Deaths: Leading Causes for 1999

by Robert N. Anderson, Ph.D. Division of Vital Statistics

Abstract

Objectives—This report presents final 1999 data on the 10 leading causes of death in the United States by age, race, sex, and Hispanic origin. Leading causes of infant, neonatal, and postneonatal death are also presented. This report supplements the annual report of final mortality statistics and responds to an increasing volume of requests by data users for leading-cause tables with more age and race detail than previously published.

Methods—Data in this report are based on information from all death certificates filed in the 50 States and the District of Columbia in 1999. Causes of death classified by the *International Statistical Classification of Diseases and Related Health Problems, Tenth Revision* (ICD-10) are ranked according to the number of deaths assigned to rankable causes. Age categories used to present leading causes of death in this report represent a substantial expansion from the age categories previously used to present leading-cause data in the annual report of final mortality statistics.

Results—In 1999 the 10 leading causes of death were (in rank order) Diseases of heart; Malignant neoplasms; Cerebrovascular diseases; Chronic lower respiratory diseases; Accidents; Diabetes mellitus; Influenza and pneumonia; Alzheimer's disease; Nephritis, nephrotic syndrome, and nephrosis; and Septicemia and accounted for nearly 80 percent of all deaths occurring in the United States. Differences in the rankings are evident by age, sex, race, and Hispanic origin. Leading causes of infant death for 1999 were (in rank order) Congenital malformations, deformations and chromosomal abnormalities; Disorders related to short gestation and low birthweight, not elsewhere classified; Sudden infant death syndrome; Newborn affected by maternal complications of pregnancy; Respiratory distress of newborn; Newborn affected by complications of placenta, cord, and Accidents; Bacterial sepsis of newborn; Diseases of the system; and Atelectasis. Important variation in the leading infant death is noted for the neonatal and postneonatal

Keywords: deaths • mortality • leading causes of death statistics

Introduction

Ranking causes of death is a popular method of presenting mortality statistics. Leading cause-of-death data have been published since 1952 (beginning with 1949 mortality data) when official tabulations ranking causes of death were first introduced (1). Those that use this method should be aware of its inherent limitations. Ranking causes of death is to some extent an arbitrary procedure. The rank order of any particular cause of death will depend on the list of causes from which selection is made, and on the rules applied in making the selection. Different cause lists and different ranking rules will typically produce different leading causes of death. Recognizing the need for a consistent ranking procedure to be used by State health departments and the National Office of Vital Statistics, in 1951 the Public Health Conference on Records and Statistics recommended that State and Federal agencies responsible for identifying diseases of public health importance adopt a uniform ranking procedure using a standard list of causes of death (2). The procedures implemented in 1952 are essentially the same as those used currently by the Centers for Disease Control and Prevention's National Center for Health Statistics (NCHS); however, the cause-of-death lists have been expanded and altered over time with each subsequent revision of the *International Classification of Diseases* (ICD).

Cause-of-death ranking is a useful tool for illustrating the relative burden of cause-specific mortality. However, it should be used with a clear understanding of what the rankings mean. Literally, the rankings denote the most frequently occurring causes of death among those

Acknowledgments

This report was prepared in the Division of Vital Statistics under the general direction of Harry M. Rosenberg, Special Assistant and James A. Weed, Acting Chief, Mortality Statistics Branch. Sherry L. Murphy of the Mortality Statistics Branch contributed to the Technical notes. Donna L. Hoyert of the Mortality Statistics Branch and Thomas D. Dunn of the Systems, Programming, and Statistical Resources Branch provided content and table review. Registration Methods staff and staff of the Data Acquisition and Evaluation Branch provided consultation to State vital statistics offices regarding collection of the death certificate data on which this report is based. This report was edited by Demarius V. Miller and typeset by Jacqueline M. Davis of the Publications Branch, Division of Data Services.

causes eligible to be ranked. The rankings do not necessarily denote the causes of death of greatest public health importance. Some causes of death of public health import are excluded from the ranking procedure. For example, Malignant neoplasms of the trachea, bronchus, and lung (lung cancer) and Motor vehicle accidents are not rankable causes of death (see below **Procedures for ranking causes of death**) though they can be identified using the standard mortality tabulation lists. Were they included in the rankings, both causes would be placed among the 10 leading causes of death—lung cancer would rank third and Motor vehicle accidents would rank eighth. However, each of these is subsumed in broader rankable categories, namely, Malignant neoplasms and Accidents (unintentional injuries), respectively. Although not perfectly suitable in all circumstances, the current framework provides a rankable list of causes of death that has broad appeal to and acceptance in the general public health community.

This report presents final 1999 data on leading causes of death in the United States by age, race, sex, and Hispanic origin. These data accompany the release of final national mortality statistics for 1999 that are presented in a separate report (3). This report responds to an increasing volume of requests by data users for leading-cause tables with more age and race detail than previously published. For the first time, leading causes of death are shown for an expanded set of age categories and for the American Indian and Asian and Pacific Islander populations. Further age detail beyond that published in this report is provided in tables published on the NCHS Web site (<http://www.cdc.gov/nchs>). Also presented in this report is the procedure used by NCHS to rank causes of death along with tables showing causes that are designated as rankable.

Data and methods

Data

Data in this report are based on information from all death certificates filed in the 50 States and the District of Columbia in 1999. Death certificates are completed by funeral directors, attending physicians, medical examiners, and coroners. Cause-of-death statistics for 1999 presented in this report are classified in accordance with the *International Statistical Classification of Diseases and Related Health Problems, Tenth Revision* (ICD-10) (4). Statistics for 1998 are classified in accordance with the Ninth Revision of the ICD (ICD-9) (5). A discussion of cause-of-death classification and comparability between 1999 and 1998 mortality data is provided in the [Technical notes](#).

Procedures for ranking causes of death

The procedures used by NCHS for ranking causes of death are consistent with the recommendations of the 1951 Public Health Conference on Records and Statistics (2). Causes are ranked according to the number of deaths assigned to rankable causes. The number of deaths is used as the ranking criteria because it most accurately reflects the frequency of cause-specific mortality. Although crude death rates could technically be used as a ranking criteria—the population denominator of the rate is constant across all cause-of-death categories—they are less than ideal. Crude death rates are typically expressed per 100,000 population and are often rounded to one decimal place, reducing the precision of the ranking criteria. This

is especially problematic when ranking causes of death for small population subgroups or geographic areas as it may be impossible to differentiate the ranks for several causes. Age-adjusted death rates should never be used to rank causes of death. The numerical value of the age-adjusted death rate depends on the population age distribution used to standardize the rate (6). Thus, rankings based on age-adjusted death rates will tend to vary depending on which standard is used. For example, when the standard age distribution gives more weight to the older population, the rank of causes of death that primarily affect the older population tend to be higher and the rank of causes that primarily affect the younger population tend to be lower.

The original cause list from which rankable causes of death were selected according to the recommendations of the 1951 Conference was the List of 64 selected causes of death prepared for use with the Sixth Revision of the ICD (2). With each subsequent revision of the ICD, the cause list from which rankable causes are selected has changed to reflect the improved classification system. Developed for use with ICD-10, the List of 113 selected causes of death (7) shown in [table A](#) is used to select 50 rankable causes (denoted by the symbol #) from which the leading causes presented in [tables 1](#) and [2](#) are derived.

The selection of the 50 rankable causes from the List of 113 selected causes of death was guided by some basic principles. As in the past, vaguely defined categories were summarily excluded from selection as rankable causes. These included the category Symptoms, signs, and abnormal clinical and laboratory findings, not elsewhere classified and all categories beginning with the words “other,” “all other,” “certain other,” or “unspecified.” Among the remaining cause-of-death categories, decisions were made to select as rankable the causes of death considered most useful from a public health perspective, with the following condition: the rankable causes must be mutually exclusive. If a category representing a subtotal (such as Tuberculosis or Malignant neoplasms) is selected as a rankable cause, its component parts are not selected as rankable. Efforts were also made to maintain historical continuity where possible.

Beginning with 1980 mortality data, NCHS introduced a separate ranking procedure for infant causes of death using a specialized list of infant causes. This was done to include in the rankings causes specific to infancy (especially the perinatal period—the period beginning shortly before and ending shortly after birth) that would otherwise be excluded. The ICD-10 List of 130 selected causes of infant death (7) ([table B](#)) is used to select 71 rankable causes of infant death from which the rankings in [tables 3](#) and [4](#) are derived. The same principles for selecting the rankable causes from the List of 113 selected causes of death guided the selection of rankable causes from the infant cause list.

Age groupings

Leading causes of death for those aged 1 year and over are presented in [tables 1](#) and [2](#) for the following age categories: 1–4, 5–9, 10–14, 15–19, 20–24, 25–34, 35–44, 45–54, 55–64, 65 and over, 65–74, 75–84, and 85 and over. These age categories respond to increasing requests from data users for more age detail and represent a substantial expansion from the age categories previously used to present leading-cause data (1–4, 5–14, 15–24, 25–44, 45–64, 65 and over) (8). Leading causes by further age detail along with the previously used age categories are published on the NCHS Web site (<http://www.cdc.gov/nchs>). [Tables 3](#) and [4](#) that present data

Table A. List of 113 selected causes of death

Number	Cause of death (<i>Tenth Revision, International Classification of Diseases, 1992</i>)
1#	Salmonella infections (A01–A02)
2#	Shigellosis and amebiasis (A03,A06)
3	Certain other intestinal infections (A04,A07–A09)
#	Tuberculosis (A16–A19)
4	Respiratory tuberculosis (A16)
5	Other tuberculosis (A17–A19)
6#	Whooping cough (A37)
7#	Scarlet fever and erysipelas (A38,A46)
8#	Meningococcal infection (A39)
9#	Septicemia (A40–A41)
10#	Syphilis (A50–A53)
11#	Acute poliomyelitis (A80)
12#	Arthropod-borne viral encephalitis (A83–A84,A85.2)
13#	Measles (B05)
14#	Viral hepatitis (B15–B19)
15#	Human immunodeficiency virus (HIV) disease (B20–B24)
16#	Malaria (B50–B54)
17	Other and unspecified infectious and parasitic diseases and their sequelae (A00,A05,A20–A36,A42–A44,A48–A49,A54–A79,A81–A82,A85.0–A85.1,A85.8,A86–B04,B06–B09,B25–B49,B55–B99) (C00–C97)
#	Malignant neoplasms
18	Malignant neoplasms of lip, oral cavity and pharynx (C00–C14)
19	Malignant neoplasm of esophagus (C15)
20	Malignant neoplasm of stomach (C16)
21	Malignant neoplasms of colon, rectum and anus (C18–C21)
22	Malignant neoplasms of liver and intrahepatic bile ducts (C22)
23	Malignant neoplasm of pancreas (C25)
24	Malignant neoplasm of larynx (C32)
25	Malignant neoplasms of trachea, bronchus and lung (C33–C34)
26	Malignant melanoma of skin (C43)
27	Malignant neoplasm of breast (C50)
28	Malignant neoplasm of cervix uteri (C53)
29	Malignant neoplasms of corpus uteri and uterus, part unspecified (C54–C55)
30	Malignant neoplasm of ovary (C56)
31	Malignant neoplasm of prostate (C61)
32	Malignant neoplasms of kidney and renal pelvis (C64–C65)
33	Malignant neoplasm of bladder (C67)
34	Malignant neoplasms of meninges, brain and other parts of central nervous system (C70–C72)
	Malignant neoplasms of lymphoid, hematopoietic and related tissue (C81–C96)
35	Hodgkin's disease (C81)
36	Non-Hodgkin's lymphoma (C82–C85)
37	Leukemia (C91–C95)
38	Multiple myeloma and immunoproliferative neoplasms (C88,C90)
39	Other and unspecified malignant neoplasms of lymphoid, hematopoietic and related tissue (C96)
40	All other and unspecified malignant neoplasms (C17,C23–C24,C26–C31,C37–C41,C44–C49,C51–C52,C57–C60,C62–C63,C66,C68–C69,C73–C80,C97) (D00–D48)
41#	In situ neoplasms, benign neoplasms and neoplasms of uncertain or unknown behavior (D50–D64)
42#	Anemias (E10–E14)
43#	Diabetes mellitus (E40–E64)
#	Nutritional deficiencies
44	Malnutrition (E40–E46)
45	Other nutritional deficiencies (E50–E64)
46#	Meningitis (G00,G03)
47#	Parkinson's disease (G20–G21)
48#	Alzheimer's disease (G30)
#	Major cardiovascular diseases (I00–I78)
49	Diseases of heart (I00–I09,I11,I13,I20–I51)
	Acute rheumatic fever and chronic rheumatic heart diseases (I00–I09)
50	Hypertensive heart disease (I11)
51	Hypertensive heart and renal disease (I13)
	Ischemic heart diseases (I20–I25)
52	Acute myocardial infarction (I21–I22)
53	Other acute ischemic heart diseases (I24)
	Other forms of chronic ischemic heart disease (I20,I25)
54	Atherosclerotic cardiovascular disease, so described (I25.0)
55	All other forms of chronic ischemic heart disease (I20,I25.1–I25.9)
	Other heart diseases (I26–I51)
56	Acute and subacute endocarditis (I33)
57	Diseases of pericardium and acute myocarditis (I30–I31,I40)
58	Heart failure (I50)

See note at end of table.

Table A. List of 113 selected causes of death—Con.

Number	Cause of death (<i>Tenth Revision, International Classification of Diseases, 1992</i>)
59	All other forms of heart disease (I26–I28,I34–I38,I42–I49,I51)
60#	Essential (primary) hypertension and hypertensive renal disease (I10–I12)
61#	Cerebrovascular diseases (I60–I69)
62#	Atherosclerosis (I70)
	Other diseases of circulatory system (I71–I78)
63#	Aortic aneurysm and dissection (I71)
64	Other diseases of arteries, arterioles and capillaries (I72–I78)
65	Other disorders of circulatory system (I80–I99)
#	Influenza and pneumonia (J10–J18)
66	Influenza (J10–J11)
67	Pneumonia (J12–J18)
	Other acute lower respiratory infections (J20–J22)
68#	Acute bronchitis and bronchiolitis (J20–J21)
69	Unspecified acute lower respiratory infection (J22)
#	Chronic lower respiratory diseases (J40–J47)
70	Bronchitis, chronic and unspecified (J40–J42)
71	Emphysema (J43)
72	Asthma (J45–J46)
73	Other chronic lower respiratory diseases (J44,J47)
74#	Pneumoconioses and chemical effects (J60–J66,J68)
75#	Pneumonitis due to solids and liquids (J69)
76	Other diseases of respiratory system (J00–J06,J30–J39,J67,J70–J98)
77#	Peptic ulcer (K25–K28)
78#	Diseases of appendix (K35–K38)
79#	Hernia (K40–K46)
#	Chronic liver disease and cirrhosis (K70,K73–K74)
80	Alcoholic liver disease (K70)
81	Other chronic liver disease and cirrhosis (K73–K74)
82#	Cholelithiasis and other disorders of gallbladder (K80–K82)
#	Nephritis, nephrotic syndrome and nephrosis (N00–N07,N17–N19,N25–N27)
83	Acute and rapidly progressive nephritic and nephrotic syndrome (N00–N01,N04)
84	Chronic glomerulonephritis, nephrosis and nephropathy not specified as acute or chronic, and renal sclerosis unspecified (N02–N03,N05–N07,N26)
85	Renal failure (N17–N19)
86	Other disorders of kidney (N25,N27)
87#	Infections of kidney (N10–N12,N13.6,N15.1)
88#	Hyperplasia of prostate (N40)
89#	Inflammatory diseases of female pelvic organs (N70–N76)
#	Pregnancy, childbirth and the puerperium (O00–O99)
90	Pregnancy with abortive outcome (O00–O07)
91	Other complications of pregnancy, childbirth and the puerperium (O10–O99)
92#	Certain conditions originating in the perinatal period (P00–P96)
93#	Congenital malformations, deformations and chromosomal abnormalities (Q00–Q99)
94	Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (R00–R99)
95	All other diseases (Residual) (Residual)
#	Accidents (unintentional injuries) (V01–X59,Y85–Y86)
	Transport accidents (V01–V99,Y85)
96	Motor vehicle accidents (V02–V04,V09.0,V09.2,V12–V14,V19.0–V19.2,V19.4–V19.6,V20–V79,V80.3–V80.5,V81.0–V81.1,V82.0–V82.1, V83–V86,V87.0–V87.8,V88.0–V88.8,V89.0,V89.2)
97	Other land transport accidents (V01,V05–V06,V09.1,V09.3–V09.9,V10–V11,V15–V18,V19.3,V19.8–V19.9,V80.0–V80.2,V80.6–V80.9,V81.2–V81. 9,V82.2–V82.9,V87.9,V88.9,V89.1,V89.3,V89.9)
98	Water, air and space, and other and unspecified transport accidents and their sequelae (V90–V99,Y85)
99	Nontransport accidents (W00–X59,Y86)
100	Falls (W00–W19)
101	Accidental discharge of firearms (W32–W34)
102	Accidental drowning and submersion (W65–W74)
103	Accidental exposure to smoke, fire and flames (X00–X09)
104	Accidental poisoning and exposure to noxious substances (X40–X49)
#	Other and unspecified nontransport accidents and their sequelae (W20–W31,W35–W64,W75–W99,X10–X39,X50–X59,Y86)
105	Intentional self-harm (suicide) (X60–X84,Y87.0)
106	Intentional self-harm (suicide) by discharge of firearms (X72–X74)
#	Intentional self-harm (suicide) by other and unspecified means and their sequelae (X60–X71,X75–X84,Y87.0)
107	Assault (homicide) (X85–Y09,Y87.1)
108	Assault (homicide) by discharge of firearms (X93–X95)
109#	Assault (homicide) by other and unspecified means and their sequelae (X85–X92,X96–Y09,Y87.1)
	Legal intervention (Y35,Y89.0)
110	Events of undetermined intent (Y10–Y34,Y87.2,Y89.9)
111	Discharge of firearms, undetermined intent (Y22–Y24)
112#	Other and unspecified events of undetermined intent and their sequelae (Y10–Y21,Y25–Y34,Y87.2,Y89.9)
113#	Operations of war and their sequelae (Y36,Y89.1)
	Complications of medical and surgical care (Y40–Y84,Y88)

NOTE: The causes designated by # are ranked to determine leading causes of death for specified population groups.

Table B. List of 130 selected causes of infant death

Number	Cause of death (<i>Tenth Revision, International Classification of Diseases, 1992</i>)	
1	Certain infectious and parasitic diseases	(A00–B99)
2#	Certain intestinal infectious diseases	(A00–A08)
3#	Diarrhea and gastroenteritis of infectious origin	(A09)
4#	Tuberculosis	(A16–A19)
5#	Tetanus	(A33,A35)
6#	Diphtheria	(A36)
7#	Whooping cough	(A37)
8#	Meningococcal infection	(A39)
9#	Septicemia	(A40–A41)
10#	Congenital syphilis	(A50)
	Gonococcal infection	(A54)
	Viral diseases	(A80–B34)
11#	Acute poliomyelitis	(A80)
12#	Varicella (chickenpox)	(B01)
13#	Measles	(B05)
14#	Human immunodeficiency virus (HIV) disease	(B20–B24)
15#	Mumps	(B26)
16	Other and unspecified viral diseases	(A81–B00,B02–B04,B06–B19,B25,B27–B34)
17#	Candidiasis	(B37)
18#	Malaria	(B50–B54)
19#	Pneumocystosis	(B59)
20	All other and unspecified infectious and parasitic diseases	(A20–A32,A38,A42–A49,A51–A53,A55–A79,B35–B36,B38–B49,B55–B58,B60–B99)
	Neoplasms	(C00–D48)
#	Malignant neoplasms	(C00–C97)
21	Hodgkin's disease and non-Hodgkin's lymphomas	(C81–C85)
22	Leukemia	(C91–C95)
23	Other and unspecified malignant neoplasms	(C00–C80,C88–C90,C96–C97)
24#	In situ neoplasms, benign neoplasms and neoplasms of uncertain or unknown behavior	(D00–D48)
#	Diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism	(D50–D89)
25	Anemias	(D50–D64)
26	Other diseases of blood and blood-forming organs	(D65–D76)
27	Certain disorders involving the immune mechanism	(D80–D89)
	Endocrine, nutritional and metabolic diseases	(E00–E88)
28#	Short stature, not elsewhere classified	(E34.3)
29#	Malnutrition and other nutritional deficiencies	(E40–E64)
30#	Cystic fibrosis	(E84)
31#	Volume depletion, disorders of fluid, electrolyte and acid-base balance	(E86–E87)
32	All other endocrine, nutritional and metabolic diseases	(E00–E32,E34.0–E34.2,E34.4–E34.9,E65–E83,E85,E88)
	Diseases of the nervous system	(G00–G98)
33#	Meningitis	(G00,G03)
34#	Infantile spinal muscular atrophy, type I (Werdnig-Hoffman)	(G12.0)
35#	Infantile cerebral palsy	(G80)
36#	Anoxic brain damage, not elsewhere classified	(G93.1)
37	Other diseases of nervous system	(G04,G06–G11,G12.1–G12.9,G20–G72,G81–G92,G93.0,G93.2–G93.9,G95–G98)
38#	Diseases of the ear and mastoid process	(H60–H93)
#	Diseases of the circulatory system	(I00–I99)
39	Pulmonary heart disease and diseases of pulmonary circulation	(I26–I28)
40	Pericarditis, endocarditis and myocarditis	(I30,I33,I40)
41	Cardiomyopathy	(I42)
42	Cardiac arrest	(I46)
43	Cerebrovascular diseases	(I60–I69)
44	All other diseases of circulatory system	(I00–I25,I31,I34–I38,I44–I45,I47–I51,I70–I99)
	Diseases of the respiratory system	(J00–J98)
45#	Acute upper respiratory infections	(J00–J06)
#	Influenza and pneumonia	(J10–J18)
46	Influenza	(J10–J11)
47	Pneumonia	(J12–J18)
48#	Acute bronchitis and acute bronchiolitis	(J20–J21)
49#	Bronchitis, chronic and unspecified	(J40–J42)
50#	Asthma	(J45–J46)
51#	Pneumonitis due to solids and liquids	(J69)
52	Other and unspecified diseases of respiratory system	(J22,J30–J39,J43–J44,J47–J68,J70–J98)
	Diseases of the digestive system	(K00–K92)
53#	Gastritis, duodenitis, and noninfective enteritis and colitis	(K29,K50–K55)
54#	Hernia of abdominal cavity and intestinal obstruction without hernia	(K40–K46,K56)
55	All other and unspecified diseases of digestive system	(K00–K28,K30–K38,K57–K92)
	Diseases of the genitourinary system	(N00–N98)
56#	Renal failure and other disorders of kidney	(N17–N19,N25,N27)
57	Other and unspecified diseases of genitourinary system	(N00–N15,N20–N23,N26,N28–N98)
	Certain conditions originating in the perinatal period	(P00–P96)

See note at end of table.

Table B. List of 130 selected causes of infant death—Con.

Number	Cause of death (<i>Tenth Revision, International Classification of Diseases, 1992</i>)	
58#	Newborn affected by maternal factors and by complications of pregnancy, labor and delivery	(P00–P04)
	Newborn affected by maternal hypertensive disorders	(P00.0)
59#	Newborn affected by other maternal conditions which may be unrelated to present pregnancy	(P00.1–P00.9)
#	Newborn affected by maternal complications of pregnancy	(P01)
60	Newborn affected by incompetent cervix	(P01.0)
61	Newborn affected by premature rupture of membranes	(P01.1)

Table B. List of 130 selected causes of infant death—Con.

Number	Cause of death (<i>Tenth Revision, International Classification of Diseases, 1992</i>)
114	Transport accidents (V01–V99) Motor vehicle accidents . . . (V02–V04,V09.0,V09.2,V12–V14,V19.0–V19.2,V19.4–V19.6,V20–V79,V80.3–V80.5,V81.0–V81.1,V82.0–V82.1,V83–V86, V87.0–V87.8,V88.0–V88.8,V89.0,V89.2)
115	Other and unspecified transport accidents . . (V01,V05–V06,V09.1,V09.3–V09.9,V10–V11,V15–V18,V19.3,V19.8,V19.9,V80.0–V80.2,V80.6–V80.9, V81.2–V81.9,V82.2–V82.9,V87.9,V88.9,V89.1, V89.3,V89.9,V90–V99)
116	Falls (W00–W19)
117	Accidental discharge of firearms (W32–W34)
118	Accidental drowning and submersion (W65–W74)
119	Accidental suffocation and strangulation in bed (W75)
120	Other accidental suffocation and strangulation (W76–W77,W81–W84)
121	Accidental inhalation and ingestion of food or other objects causing obstruction of respiratory tract (W78–W80)
122	Accidents caused by exposure to smoke, fire and flames (X00–X09)
123	Accidental poisoning and exposure to noxious substances (X40–X49)
124	Other and unspecified accidents (W20–W31,W35–W64,W85–W99,X10–X39,X50–X59)
#	Assault (homicide) (X85–Y09,Y87.1)
125	Assault (homicide) by hanging, strangulation and suffocation (X91)
126	Assault (homicide) by discharge of firearms (X93–X95)
127	Neglect, abandonment and other maltreatment syndromes (Y06–Y07)
128	Assault (homicide) by other and unspecified means (X85–X90,X92,X96–X99,Y00–Y05,Y08–Y09,Y87.1)
129#	Complications of medical and surgical care (Y40–Y84)
130	Other external causes and their sequelae (X60–X84,Y10–Y36)

NOTE: The causes designated by # are ranked to determine leading causes of infant death for specified population groups.

for infants (under 1 year) also show leading causes of death for the age subcategories neonatal (under 28 days) and postneonatal (28 days to 11 months).

The age grouping used when ranking causes of death can have an impact on the rankings assigned to any particular age (9). For example, in 1999 the rankings for the 10 leading causes of death for a 45-year old male are slightly different depending on whether one uses the age group 45–49, 45–54, or 45–64 years. To illustrate, the category Chronic lower respiratory disease (CLRD) is not ranked among the 10 leading causes for 45–49 year-old men, but is ninth for men 45–54 years old and seventh for men 45–64 years old. Viral hepatitis is ranked tenth for men 45–49, but is not ranked in the top 10 for the other two age groups. Each aggregation of age results in a different understanding of the relative importance of CLRD and Viral hepatitis for those at or near age 45. These differences can have important program implications.

Results

In 1999 the 10 leading causes of death accounted for nearly 80 percent of all deaths occurring in the United States (table C). The top two causes, Diseases of heart (heart disease) and Malignant neoplasms (cancer) accounted for a little more than half (53.3 percent) of all deaths in 1999. Cerebrovascular diseases (stroke) was ranked third, followed by Chronic lower respiratory diseases (CLRD) and Accidents (unintentional injuries), which were ranked fourth and fifth, respectively. Rounding out the top 10 were Diabetes mellitus (6th), Influenza and pneumonia (7th), Alzheimer's disease (8th), Nephritis, nephrotic syndrome, and nephrosis (kidney disease) (9th), and Septicemia (10th).

The positioning of the top five leading causes remained unchanged from 1998 to 1999 (the ICD-9 title Chronic obstructive pulmonary diseases is comparable to the ICD-10 title Chronic lower respiratory diseases). Influenza and pneumonia and Diabetes mellitus, ranked sixth and seventh respectively in 1998, switched rankings between 1998 and 1999. Alzheimer's disease and Septicemia,

previously not ranked among the 10 leading causes in 1998, became the 8th and 10th leading causes in 1999. Kidney disease remained the 9th leading cause of death. Suicide and Chronic liver disease and cirrhosis, despite changing only slightly between 1998 and 1999, dropped out of the top 10 during this period as the result of large increases in deaths due to Alzheimer's disease, kidney disease, and Septicemia.

Changes in the number of deaths by cause from 1998 to 1999 can be explained by two factors. First, due to the introduction of ICD-10 beginning with 1999 mortality data, some changes occurred in cause-of-death titles and groupings and in the rules for selecting the underlying cause of death (see [Technical notes](#)) (10). Mortality data for 1998 were classified according to ICD-9 (5). The second factor is actual changes in mortality levels between 1998 and 1999. [Table D](#) compares leading causes for 1998 with leading causes based on 1998 comparability-modified counts and estimates the impact of ICD-10 on the leading causes of death for 1998. The comparability-modified data approximate the pattern that would occur if the 1998 data were classified by ICD-10. The modified counts for causes of death are calculated by multiplying the 1998 count by cause-specific comparability ratios (see [Technical notes](#)) (3,10).

The ranking of the top five leading causes are unaffected by the introduction of ICD-10. However, ICD-10 does have a substantial impact on the rankings for leading causes 6–10 and is the primary factor responsible for changes in the ranking of these causes from 1998 to 1999. A comparison between leading causes based on comparability-modified 1998 data (table D) and 1999 leading causes (table C) shows almost identical rankings. A change in the rules for selecting the underlying cause of death is primarily responsible for the large decrease in deaths and resulting drop in ranking from 1998 to 1999 for Influenza and pneumonia (see [Technical notes](#)) (3,10). The increases in deaths for Alzheimer's disease and kidney disease and the substantial increase in ranking for Alzheimer's disease were primarily due to an ICD-10-related classification change. A change in the rules for selecting underlying cause of death also resulted in an increase in deaths due to Septicemia. However, the comparability-modified 1998 data show Suicide ranked 10th (Septicemia is ranked

¹Rank based on number of deaths.²Modified counts for causes of death calculated by multiplying the 1998 count by cause-specific comparability ratios; see Technical notes.

11th). The combination of increases in the mortality level for Septicemia and decreases for Suicide between 1998 and 1999 pushed Septicemia to rank 10th ahead of Suicide in 1999.

Age differences

Leading causes of death vary substantially by age. The leading cause of death for age groups from 1–4 to 25–34 is unintentional injuries ([table 1](#)). Assault (homicide) and Intentional self-harm (suicide) are also important causes of death in these age categories. Unintentional injuries, homicide, and suicide combined accounted for 75 percent of deaths for those aged 15–19 years, 72 percent of deaths for those aged 20–24 years, and 52 percent of deaths for those aged 25–34 years. Congenital malformations, deformations, and chromosomal abnormalities, Human immunodeficiency virus (HIV) disease and cancer were also typically ranked among the leading causes for the younger age groups.

In the older age groups, mortality due to chronic diseases was most prevalent. Cancer and heart disease were the top two causes of death for ages 45–54 and older age groups and consistently account for more than half of all deaths in these age groups. Other prevalent chronic causes among the older age groups were stroke, CLRD, Diabetes mellitus, Alzheimer's disease, kidney disease, and Chronic liver disease and cirrhosis. Unintentional injuries, Influenza and pneumonia, and Septicemia were also important causes of death for those in older age groups.

Sex differences

[Table E](#) contrasts leading causes of death for males and females. The top three causes for males and females—heart disease, cancer, and stroke—are exactly the same. The next four most prevalent causes are also the same, although not in exactly the same order. The rank of unintentional injuries is fourth for males and seventh for females. CLRD, Diabetes mellitus, and Influenza and pneumonia, which rank fifth, sixth, and seventh, respectively, for males, rank fourth, fifth, and sixth for females. Suicide and Chronic liver disease and cirrhosis were ranked eighth and ninth respectively for males, but were not ranked among the 10 leading causes for females. Alzheimer's disease and Septicemia, ranked 8th and 10th, respectively, for females, were not ranked among the top 10 for males. Kidney disease was ranked 9th for females and 10th for males.

Race differences

[Table F](#) shows variation across race groups in the 10 leading causes of death. The four major race groups shown all share seven leading causes in common. Heart disease and cancer rank first and second for each of the four race groups. Stroke ranks third for the white, black, and Asian or Pacific Islander (API) populations, but ranks fifth for the American Indian population. CLRD, unintentional injuries, Influenza and pneumonia, and Diabetes mellitus also rank among the 10 leading causes of death for each race group. CLRD ranks fourth for the white population, sixth for the black and API populations, and seventh for the American Indian population. Unintentional injuries ranks third for the American Indian population, fourth for the black and API populations, and fifth for the white population. Influenza and pneumonia ranks 6th for the white population, 7th for the API population, 8th for the American Indian population and 10th

for the black population. Diabetes mellitus is ranked fourth for the American Indian population, fifth for the black and API populations, and seventh for the white population. Other leading causes common to more than one race group include kidney disease, ranked 9th for the white, black, and API populations; suicide, ranked 8th for the API population, 9th for the American Indian population, and 10th for the white population; and homicide, ranked 8th for the black population and 10th for the American Indian population.

For each of the four race groups, one of the 10 leading causes is exclusive to that group. For the American Indian population, Chronic liver disease and cirrhosis ranks sixth but is not ranked in the top 10 for the other three race groups. HIV disease ranks seventh for the black population, but is not among the leading causes for the other race groups. Alzheimer's disease, ranked eighth for the white population, is not ranked among the 10 leading causes for the other race groups. Septicemia is ranked 10th for the API population, but not ranked in the top 10 for the other race groups.

Hispanic origin

[Table G](#) shows leading causes of death for the Hispanic, non-Hispanic white, and non-Hispanic black populations. Heart disease and cancer rank first and second for both the Hispanic and non-Hispanic populations. Unintentional injuries rank third for the Hispanic population, higher than the rank for the non-Hispanic white (fifth) and non-Hispanic black (fourth) populations. The fourth ranked cause for Hispanics is stroke, which is ranked third for the non-Hispanic populations. Diabetes mellitus is ranked fifth for both the Hispanic and non-Hispanic black populations, but seventh for the non-Hispanic white population. Chronic liver disease and cirrhosis, ranked sixth for the Hispanic population, is not ranked among the 10 leading causes for the non-Hispanic white and black populations. Homicide ranks seventh for the Hispanic population and eighth for the non-Hispanic black population. CLRD is ranked much lower for the Hispanic population (eighth) than for the non-Hispanic white (fourth) and non-Hispanic black (sixth) populations. Influenza and pneumonia is also ranked much lower for the Hispanic population (9th) than for the non-Hispanic white population (sixth), but higher than for the non-Hispanic black population (10th). The 10th ranked cause for the Hispanic population is Certain conditions originating in the perinatal period (perinatal conditions), a category consisting of diseases that primarily affect infants. The high ranking of perinatal conditions is largely a reflection of the relatively young age distribution of the Hispanic population. HIV disease (ranked 7th for the non-Hispanic black population), Alzheimer's disease and suicide (ranked 8th and 10th, respectively, for the non-Hispanic white population) and kidney disease (ranked 9th for both the non-Hispanic white and black populations) are not ranked among the 10 leading causes of death for Hispanics.

Leading causes of infant death

The leading cause of infant death in 1999 was Congenital malformations, deformations, and chromosomal abnormalities (congenital anomalies) that accounted for nearly one-fifth of all infant deaths ([table H](#)). Disorders related to short gestation and low birthweight, not elsewhere classified was ranked second, followed by Sudden infant death syndrome (SIDS) (third); Newborn affected by

¹Rank based on number of deaths.

maternal complications of pregnancy (4th); Respiratory distress of newborn (5th); Newborn affected by complications of placenta, cord and membranes (6th); unintentional injuries (7th); Bacterial sepsis of newborn (8th); Diseases of the circulatory system (9th); and Atelectasis (10th). In all, the 10 leading causes of infant death accounted for about 68 percent of all infant deaths.

From 1998 to 1999, the six most prevalent causes of infant death did not change (cause-of-death titles did change in some instances due to the implementation of ICD-10; see [Technical notes](#)). Unintentional injuries rose in the ranking from eighth in 1998 to seventh in 1999 despite remaining unchanged in terms of the number of deaths. Infections specific to the perinatal period, which ranked seventh in 1998, is not a rankable cause of infant death under the ICD-10 rubric. Its

subcategories, however, are designated as rankable. One of these subcategories is Bacterial sepsis of newborn, which is ranked eighth in 1999. Intrauterine hypoxia and birth asphyxia and Pneumonia and influenza, ranked 9th and 10th in 1998, dropped out of the top 10 in 1999 because with the introduction of ICD-10, Diseases of the circulatory system and Atelectasis as rankable causes of infant death each exceed Intrauterine hypoxia and birth asphyxia and Pneumonia and influenza in terms of number of deaths.

Neonatal and Postneonatal mortality

Stark differences are evident when comparing leading causes of death in the neonatal (less than 28 days after birth) and postneonatal

leading causes are more characterized by conditions prevalent among the general population, including unintentional injuries (third), Influenza and pneumonia (fifth), Septicemia (sixth) and homicide (seventh).

Discussion

This report presents leading causes of death in the United States by age, race, sex, and Hispanic origin, and for the infant, neonatal and postneonatal periods. Cause-of-death ranking is a popular method of presenting mortality statistics and is a useful tool for illustrating the relative burden of cause-specific mortality, but it must be used cautiously with a clear understanding of the limitations underlying the method.

When comparing rankings across groups or over time, one should be mindful of the age distribution of the populations being compared. Leading causes of death for populations with younger age distributions will tend to show higher rankings for causes of death that are prevalent among the young, such as homicide, unintentional injuries, and HIV infection. Leading causes for older populations will tend to show higher rankings for causes that are more prevalent among the elderly, such as Alzheimer's disease, heart disease, cancer, and stroke.

Consideration should also be given to the effects of random variation on cause-of-death rankings. When the number of events is small (perhaps less than 100 deaths), estimates of mortality risk are more subject to random fluctuations (see [Technical notes](#)). This is less problematic when analyzing the relative ranking of causes of death because the observed frequency of deaths for any particular cause is

fixed for any given group in any given year, and the ranking is based on that fixed value. Nevertheless, when comparing rankings based on small numbers of deaths between groups or over time, it is important to be aware that differences in relative rankings may be attributable to random variability.

Because the rank order of any particular cause of death will depend on the list of causes from which selection is made and on the rules applied in making the selection, a clearly defined, uniform method for ranking causes of death is vital to maintain consistency in the reporting of leading causes by Federal and State agencies. The standard method and cause-lists described in this and other publications (1–3,7) provides this needed structure.

¹Rank based on number of deaths

²Figures for age not stated are included in "All ages" but not distributed among age groups.

³Includes deaths for "Under 1 year."

Table 2. Deaths, percent of total deaths, and death rates for the 10 leading causes of death in selected age groups, by Hispanic origin, race for non-Hispanic population, and sex: United States, 1999

[Rates per 100,000 population in specified group. Race and Hispanic origin are reported separately on the death certificate. Persons of Hispanic origin may be of any race. Data for Hispanic persons are not tabulated by race, data for non-Hispanic persons are tabulated by race]

Table 3. Infant, neonatal, and postneonatal deaths, percent of total deaths, and mortality rates for the 10 leading causes of infant death by race and sex: United States, 1999—Con.

[Rates are infant (under 1 year), neonatal (under 28 days), and postneonatal (28 days–11 months) deaths per 100,000 live births in specified group. Data for races other than white and black should be interpreted with caution. Deaths based on race of decedent; live births based on race of mother; see Technical notes]

¹Rank based on number of deaths.

Table 4. Infant, neonatal, and postneonatal deaths, percent of total deaths, and mortality rates for the 10 leading causes of infant death by Hispanic origin, races for non-Hispanic population, and sex: United States, 1999

[Rates are infant (under 1 year), neonatal (under 28 days), and postneonatal (28 days–11 months) deaths per 100,000 live births in specified group. Race and Hispanic origin are reported separately on the death certificate. Persons of Hispanic origin may be of any race. Data for Hispanic persons are not tabulated separately by race, data for non-Hispanic persons are tabulated by race. Data for Hispanic origin should be interpreted with caution because of inconsistencies between reporting Hispanic origin on birth and death certificates; see Technical notes. National linked files should be used to measure infant mortality for specific Hispanic subgroups]

Table 4. Infant, neonatal, and postneonatal deaths, percent of total deaths, and mortality rates for the 10 leading causes of infant death by Hispanic origin, races for non-Hispanic population, and sex: United States, 1999—Con.

[Rates are infant (under 1 year), neonatal (under 28 days), and postneonatal (28 days–11 months) deaths per 100,000 live births in specified group. Race and Hispanic origin are reported separately on the death certificate. Persons of Hispanic origin may be of any race. Data for Hispanic persons are not tabulated separately by race, data for non-Hispanic persons are tabulated by race. Data for Hispanic origin should be interpreted with caution because of inconsistencies between reporting Hispanic origin on birth and death certificates; see Technical notes. National linked files should be used to measure infant mortality for specific Hispanic subgroups]

¹Rank based on number of deaths.

Technical notes

Nature and sources of data

Data in this report are based on information from all death certificates filed in the 50 States and the District of Columbia. The U.S. Standard Certificate of Death—which is used as a model by the States—was last revised in 1989; for additional details see the 1989 revision of the U.S. standard certificates and reports (11) and Technical Appendix of *Vital Statistics of the United States, 1989*, Volume II, Mortality, part A (12). Information from death certificates are coded by the States and provided to the National Center for Health Statistics (NCHS) through the Vital Statistics Cooperative Program (VSCP) and from copies of the original certificates received by NCHS from the State registration offices. In 1999 all the States and the District of Columbia participated in this program and submitted part or all of the mortality data for 1999 in electronic data files to NCHS. All States provided pre-coded medical (cause-of-death) data to NCHS except Arizona, Illinois, Kentucky, Missouri, New Jersey, Ohio, West Virginia, New York City, and the District of Columbia. For 1999 all States submitted pre-coded demographic data for all deaths.

Cause-of-death classification

The mortality statistics presented here were compiled in accordance with the World Health Organization (WHO) regulations, which specify that member nations classify and code causes of death in accordance with the current revision of the *International Statistical Classification of Diseases and Related Health Problems, Tenth Revision* (ICD-10). The International Classification of Diseases (ICD) provides the basic guidance used in virtually all countries to code and classify causes of death. Effective with deaths occurring in 1999, the United States began using the 10th revision of this classification, (ICD-10) (4); during the period 1979–98, causes were coded and classified according to the 9th revision (ICD-9) (5). For earlier years causes of death were classified according to the revisions then in use—1968–78, eighth revision, adapted for use in the United States; 1958–67, seventh revision; and 1949–57, sixth revision.

One of the efforts to maintain the tradition of progress in the classification of diseases has been the practice, begun in 1900, to revise about every 10 to 20 years what is now the ICD. Each of these revisions has produced some break in the comparability of cause-of-death statistics. ICD-10 has many changes from ICD-9, including considerably greater detail, shifts of inclusion terms and titles from one category, section, or chapter to another; regroupings of diseases; new titles and sections; and modifications in coding rules (10). As a result, serious breaks occur in comparability for a number of causes of death. Measures of this discontinuity are essential to the interpretation of mortality trends. Ratios of comparability between ICD-9 and ICD-10 have been computed for this purpose and are presented in a separate report (10). Comparability ratios measuring discontinuities between previous revisions of the ICD have also been published (13–15).

The ICD not only details disease classification but also provides definitions, tabulation lists, the format of the death certificate, and the rules for coding cause of death. Cause-of-death data presented in this publication were coded by procedures outlined in annual issues of the *NCHS Instruction Manual* (16–18). The manual includes rules for

selecting the underlying cause of death for tabulation purposes, definitions, tabulation lists, and regulations on the use of the classification.

Before data for 1968, mortality medical data were based on manual coding of an underlying cause of death for each certificate in accordance with WHO rules. Effective with data year 1968, NCHS converted to computerized coding of the underlying cause and manual coding of all causes (multiple causes) on the death certificate. In this system, called “Automated Classification of Medical Entities” (ACME) (19), multiple cause codes serve as inputs to the computer software that employs WHO rules to select the underlying cause. Many States have implemented ACME and provide multiple cause and underlying cause data to NCHS in electronic form; for those States that have not, NCHS coded the mortality medical data using ACME.

The ACME system is used to select the underlying cause of death on all death certificates in the United States. In addition, NCHS has developed two computer systems as inputs to ACME. Beginning with 1990 data, the Mortality Medical Indexing, Classification, and Retrieval system (MICAR) (20,21), was introduced to automate coding multiple causes of death. In addition, MICAR provides more detailed information on the conditions reported on death certificates than is available through the ICD code structure. Then, beginning with data year 1993, SuperMICAR, an enhancement of the MICAR system, was introduced. SuperMICAR allows for literal entry of the multiple cause-of-death text as reported by the certifier. This information is then automatically processed by the MICAR and ACME computer systems. Records that cannot be automatically processed by MICAR or SuperMICAR are manually multiple-cause coded and then further processed through ACME.

In this report tabulations of cause-of-death statistics are based solely on the underlying cause of death. The underlying cause is defined by WHO as the disease or injury that initiated the train of events leading directly to death, or the circumstances of the accident or violence which produced the fatal injury (4). It is selected from the conditions entered by the physician in the cause-of-death section of the death certificate. When more than one cause or condition is entered by the physician, the underlying cause is determined by the sequence of conditions on the certificate, provisions of the ICD, and associated selection rules and modifications. Generally, more medical information is reported on death certificates than is directly reflected in the underlying cause of death. This is captured in NCHS multiple cause-of-death statistics (22–24).

Race and Hispanic origin

Race and Hispanic origin are reported separately on the death certificate. Therefore, data shown by race include persons of Hispanic or non-Hispanic origin, and data for Hispanic origin include persons of any race. In this report, unless otherwise specified, deaths of Hispanic origin are included in the totals for each race group—white, black, American Indian, and API—according to the decedent's race as reported on the death certificate. Data shown for Hispanic persons include all persons of Hispanic origin of any race.

Mortality data for the Hispanic-origin population are based on deaths to residents of all 50 States and the District of Columbia. Data year 1997 was the first year that mortality data for the Hispanic population were available for the entire United States.

Quality of race and Hispanic origin data—Death rates for Hispanic, American Indian, and API persons should be interpreted with caution

because of inconsistencies in reporting race on the death certificate as compared with race on censuses, surveys, and birth certificates. Studies have shown underreporting on death certificates of American Indians, API, and Hispanic decedents; and undercounts of these groups in the censuses (25,26).

A number of studies have been conducted on the reliability of race reported on the death certificate by comparing race on the death certificate with that reported on another data collection instrument, such as the census or a survey. Differences may arise because of differences in who provides race information on the compared records. Race information on the death certificate is reported by the funeral director as provided by an informant or in the absence of an informant, on the basis of observation. In contrast, race on the census or on the Current Population Survey (CPS) is obtained while the individual is alive and is self-reported or reported by another member of the household familiar with the individual and, therefore, may be considered more valid. A high level of agreement between the death certificate and the census or survey report is essential to assure unbiased death rates by race.

Studies (26,27) show that a person self-reported as American Indian or Asian on census or survey records was sometimes reported as white on the death certificate. The net effect of misclassification is an underestimation of deaths and death rates for races other than white and black. In addition, undercoverage of minority groups in the census and resultant population estimates, introduces biases into death rates by race (25,28). Estimates of the approximate effect of the combined bias due to race misclassification on death certificates and underenumeration on the 1990 census are as follows: white, -1.0 percent; black, -5.0; American Indian, +20.6; Asian or Pacific Islander, +10.7 (25).

The National Longitudinal Mortality Study (NLMS) examined the reliability of Hispanic origin reported on 43,520 death certificates with that reported on a total of 12 Current Population Surveys conducted by the U.S. Bureau of the Census for the years 1979–85 (25). In this study, agreement—on a record-by-record basis—was 89.7 percent for any report of Hispanic origin. The ratio of deaths for CPS divided by deaths for death certificate was 1.07 indicating net underreporting of Hispanic origin on death certificates of 7 percent as compared with self-reports on the surveys. Death rates for the Hispanic-origin population are also affected by undercoverage of this population group in the census and resultant population estimates; the estimated net correction, taking into account both sources of bias, is 1.6 percent (25,28).

Other races and race not stated—Beginning in 1992 all records coded as “Other races” (0.02 percent of the total deaths in 1999) were assigned to the specified race of the previous record. Records for which race was unknown, not stated, or not classifiable (0.10 percent) were assigned the racial designation of the previous record.

Infant mortality rates—For 1989–99, as in previous years, infant deaths continue to be tabulated by the race of the decedent. However, beginning with the 1989 data year, the method of tabulating live births by race was changed from race of parents to race of mother as stated on the birth certificate. This change affects infant mortality rates because live births are the denominators of these rates (29,30).

Quantitatively, the change in the basis for tabulating live births by race results in more white births and fewer black births and births of other races. Consequently, infant and maternal mortality rates under the new tabulating procedure tend to be about 2 percent lower for white

infants and about 5 percent higher for black infants than when they are computed by the previous method of tabulating live births by race of parents. Rates for most other minority races also are higher when computed by race of mother (12,30).

Infant mortality rates for specified race are in error because of reporting problems that affect the classification of race on the birth and death certificates for the same infant. Infant mortality rates by specified race are more accurate when based on the linked file of infant deaths and live births (31). The linked file computes infant mortality rates using the race of the mother from the birth certificate in both the numerator and denominator. Race information on the birth certificate is considered to be more accurate than that on the death certificate because, on the birth certificate, race is generally reported by the mother at the time of delivery. Estimates of reporting errors have been made by comparing rates based on the linked files with those in which the race of infant death is based on information from the death certificate (12,25).

Infant mortality rates for the Hispanic-origin population are based on numbers of resident infant deaths reported to be of Hispanic origin and numbers of resident live births by Hispanic origin of mother for the United States. In computing infant mortality rates, deaths and live births of unknown origin are not distributed among the specified Hispanic and non-Hispanic groups. The percent of infant deaths of unknown origin was 1.4 and the percent of live births to mothers of unknown origin was 1.2 for the United States for 1999. Infant mortality rates by Hispanic origin are more accurate when based on linked files of infant deaths and live births (31).

Computation of rates and population bases

Rates in this report (except for infant mortality rates) are crude death rates presented per 100,000 estimated population in a specified group. Population estimates represent the population at risk of dying in a specified group. The populations used for computing death rates (furnished by the U.S. Bureau of the Census) in this report are estimates as of July 1, 1999 (32) and based on 1990 census level counts. Census level counts by race were modified to be consistent with U.S. Office of Management and Budget categories and historical categories for death data (33). Population estimates by race, sex, and the age categories presented in this report are shown in [table I](#). Population estimates by Hispanic origin, race for the non-Hispanic population, and sex and age are shown in [table II](#).

Infant mortality rates are the most commonly used index for measuring the risk of dying during the first year of life. Infant mortality rates use the number of live births to approximate the population at risk of dying before the first birthday. They are calculated by dividing the number of infant deaths in a calendar year by the number of live births registered for the same period and are presented as rates per 100,000 live births. Neonatal and postneonatal mortality rates are also calculated using live births in the denominator. For final birth figures used in the denominator for infant mortality rates, see “Births: Final Data for 1999” (34).

Random variation

The mortality data presented in this report are not subject to sampling error. However, mortality data, even based on complete counts, may be affected by random variation. When the number of

events is small (perhaps less than 100) and the probability of such an event is small, caution must be observed when interpreting mortality data. This is less problematic when analyzing the relative ranking of causes of death because the observed frequency of deaths for any particular cause is fixed for any given group in any given year, and the ranking is based on that fixed value. Nevertheless, when comparing rankings based on small numbers of deaths between groups or over time, it is important to be aware that differences in relative rankings may be attributable to random variability (see reference 3 for a more detailed discussion of random variation and formulas for calculating standard errors for death rates and infant mortality rates).

Contents

Abstract.....	1
Introduction	1
Data and methods.....	2
Data	2
Procedures for ranking causes of death.....	2
Age groupings	2
Results	7
Age differences	9
Sex differences	9
Race differences	9
Hispanic origin.....	9
Leading causes of infant death	9
Neonatal and postneonatal mortality.....	10
Discussion	12
References.....	12
List of detailed tables.....	13
Technical notes	84
