Abbreviations: CASRN = Chemical Abstracts Service Registry Number; g/mol = grams per mole.

¹ K_{ow} represents the octanol-water partition coefficient (expressed on log scale).

² When two numbers are shown for K_{ow}, the first number is the value calculated by the method of Moriguchi et al. (1994) and provided in Gerberick et al. (2005). The second number was calculated by the method of Meylan and Howard (1995) and obtained from the website: <http://www.srcinc.com/what-we-do/databaseforms.aspx?id=385>. LogP (log K_{ow}) values for GSK chemicals were calculated using the method provided by Daylight Chemical Information Systems (see: <http://www.daylight.com/dayhtml/doc/clogp/index.html>).

³ Chemical classifications based on the Medical Subject Headings classification for chemicals and drugs, as developed by the National Library of Medicine (available at <http://www.nlm.nih.gov/mesh/meshhome.html>). Chemical classification of "pharmaceutical chemicals" for the GSK chemicals was suggested by Dr. Michael Olson of GSK, which in spirit captures three types of pharmaceutical active substances (actives, intermediates, and starting materials).
