Abbreviations: Conc. = Concentration, DEP = Diethyl phthalate; EtOH = Ethanol; HMT = Human Maximization Test; HRIFT = Human Repeat Insult Patch Test; LLNA = Local Lymph Node Assay; NA = Not Available; NC = Not Calculated since SI< 3; RIFM = Research Institute for Fragrance Materials; sens. = sensitization, SI = Stimulation Index

¹⁺,²⁻ = Sensitizer, ¹⁻,²⁺ = Non-sensitizer

²Positive result possibly due to "Spillover effect." In maximization testing, four unrelated materials are tested on each of 25 human subjects. In the event that one of the four test materials turns out to be a potent sensitizer (in this case it was Costus oil, which sensitized 25/25 subjects), false weak positive results may occur with the other three materials. When these three materials are subsequently retested out of the context of the serious allergen, and in the same or different groups of subjects, they prove to be negative. We refer to this as the "spillover effect" (Opdyke 1976c).
