

Advance Summary

U.S. Crude Oil, Natural Gas, and Natural Gas Liquids Reserves

2007 Annual Report

October 2008

Energy Information Administration

Office of Oil and Gas

U.S. Department of Energy

Washington, DC 20585

This report was prepared by the Energy Information Administration, the independent statistical and analytical agency within the Department of Energy. The information contained herein should not be construed as advocating or reflecting any policy position of the Department of Energy or any other organization.

Released for printing October 16, 2008

Advance Summary: U.S. Crude Oil, Natural Gas, and Natural Gas Liquids Reserves 2007 Annual Report

In 2007, the U.S. recorded record-high additions to dry natural gas proved reserves totaling 46.1 trillion cubic feet (Tcf), more than double the 19.5 Tcf of dry natural gas actually produced in the United States during the year. The resulting 2007 year-end total proved reserves of dry natural gas in the United States rose 13 percent above 2006 levels to 237.7 Tcf, the highest level in the 31 years EIA has published annual reserves data. The record additions mostly reflect the rapid development of unconventional gas resources made up of coalbed methane and those resources that use advanced technologies like horizontal drilling with hydraulic fracturing including shales and tight, low permeability, formations.

For the first time in four years, the United States also recorded more 2007 proved reserves additions of crude oil than it produced, 2.0 billion barrels, or 0.3 billion barrels above production of 1.7 billion barrels. Year-end proved reserves in 2007 stood at 21.3 billion barrels, nearly two percent higher than at the end of 2006.

Changes to Proved Reserves, 2007:

Crude Oil (billion barrels)	
Proved Reserves, 2006	21.0
Plus Proved Reserves Additions	+2.0
Less 2007 Production	<u>-1.7</u>
Proved Reserves, 2007	21.3 (+2%)

Dry Natural Gas (trillion cubic feet)	
Proved Reserves, 2006	211.1
Plus Proved Reserves Additions	+46.1
Less 2007 Production	<u>-19.5</u>
Proved Reserves, 2007	237.7 (+13%)

Natural Gas Liquids (billion barrels)	
Proved Reserves, 2006	8.47
Plus Proved Reserves Additions	+1.50
Less 2007 Production	<u>-0.83</u>
Proved Reserves, 2007	9.14 (+8%)

Proved reserves are the estimated quantities which geological and engineering data demonstrate with reasonable certainty to be recoverable in future years from known reservoirs under existing economic and operating conditions. Since 1977, EIA has published comprehensive U.S. proved reserves data. The 2007 *Annual Report of U.S. Crude Oil, Natural Gas, and Natural Gas Liquids Reserves* marks the thirty-first edition of this EIA publication.

Natural Gas

In any given year, EIA's aggregate U.S. estimate of proved reserves represents a snapshot of what can be produced with reasonable certainty. Each year estimates change as new discoveries and improving technologies increase and changing prices alter estimates of proved reserves. The result is aggregated as proved reserves additions. If proved reserves additions are greater than production, reserves increase; if not, they decline.

Developments in 2007. Proved reserves of natural gas increased by 26.6 Tcf in 2007, with 46.1 Tcf total proved reserves additions and 19.5 Tcf of natural gas production. 2007 was the ninth consecutive year that U.S. natural gas proved reserves rose, but the increase was more than twice as great an increase as in any other year since EIA began estimating this data in 1977.

In 2007, natural gas proved reserves additions came mostly from two broad categories, *total discoveries* and *net revisions*.

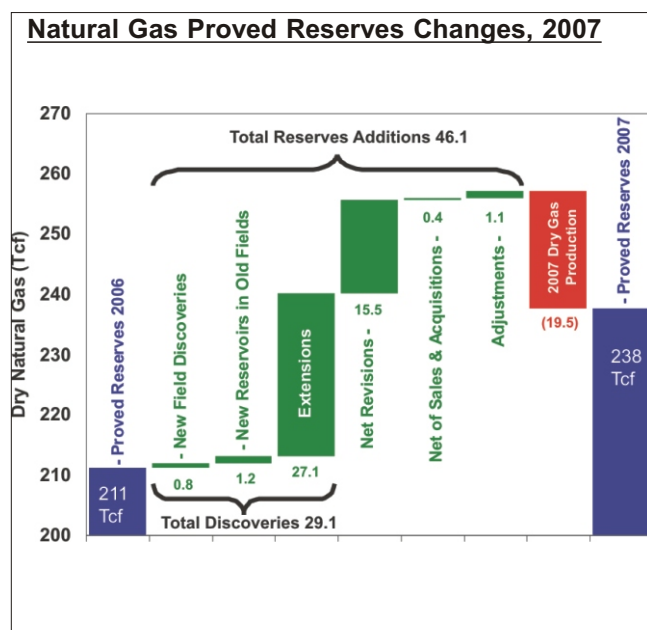

Total Discoveries. Discoveries arise from drilling exploratory wells. *Total discoveries* include extensions to known fields, discovery of new fields, and the discovery of new reservoirs in old fields.

In 2007, *total discoveries* accounted for 63 percent of total natural gas proved reserves additions. Exploratory gas well completions in 2007 rose by 21 percent from 2006. These exploration efforts led to 29 Tcf of *total discoveries* in 2007 - 26 percent more than in 2006 and 59 percent more than the prior 10-year average (18.4 Tcf).

The different types of discoveries largely reflect different stages of exploration. When an operator discovers a new field or a new reservoir in an old

field, the proved reserves are often fairly low compared to the eventual *proved ultimate recovery*. The operator knows relatively little about the new field or reservoir and can therefore be "reasonably certain" of being able to produce only a small part of the reserves that may be found and proved up at a later stage of exploration. In 2007, new field and reservoir discoveries accounted for about 8 percent of *total discoveries*. *New field discoveries* were 0.8 Tcf, 95 percent more than in 2006, but 50 percent less than the prior 10-year average (1.6 Tcf). *New reservoir discoveries in old fields* were 1.2 Tcf, 3 percent more than in 2006, and 37 percent less than the prior 10-year average (1.9 Tcf).

After the initial discovery of a field or reservoir, proved reserves (and production) often grow rapidly as further exploration extends the original boundary. The resulting proved reserves additions are recorded as *extensions* of an existing field. Every year, most natural gas *total discoveries* are *extensions*. In 2007, 27.1 Tcf, or the vast majority of *total discoveries* - and almost 59 percent of all additions - were *extensions* to existing gas fields. *Extensions* of dry gas proved reserves in 2007 were 24 percent larger than in 2006 and 82 percent larger than the prior 10-year average of 14.9 Tcf.

Net Revisions. Revisions occur primarily during the development of already discovered reservoirs or fields. Each year U.S. exploration and production companies make positive and negative revisions. In most years, *net revisions* are positive and sometimes they are large, as in 2007. Most proved reserves additions at this stage come from the ability to produce a greater proportion of the original in-place

resources in the reservoir. Revisions can result from greater experience with and understanding of the geology and production characteristics of the field, drilling on tighter spacing, installation of enhanced recovery projects, improving technology, and operator corrections to prior year reports. Changing prices and price expectations lead to revisions, both positive and negative, as well.

In 2007, *net revisions* accounted for 36 percent of total natural gas reserves additions (15.5 Tcf). Over the last 10 years, about 15 percent of proved reserves additions have come from *net revisions*.

Sales and Acquisitions, and Adjustments. Three percent of natural gas proved reserves additions came from a small difference in the estimates of buyers and sellers of reserves during the year and because of various EIA adjustments made for statistical purposes.

Production. Natural gas production grew to 19.5 Tcf in 2007, a five percent increase over 2006. With 46.1 Tcf of gross proved reserves additions, net proved reserves additions totaled 26.6 Tcf.

Prices. Natural gas prices at the wellhead in 2007 changed little from 2006, declining by only a penny to an average of \$6.39 per thousand cubic feet. Natural gas prices had increased considerably between 2002 and 2005. Drilling for natural gas also increased in 2003 and has continued to increase each year through 2007.

Long-term perspective. Dry natural gas proved reserves declined between 1977 and 1993, but have generally risen since then. Looking at the whole 30-year period from 1977 through 2007, gross proved reserves additions totaled 601.4 Tcf, almost three times the total proved reserves estimated in 1977 and more than enough to replace the 571 Tcf of production during that period.

Regional Natural Gas Proved Reserves Additions. Regionally, Texas had the nation's largest increase in dry natural gas proved reserves in 2007, amounting to a 17 percent gain (10.3 Tcf). Major net reserves additions in the Rocky Mountain States included a 26 percent (6.2 Tcf) increase in Wyoming, a 27 percent (4.7 Tcf) increase in Colorado, and a 24 percent (1.2 Tcf) increase in Utah. Proved reserves declined in two major gas-producing regions including a 6 percent decline in the Gulf of Mexico Federal Offshore (1.0 Tcf) and a 4 percent decline in New Mexico (0.7 Tcf).

The additions in Texas were primarily due to development of unconventional gas resources in north and east Texas from shale in the Barnett Shale and from tight sands in the Cotton Valley Formation, supported by relatively high natural gas prices and advancing technologies. The Newark East field in the Texas Barnett Shale formation may soon become the largest natural gas field in the country.

Unconventional Natural Gas Proved Reserves Additions. Unconventional resources are playing an increasingly important role in U.S. dry natural gas reserves and production. For example, improved technology now allows high economic returns for development of reserves in *shale* reservoirs at the prices seen in 2006 and 2007. As a result, proved reserves of shale gas have been increasing rapidly. EIA has collected data on proved natural gas reserves from shale reservoirs for two years. The shale gas proved reserves increased 50 percent in 2007 and are now at about 9 percent of the U.S. total.

Proved reserves and production from *coal reservoirs* increased rapidly from 1989 through 2002 before stabilizing and even dropping slightly in 2006. However, coalbed natural gas reserves saw an 11.5 percent increase in 2007. Coalbed proved reserves now account for about 9 percent of U.S. dry natural gas reserves. Coalbed natural gas production decreased in 2007 but still accounted for about 9 percent of U.S. dry natural gas production.

Crude Oil

In 2007, U.S. crude oil proved reserves increased nearly 2 percent as proved reserves additions replaced 120 percent of production. Alaska saw the largest increase in year-end crude oil proved reserves, growing 7 percent over 2006 (284 million barrels), followed closely by Texas with an increase in year-end proved reserves of 5 percent (251 million barrels). Alaska's increase included 45 million barrels of new field discoveries. Due to rapid development of unconventional oil resources associated with the Bakken Formation, North Dakota had the third largest increase in crude oil proved reserves, up 17 percent from 2006 (70 million barrels).

Developments in 2007. *Total discoveries* of crude oil were 790 million barrels in 2007, 28 percent lower than the prior 10-year average (1,100 million barrels) and 37 percent greater than in 2006 (577 million barrels). The majority of crude oil *total discoveries* in 2007 came from *extensions* to existing fields in Texas, the Gulf of Mexico Federal Offshore, North Dakota, New Mexico, and Alaska.

Total Discoveries. Operators discovered 29 percent more *extensions* in 2007 than in 2006 (651 million barrels) and 18 percent more than the prior 10-year average (554 million barrels).

New field discoveries of crude oil reserves doubled in 2007 over 2006 (66 million barrels), though they were only 16 percent of the prior 10-year average (407 million barrels). More than two thirds of these discoveries (45 of 66 million barrels) were in Alaska.

New reservoir discoveries in old fields were 70 percent greater than 2006 (73 million barrels) but 48 percent lower than the prior 10-year average (140 million barrels).

Net Revisions. Crude oil *net revisions* totaled 1,200 million barrels in 2007.

Production. U.S. crude oil production increased for the first time in 4 years, up 2 percent from estimated 2006 production. Alaska and the lower 48 States each contributed about half of the U.S. total increase.

Other 2007 crude oil events of note:

- The annual average domestic first purchase price for crude oil increased 11 percent from \$59.69 per barrel in 2006 to \$66.52 per barrel.

- Exploratory oil well completions increased 17 percent from 2006.

Long-term Perspective. Starting in 1977, EIA estimated 32 billion barrels of crude oil proved reserves. As with natural gas, this estimate proved not to be a limit to future production, but an estimate that was revised upward in many years since. The United States produced 76 billion barrels from 1977 through 2007, more than twice the proved reserves estimated in 1977. Total proved reserves of crude oil have declined by more than a third since 1977 as the rate of production has outstripped proved reserves additions (a total of 62 billion barrels over the period). However, the rate of decline in total U.S. crude oil reserves began to slow in 1994. Proved reserves additions from revisions due to intensive field development and enhanced oil recovery projects have helped to sustain crude oil proved reserves by providing more than half of all proved reserves additions.

Natural Gas Liquids

Natural gas liquids reserves are associated with natural gas production and include lease condensate extracted at the well on the producing lease and natural gas plant liquids reserves extracted at plants. Large increases in natural gas proved reserves lead to large increases in natural gas liquids proved reserves, but the percent increases are not the same because natural gas from different fields varies in how much liquid is extractable. Overall, natural gas liquids proved reserves increased 8 percent in 2007. Operators replaced 181 percent of U.S. natural gas liquids production with reserves additions.

Natural gas liquids represented 30 percent of total liquid hydrocarbon proved reserves in 2007. Total proved reserves of liquid hydrocarbons (crude oil plus natural gas liquids) were 30.5 billion barrels in 2007, a 3 percent increase from the 2006 level.

Data

These estimates are based upon analysis of data from Form EIA-23, Annual Survey of Domestic Oil and Gas Reserves, filed by 1,379 operators of oil and gas wells, and Form EIA-64A, Annual Report of the Origin of Natural Gas Liquids Production, filed by operators of 506 active natural gas processing plants. The U.S. proved reserves estimates for crude oil and natural gas are associated with sampling errors of less than 1 percent.

EIA collects data on eight categories of proved reserves changes in a survey at the field level. This reported data represents a sample of the roughly 55,000 oil and gas fields that EIA has identified. Companies report about 96 percent of the proved reserve total. *Adjustments* cannot be attributed directly to one of the other specific eight categories because of the survey and statistical survey methods employed.

NA=Not available.

Notes: Old means discovered in a prior year. New means discovered during the report year. The production estimates in this table are based on data reported on Form EIA-23, "Annual Survey of Domestic Oil and Gas Reserves" and Form EIA-64A, "Annual Report of the Origin of Natural Gas Liquids Production." They may differ from the official EIA production data for crude oil, natural gas, and natural gas liquids for 2007 contained in the *Petroleum Supply Annual 2007*, DOE/EIA-0340(07) and the *Natural Gas Annual 2007*, DOE/EIA-0131(07).

Sources: *U.S. Crude Oil, Natural Gas, and Natural Gas Liquids Reserves*, 1997 through 2007 annual reports, DOE/EIA-0216.

^aIncludes Illinois, Indiana, Ohio, Pennsylvania, Virginia, and West Virginia. Beginning in 2006, Virginia is individually listed.

^bIncludes Arkansas, Kansas, Louisiana, Montana, and Oklahoma.

^cIncludes Oklahoma, Pennsylvania, Utah, Virginia, West Virginia, and Wyoming. Beginning in 2000, these states are individually listed or grouped in Eastern States and Western States.

NA -- Not applicable.
