

Renewable Energy Annual 2003

With Preliminary Data For 2003

June 2005

Energy Information Administration
Office of Coal, Nuclear, Electric and Alternate Fuels
U.S. Department of Energy
Washington, DC 20585

This report was prepared by the Energy Information Administration, the independent statistical and analytical agency within the U.S. Department of Energy. The information contained herein should be attributed to the Energy Information Administration and should not be construed as advocating or reflecting any policy of the Department of Energy or any other organization.

General information regarding this publication may be obtained from Fred Mayes, Team Leader (202/287-1750, e-mail fred.mayes@eia.doe.gov). Questions about the preparation and content of the report should be directed to Louise Guey-Lee, project coordinator (202/287-1731, e-mail louise.guey-lee@eia.doe.gov).

Overview

Renewable energy consumption in 2003 grew 3 percent to 6.1 quadrillion Btu (Table 1). More than half of the increase came from a 4 percent gain in conventional hydropower, which contributed 104 trillion Btu more to consumption than it did in 2002. A 3 percent increase in biomass accounted for most of the remaining growth. Wind, geothermal, and solar energy consumption changed only modestly. Overall, renewable energy contributed 6 percent of the Nation's total energy supply (Figure 1).

At 6.1 quadrillion Btu, renewable energy consumption in 2003 was at essentially the same level it was in 1989, the year the Energy Information Administration (EIA) first began tracking "non-utility" electricity facilities (Table B1 and Figure 2). Renewable energy consumption peaked in the mid-1990s at 7.1 quadrillion Btu, or 7.5 percent of total US energy, owing largely to record hydropower output. After its peak in 1997, hydropower production declined for 5

Source: Table 1 of this report

consecutive years and has been at normal or below-normal levels since 2000. Industrial and residential biomass consumption have declined slowly, while geothermal output has remained static. Wind and solar photovoltaics have expanded rapidly in recent years, but their share of the total is so small that this growth has not affected the renewable industry trend significantly.

Biomass energy consumption presented a complex picture in 2003. Although overall consumption rose 3 percent, there was great disparity among the components. Industrial and electric power sector biomass consumption declined 1 and 2 percent, respectively, compared to 2002 (Table 2). These two sectors account for over three-fourths of total biomass consumption. However, consumption during 2003 grew so fast in the smaller residential and transportation sectors, 15 and 41 percent, respectively, that their growth more than offset the major sector declines. Ethanol use increased from 133

¹For a discussion of states which have banned MTBE, see <http://www.eia.doe.gov/oiaf/servicercpt/mtbeban/table1.html>.

Source: Table B1 of this report

trillion Btu in 2001 to 156 trillion Btu in 2002 and surged to 220 trillion Btu in 2003 (Figure 2). Since ethanol's primary use is as an oxygenate in reformulated gasoline, its demand is tied to reformulated gasoline output and as a replacement for the other oxygenate additive, MTBE. Originally, MTBE was the overwhelming choice for oxygenating gasoline. Over the past few years, however, several states have passed bans on MTBE due to fears of groundwater contamination from leaky tanks.¹ As a result, MTBE consumption has declined since 2001, from 313 trillion Btu to 277 trillion Btu in 2002 and to 225 trillion Btu in 2003 (Figure 3).

Figure 3. Ethanol and MTBE Consumption in the Transportation Sector, 1992-2003

Sources: Ethanol: Table B1 of this report. MTBE: 1992-2001: Energy Information Administration, Alternatives to Traditional Transportation Fuels, 2003. Estimated Data (Washington, DC, February 2004), Table 10. (See: http://www.eia.doe.gov/cneaf/alternate/page/databables/atf1-13_03.html). MTBE: 2002 and 2003: Energy Information Administration, Petroleum Supply Monthly February 2003, DOE/EIA-0109(2003/02) (Washington, DC, February 2003), Tables 34 and D3, and Office of Oil and Gas, unpublished data.

Geothermal energy consumption has remained largely unchanged for 5 years, as very little new generating capacity has come on line. During 2000, nearly 600 net megawatts of geothermal capacity were retired, and little new capacity has come on line since (Table 5). Non-electric applications represent only a tiny fraction of total geothermal energy consumption.

Wind energy consumption grew 3 percent during 2003 to 108 trillion Btu, far below the double-digit growth experienced in the last few years. The EIA and industry sources document a major increase in capacity at the end of 2003 in anticipation of the expiration of the production tax credit. However, the full effect of these plants on generation levels will not be felt until 2004 when they are in full operation and are reporting to the EIA.

Solar energy maintained its contribution of about 63 trillion Btu in 2003, as solar thermal energy consumption declined while photovoltaic use expanded.

The electric power sector (excluding industrial and commercial combined heat and power (CHP) plants) consumed the most renewable energy in 2003 of any energy use sector, using nearly 60 percent, or 3.6 quadrillion Btu, of total renewable energy consumption. Three-fourths of electric power sector renewable consumption is water for hydropower. The industrial sector is heavily dominated (over 95 percent) by biomass; specifically, wood and wood waste. Residential renewable energy consumption is also heavily dominated by biomass. Residential wood consumption has generally been declining over the past 15 years. Despite a 15 percent increase to 359 trillion Btu, 2003 residential consumption equals just 62 percent of its 1990 value. Commercial sector consumption experienced a 15 percent rate of growth in 2003, bringing consumption near levels of the late 1990's and 2000. As mentioned previously, ethanol consumption in the transportation sector surged during 2003.

Electricity generation (including generation from CHPs) accounted for 4.1 quadrillion Btu, or two-thirds of total renewable energy consumption in 2003 (Table 3). Over 90 percent of this amount came from biomass and water for hydropower. Renewable energy was also consumed for space heating, process heat, and steam (Table 6).

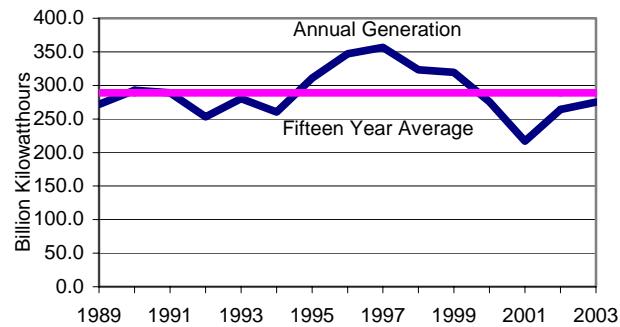

Renewable net electricity generation amounted to nearly 360 billion kilowatthours in 2003, up 2 percent from 2002 (Table 4). Ninety percent came from the electric power sector; its 322 billion kilowatthours was also up 2 percent from 2002. Industrial sector generation was essentially flat.

Geothermal generation dropped 9 percent between 2002 and 2003. The majority of geothermal generation comes from 21 plants at The Geysers field in California, one of the largest

geothermal fields in the world. Production at The Geysers fell sharply about 10 years ago because of a decline in underground pressure to produce steam. As a result, The Geysers, which have a total rated capacity of 1,650 megawatts, are currently achieving (according to industry measurements) an average annual net capacity of only 862 megawatts. The Santa Rosa Geysers Recharge Project, which became operative in December 2003, is designed to enhance steam production and produce 85 megawatts of additional generating capacity from this field by pumping about 11 million gallons of tertiary-treated wastewater daily into The Geysers geothermal reservoir.² The wastewater comes from the Santa Rosa regional sewage treatment plant and other cities through a 41-mile underground pipeline. The project also mitigates a major wastewater disposal problem. The project's final cost was just over \$200 million.

Hydroelectric generation, largely in the electric power sector, rose 4 percent and accounted for over three-fourths of renewable electricity generation in 2003. Despite increasing 27 percent since 2001, hydroelectric generation remains slightly below its average over the past 15 years (Figure 4). Generation from biomass in 2003 varied by detailed fuel category, with wood/wood waste-based generation declining 4 percent, but generation from "other biomass" jumping 17 percent.

Figure 4. Historical Hydroelectric Generation Compared to 15 Year Average for 1989-2003

Sources: 1989-1998: Energy Information Administration, Annual Energy Review 2002, DOE/EIA-0384(2002) (Washington, DC, October 2003), Table 8.2a. 1999-2003 Table 4 of this report.

There was a net addition of 560 megawatts of renewable electric generating capacity in 2003 (Table 5). Of this amount, 438 megawatts was additional wind capacity, and 110 megawatts was biomass. Industry sources indicate the increase for wind was closer to a total of 1,700 megawatts, but some new plants were not yet reporting to EIA.³ At nearly 97,000 megawatts of capacity, renewable energy provided 10 percent of the 2003 total net summer electric generating

capacity. Note that a considerable amount of renewable capacity typically operates at lower capacity factors than large baseload coal, gas, and nuclear plants.

Use of renewable energy for space heat, steam, and process heat grew 8 percent in 2003 to 2 quadrillion Btu (Table 6). Over 60 percent of this energy was consumed in the industrial sector. Over 95 percent of total non-electric renewable energy consumption, and nearly 97 percent of industrial sector non-electric consumption, is biomass. Most of the 1.1 quadrillion Btu of "Wood" consumed in the industrial sector for non-electric energy is a paper mill wood waste product, black liquor. Residential biomass use grew 15 percent in 2003, due mostly to a colder winter than in 2002. Commercial sector biomass use grew similarly. As mentioned previously, transportation sector non-electric consumption growth was rapid at 41 percent, due to increased ethanol usage as an oxygenate in gasoline.

A detailed examination of total biomass energy consumption reveals some interesting points. First, twice as much biomass was used for space, steam, and process heat (1.9 quads) as for electricity production in 2003. This contrasts with all other renewables, which are largely or entirely used to generate electricity. Since the industrial sector has by far the greatest demand for process heat and steam, the majority of total biomass (59 percent) was consumed there in 2003.

Figure 5. Industrial Biomass Energy Consumption by End Use, 2002 (Trillion Btu)

Source: Table 8 of this report.

Second, about 72 percent (1.2 quadrillion Btu) of industrial biomass was used for steam and process heat (also known as "useful thermal output") in 2002 (Tables 8 and B3 and Figure 5). In addition to the Paper and Allied Products industry, the Lumber industry used a significant amount of biomass (248

trillion Btu) in 2002 to produce useful thermal output (Table 8). (Data for 2003 is not presently available for these detailed categories.) Third, after growing strongly between 2001 and

2002, waste and other biomass declined in 2003 by 3 and 7 percent, respectively (Table 7). Over half of biomass waste was consumed by independent power producers in 2002 (Table 9).

The Pacific "contiguous" (i.e., continental) Census Division generated nearly half, or 170 billion kilowatthours, of all renewable electricity in 2002 (Table B2). This included 144 billion kilowatthours of hydropower. Four other divisions (East South Central, Middle Atlantic, Mountain, and South Atlantic) generated roughly 30 billion kilowatthours each. The Pacific Contiguous division, which includes California and Washington, dominated generation from all renewable fuels except biomass. Black liquor- and wood/wood waste solids-based electricity were concentrated in the South Atlantic, South Central and Pacific Contiguous divisions (Table B4). New England also had substantial generation from black liquor.

Ninety-six electricity generating plants burned both biomass and coal in 2002 (Table B5). Plants for which biomass is only a small fraction of coal consumption are generally "co-firing" plants attempting to reduce emissions without making major retrofit investments. The remainder are genuine dual- or multi-fired plants consuming fuels based upon availability, demand, and price. For example, paper mills frequently require more energy than is available from the quantity of black liquor produced in the paper-making process.

State developments in renewable electricity generation complemented national trends in 2002. Washington, Oregon, California, and Montana (in descending order of importance) experienced major increases in hydroelectric generation as they recovered from the 2001 drought in the West (Tables C3 and C6). The net increase in renewable electric capacity was modest, less than 500 MW, led by expansion of wind in California, Iowa, and Texas and hydroelectric power in South Dakota and Tennessee (Tables C9 and C12). The western states and New York dominated hydroelectric capacity, while California was the leader in non-hydro electric capacity, with 30 percent of the national non-hydro total.

According to the Database of State Incentives for Renewable Energy (DSIRE), 18 states have renewable portfolio standards or state mandates with varying degrees of commitment to develop renewable energy in the future⁴ (Table C14). The list includes recently added Colorado, Florida and Maryland.

⁴ DSIRE is funded by the US Department of Energy and maintained by the North Carolina Solar Center.

^a Municipal solid waste, landfill gases, agriculture byproducts/crops, sludge waste, tires, and other biomass solids, liquids and gases.

^b Ethanol primarily derived from corn.

^c Includes small amounts of distributed solar thermal and photovoltaic energy used in the commercial, industrial and electric power sectors.

*=Less than 500 billion Btu.

P=Preliminary.

Note: Revised data are in italics. Totals may not equal sum of components due to independent rounding.

Sources: Analysis conducted by Energy Information Administration, Office of Coal, Nuclear, Electric, and Alternate Fuels and specific sources described as follows. Residential: Energy Information Administration, Form EIA-457A/G, "Residential Energy Consumption Survey;" Oregon Institute of Technology, Geo-Heat Center and Energy Information Administration, Form EIA-63-A, "Annual Solar Thermal Collector Manufacturers Survey" and Form EIA-63B, "Annual Photovoltaic Module/Cell Manufacturers Survey." Commercial: Energy Information Administration, Form EIA-867, "Annual Nonutility Power Producer Report," Form EIA-860B, "Annual Electric Generator Report - Nonutility," Form EIA-906, "Power Plant Report," and Oregon Institute of Technology, Geo-Heat Center. Industrial: Energy Information Administration, Form EIA-846 (A,B,C) "Manufacturing Energy Consumption Survey," Form EIA-867, "Annual Nonutility Power Producer Report," Form EIA-860B, "Annual Electric Generator Report - Nonutility," and Form EIA-906, "Power Plant Report", Oregon Institute of Technology, Geo-Heat Center and Government Advisory Associates, Resource Recovery Yearbook and Methane Recovery Yearbook. Transportation: Bureau of Alcohol, Tobacco and Firearms, fuel ethanol production and import data, U.S. Bureau of Census, Schedule B, Commodity Number 2207.20.0000, "Ethyl Alcohol, Denatured of Any Strength," Energy Information Administration, Form-EIA-819M, "Monthly Oxygenate Telephone Report," and Form EIA-814, "Monthly Imports Report." Electric Power: Energy Information Administration, Form EIA-759, "Monthly Power Plant Report," Form EIA-867, "Annual Nonutility Power Producer Report," Form EIA-860B, "Annual Electric Generator Report - Nonutility," and Form EIA-906, "Power Plant Report."

Overview

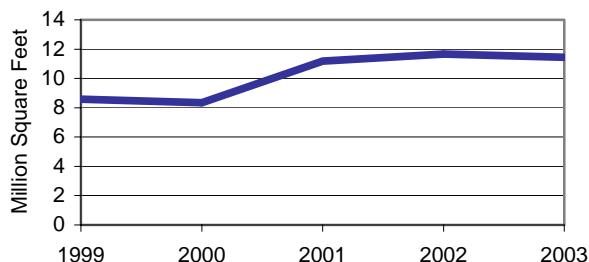

Summary

While the U.S. solar collector market was ho-hum in 2003, the photovoltaic cell and module business was anything but dull. The second-largest manufacturer of photovoltaic (PV) cells and modules, AstroPower, went bankrupt. Other major manufacturers significantly changed their relative outputs of cells and modules, as well as entering and leaving major end-use markets. The result was the first decline in total peak kilowatt production of photovoltaic cells and modules since EIA resumed collecting such data in 1986.

Solar Thermal Collectors

The solar collector market was lackluster in 2003. Total and domestic shipments of solar collectors remained close to 2002 and 2001 levels (Tables 10 and 11 and Figure 1). Total sales were 11.4 million square feet, down 2 percent from 2002. Domestic shipments of 10.9 million square feet declined a similar amount from 2002 levels. The number of companies shipping solar collectors has remained steady since 2000.

Figure 1. Total Solar Thermal Collector Shipments, 1999-2003

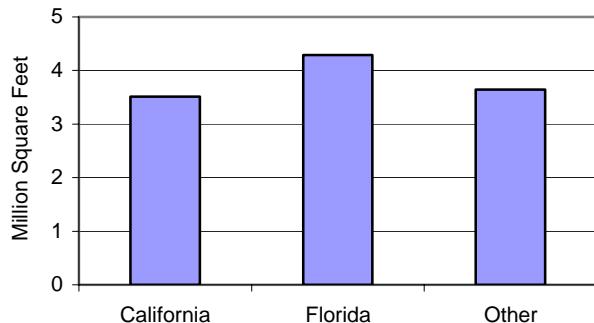

Source: Energy Information Administration, Form EIA-63A, "Annual Solar Thermal Collector Manufacturers Survey."

Low-temperature collectors continued to dominate the market in 2003, with a 95 percent share (Table 12). Nearly three-fourths of all collectors were produced in five domestic locales: California, New Jersey, Florida, Puerto Rico, and Tennessee (Table 13a), with two-thirds shipped from California and New Jersey alone. As in the past few years, around 80 to 85 percent of solar collectors were sent to the top 5 destinations (Table 13b). For 2003, these states were: Florida, California, New Jersey, Arizona, and Hawaii.

All but New Jersey have relatively high incidences of heated swimming pools. Over two-thirds were shipped to just Florida and California (Figure 2).

The small (0.5 million square feet) solar collector export market was dominated by sales to Canada, Mexico, and

Figure 2. Solar Thermal Collector Shipments Top Destinations, 2003

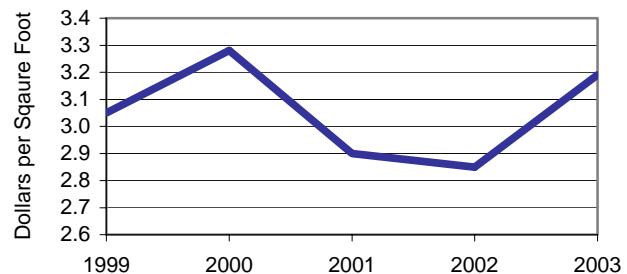

Source: Energy Information Administration, Form EIA-63A, "Annual Solar Thermal Collector Manufacturers Survey."

Austria (Table 15). Collectors were shipped to various kinds of business in similar proportions for both 2002 and 2003 (Table 16).

Steady sales produced steady prices for the dominant low-temperature collector in 2003. The average price per square foot rose slightly to \$2.08 from \$1.97 in 2002 (Table 17). Medium- and high-temperature collectors went for a somewhat higher average price, resulting in the overall average price per square foot of all solar collectors rising to \$3.19 in 2003 from \$2.85 in 2002 (Figure 3).

Figure 3. Solar Thermal Collector Average Prices, 1999-2003

Source: Energy Information Administration, Form EIA-63A, "Annual Solar Thermal Collector Manufacturers Survey."

Shipments by market sector, end use, and type were also similar in 2003 to 2002 (Table 18). The only shift of any size was between the residential and commercial sectors.

One of the few notable differences between 2002 and 2003 solar collector shipments was in complete shipments. The number of complete systems rose 15 percent to 7,266 systems in 2003 (Table 19). Moreover the value of complete shipments increased even more—31 percent. This difference is likely due to the average size of a complete collector decreasing from 143 square feet to 119 square

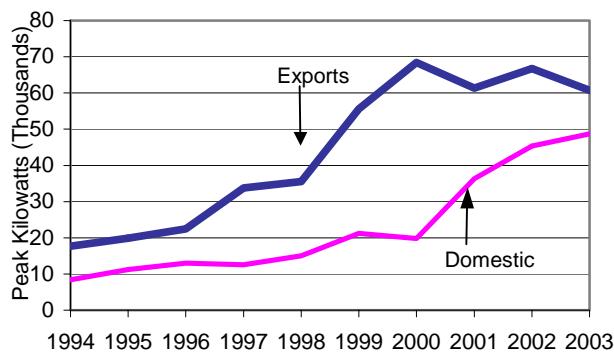

feet, requiring fixed per system costs to be spread over a smaller collector area.

Sales concentration remained constant during 2003, with 92 percent of sales made by the 5 largest firms (Table 21). This concentration has stayed between 90 and 96 percent over the past 5 years. New product introduction continues to be anticipated by only a few companies (Table 20); employment is near the 5-year industry average (Table 22); and except for non-collector system component manufacture, solar collector companies are remaining in the same lines of work (Table 23) as in recent years. Companies which produce solar products continue to do so as the predominant portion of their business (Table 24).

Photovoltaic Cells and Modules

After uninterrupted increases for nearly two decades, shipments of photovoltaic (PV) cells and modules declined 2.5 percent in 2003 to 109,357 peak kilowatts (Table 26). Exports dropped sharply—9 percent—while domestic shipments rose 7 percent (Table 10 and Figure 4).

Figure 4. Photovoltaic Exports and Domestic Shipments, 1994-2003

Sources: Energy Information Administration, Form EIA-63A, "Annual Solar Thermal Collector Manufacturers Survey," and Form EIA-63B, "Annual Photovoltaic Module/Cell Manufacturers Survey."

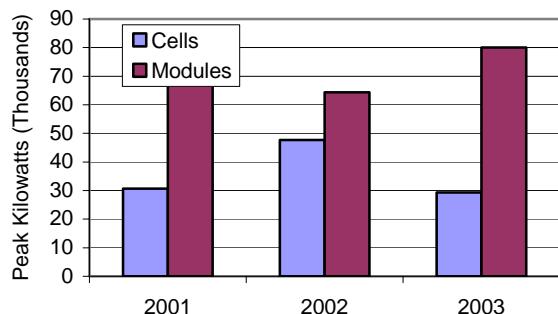

Module shipments increased 24 percent to 80,062 peak kilowatts, but cell shipments decreased to 29,295 peak kilowatts from 47,677 peak kilowatts in 2002 (Table 25 and Figure 5).

Two major events occurred in the PV industry during 2003 that affected cell and module shipments:

- The second-largest producer of PV cells and modules, AstroPower, went bankrupt. Its assets were purchased by General Electric's solar division. The bankruptcy had a major impact on the amount and distribution of cell and module shipments, as will be described later.
- Shell Solar repurchased substantial quantities of cells during 2003 for module manufacture.

Both of these events affected shipments to business categories. Shipments to module manufacturers decreased nearly two-thirds, owing largely to Shell Solar cell

Figure 5. Photovoltaic Cell and Module Shipments, 2001-2003

Source: Energy Information Administration, Form EIA-63B, "Annual Photovoltaic Module/Cell Manufacturers Survey."

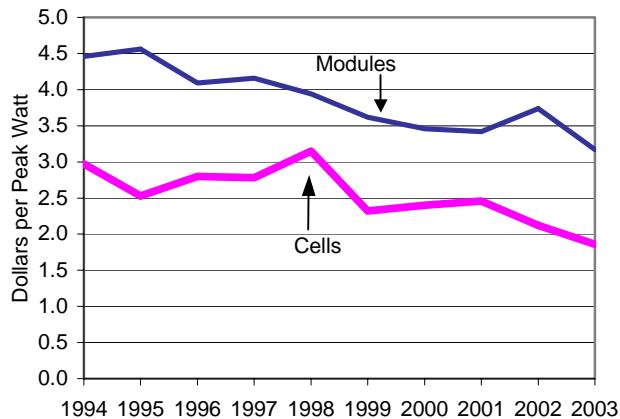

repurchases, which are treated as negative shipments (Table 27). In contrast, shipments to exporters and end-users rose substantially.

Single crystal cell and module shipments suffered the worst drop in 2003 of all PV technologies, falling 15,000 peak kilowatts (Table 28). This was due in large measure to the fact that Astropower produced only single crystal cells. The sharp increase in cast and ribbon cell and module shipments was largely due to one company, RWE, expanding its module capacity substantially during 2003. Other companies also expanded module capacity.

Softer shipments also adversely affected prices in 2003. The average cell price per peak watt for the most prevalent technology, single-crystal silicon, dropped to \$1.88 from \$2.14 in 2002 (Table 29). Single-crystal module prices also dropped, despite increased shipments, from \$3.64 in 2002 to \$3.38 in 2003.

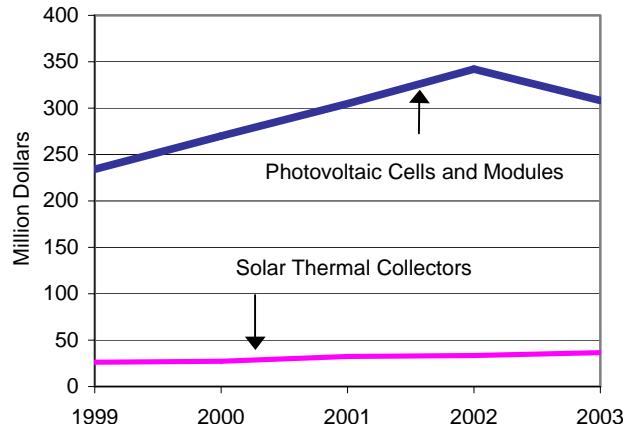

The average price per peak watt of all PV cells displayed a similar pattern (\$2.12 to \$1.86), while the average price of

Figure 6. Photovoltaic Cell and Module Average Prices, 1994-2003

Source: Energy Information Administration, Form EIA-63B, "Annual Photovoltaic Manufacturers Survey."

Figure 7. Solar Equipment Manufacturers' Value of Shipments, 1999-2003

Sources: Energy Information Administration, Form EIA-63A, "Annual Solar Thermal Collector Manufacturers Survey," and Form EIA-63B, "Annual Photovoltaic Module/Cell Manufacturers Survey."

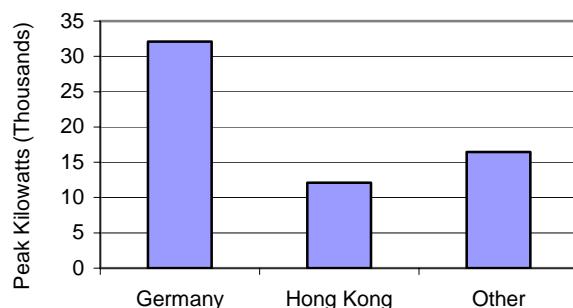

modules declined more (\$3.74 to \$3.17) than did the price of single-crystal modules (Figure 6).

The decline in average price combined with the drop in shipments to reduce the total value of PV shipments to \$308 million in 2003, a 9 percent decline from 2002 (Figure 7). The value of PV shipments still outweighs the value of solar thermal collectors by an 8:1 margin.

Market sector and end-use distributions of PV shipments in 2003 changed considerably from 2002. Shipments in 2003 to the industrial and residential markets declined sharply, 13 and 20 percent, respectively (Table 30). Commercial shipments, in contrast, rose nearly 60 percent from about 21,000 peak kilowatts in 2002 to nearly 33,000 peak kilowatts in 2003. Much of the commercial market increase was due to Shell Solar, which discontinued its recreational vehicle kits and began providing rooftop applications in 2003. This made the commercial market the largest market for PV shipments in 2003, supplanting the industrial market. The distribution of former Astropower markets also affected 2003 market sector shipments substantially.

Shell Solar's product switch also affected the distribution of shipments to end-use categories. Shipments to the transportation sector declined in 2003 by nearly 2,000 peak kilowatts, or 12 percent. Also, grid-interactive electricity generation shipments, which are how rooftop applications

Figure 8. Photovoltaic Export Shipment Top Destinations, 2003

Source: Energy Information Administration, Form EIA-63B, "Annual Photovoltaic Module/Cell Manufacturers Survey."

are generally used, rose almost 9,000 peak kilowatts to over 42,000 peak kilowatts in 2003. With nearly a 40 percent share in 2003, the grid-interactive application increased its position as the predominant use of PV cell and module shipments, up from 30 percent in 2002.

PV exports were split nearly 50:50 between cells and modules during 2003 (Table 31). This was fairly similar to the 2002 pattern, when cells held a slight edge. Over half of 2003 PV exports were to Germany, which imported 2.5 times more U.S. cells and modules than the next-largest importer, Hong Kong (Table 32 and Figure 8).

Shipments of complete PV systems dropped 21 percent in 2003, yet the total peak kilowatts and value of shipped systems actually rose substantially (Table 33). These characteristics are heavily influenced by Shell Solar's change in product mix to larger rooftop installations. These developments affected prices. While the price per system increased more than 40 percent in 2003, the price per peak kilowatt dropped only slightly (\$5.28 in 2003 versus \$5.51 in 2002).

Employment in the PV manufacturing industry dropped slightly in 2003 but remained at approximately 2001-2002 levels (Table 34). Employment rose fairly steadily from 1994 through 1998, then remained stable through 2000. Despite only a 10 percent market share, 5 companies plan to introduce new thin-film products (Table 35). More companies (7) are planning for new products using crystalline silicon technology. No new flat plate or concentrator products are planned. The number and type of companies involved in PV-related businesses remained essentially unchanged in 2003 (Table 36).

Survey of Geothermal Heat Pump Shipments 2003

This report provides information on geothermal heat pump shipments, based on the Energy Information Administration, Form EIA-902, "Annual Geothermal Heat Pump Manufacturers Survey." The survey shows that manufacturers shipped 36,439 geothermal heat pumps in 2003, a 2 percent decrease over the 2002 total of 37,139. Of those shipped in 2003, 10,306 were ARI-320 rated,¹ and 25, 211 were ARI-325 or ARI-330. ARI-rated shipments increased to 35,517 units in 2003, while the number of non-ARI-rated units shipped decreased to 922 ([Table 37](#)).

The total rated capacity of heat pumps shipped in 2003 was 124,438 tons, compared to 125,297 tons in 2002 ([Table 38](#)).

The proportion of geothermal heat pumps shipped to each Census Region in 2003 was as follows: the South (34 percent), the Midwest (33 percent), the Northeast (16 percent), and the West (9 percent) ([Table 39](#)). The proportion of geothermal heat pumps exported was 8 percent. Forty-four percent of geothermal heat pumps were shipped to wholesale distributors, while 30 percent went to installers. The remaining 26 percent were sold to exporters, retail distributors, end-users, or other domestic customers. ([Table 40](#)).

Table 37. Geothermal Heat Pump Shipments by Model Type, 1997-2003
(Number of Units)

| Model | 1997 | 1998 | 1999 | 2000 | 2001 | 2002 | 2003 |

¹For a detailed explanation of the Air-Conditioning & Refrigeration Institute (ARI) system of rating geothermal heat pumps see: http://www.eia.doe.gov/cneaf/solar.renewables/rea_issues/geo_hp_art.pdf, June 7, 2004

Green Pricing and Net Metering Programs 2003

Green pricing/marketing programs allow electricity customers to pay the additional costs for renewable energy through direct payments on their monthly bills. The Energy Information Administration (EIA) first collected information on green pricing on the Form EIA-861, "Annual Electric Power Industry Report," which is a survey of electric industry participants including: electric utilities, wholesale power marketers, energy service providers, and electric power producers. All respondents, except independent power producers and qualifying facilities, were asked to report the number of their customers in green pricing programs by state and customer class.

Net metering provisions vary by state and utility, but usually apply only to very small generators that typically use solar or wind energy. This system usually permits a customer operating a small generator to purchase extra electricity when needed. Also, any excess power at the end of the month can be sold back to the utility. Pricing schemes vary by individual utility and customer circumstances. This system facilitates the ease of operating intermittent generators such as those using solar and wind energy and improves their economics. The EIA first collected information on net metering on the Form EIA-861 in much the same manner as it did green pricing.

In 2003, the number of electric industry participants reporting customers in green pricing programs was 308, up 45 percent from 2002 (Table 1). The number of customers

Table 1. Estimated U.S. Green Pricing Customers by Customer Class, 2002-2003

| Year | Electric Industry Participants | Participating Customers | | | Total | |
|-------------------------|--------------------------------------|-------------------------|-----------------|-------------|-------|--|
| | | Customer Class | | Residential | | |
| | | Residential | Non-residential | | | |
| 2002 ^R | 212 | 688,069 | 23,481 | 711,550 | | |
| 2003 ^P | 308 | 819,579 | 57,547 | 877,126 | | |

P=Preliminary

R=Revised

Note: Electric industry participants include the following respondent types: federal, state, municipal, investor-owned, and cooperative utilities; municipal marketing authorities; and power marketers (or energy service providers). Non-residential may include some customers for which no customer class is specified. Totals may not equal the sum of the components due to independent rounding.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Power Industry Report."

in green pricing programs dwarfed those in net metering and increased 23 percent from 711,550 nationwide in 2002 to 877,126 in 2003. Residential customers accounted for about 93 percent of the total in 2003. However, this was down from residential's 97 percent share in 2002.

Electric industry participants reported having green pricing customers in forty states, including six states that were reported for the first time in 2003 (Table 3). Ohio led the United States in total number of green pricing customers with 428,849 customers and accounted for nearly 44 percent of the annual increase. Pennsylvania, Texas, California and Colorado followed next in order of importance.

In 2003, the number of electric industry participants reporting customers in net metering programs was up to 127 from just 96 one year earlier (Table 2). The number of customers in net metering during 2003 was 6,813 and represented a 52 percent increase from 2002. Residential customers accounted for 86 percent of the customers in the program. Electric industry participants reported having net metering customers in thirty-nine states, including four states that were reported for the first time (Table 4). California dominated with 77 percent of the national total.

Table 2. Estimated U.S. Net Metering Customers by Customer Class, 2002-2003

| Year | Electric Industry Participants | Participating Customers | | | Total | |
|-------------------------|--------------------------------------|-------------------------|-----------------|-------------|-------|--|
