# World Agricultural Production

## Brazil Corn Yield

### Brazil's Corn Crop Continues To Rise in Area, Yield, and Production

Brazil's corn production for 2006/07 is forecast at a record 48.0 million tons, up 2.0 million from last month, and up 6.3 million from last year. Harvested area is forecast at 13.3 million hectares, up 0.3 million from last month and up 0.4 million from last year. Yield is forecast at 3.6 tons per hectare, up slightly from last month and up 12 percent from last year. Summer corn harvest is underway, and is especially advanced in Parana, Rio Grande do Sul and Mato Grosso do Sul. Reported yields have been above average due to optimal weather since planting in most of Brazil's corn regions. Brazil's largest summer corn producing states are Parana, Minas Gerais, and Rio Grande do Sul, which account for approximately 17, 14, and 11 percent of the total corn crop, respectively. High corn prices due to US ethanol demand are influencing farmers to plant a bigger safrinha (winter) corn crop and may help to boost yield due to increased fertilizer sales. Winter corn planting is underway and should be nearly finished by the end of March. Soybeans are being harvested ahead of normal in Mato Grosso despite wetness in some areas, which will mean earlier planting of winter corn (which follow

Approved by the World Agricultural Outlook Board

soybeans), thus resulting in higher yield prospects. Winter corn typically accounts for 25 percent of Brazil's total corn area and 23 percent of the total corn production. *(For more information, contact Nicole Wagner at 202-720-0882.)*

## **Record Production Forecast for Brazil Soybeans**

Brazil's soybean production for 2006/07 is forecast at a record 57.0 million tons, up 1.0 million from last month and up 2.0 million from last year. Harvested area is forecast at 21.0 million hectares, unchanged from last month but down 1.0 million from last year. Yield is forecast at 2.71 tons per hectare, up slightly from last month and up 9 percent from last year. While wet conditions during the middle of February threatened quality and yield in the number one producing state of Mato Grosso, and in the secondary regions of the northeast, sunny and dry weather arrived at the end of February allowing beans to dry and harvest to resume. According to Brazil's Ministry of Agriculture (CONAB), yields have been revised upward in Parana, Mato Grosso do Sul, Santa Catarina, and Rio Grande do Sul from their last survey. These state yield increases have more than offset localized yield losses in Mato Grosso. Mato Grosso is 42 percent harvested, compared to 31 percent harvested this time last year. Parana is 19 percent harvested compared to 16 percent a year ago. Rio Grande do Sul is the last state to be harvested; approximately 1 percent of its crop has been collected. Mato Grosso, Parana, and Rio Grande do Sul account for approximately 29, 18, and 13 percent of the total production, respectively. Total harvest progress is 18 percent complete, compared to 16 percent this time last year and 13 percent on average. *(For more information, contact Nicole Wagner at 202-720-0882.)*

## **Drought in South Africa Reduces Corn Yields**

South Africa's 2006/07 corn production is forecast at 7.0 million tons, down 2.5 million tons from last month but up 0.1 million from last year. Area is forecast at 2.9 million hectares, down 0.2 million hectares from last month but up 0.9 million or 45 percent from last year. Area was reduced from last month, because low rainfall prevented farmers from planting all their seeds and crops failed in many regions in the west due to moisture stress and high temperatures from early January through early March. The estimated yield of 2.41 tons per hectare is below the 5-year-average yield of 3.10 tons.

Crop conditions were above average at the end of December, but prolonged dryness and near record high temperatures from early January through early March (during the critical pollination and early grain-filling stages) caused irreversible crop damage and lowered potential yield and grain quality. In addition, the crop continues to wilt from lack of rainfall and warm temperatures in early March.

Crop conditions in the east are better than in the west, but yields in the east will also be below average. Rainfall in March would help to reduce further yield losses, but dry and hot weather during January and February reduced yields to below average for most regions within the Maize Triangle.

On February 27, the National Crop Estimates Committee (NCEC) released their first corn

---

production estimate for the commercial sector of 7.7 million tons on 2.59 million hectares. Next month, their estimate will include the developing sector, which last year was estimated at 0.3 million tons on approximately 430,000 hectares. *(For more information, contact Curt Reynolds at 202-690-0134.)*

### **Australia Sorghum Production Slashed by Drought**

Australia sorghum production for 2006/07 is forecast at 1.5 million tons, down 0.4 million or 21 percent from last month and down 0.52 million or 26 percent from last year. This is the smallest crop since the El Niño-induced drought of 2002. The area forecast is 0.65 million hectares, down 0.15 million or 19 percent from last month, and down 0.24 million or 27 percent from last year. The yield forecast is 2.31 tons per hectare. This is 5 percent above the severe drought of 2002.

Sorghum is grown predominantly in northern New South Wales and southern Queensland. Summer rainfall has been well below average and irregular, which has resulted in many early sown crops suffering from moisture stress. The exception has been in Central Queensland where average to above average rainfall has boosted yield potential for early sown crops. In addition sporadic but significant February rainfall is likely to have spurred additional planting as some areas can sow sorghum well into February. *(For more information, contact Jim Crutchfield at 202-690-0135.)*

### **Lack of Rainfall Cuts Indonesia Rice Production**

Indonesia rice production for 2006/07 is forecast at 33.3 million tons on a milled basis, down 0.4 million or 1 percent from last month, and down 1.7 million or 5 percent from last year. The area forecast is 11.4 million hectares, down 0.1 million or 1 percent from last month, and down 0.4 million or 3 percent from last year. The paddy yield forecast is 4.53 tons per hectare; on a milled basis the yield forecast is 2.92 tons per hectare.

The delayed rainy season is expected to reduce sown area on the island of Java, which accounts for over half of Indonesian rice production. Conditions are reportedly normal on the island of Sumatra, which accounts for about one-fourth of Indonesian rice production. The Indonesian Meteorology and Geophysics Agency recently predicted that the rainy season will end in March, several weeks later than normal. This will likely result in harvest delays in March and April when normally 65 percent of rice is harvested.

The main rice crop is sown from November through January and is harvested from March through May. The smaller crop second crop on Java is sown during July and August and then harvested during November and December. *(For more information, contact Jim Crutchfield at 202-690-0135.)*

### **India Cotton Production Rises to a New High**

India's 2006/07 cotton production is estimated at 21.5 million bales, up 0.5 million from last month and up 2.45 million or 13 percent from last year. The area forecast is 9.25 million hectares, unchanged from last month but up 0.38 million or 4 percent from last year. The

---

increase in estimated production is based on higher than expected market arrivals. Cotton arrivals to date have tracked above last season in all production regions. Total market arrivals for India through March 3, 2007, are estimated at 16.8 million bales compared to 14.1 million bales for the comparable period last year. The area estimate of 9.25 is the compilation of State government data. According to FAS/New Delhi Office of Agricultural Affairs, cotton planting for the 2006/07 season increased to 9.25 million hectares as a result of strong cotton prices and positive returns received by farmers in 2005/06.

It is widely accepted that the strong upward trend in India's cotton yield in recent years is a direct result of the increasing adoption of Bt cotton. Given the continuing development of optimally suited Bt varieties for the various production zones within India and the year-to-year increase of Bt area, a record yield of 506 kilograms per hectare is forecast for the season. Bt varieties are not typically higher yielding than other quality hybrids or non-GMO varieties, but a yield advantage is realized in India and other developing countries through the significant reduction of yield losses due to bollworms. *(For more information, contact Jim Crutchfield at 202-690-0135.)*

### **China Peanut and Rapeseed Production Higher Than Expected**

China's peanut and rapeseed estimates for 2006/07 were revised this month based on official data from the China's National Bureau of Statistics (NBS). On February 28, NBS announced that total oilseed production (rapeseed, peanuts, sesame sunflower seed, and miscellaneous seeds) fell slightly to 30.61 million tons in 2006. An estimated 3.6-percent drop in oilseed area to 13.8 million hectares was nearly offset by an estimated 3 percent increase in yield.

USDA estimates China's 2006/07 rapeseed production this month at 12.7 million tons, up 0.2 million from last month but down 0.35 million or 3 percent from last year. Estimated area was lowered to 6.95 million hectares, down 3 percent from last month and down more than 4 percent from last year. Many farmers reportedly shifted from rapeseed to winter wheat in 2006. The estimated yield of 1.83 tons per hectare is up about 2 percent from last year. Production dropped in several key rapeseed provinces along the Yangtze River due to lower planted area and unusually cool spring weather, but these losses were partly offset by higher yields in other areas.

USDA estimates peanut production in 2006/07 at a record 14.6 million tons, up 0.6 million from last month and up 0.3 million or 2 percent from last year. Area is estimated at 4.55 million hectares, down about 2 percent from last year, while estimated yield was raised to a record 3.21 tons per hectare, up about 5 percent from a year ago. Peanut production is concentrated on the North China Plain, where the crop benefited from near-normal weather last summer and excellent harvest conditions in the fall, particularly in Henan, Anhui, and Jiangsu provinces. Severe drought and typhoons, however, lowered peanut output in parts of southern and southwest China. *(For more information, contact Paulette Sandene at 202-690-0133.)*

This report uses information from the Foreign Agricultural Service's (FAS) global network of agricultural attachés and counselors, official statistics of foreign governments and other foreign source materials, and the analysis of economic data and satellite imagery. Estimates of foreign area, yield, and production are from the International Production Assessment Branch, FAS, and are reviewed by USDA's Inter-Agency Commodity Estimates Committee. Estimates of U.S. area, yield, and production are from USDA's National Agricultural Statistics Service. Numbers within the report may not add to totals because of rounding. This report reflects official USDA estimates released in the World Agricultural Supply and Demand Estimates (WASDE-442), March 9, 2007.

**Printed copies are available from the National Technical Information Service. Download an order form at [http://www.ntis.gov/products/specialty/usda/fas\\_a-g.asp](http://www.ntis.gov/products/specialty/usda/fas_a-g.asp), or call NTIS at 1-800-363-2068.**

The FAS International Production Assessment Branch prepared this report. The next issue of World Agricultural Production will be released after 9:30 a.m. Eastern Time, April 10, 2007.

World and Selected Countries and Regions

3/9/2007 9:06:41 AM

**TABLE 18**

The table below presents a 25-year record of the differences between the March projection and the final estimate. Using world wheat production as an example, changes between the March projection and the final estimate have averaged 2.5 million tons (0.5 percent) and ranged from -8.0 to 6.9 million tons. The March projection has been below the final 17 times and above the final 8 times.

**RELIABILITY OF PRODUCTION PROJECTIONS**

COMMODITY AND REGION	PROJECTION AND FINAL ESTIMATES, 1981/82 - 2005/06 1/					
	Difference		Lowest	Highest	Below	Above
	Average	Average	Difference		Final	Final
	Percent	---Million metric tons---		Number of years 2/

<b>BARLEY</b>	0.3	1	-3	11	11	4
<b>OATS</b>	0.1	0	-2	1	4	3

1/ The final estimate for 1981/82-2004/05 is defined as the first December estimate following the marketing year.

2/ May not total 25 if projection was the same as the final.

3/ Includes corn, sorghum, barley, oats, rye, millet, and mixed grain.
