

# PREOPERATIVE THERAPY IN INVASIVE BREAST CANCER

Reviewing the State of the Science and Exploring New Research Directions

## Evaluating the Axilla and Other Nodal Areas with Non-Invasive Techniques

Nagi Khouri M.D.

Associate Professor of Radiology and Oncology

The Johns Hopkins University

# PREOPERATIVE STAGING OF BREAST CANCER

---

- Local extent of the cancer
- Multifocality
- Multicentricity
- Contralateral breast
- Regional lymph node extension
- Systemic Extension

# ULTRASOUND EVALUATION OF REGIONAL NODES IN BREAST CANCER

---

- Axillary nodes
- Internal mammary nodes
- Supra and infraclavicular and low cervical

# Variability of breast imager's approach to the axilla in breast cancer

---

- Will not look
- Ultrasound evaluation
- Information from MRI
- +/- Needle biopsy

# Pathologic distribution of cancer cells in metastatic lymph nodes

---

- Isolated tumor cells
- Islands of metastatic cancer
- Focal mass
- Total replacement

# Sonographic Criteria of Indeterminate/Suspicious/Metastatic Nodes

---

- Size
- Thickening of cortex (diffuse or eccentric)
- Lobulation of cortex
- Rounded or vertically oriented lymph node
- Complete disappearance of the hilum

Don't forget that you can compare to the other side!

# BENIGN CAUSES AXILLARY ADENOPATHY

---

- Normal
- Hyperplasia
- Recent Biopsy (>3 weeks)
- HIV
- Collagen Vascular Diseases
- Dermatopathic
- Silicone adenopathy
- Toxoplasmosis

# Metastatic / Reactive Nodes

---

9L

- 1

- 2

- 3

# Accuracy of Sonography of Axillary Lymph Nodes in Breast Cancer

---

## **SENSITIVITY**

Palpable and Non-palpable

Size 66-77%

Morphology 55-92%

Non-palpable Only

Size 49-87%

Morphology 26-76%

Ultrasound Guided Biopsy

43-95%

## **SPECIFICITY**

Palpable and Non-palpable

Size 44-98%

Morphology 80-97%

Non-palpable Only

Size 55-97%

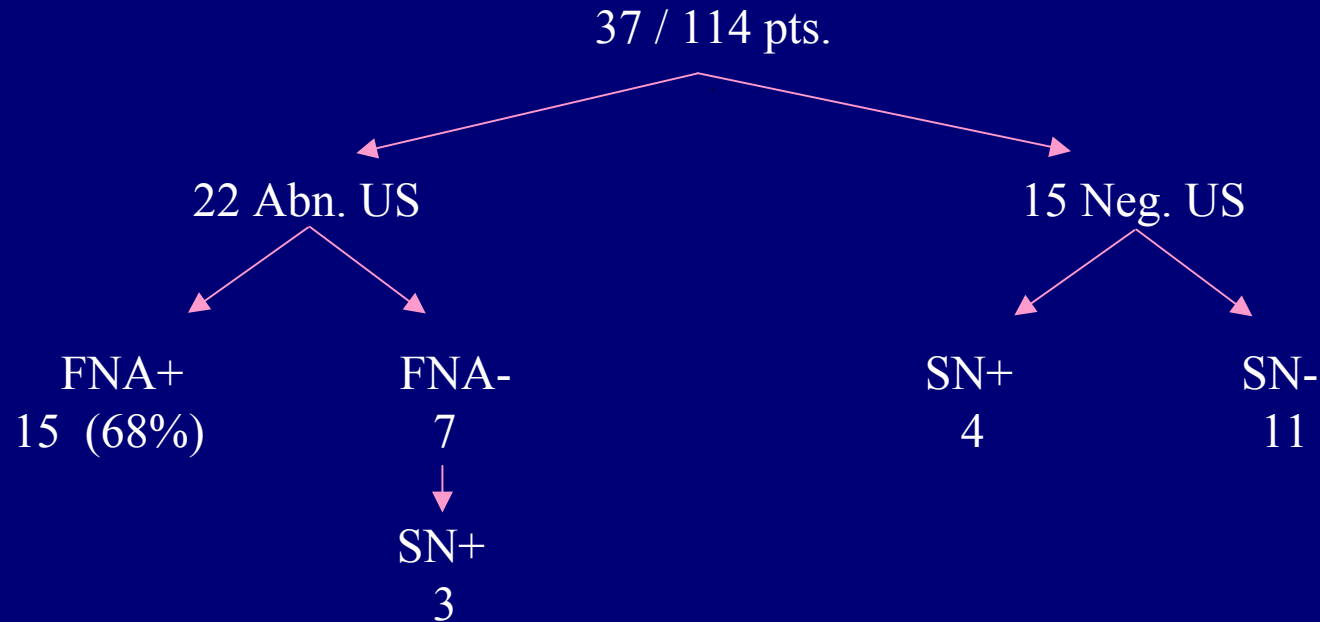

Morphology 88-98%

Ultrasound Guided Biopsy

97-100%

AJR 2006, 186:1342-1348

# FNA in High Risk Pts. Clinically Neg. Nodes

In total 22/37 had metastatic disease on final histology

64% had grade 3 mean size 5cm with lymphatic invasion in 50% , positive FNA 68%

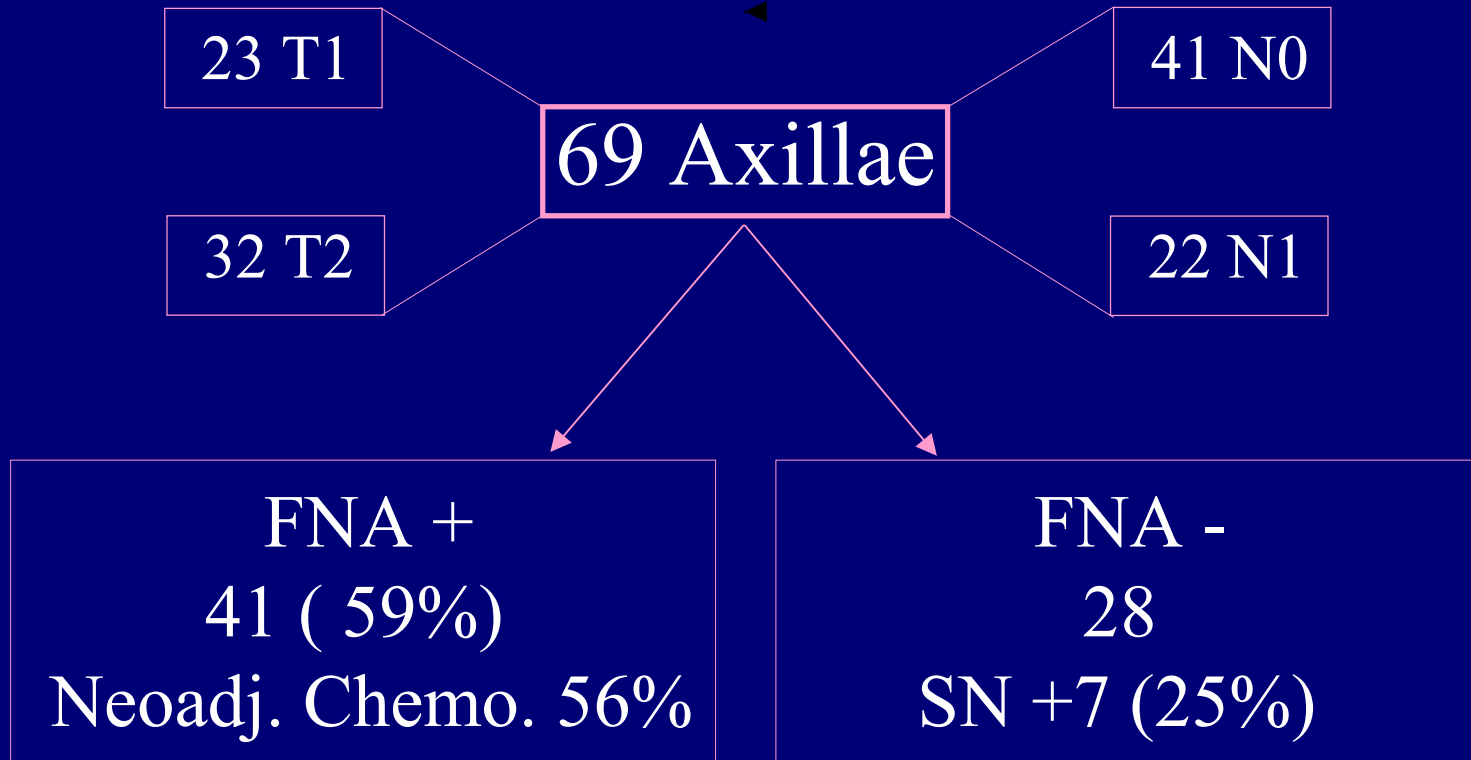

In total 15/37 had no lymph node metastases

87% had grade 2 mean size 3.2cm with lymphatic invasion in 8%

# FNA Axillary Nodes

## The Johns Hopkins Experience

---

- Sensitivity 82%
- Specificity 100%
- PPV 100%
- NPV 70%

# Technical aspects of FNA of lymph nodes

---

- Needle 23-20g
  - Ventral, caudal, cephalad and dorsal sampling
  - Avoid the hilum
  - Three passes of same node or one pass of three separate nodes
  - 30 to 40 excursions-stop when blood in hub of needle
- Learn to smear slides- Avoid dryness

# Challenges to successful FNA of lymph nodes in breast cancer

---

- Skills of axillary ultrasound performance and interpretation
- Skills of performance of FNA
- Skills of cytopathologic interpretation

# Impact of Axillary US and FNA

---

- Reasonable sensitivity, high specificity
- If FNA is positive for cancer cells:

Patient candidate for surgery and LN dissection  
or

Preoperative Chemotherapy followed by surgery

- If FNA is negative for cancer cells:

Patient needs sentinel node biopsy
