrock, whichever is at a shallower depth. The various regimes are defined according to the freezing point of water or to the high and low extremes for significant biological activity. The regimes are defined in “Keys to Soil Taxonomy” (Soil Survey Staff, 2006). Those that occur in this survey area are as follows:

Cryic.—Soils that have a mean annual temperature of 32 to 47 degrees F and remain cold in summer.

Frigid.—Soils that have a mean annual temperature similar to that of the cryic regime but have a mean summer temperature at least 9 degrees warmer.

Terminal moraine. An end moraine that marks the farthest advance of a glacier and commonly has the form of a massive arcuate or concentric ridge, or complex of ridges, underlain by till and other types of drift.

Terrace (conservation practice). An embankment, or ridge, constructed across sloping soils on the contour or at a slight angle to the contour. The terrace intercepts surface runoff so that water soaks into the soil or flows slowly to a prepared outlet. A terrace in a field generally is built so that the field can be

farmed. A terrace intended mainly for drainage has a deep channel that is maintained in permanent sod.

Terrace (geologic). An old alluvial plain, ordinarily flat or undulating, bordering a river, a lake, or the sea.

Terrace (geomorphologic). A steplike surface bordering a valley floor or shoreline that represents the former position of a flood plain, lake, or seashore. The term is commonly applied to both the relatively flat summit surface (tread) that has been cut or builtup by stream or wave action and the steeper descending slope (scarp or riser) that grades to a lower base level of erosion. Practically, terraces are considered to be generally flat alluvial areas above the 100-year flood stage.

Terracette. A small, irregular steplike area on steep hillslopes, especially in pasture, that formed as a result of creep or erosion of surficial material that may or may not have been induced by trampling of livestock such as sheep or cattle.

Texture, soil. The relative proportions of sand, silt, and clay particles in a mass of soil. The basic textural classes, in order of increasing proportion of fine particles, are *sand, loamy sand, sandy loam, loam, silt loam, silt, sandy clay loam, clay loam, silty clay loam, sandy clay, silty clay,* and *clay*. The sand, loamy sand, and sandy loam classes may be further divided by specifying "coarse," "fine," or "very fine." Abbreviations for the texture terms are *C—clay, CL—clay loam, COS—coarse sand, COSL—coarse sandy loam, FS—fine sand, FSL—fine sandy loam, L—loam, LCOS—loamy coarse sand, LFS—loamy fine sand, LS—loamy sand, LVFS—loamy very fine sand, S—sand, SC—sandy clay, SCL—sandy clay loam, SI—silt, SIC—silty clay, SICL—silty clay loam, SIL—silt loam, SL—sandy loam, VFS—very fine sand,* and *VFSL—very fine sandy loam.*

Terms used in lieu of texture descriptions are *BR—bedrock, BY—boulders, CB—cobbles, CN—channers, FL—flagstones, G—gravel, HPM—highly decomposed plant material, MAT—material, MPM—moderately decomposed plant material,* MUCK—muck, *MPT—mucky peat,* MUCK—muck, PBY—paraboulders, *PCB—paracobbles, PCN—parachanners,* PEAT—peat, *PFY—paraflagstones, PG—paragravel, PST—parastones, SPM—slightly decomposed plant material, ST—stones, UWB—unweathered bedrock, VAR—variable,* and *W—water.*

The texture modifiers that may apply to textural classes are *ASHY—ashy, BY—bouldery, BYV—very bouldery, BYX—extremely bouldery, CB—cobbly, CBV—very cobbly, CBX—extremely cobbly, CEM—cemented, CN—channery, CNV—very channery, CNX—extremely channery, COP—coprogenous, DIA—diatomaceous, FL—flaggy, FLV—very flaggy, FLX—extremely flaggy, GR—gravelly, GRC—coarse gravelly, GRF—fine gravelly, GRM—medium gravelly, GRV—very gravelly, GRX—extremely gravelly, GS—grassy, GYP—gypsiferous, HB—herbaceous, HYDR—hydrous, MEDL—medial, MK—mucky, MR—marly, MS—mossy, PBY—paraboulder, PBYV—very paraboulder, PBYX—extremely paraboulder, PCB—paracobbly, PCBV—very paracobbly, PCBX—extremely paracobbly, PCN—parachannery, PCNV—very parachannery, PCNX—extremely parachannery, PF—permanently frozen, PFY—paraflaggy, PFYV—very paraflaggy, PFYX—extremely paraflaggy, PG—paragravelly, PGV—very paragravelly, PGX—extremely paragravelly, PST—parastony, PSTV—very parastony, PSTX—extremely parastony, PT—peaty, ST—stony, STV—very stony, STX—extremely stony,* and *WD—woody.*

Till. Unsorted, nonstratified glacial drift consisting of clay, silt, sand, and boulders transported and deposited by glacial ice.

Till plain. An extensive area of nearly level to undulating soils underlain by glacial till.

Tilth, soil. The physical condition of the soil as related to tillage, seedbed preparation, seedling emergence, and root penetration.

Toeslope. The outermost inclined surface at the base of a hill; part of a footslope.

Topsoil. The upper part of the soil, which is the most favorable material for plant growth. It is ordinarily rich in organic matter and is used to topdress roadbanks, lawns, and land affected by mining.

Trace elements. Chemical elements, for example, zinc, cobalt, manganese, copper, and iron, in soils in extremely small amounts. They are essential to plant growth.

Tuff. A generic term for any consolidated or cemented deposit that is 50 percent volcanic ash (less than 2 millimeters in size). Various types of tuff can be recognized by their composition; acidic tuff is dominantly acidic particles and basic tuff is dominantly basic particles.

Unified soil classification. A system for classifying mineral and organic soils for engineering purposes based on particle-size characteristics, liquid limit, and plasticity index.

Upland (geomorphologic). A general term for the higher land of a region in contrast to the low-lying, adjacent land, such as a valley or plain; land at a higher elevation than the flood plain or low stream terrace; or land above the footslope zone of the hillslope continuum.

Valley fill. The unconsolidated sediment deposited by any agent (water, wind, ice, or mass wasting) that fills or partly fills a valley.

Variegation. Refers to patterns of contrasting colors assumed to be inherited from the parent material rather than to be the result of poor drainage.

Varve. A sedimentary layer or a lamina or sequence of laminae deposited in a body of still water within a year. Specifically, a thin pair of graded glaciolacustrine layers seasonally deposited, usually by meltwater streams, in a glacial lake or other body of still water in front of a glacier.

Vegetative cover. The crown cover of all live plants in relation to the ground surface.

Very deep soil. See Depth, soil.

Very shallow soil. See Depth, soil.

Water bars. Smooth, shallow ditches or depressional areas that are excavated at an angle across a sloping road. They are used to reduce the downward velocity of water and divert it off and away from the road surface. Water bars can easily be driven over if constructed properly.

Water table. The upper surface of ground water or the level below which the soil is saturated by water. Also, the top of an aquifer.

Weathering. All physical and chemical changes produced in rocks or other deposits at or near the earth's surface by atmospheric agents. These changes result in disintegration and decomposition of the material.

WEG. See Wind erodibility group.

Well graded. Refers to soil material consisting of coarse grained particles that are well distributed over a wide range in size or diameter. Such soil normally can be easily increased in density and bearing properties by compaction. Contrasts with poorly graded soil.

Wilting point (or permanent wilting point). The moisture content of soil, on an ovendry basis, at which a plant (specifically a sunflower) wilts so much that it does not recover when placed in a humid, dark chamber.

Wind erodibility group (WEG). A grouping of soils that have similar properties affecting their resistance to wind erosion in cultivated areas.

Windthrow. The uprooting and tipping over of trees by the wind.

Xeric moisture regime. The typical moisture regime in areas of Mediterranean climates, where it is moist and cool in winter and warm and dry in summer. The moisture, which falls during winter, when potential evapotranspiration is at a minimum, is particularly effective in leaching. The mean annual soil temperature is less than 22 degrees C, and the difference between the mean summer and mean winter soil temperatures is 6 degrees or more.

Xerophytic. Pertaining to vegetation that is adapted to dry areas.

Tables

Table 1a.--Temperature and Precipitation

(Recorded in the period 1971-2000 at Tahoe City, California)

Month	Temperature						Precipitation				
				2 years in 10 will have--				2 years in 10 will have--			
	Average daily maximum	Average daily minimum	Average	Maximum temperature higher than--	Minimum temperature lower than--	Average number of growing degree days*	Average	Less than--	More than--	Average number of days with 0.10 inch or more	Average snowfall

* A growing degree day is a unit of heat available for plant growth. It can be calculated by adding the maximum and minimum daily temperatures, dividing the sum by 2, and subtracting the temperature below which growth is minimal for the principal crops in the area (50 degrees F).

Table 1b.--Temperature and Precipitation

(See explanations of terminology at the end of this table. The data are from various periods of record for the representative SNOTEL sites)

ID	Site name	MAAT	MWAT	MSAT	Frost	Freeze	MAP	Notes
		Avg	Avg	Avg	Median	Median	Avg

NV19k04s	Marlette Lake----	4	-3	12	85	113	35	1979-2004 data used for MAP values.

MAAT--Mean annual air temperature in degrees C; calculated by averaging the month and then averaging the results to get the year.

MSAT--Mean summer air temperature (June, July, August) in degrees C.

MWAT--Mean winter air temperature (December, January, February) in degrees C.

Frost--Frost-free days: The number of days between the last freezing temperature (0 degrees C) in spring (January through July) and the first freezing temperature (0 degrees C) in fall (August through December).

Freeze--Freeze-free days: The number of days between the last freezing temperature (-2 degrees C) in spring (January through July) and the first freezing temperature (-2 degrees C) in fall (August through December).

MAP--Mean annual precipitation.

Table 2.--Freeze Dates in Spring and Fall

(Recorded in the period 1971-92 at Tahoe City, California)

Probability	Temperature		
	24 °F or lower	28 °F or lower	32 °F or lower
Last freezing temperature in spring:			
1 year in 10 later than--	May 31	June 15	July 6
2 years in 10 later than--	May 22	June 9	June 30
5 years in 10 later than--	May 6	May 27	June 17
First freezing temperature in fall:			
1 year in 10 earlier than--	Oct. 11	Sept. 19	Aug. 29
2 years in 10 earlier than--	Oct. 16	Sept. 26	Sept. 5
5 years in 10 earlier than--	Oct. 27	Oct. 9	Sept. 19

Table 3.--Growing Season

(Recorded in the period 1971-92 at Tahoe City, California)

Probability	Daily minimum temperature during growing season		
	Higher than 24 °F	Higher than 28 °F	Higher than 32 °F
	Days	Days	Days
9 years in 10	143	106	69
8 years in 10	154	116	77
5 years in 10	173	134	93
2 years in 10	193	152	109
1 year in 10	203	161	118

Table 15a.--Recreational Development

(The information in this table indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the potential limitation. The rating is based on the limitation with the highest value. Only the three highest value limitations are listed. There may be more limitations. Fine-earth fractions and coarse fragments are reported on a weight basis. An explanation of the rating criteria and of the abbreviations used in describing the limitations is given at the end of the table)
