by Brian Balkovic

he Tax Reform Act of 1976 requires annual publication of data on individual income tax returns reporting income of \$200,000 or more, including the number of such returns reporting no income tax liability and the importance of various tax provisions in making these returns nontaxable [1]. This article presents detailed data for the 2.5 million high-income returns for 2003, as well as summary data for the period 1977 to 2002. Detailed data for the years 1974 through 2002 have been published previously [2].

Two income concepts are used in this article to classify tax returns as high-income: the statutory concept of adjusted gross income (AGI) and the expanded income concept [3]. Expanded income uses items reported on tax returns to obtain a more comprehensive measure of income than AGI. Specifically, expanded income is AGI *plus* tax-exempt interest, nontaxable Social Security benefits, the foreign-earned income exclusion, and items of "tax preference" for "alternative minimum tax" purposes; less unreimbursed employee business expenses, moving expenses, investment interest expense to the extent it does not exceed investment income, and miscellaneous itemized deductions not subject to the 2-percent-of-AGI floor [4, 5, 5A]. Note that, although expanded income is a more comprehensive measure of income than AGI, for some taxpayers, the subtractions from AGI to arrive at expanded income exceed the additions, with the result that expanded income is less than AGI.

Number of High-Income Returns

Figure A and Table 1 show that, for 2003, there were 2,536,439 individual income tax returns reporting AGI of \$200,000 or more, and 2,573,133 returns with expanded income of \$200,000 or more. These returns represented 1.945 percent and 1.973 percent, respectively, of all returns for 2003.

From 1977 to 2000, the numbers of returns reporting incomes of \$200,000 or more increased each year, and each year those high-income returns were a larger share of all tax returns. However, for 2001 and 2002, both the number of high-income returns and their percentage of all returns decreased. For

2003, both the numbers of high-income returns and their share of all returns increased slightly, but by all measures were still lower than in 2001.

The difference in the number of high-income returns between the two income concepts significantly decreased beginning with 1987, when AGI began to include 100 percent of long-term capital gains. That change in the definition of AGI made AGI and expanded income concepts more comparable. In addition, as a result of the inclusion of tax-exempt interest in expanded income starting with 1987, expanded income for years after 1986 is not strictly comparable to expanded income for years before 1987.

In the top panel of Figure A, the \$200,000 threshold for high-income returns is measured in current-year (nominal) dollars. As a result of inflation, the real (constant) dollar level of the threshold fell over time, and some returns are classified as high-income that would not have been classified as high-income for earlier years. To maintain the comparability of the real threshold over time, the nominal \$200,000 threshold has been adjusted for inflation to 1976 constant dollars for all years, and the number of high-income tax returns has been recomputed in the lower panel of Figure A [6].

When measured in 1976 constant dollars, under the expanded income concept, the total number of high-income returns for 2003 was only 6.2 times the number for 1977, whereas the number of high-income returns for 2003 measured in current-year dollars was 38.1 times as large as for 1977. Since 1977, the percentage of returns with expanded income of \$200,000 or more in current dollars increased every year except 2001 and 2002. The share of high expanded-income returns in 1976 constant dollars decreased from 2000 to 2002 and then showed a slight increase in 2003. For 2003, the share of high-expanded income returns in constant dollars was 0.281 percent, an increase from 0.274 percent, in 2002, but below a peak of 0.381 percent in 2000. Figure B shows the difference between the constant and current dollar shares of high expanded-income returns.

Based on AGI, the number of high-income returns for 2003 measured in current-year dollars was 47.5 times as large as for 1977, whereas, measured in 1976 constant dollars, the number of returns for 2003 was only 7.8 times the number for 1977. For Tax Year 2003, the share of high AGI income re-

turns in constant dollars increased to 0.274 percent from 0.266 percent in 2002.

Nontaxable High-Income Returns

Two tax concepts are used in this article to classify tax returns as taxable or nontaxable. The first concept, "U.S. income tax," is total Federal income tax liability (including the "alternative minimum tax" (AMT)), less all credits against income tax. Since the U.S. income tax applies to worldwide income and since a credit (subject to certain limits) is allowed against U.S. income tax for income taxes paid to foreign governments, a return could be classified as nontaxable under this first concept even though income taxes had been paid to a foreign government. The second tax concept, "worldwide income tax," addresses this circumstance by adding to U.S. income

tax the allowed foreign tax credit and foreign taxes paid on excluded foreign-earned income [7, 8].

For 2003, of the 2,536,439 income tax returns with AGI of \$200,000 or more, 2,824 (0.111 percent) showed no U.S. income tax liability; and 2,416 (0.095 percent) showed no worldwide income tax liability (the top panel of Figure C). For 2002, of the 2,414,128 returns with AGI of \$200,000 and over, 2,959 returns (0.123 percent) had no U.S. income tax liability, and 2,551 returns (0.106 percent) had no worldwide income tax liability.

For 2003, of the 2,573,133 tax returns with expanded income of \$200,000 or more, 5,839 (0.227 percent) had no U.S. income tax liability; and 4,934 (0.192 percent) had no worldwide income tax liability. For 2002, of the 2,464,515 returns with expanded income of \$200,000 or more, there were 5,650 (0.229)

1976 constant dollars were calculated using the U.S. Bureau of Labor Statistics' consumer price index for urban consumers. See footnote 6 of this article for further details.

NOTE: See Figure H for the derivation of U.S. income tax and worldwide income tax.

percent) with no U.S. income tax liability and 4,922 (0.200 percent) with no worldwide income tax liability.

Thus, whether measured by absence of U.S. income tax or absence of worldwide income tax, or by AGI or expanded income, the proportion of non-taxable high-expanded income returns decreased slightly between 2002 and 2003.

Regardless of the income measure (AGI or expanded income) or the tax concept (U.S. income tax or worldwide income tax) used, the numbers of 2003 nontaxable, high-income returns in 1976 constant dollars were much lower than the numbers in current dollars. The percentages of nontaxable returns, however, are not substantially different regardless of whether measured in constant or current dollars. Of returns with AGI of \$200,000 or more in current dollars, 0.111 percent reported no U.S. income tax for 2003; and 0.095 percent had no

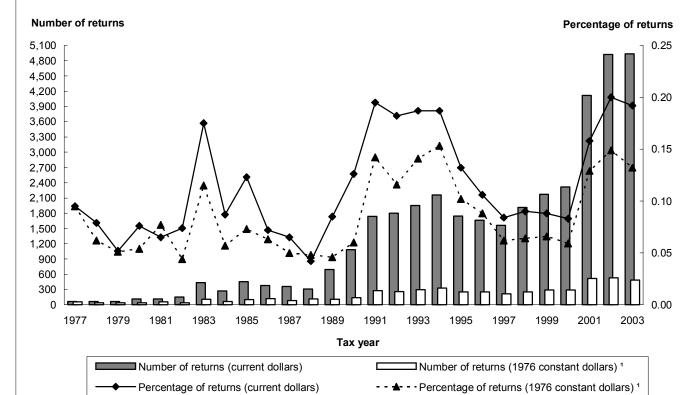

worldwide income tax. For returns in 1976 constant dollars, the percentage without U.S. income tax liability was 0.114; the percentage without worldwide income tax liability was 0.095 (see the lower panel of Figure C).

Of returns with expanded income of \$200,000 or more in current dollars, 0.227 percent reported no U.S. income tax for 2003, and 0.192 percent had no worldwide income tax. When looking at these returns using 1976 constant dollars, the percentage without U.S. income tax liability was 0.154; the percentage without worldwide income tax liability was 0.132.

Figure D shows the number of returns with no worldwide income tax and with expanded income of \$200,000 or more and their proportion of all high-expanded income returns for 1977 through 2003. These data are shown in both current-year and 1976

Figure D

Number and Percentage of Returns with No Worldwide Income Tax and with Expanded Income of \$200,000 or More, Tax Years 1977-2003

¹ 1976 constant dollars were calculated using the U.S. Bureau of Labor Statistics' consumer price index for urban consumers. See footnote 6 of this article for further details.

NOTE: See Figure H for the derivation of worldwide income tax.

constant dollars. In this figure, the spread between the two percentage lines was small for the late 1970's, showed an increase for the early 1980's, and then narrowed before widening again after 1988. The spread generally narrowed after 1993 but has increased for 2002 and 2003.

Note that, because the number of nontaxable returns with expanded income of \$200,000 or more is based on samples, year-to-year differences in the numbers and percentages of nontaxable returns with expanded income of \$200,000 or more may represent sampling variability, in addition to actual changes in the numbers of such returns. Beginning with Tax Year 1991, nontaxable returns with expanded income of \$200,000 or more were sampled at higher rates for Statistics of Income, which reduced the sampling variability of these returns and therefore provided improved estimates. Thus, the data for returns prior to 1991 are not entirely comparable with data for more recent years.

Detailed Data for 2003

Tables 1 through 12 present data based on income tax returns for 2003, mainly those with income of \$200,000 or more (measured in current-year dollars) of AGI or expanded income. Most of the data are shown for taxable and nontaxable returns, both separately and combined. In summary, the tables show:

- ☐ The numbers of returns under the two tax concepts, cross-classified by broad AGI and expanded income-size classes (Tables 1 and 2 for 2003 current dollar income classes and Table 1 and 2 for 1976 constant dollar income classes).
- ☐ The distributions of taxable income as a percentage of AGI and expanded income (Tables 3 and 4).
- ☐ The frequencies and amounts of various sources of income, exclusions, deductions, taxes, and tax credits, as well as the relationship between the two income concepts (Tables 5 and 6).
- ☐ The frequencies with which various deductions and tax credits are the most important

and second most important items in reducing (or eliminating) income tax (Tables 7 and 8).

- ☐ The frequencies with which various itemized deductions, tax credits, and tax preference items occur as certain percentages of income (Tables 9 and 10).
- ☐ The distributions of effective tax rates, i.e., income tax under each definition as a percentage of income, by broad income-size classes (Tables 11 and 12).

Tables 1,3,5,7,9, and 11 use the U.S. income tax concept to classify returns as taxable or nontaxable, whereas Tables 2, 4, 6, 8, 10, and 12 use the worldwide income tax concept.

Size of Income

Tables 1 and 2 show the number of all returns, taxable returns, and nontaxable returns, cross-classified by broad AGI and expanded income-size classes. The tables show that most returns fall in the same broad income-size class under both income concepts, but that the number of nontaxable returns is greater in each income class over \$50,000 when income is measured by economic income rather than by AGI. Table 1 shows that 2,824 returns with no U.S. income tax had an AGI of \$200,000 or more; and 5,839 returns with no U.S. income tax had an expanded income of \$200,000 or more.

Distribution of Tax Levels

Tables 3 and 4 show the distributions of high-income returns by the ratios of "adjusted" taxable income to AGI or expanded income. Taxable income has been adjusted for these tables by subtracting from taxable income the deduction equivalents of tax credits and other items [9]. Thus, the tables show the extent to which AGI or expanded income, respectively, are reduced before taxes are imposed on the remaining income. The tables also illustrate three important facts about high-income tax returns. (The examples in the paragraphs below are drawn from the "expanded income" columns in Table 4.)

Fact 1: As already described, only a small portion of high-income taxpayers were able to escape all income taxes (0.2 percent).

- Fact 2: Another group of high-income taxpayers--small, but larger than the nontaxable group--was able to offset a very substantial fraction of its income before being subject to tax. This type of high-income taxpayer pays income tax equal to only a small share of his or her income. Such taxpayers may be called "nearly nontaxables." (Around 0.9 percent of high expanded-income taxpayers who reported at least some worldwide tax liability were able to reduce their taxable incomes to less than 25 percent of their expanded incomes.)
- Fact 3: Overall, a large portion of highincome taxpayers were subject to tax on a large share of their income and, consequently, reported very substantial amounts of tax. (66.4 percent of high-expanded income taxpayers had taxable income equal to 80 percent or more of expanded income; and 95.5 percent had taxable income equal to 50 percent or more of expanded income.)

Tables 11 and 12 show the distributions of tax returns in another way: by tax burden. These two tables classify all tax returns by both size of income and effective tax rate, i.e., income tax as a percentage of either adjusted gross income or expanded income. These tables show that, on average, highincome taxpayers did have higher effective tax rates. The tables also illustrate the wide dispersion of effective tax rates for high-income returns. For example, Table 12 shows that, while 3.2 percent of returns with expanded income of \$200,000 or more had either no worldwide income tax or worldwide income tax of less than 10 percent of expanded income, 26.0 percent had effective tax rates of 25 percent or more. In addition, 36.6 percent had effective tax rates between 20 percent and 25 percent.

Characteristics of Tax Returns

Tables 5 and 6 show, in the aggregate, the frequencies and amounts of the types of income, the items of tax preference, and the various deductions, credits, and income taxes shown on high-income returns. By comparing the columns for nontaxable returns with those for taxable returns, some of the different characteristics of nontaxable returns can be deduced.

For example, nontaxable returns under the expanded-income concept, were much more likely to have tax-exempt interest than were taxable returns, and, when they did have it, the average amount was much higher. Similarly, nontaxable returns were much less likely to have any income from salaries and wages.

Reasons for Nontaxability

It is possible for certain itemized deductions and certain exclusions from income to cause nontaxability by themselves, but high-income returns are more often nontaxable as a result of a combination of reasons, none of which, by itself, would result in nontaxability. Moreover, some items, which singly or in combination may eliminate "regular tax" liability, i.e., income tax excluding the alternative minimum tax (AMT), cannot eliminate an AMT liability, since these items give rise to adjustments or preferences for AMT purposes.

Because they do not generate AMT adjustments or preferences, tax-exempt bond interest, itemized deductions for interest expense, miscellaneous itemized deductions not subject to the 2-percent-of-AGI floor, casualty or theft losses, and medical expenses (exceeding 10 percent of AGI) could, by themselves, produce nontaxability [10].

Due to the AMT exemption of \$58,000 on joint returns (\$40,250 on single and head-of-household returns and \$29,000 on returns of married taxpayers filing separately), a return could have been nontaxable, even though it included some items that produced AMT adjustments or preferences [11]. Further, since the starting point for "alternative minimum" taxable income" was taxable income for regular tax purposes, a taxpayer could have adjustments and preferences exceeding the AMT exclusion without incurring AMT liability. This situation could occur if taxable income for regular tax purposes was sufficiently negative, due to itemized deductions and personal exemptions exceeding AGI, so that the taxpayer's AMT adjustments and preferences are less than the sum of the AMT exclusion and the amount by which regular taxable income is below zero. Note that, because of the AMT, taxpayers may have found it beneficial to report additional deduction items on their tax returns, even if the items did not produce a benefit for regular tax purposes.

Tables 7 and 8 classify tax returns by the items that had the largest and second largest effects in

reducing or eliminating income tax. For returns on which each of the largest effects was identified, the tables show each of the second largest effects [12]. For example, Table 7 shows that on taxable returns with some U.S. income tax and expanded income of \$200,000 or more, the taxes paid deduction was the most important item 52.2 percent of the time. Where this was the primary item, the interest paid deduction was the second most important item 60.7 percent of the time, and the charitable contributions deduction was the second most important item 26.9 percent of the time.

Table 8 shows that on returns without any world-wide tax and expanded income of \$200,000 or more, the most important item in eliminating tax, on 64.6 percent of returns, was the exclusion for State and local government interest ("tax-exempt interest"). For these returns, the itemized deduction for taxes paid was the second most important item 24.7 percent of the time, and the deduction for medical and dental expenses was the second most important item 20.3 percent of the time.

The four categories with the largest effect in reducing taxes on high adjusted-gross-income returns with no worldwide income tax were the total miscellaneous deductions (740 returns, or 30.6 percent of the 2,416 tabulated returns with AGI of \$200,000 or more and with no worldwide tax liability); "all other" tax credits[13] (347 returns, or 14.4 percent); investment interest expense deduction (329 returns, or 13.6 percent); and medical and dental expense deduction (308 returns, or 12.7 percent). These effects are also shown graphically in Figure E.

The four categories with the largest effect in reducing taxes for high expanded-income returns with no worldwide income tax were tax-exempt interest (3,187 returns, or 64.6 percent of the 4,934 tabulated returns with expanded income of \$200,000 or more and with no worldwide tax liability); medical and dental expense deductions (589 returns, or 11.9 percent); "all other" tax credits (348 returns, or 7.1 percent); and Partnership and S corporation net losses (282 returns, or 5.7 percent). These effects are also shown graphically in Figure F.

Figure E

Returns with No Worldwide Income Tax and with Adjusted Gross Income of \$200,000 or More: Primary Reasons for Reduced Income Tax Liabilities, Tax Year 2003

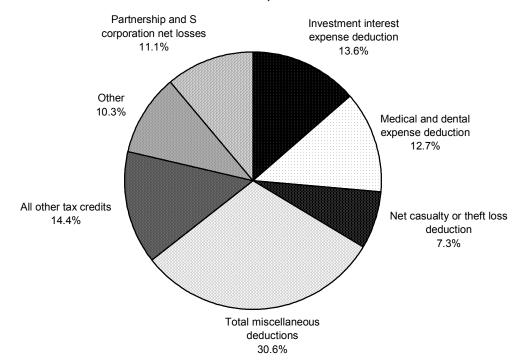

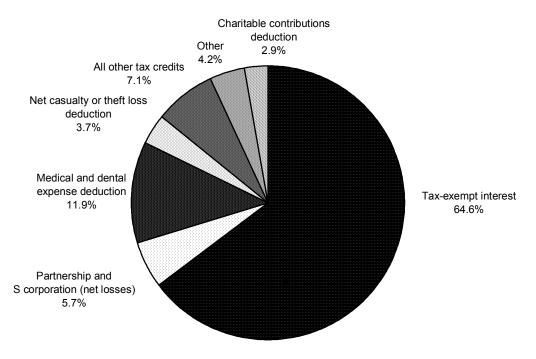

Figure F

Returns with No Worldwide Income Tax and with Expanded Income of \$200,000 or More: Primary Reasons for Reduced Income Tax Liabilities, Tax Year 2003

NOTE: Percentages do not add to totals because of rounding.

Table 8 also shows the two items that most frequently had the second largest effect in reducing regular tax liability for high expanded-income returns with no worldwide tax. These were the deduction for taxes paid (1,073 returns, or 21.7 percent) and the deduction for medical and dental expense deduction (683 returns, or 13.8 percent).

Tables 9 and 10 present another way of illustrating the importance of various tax provisions in reducing or eliminating income tax. Unlike Tables 7 and 8, these tables cover only nontaxable returns, i.e., returns showing no income tax liability. Tables 9 and 10 show the number of times that various items reduced income by different percentages of income. The items shown are the various categories of itemized deductions, the deduction equivalents of two different types of tax credits, and total tax preferences excluded from income. For example, for high expanded-income returns with no worldwide income tax (Table 10), the itemized deduction for casualty or theft losses exceeded 100 percent of expanded

income on 124 of the 4,934 returns, but there was no casualty or theft loss deduction on 4,726 returns.

- Spring 2005, Volume 24, Number 4, pp. 6-58.
- [3] The 1976 Act specified four income concepts for classifying tax returns: adjusted gross income (AGI), expanded income, AGI plus excluded tax preference items, and AGI less investment interest expense not in excess of investment income. Section 441 of the Deficit Reduction Act of 1984 (98 Stat. at 815) eliminated the requirement to use the last two income concepts.
- [4] The definition of adjustments to AGI to obtain the expanded income given in the text is for the current year. See Appendix A for a discussion of AGI and expanded income and a list of adjustments covering all years since 1977.
- [5] See Notes to Appendix A, Note A4.
- [5A] Tax-exempt interest had to be reported on the individual income tax return starting with Tax Year 1987 and is included in expanded income starting with that year. Beginning with Tax Year 1991, tax-exempt interest was incorporated into the criteria used for sampling returns for Statistics of Income, thus increasing the reliability of the estimates of expanded income.
- [6] Inflation-adjusted constant dollars are based on the Consumer Price Index (CPI-U) computed and reported by the U.S. Department of Labor, Bureau of Labor Statistics, *Monthly Labor Review*. The consumer price index represents annual averages of monthly indices and approximates buying patterns of typical urban consumers.
- [7] See Appendix B for a discussion of the tax concepts. In data published for years prior to 1989, either in articles presented in the *Statistics of Income Bulletin* or in chapters in *Statistics of Income-Individual Income Tax Returns* (see footnote 2), the "U.S. income tax" concept was described as "total income tax," and the "worldwide income tax" concept was described as "modified total income tax."
- [8] The inclusion of foreign taxes paid on excluded foreign-earned income, beginning with Tax Year 1990, represents an improvement in the worldwide income tax concept. It does, however, represent a slight break in the year-to-year comparability of data for worldwide income tax.

However, the number of returns with foreign taxes paid on excluded foreign-earned income is extremely small compared to the number of returns with the foreign tax credit.

- [9] See Appendix B for a description of how the deduction equivalent of credits was computed.
- [10] The deduction for charitable contributions could also fall into this class if it were not limited to 50 percent of AGI.
- [11] The AMT exclusion phases out above certain levels of "alternative minimum taxable income," based on filing status, but, since taxpayers will have some AMT liability in the phaseout range, the phaseout income is not relevant for nontaxable, high-income returns.
- [12] Tax-exempt interest and the foreign-earned income exclusion were not included in Tables 7 and 8 as possible tax effects before Tax Year 1994. Thus, caution should be exercised in making comparisons between data prior to 1994 and after 1993.
- [13] "All other" tax credits include: child and dependent care credit, credit for the elderly and disabled, child tax credit, education credits, rate reduction credit, retirement savings contribution credit, adoption credit, minimum tax credit, mortgage interest credit, empowerment zone employment credit, New York Liberty Zone credit, nonconventional source fuel credit, qualified electrical vehicle credit, and DC first time home buyer credit.

Appendix A: Income Concepts

Congress wanted data on high-income taxpayers classified by an income concept that was more comprehensive than adjusted gross income (AGI), but that was based entirely on items already reported on income tax returns. In order to derive such an income concept, it was necessary to begin with a broad, inclusive concept of income. AGI must then be compared to this broad income concept, and the differences (both additions and subtractions) that can be determined from items reported on tax returns identified.

This appendix begins by defining "Haig-Simons income," a very broad concept of income used by

economists and others as a standard. AGI is then compared to Haig-Simons income, and the major differences between the two income concepts are listed. The final section defines "expanded income," a more comprehensive income measure than AGI, based entirely on tax return data.

Haig-Simons Income

The broadest measure of annual income generally used by economists and others is defined as the value of a household's consumption plus the change, if any, in its net worth. This income concept is referred to as Haig-Simons income, or H-S income, after the two economists who wrote extensively about it [A1]. The H-S income of a household that consumed \$25,000 and saved \$2,000 in a year would be \$27,000. Alternatively, the H-S income of a household that consumed \$25,000 and had no additions to savings, but had assets that declined in value by \$1,000 in a year, would be \$24,000.

H-S income consists of three broad components: labor income, capital income (income from assets), and income from transfer payments. The major elements of each of these three components are as follows:

Labor income.--This includes all forms of employee compensation (including wages and salaries), employee fringe benefits (such as employer-provided health insurance and accrued pension benefits or contributions), and the employer share of payroll taxes (such as Social Security taxes). Labor income also includes the labor share of self-employment income. Expenses of earning labor income would be deducted in arriving at H-S income. Deferred labor income (such as pension benefits) would be counted in the year it was earned, rather than in the year it was received.

Capital income.--This includes all income from assets, including interest, dividends, rents, royalties, accrued capital gains (whether or not realized), the capital income share of self-employment income, and the rental value of consumer durables (most importantly, the rental value of owner-occupied housing). Capital income is measured in real (inflation-adjusted) terms and is net of real, economic depreciation and all other expenses (which could exceed capital income).

Transfer payments.--These include payments in cash (such as Social Security benefits, workers' compensation, unemployment benefits, Aid to Fami-

lies with Dependent Children (AFDC), and noncash benefits (such as Medicare, Medicaid, and food stamps).

For purposes of tax analysis, H-S income should be measured on a pretax basis, the amount that would be earned if there were no Federal income tax in place. Most items of income are unaffected, or little affected, by the income tax and so are reported on a pretax basis. However, certain income items from tax-preferred sources may be reduced because of their preferential treatment. An example is interest from tax-exempt State and local government bonds. The interest rate on tax-exempt bonds is generally lower than the interest rate on taxable bonds of the same maturity and risk, with the difference approximately equal to the tax rate of the typical investor in tax-exempt bonds. Thus, investors in tax-exempt bonds are effectively paying a tax, referred to as an "implicit tax," and tax-exempt interest as reported is measured on an after-tax, rather than a pretax, basis. Income from all tax-preferred sources should be "grossed up" by implicit taxes to properly measure H-S income.

Adjusted Gross Income

AGI is the statutory definition of income for Federal income tax purposes. AGI differs from H-S income by excluding some components of H-S income and by allowing accelerated business deductions and deductions unrelated to income, but also by disallowing or limiting certain expenses of earning income and certain losses. In addition, AGI is not "grossed up" for implicit taxes.

The components of H-S income excluded from AGI include most employee fringe benefits, the employer share of payroll taxes, accrued but deferred employee compensation, accrued but unrealized real capital gains, the rental value of consumer durables, most Social Security benefits, most other cash transfers, all noncash transfers, and the real income of borrowers due to inflation [A2].

Depreciation and certain other expenses allowed in determining AGI may be accelerated (relative to economic depreciation and other costs) in the early years of an investment, thus understating investment income. In later years, however, investment income in AGI will be overstated because depreciation and other accelerated expenses will then be understated.

AGI also excludes some expenses not related to earning income, such as contributions to self employed retirement (Keogh) plans, deductible contributions to Individual Retirement Arrangements (IRA's). the portion of Social Security contributions for selfemployed workers that is analogous to the employer share of such contributions for employees, and contributions to medical savings accounts. AGI generally exceeds H-S income to the extent that expenses of earning income and losses are limited or disallowed. Most of the expenses of earning income are deductible from AGI in calculating taxable income, but only if the taxpayer "itemizes" deductions and then, in some cases, only to the extent that the sum of all such items exceeds 2 percent of AGI. Expenses incurred in the production of income that are itemized deductions include certain expenses of employees (such as union dues: expenditures for items used on the job but not reimbursed by the employer; and the employees' travel, meal, and entertainment expenses); and expenses attributable to a taxpaver's (passive) investments (as opposed to active participation in a trade or business, for example), including, but not limited to, interest expense incurred in connection with investments in securities [A3]. Note that there are limits on certain types of deductible expenses. In particular, deductible meal and entertainment expenses are limited to 50 percent of total meal and entertainment expenses.

Although net capital losses reduce economic income, only the first \$3,000 of net realized capital losses may be deducted in computing AGI. Any additional realized losses must be carried forward to future years. In a somewhat similar manner, passive losses (from investments in a trade or business in which the taxpayer does not materially participate) can also reduce economic income, but, in computing AGI, they can only be deducted from passive income from other, similar investments (although a larger amount may be deducted when the losses are from rental real estate activities).

AGI can also exceed H-S income because of differences in the timing of income between the two concepts. For example, a taxpayer may realize more capital gains in a year than he or she accrues in capital gains. Since AGI includes only realizations of capital gains, whereas H-S income includes only accruals, AGI in this circumstance would exceed H-S income.

Finally, just as AGI understates the income of borrowers due to inflation, it overstates the income of lenders, who include bond owners and owners of bank deposits.

Expanded Income

Expanded income is meant to be a measure of income that is conceptually closer to H-S income than AGI, but which is derived entirely from items already reported on income tax returns. Figure G shows the adjustments made to AGI to arrive at expanded income. Since the definition of AGI was changed by legislation several times since 1977, and certain reporting requirements also changed, the adjustments differ over the years, as indicated for each item [A4]. Most of these adjustments are relatively straightforward, but the adjustment for investment requires some explanation.

Investment Interest

In measuring H-S income, it generally would be appropriate to deduct all expenses incurred in the production of income, including those related to any income-producing investments, without limit. Invest-

Figure G

Derivation of Expanded Income from Adjusted Gross Income, Tax Years 1977-2003

Adjusted gross income (AGI)

- o Excluded capital gains (tax years prior to 1987)
- o Tax-exempt interest (1987 and later tax years)
- o Nontaxable Social Security benefits (1987 and later tax years)
- Tax preferences for alternative minimum tax purposes [A5]
- o Foreign-earned income exclusion (1990 and later tax years)

- MINUS: o Unreimbursed employee business expenses [A6]
 - o Nondeductible rental losses (Tax Year 1987)
 - o Moving expense deduction (Tax Years 1987 through 1993) [A7]
 - o Investment interest expense deduction to the extent it does not exceed investment income
 - o Miscellaneous itemized deductions not subject to the 2-percent-of-AGI floor (1989 and later tax years)

Expanded income

NOTE: Footnotes to Figure G are included with the footnotes to Appendix A.

ment expenses in excess of investment income would then represent net economic losses. However, such a liberal deduction for investment-related expenses is not necessarily correct when not all income items have been included currently. (Investment income includes interest, dividends, and capital gains.)

If all income has not been included currently, full deduction of investment expenses might represent a mismatching of receipts and expenses and might result in understating income. For example, if a taxpayer borrowed funds to purchase securities, net income would be understated if the taxpayer deducted all interest payments on the loan, but did not include as income any accrued gains on the securities. A similar mismatching of income and expenses would occur if investment expenses that should properly be capitalized were deducted when paid. In these instances, a more accurate measure of income might be obtained by postponing the deduction of the expense until such time as the income were recognized for tax purposes.

Additional problems are created when a person with a loan has both income-producing assets, such as securities, and nonincome-producing assets, such as a vacation home or yacht. It is not possible to determine what portion of the interest expense should be attributed to taxable income-producing assets and, therefore, ought to be deductible against the gross receipts from such taxable assets. As a result of these problems, it has been necessary to set arbitrary limits on the amount of investment expenses that are deductible in calculating expanded income.

Investment expenses that have not been deducted in determining AGI generally can appear on a Federal individual income tax return in two places. Investment interest expense is taken into account in the calculation of the itemized deduction for interest paid. Deductible investment interest expense is a separate part of the total interest deduction. Other investment expenses, such as management fees, are included in the miscellaneous category of itemized deductions [A5]. Beginning with 1987, most types of income-producing expenses included as miscellaneous itemized deductions are only deductible to the extent that their total exceeds 2 percent of AGI. To determine expenses that should be deductible in calculating an approximation of H-S income, investment expenses have been defined as deductible

investment interest expense. Other investment expenses could not be separated from the remainder of miscellaneous deductions. Hence, they have not been used in the adjustment for investment expenses.

To the extent that interest expenses do *not* exceed investment income, they are generally allowed as a deduction in the computation of deductible investment interest expense and thus expanded income. Investment interest expenses that do *exceed* investment income are *not* deductible in calculating expanded income. One consequence of this definition is that investment expenses can never turn positive investment income into investment losses. Generally, allowing investment expenses to offset all investment income is generous and tends to understate broadly-measured income. However, in some instances, limiting investment expenses to investment income may *overstate* income by disallowing genuine investment losses.

Notes to Appendix A

- [A1] Haig, Robert M. (ed.), *The Federal Income Tax*, Columbia University Press, 1921, and Simons, Henry C., *Personal Income Taxation*, University of Chicago Press, 1938.
- [A2] Borrowers receive income due to inflation because the real value of debt is reduced by inflation. Even though inflation may be anticipated and reflected in interest rates, tax deductions for nominal interest payments overstate interest costs because part of these payments represent a return of principal to the lender, rather than interest.
- [A3] See Notes and References, footnote 4.
- [A4] For 1977, about 50 percent of net long-term capital gains were included in AGI. During 1978, the inclusion ratio was changed to 40 percent. This inclusion ratio remained unchanged through 1986. Beginning with 1987, there was no exclusion allowed for capital gains in computing AGI, and, thus, this adjustment was not made in computing expanded income for returns for years after 1986.

Beginning in 1987, taxpayers were required to report on their Federal income tax returns the amount of their tax-exempt interest incomes

from State and local government bonds. Since 1987, tax-exempt interest has been included in expanded income.

Taxpayers are also required to report Social Security benefits. Since 1988, nontaxable Social Security benefits have been included in expanded income. However, if none of a particular taxpayer's Social Security benefits are taxable, then gross Social Security benefits are not required to be shown on the income tax return. In such instances, which generally only affect lower- and middle-income taxpayers, Social Security benefits are not included in expanded income.

The subtraction of unreimbursed employee business expense and the moving expense deduction is to make the concept of expanded income comparable to years prior to 1987. All current-year moving expenses beginning with Tax Year 1994 were deducted in the calculation of AGI as a statutory adjustment.

Due to subtracting nonlimited miscellaneous deductions and not subtracting the nondeductible rental loss for 1989, the expanded income concept for 1989 is not strictly comparable to expanded income for 1988. Nor is the expanded income concept for 1990 strictly comparable to expanded income for 1989 because of the addition of the foreign-earned income exclusion. Specific details on the definition of expanded income for any given year are available in the reports and publications enumerated in footnote 2, under Notes and References.

[A5] Some income deferrals and accelerated expense deductions may also be involved in income or losses from rental property, from royalties, from partnerships, and from S corporations, only the net amounts of which are included in adjusted gross income.

Appendix B: Tax Concepts

This appendix provides a brief summary of the U.S. taxation of worldwide income and the foreign tax credit. The two tax concepts used in this article are then defined. The following section explains the computation of the deduction equivalent of credits

and other items. A final section discusses the possible implications of the use of unaudited tax return data for this article.

U.S. Taxation of Worldwide Income and the Foreign Tax Credit

Citizens and residents of the United States, regardless of where they physically reside, must generally include in income for Federal income tax purposes income from all geographic sources. Thus, for example, dividends and interest received from a foreign corporation or income earned working abroad is subject to Federal income tax in the same manner as income received from sources inside the United States [B1]. Income from sources outside the United States may also be subject to tax by foreign governments.

To reduce, if not eliminate, the possibility of double taxation of the foreign-source income of U.S. citizens and residents, the Federal income tax allows a credit for income taxes paid to foreign governments. This foreign tax credit is generally limited to the amount of (precredit) U.S. tax liability attributable to foreign-source income. This limit prevents the foreign tax credit from offsetting the U.S. tax on U.S.-source income.

As a result of taxing citizens and residents on a worldwide basis but allowing a foreign tax credit, some Federal income tax returns may report substantial income but little or no U.S. tax liability after credits. This may occur, for example, if a taxpayer has income only from foreign sources (the taxpayer may live abroad the entire year and have no income-producing assets in the United States), or if a taxpayer has foreign-source income that exceeds a net loss from U.S. sources and pays income taxes to a foreign government that are comparable to the U.S. tax [B2].

For taxpayers with income from foreign sources, these procedures understate the taxpayers' true worldwide income tax liabilities and effective income tax rates. For such taxpayers, it does not seem appropriate to classify U.S. income tax credits for foreign tax payments as reducing tax liabilities. This is particularly true for tax filers who appear to be nontaxable because they do not have any U.S. tax liability, but who have paid foreign income taxes. A more accurate measure of overall income tax burden, as well as the numbers of nontaxable returns, can be

obtained by considering all income taxes--U.S. as well as foreign. Thus, a second tax concept, worldwide income tax, has been used in addition to the traditional U.S. income tax.

Two Tax Concepts

Two tax concepts are used in this article to classify tax returns as taxable (i.e., returns showing an income tax liability) or nontaxable (i.e., returns showing no income tax liability) and to measure the tax burdens on taxable returns: U.S. income tax and worldwide income tax Worldwide income tax is defined for purposes of this article as U.S. income tax plus the foreign tax credits reported on the U.S. income tax return and foreign taxes paid on excluded foreign-earned income (obtained from Form 1116, Foreign Tax Credit). The amount of the foreign tax credits and foreign taxes paid on excluded foreignearned income is used as a proxy for foreign tax liabilities [B3]. The relationship of U.S. income tax to tax items reported on individual income tax returns, and to worldwide income tax, is shown in Figure H.

Comparing Exclusions, Deductions, Tax Credits, and Special Tax Computations

In order to compare the importance of various exclusions, deductions, tax credits, and special tax

Figure H

Derivation of "U.S. Income Tax" and "Worldwide Income Tax," Tax Year 2003

Tax at regular rates (tax generated)

distributions from qualified retirement plans,

Form 4972)

PLUS: Alternative minimum tax (Form 6251)

EQUALS: Income tax before credits

MINUS: Tax credits

EQUALS: U.S. income tax

PLUS: Foreign tax credit

PLUS: Foreign taxes paid on excluded foreign-earned

income (Form 1116)

EQUALS: Worldwide income tax

computations (such as the alternative minimum tax on tax preferences), the different types of items must be placed on the same basis. One way of doing so is to calculate the size of the deduction that would reduce (or increase) income tax by the same amount as a tax credit or special computation. This amount is called the "deduction equivalent" of the tax credit or special computation.

The deduction equivalent of a tax credit or a special tax computation is the difference between the taxable income that, using the ordinary tax rate schedules, would yield the actual tax before the provision in question is considered and the actual tax after the provision. For example, the "deduction equivalent of all tax credits" is equal to the difference between "taxable income that would yield income tax before credits" and "taxable income that would yield income tax after credits."

Using this method of equating the value of deductions, exclusions, credits, and special tax computations, the order in which the various credits and special tax computations are calculated may affect the value of their deduction equivalents. Because the tax rate schedules are progressive, with successive increments to income taxed at successively higher tax rates, the deduction equivalent of the credit converted last to a deduction equivalent will be larger (for the same amount of a credit) than the item converted first, unless all relevant taxable income amounts are within a single tax-rate bracket.

The deduction equivalents of tax credits shown in Tables 9 and 10 were computed by assuming that deductions and exclusions reduce taxes before credits. As a result, the deduction equivalent of tax credits may be overstated.

Unaudited Data

Tax return data used for Statistics of Income have been tabulated as they were reported on tax returns filed with the Internal Revenue Service (IRS). Certain obvious arithmetic errors have been corrected, and certain adjustments have been made to achieve consistent statistical definitions. Otherwise, the data have not been altered. In particular, the data do not reflect any changes that may have been or could be made as a result of IRS audits. While this is true of data throughout the entire Statistics of Income program, it is particularly relevant for high-income tax returns. Because of the greater complexity of these returns, there is a higher probability of error and more scope for disagreement about the proper interpretation of tax laws.

The fact that the data have been drawn from unaudited returns is of even greater importance for those high-income returns that are nontaxable. Almost any audit changes would make such returns taxable. Even where the tax consequences are minor, such returns could be reclassified from nontaxable to taxable, thereby changing the counts of nontaxable returns.

Notes to Appendix B

- [B1] An exception is that certain income earned abroad may be excluded from AGI. Any foreign taxes paid on such income are not creditable against U.S. income tax. The tables in this article include such excluded income in expanded income. Foreign taxes paid on such income are reflected in worldwide income tax, as discussed later.
- [B2] Although the foreign tax credit is an item of tax preference for AMT purposes, taxpayers below the AMT exclusion thresholds, or with preferences or deductions not subject to AMT, could completely offset precredit U.S. income tax liability with foreign tax credits.
- [B3] Where foreign tax rates exceed U.S. rates, foreign tax credits will be less than foreign tax liabilities. In such cases, using foreign tax credits as a proxy for foreign tax liabilities understates worldwide income tax liability. In other cases, when foreign tax credits are for taxes paid on income from previous years, use of foreign tax credits as a proxy may overstate *or* understate worldwide taxes on current-year income.

¹ Section 179 of the Internal Revenue Code permits certain taxpayers to elect to deduct all or part of the cost of certain qualifying property in the year they place it in service, instead of taking depreciation deductions over a specified recovery period.

² Includes tax-exempt interest and tax preference items subject to alternative minimum tax.

NOTE: Detail may not add to totals because of rounding.

¹ Section 179 of the Internal Revenue Code permits certain taxpayers to elect to deduct all or part of the cost of certain qualifying property in the year they place it in service, instead of taking depreciation deductions over a specified recovery period.

NOTE: Detail may not add to totals because of rounding.

² Includes tax-exempt interest and tax preference items subject to alternative minimum tax.
