# Inpatient Health Facilities as Reported From the 1971 MFI Survey

Statistics about nursing homes, hospitals, and other kinds of inpatient health facilities include numbers of institutions, beds, and employees as well as types of ownership, geographic distribution, and comparisons with other surveys. Based on data collected during the period August-October 1971.

### **COOPERATION OF THE BUREAU OF THE CENSUS**

Under the legislation establishing the National Health Survey, the Public Health Service is authorized to use, insofar as possible, the services or facilities of other Federal, State, or private agencies. In accordance with specifications established by the National Center for Health Statistics, the Bureau of the Census, under a contractual arrangement, participated in planning the survey and collecting the data.

## INPATIENT HEALTH FACILITIES

Alvin Sirrocco, Division of Health Resources Statistics

### INTRODUCTION

This report reflects the findings from the 1971 Master Facility Inventory (MFI) Survey. The survey is the fourth of its kind; the first survey was conducted in 1963,<sup>1</sup> the second in 1967,<sup>2</sup> and the third in 1969.<sup>3</sup> In addition to statistics from the 1971 survey, this report includes a comparison with the findings from the 1969 and the 1967 surveys.

Included in the 1971 MFI Survey were 22,004 nursing homes, 7,678 hospitals, 1,236 facilities for the mentally retarded, 1,015 homes for dependent children, 875 homes or resident schools for the emotionally disturbed, 176 homes for unwed mothers, 166 resident facilities for alcoholics or drug abusers, 143 homes for the deaf and/or blind, 94 resident facilities for the physically handicapped, 752 correctional facilities for children (under age 21), and 312 other types of health-related inpatient facilities. This latter group included such places as boarding schools and health facilities exclusively for American Indians, and multipurpose types of facilities such as homes for the blind and mentally retarded, or homes for the physically handicapped and emotionally disturbed.

For purposes of the MFI, nursing homes are defined as establishments with three beds or more which provide nursing or personal care to the aged, infirm, or chronically ill. Hospitals include all establishments having six beds or more that are licensed as hospitals.

### Background

In 1963 the National Center for Health Statistics (NCHS) conducted its first national survey of all health facilities and institutions. The survey

was called the Master Facility Inventory Survey and it covered the same types of facilities included in the 1971 survey with one exception. The 1963 survey included Federal- and State-operated adult penal institutions within the framework of correctional facilities. However, these institutions were dropped from the MFI beginning with the 1969 survey.

For the 1963 survey, names and addresses of approximately 46,000 health facilities and institutions were obtained from State and Federal licensing or regulating lists and from lists furnished by the Division of Vital Statistics of the Center, the Health Care Facilities Service of the Health Resources Administration, the American Hospital Association, and the U.S. Bureau of the Census. By matching and unduplicating these various lists, a final listing of about 30,000 facilities was established. The response rate for this first MFI Survey was 93 percent.

Information obtained from the 1963 survey was very basic with such data being collected as type of facility, number of beds, and type of ownership. These data were used primarily for classifying the various establishments. In addition to supplying basic information on health facilities, the resulting list of facilities (with the corresponding classification information) was used as the sampling frame for the more detailed surveys conducted on the institutionalized population within these facilities.

The second MFI survey was conducted from August through December 1967. Between the 1963 and 1967 surveys, the Agency Reporting System was devised for obtaining the names and addresses of all new hospitals, nursing homes, and other health facilities in the country. The 1967 survey found over 31,000 facilities providing inpatient

health care and more than 29,000 of these returned their completed questionnaires (a response rate of 94 percent).

The basic information of the 1967 survey provided valuable information to other government agencies as well as to private organizations and individuals. With this in mind, the 1969 MFI questionnaires (one for nursing homes and one for facilities other than hospitals) were expanded to include more detailed information about each facility, making it possible for NCHS to provide even more information. In spite of the extra questions, the 1969 survey had a response rate of 96 percent. This survey was conducted from October 1969 through January 1970 among 27,267 nursing homes and other facilities.

For the 1971 MFI Survey, NCHS put the nursing home and "other health facilities" questions on one questionnaire. This portion of the MFI Survey, which is conducted by the U.S. Bureau of the Census, produced a response rate of 97 percent.

To avoid the duplication of effort involved in having hospital administrators fill out two similar questionnaires, NCHS and the American Hospital Association (AHA) entered into a contractual arrangement prior to the 1969 MFI Survey in which the AHA's annual survey of hospitals became the instrument for updating information for the hospital portion of the MFI. However, since not all hospitals are registered or members of the AHA, it was necessary for NCHS to conduct a separate survey on the non-AHA hospitals, which make up about 10 percent of all the hospitals in the country. The hospital portion of the MFI Survey is, therefore, conducted every year in conjunction with the annual AHA hospital survey. A large amount of new information on hospitals is now available due to this arrangement with the AHA. The hospital portion of the 1971 MFI produced a response rate of 93 percent.

Methodology for the 1971 MFI Survey is given in appendix  $I_{\:\raisebox{1pt}{\text{\circle*{1.5}}}}$ 

It should be noted that Series 14, No. 4,<sup>2</sup> contains data from the 1967 MFI Survey and Series 14, No. 6,<sup>3</sup> contains data from the 1969 MFI Survey. Comparisons with the 1971 data were obtained by using the statistics found in these reports.

### **NURSING HOMES**

### Highlights

In 1971 the United States had 22,004 nursing homes according to the MFISurvey conducted that year. These homes contained more than 1,200,000 beds and had 1,075,000 residents (an occupancy rate of 90 percent). The residents were served by approximately 568,000 full-time and 201,000 part-time employees (7 employees for every 10 residents).

These are just a few of the basic findings from the nursing home portion of the 1971 MFI Survey. The following sections take a closer look at the nursing home field and show how it has changed since the 1969 and 1967 MFI Surveys were conducted.

Before presenting the nursing home data, however, the following section is given as both a background on what has been done in the past and as a preliminary explanation of the effects that current classification procedures may be having on the data presented in this report.

### History

Many different names are used to describe a nursing home facility. Among the most common names other than nursing homes are homes for the aged, convalescent homes, and rest homes. Since the name by which a nursing home is called has virtually nothing to do with the type and amount of nursing care it is providing, classifying nursing homes by the type of services they provide becomes essential.

Since the inception of the MFI, the National Center for Health Statistics has grouped nursing homes according to the primary type of service offered in the home. This results in classifying nursing homes as nursing care homes, personal care homes with nursing, personal care homes (without nursing), and domiciliary care homes. These four types of homes will be referred to as NC homes, PCN homes, PC homes, and DC homes, respectively.

The criteria given in appendix II were developed by NCHS in order to classify each nursing home into one of these four types. Essentially, the classification is based on the number of persons

receiving nursing care, the services provided, and the employment of full-time registered nurses (RN's) and licensed practical nurses (LPN's). Table II in appendix II gives the criteria for classifying all nursing homes. As this classification scheme was developed prior to the Medicare and Medicaid legislation, it does not correspond exactly to the definitions for Medicare extended care facilities or Medicaid skilled nursing homes or intermediate care facilities.

In order to keep the MFI list of health facilities current, the Agency Reporting System (ARS) has been developed; this system obtains on an annual or more frequent basis, the names and addresses of all newly opened health facilities. The ARS consists of national voluntary organizations and Federal and State agencies including health, welfare, and voluntary religious organizations; publishers of commercial directories; State agencies that administer, regulate, license, certify, approve, list, or are otherwise concerned with medical and resident care facilities; and Federal agencies that administer inpatient facilities.

Upon obtaining these lists, the facilities are matched against the current MFI list to eliminate duplicates. Those facilities which are not on the MFI list and seem to be an inpatient health facility are placed on the mailing list for the next ARS or "birth" survey,4 which occurs every 6 months. These ARS surveys verify the names and addresses of the newly found facilities and obtain from them a limited amount of additional information.

Prior to the 1971 MFI Survey, NCHS signed a 3-year contract with a private company for the maintenance of the ARS. In addition to obtaining current directories from the agencies already in the system, they are to locate any new agencies which maintain lists of health facilities and incorporate them into the system. Of particular concern are the small personal care homes in California which are difficult to locate because they are under county rather than State control and which go in and out of business so quickly that they go on and off the MFI list from one survey to the next.

Another area where the contractor is to focus his attention is the area of extended care facilities. In past MFI Surveys, if an extended care facility was structurally part of a hospital, it was treated as a unit of the hospital. In the 1971 MFI Survey, however, the hospital-based extended care facility is treated as a separate facility—a nursing home. Thus instead of one health facility (a hospital) being reported there are now two (a hospital and a nursing home). Every effort has been made to gather separate statistics for each part of the facility. In other words, the number of beds, patients, employees, and so forth located within the extended care facility are included only in the nursing home statistics and are not counted in the hospital statistics.

It is hoped that these changes in the operation of the ARS will result in the addition of some newly opened facilities that would not have been found otherwise and also in the addition of facilities that have been missed in the past.

### Physical Changes From 1969 to 1971

In a report based on the 1969 MFI Survey,<sup>3</sup> it was surmised that smaller nursing homes were going out of business or expanding and bigger ones were being built. This assumption was based on the huge increase in nursing home beds (over 107,000 more), despite a *decrease* in the number of homes (231 fewer) from 1967 to 1969.

From 1969 to 1971 there were increases in both homes and beds, and although there was a higher rate of increase for the beds than for the homes (28 percent and 16 percent), the same assumption that was made in 1969 could not be made in 1971 from these figures alone. The following two sections deal with both questions under consideration, namely, (1) were small nursing homes going out of business and bigger ones being built? and (2) were existing nursing homes expanding their bed capacities?

"Births."—There was some question as to how many of the newly found nursing homes ("births") were actually new and how many had been missed by previous surveys. Although this question cannot be answered conclusively, there is reason to believe that the vast majority of the homes were indeed new and that those missed previously were in all likelihood the smaller homes.

On the assumption that all 3,506 "births" found in the United States between the 1969 and 1971 MFI Survey were new nursing homes, table

1 shows how they are distributed by type of home and bed size. It is clear from this table that most of these newly found homes were small, with 56.5 percent of them having less than 25 beds and only 13.9 percent having 100 beds or more. The table also shows data for California, where the biggest segment of these homes was located. More than 43 percent (1,514) of the newly found homes were discovered in this State, and of these, 1,325 had less than 25 beds.

As the table indicates, three-fourths of the California "births" were personal care homes, and almost all of them had less the 25 beds. It is obvious from the table that the California "births" had a tremendous effect on the total number of "births," particularly in the category under 25 beds. In fact, if the California "births" (both homes and beds) were excluded from the totals, the result would be an average capacity of 64 beds per home instead of the 44 beds per home that result when they are included.

It is interesting to note that although the national average size of nursing homes in 1969 was 50 beds and the average size of these 1971 "birth" nursing homes was 44 beds, the average size of all nursing homes in 1971 was 55 beds. Adding the nursing homes in existence in 1969 (with their 50-bed average) to those that came into being from 1969 to 1971 (with their 44-bed average) would, by itself, result in an average of less

than 50 beds for nursing homes in 1971. Why, then, was the average higher than this?

One reason was the fact that 1,445 nursing homes went out of business and the average bed size of these homes was 33 beds. The loss of these homes of course resulted in a raising of the bed size average for 1971.

A second (and the major) reason for this higher average in 1971 was the expansion in bed capacity of existing nursing homes from 1969 to 1971. The following paragraphs discuss the changes in bed capacity that took place in nursing homes from 1969 to 1971.

Changes in bed capacity.—In an effort to determine whether existing nursing homes were indeed expanding, those nursing homes that were in operation during both the 1969 and 1971 MFI Surveys were checked for possible changes in bed capacity. To find out how many homes were in operation during both surveys, it was necessary to eliminate the various other types of changes which occurred. For instance, of the 18,910 nursing homes in operation during 1969, 288 were reclassified as "other health facilities" due to changes in the services they offered and 1,445 went out of business. The final result, therefore, was 17,177 nursing homes which were in operation during both surveys.

As table A indicates, most of the nursing homes (15,166) were in the same bed size group

Table A. Number of nursing homes that stayed in the same bed size group from 1969 to 1971, number of beds in each year, and difference: United States

Bed size	Homes	Beds in 1971	Beds in 1969	Bed difference 1969 to 1971
All bed sizes	15,166	761,699	755,795	5,904
Less than 25 beds	5,787 3,747 2,402 1,290 1,684 178 60	74,068 133,640 143,304 112,596 219,597 41,914 22,524 14,056	74,327 133,018 142,407 112,289 215,871 41,446 21,768 14,669	-259 622 897 307 3,726 468 756 -613

in 1971 as they were in 1969. However, of those 2,011 homes that changed bed size groups, 1,533 (76 percent) moved to a larger bed size group (table B). In addition, only 19 percent of the homes that changed to a smaller bed size group went below the next smaller group, whereas 43 percent of the homes that changed to a larger bed size group went above the next larger group.

The 2,011 nursing homes that changed bed size groups had an overall net increase of 63,379 beds. In addition, a look at table A shows that although 15,166 homes did not change bed size group, there still was an overall increase of 5,904 beds within these same groups.

Table B. Number of nursing homes that changed bed size groups from 1969 to 1971: United States

Change in bed size group <sup>1</sup>	Number
All nursing homes chang- ing bed size group	2,011
All homes increasing to a higher bed size group	1,533
Increasing 1 bed size group Increasing 2 bed size groups Increasing 3 bed size groups Increasing 4 bed size groups Increasing 5 bed size groups Increasing 6 bed size groups Increasing 7 bed size groups	876 355 148 122 26 4 2
All homes decreasing to a lower bed size group	478
Decreasing 1 bed size group Decreasing 2 bed size groups Decreasing 3 bed size groups Decreasing 4 bed size groups Decreasing 5 bed size groups Decreasing 6 bed size groups Decreasing 7 bed size groups	387 55 25 7 4 0

<sup>1</sup>These bed size groups or categories are the same as those given in Table A. The following is an example of a home increasing in bed size groups.

EXAMPLE: If a nursing home had 70 beds in 1969 and 105 beds in 1971, it increased by two bed size groups (from the 50-74 group to the 100-199 group).

To conclude, at the beginning of this section on physical changes in nursing homes from 1969 to 1971, two questions were asked: (1) Are the smaller nursing homes going out of business and bigger ones being built? and (2) are existing nursing homes expanding their bed capacities?

In answer to the first question, the analysis indicates that many small homes *are* going out of business. (The average bed size of the 1,445 homes that went out of business between 1969 and 1971 was 33 beds.) However, it is also true that many small homes (1,981 with under 25 beds) came into existence between 1969 and 1971. On the whole, however, the newly opened homes, with an average of 44 beds, are slightly larger than those that went out of business. In addition, if California is excluded as an exceptional case and only the remaining States plus the District of Columbia are examined, then the newly opened homes have an average of 64 beds—nearly twice the size of the out-of-business homes.

In answer to the second question, the analysis shows that although most of the homes remained virtually unchanged between 1969 and 1971, those that did change their bed capacities *added* beds; very few nursing homes decreased their beds.

# Comparisons Between 1971 and Past MF! Surveys

The preceding section described the actual physical changes (opening, closing, expansion) undergone by nursing homes from 1969 to 1971. The following analysis shows how these changes affected the total nursing home picture and com-

Table C. Number of nursing homes and nursing home beds: United States, 1967, 1969, and 1971

Year	Homes	Beds
1971	22,004	1,201,598
1969	18,910	943,876
1967	19,141	836,554

Table D. Number of nursing homes in 1967, 1969, and 1971 and percent change between years, by bed size: United States

Bed size	1971 homes	Percent change 1969 to 1971	1969 homes	Percent change 1967 to 1969	1967 homes
All bed sizes	22,004	16	18,910	-1	19,141
Less than 25 beds	8,266 4,784 3,475 2,046 2,825 422 141 45	11 3 20 26 46 66 52 55	7,445 4,625 2,904 1,627 1,933 254 93 29	-13 -5 8 27 34 18 2 32	8,522 4,868 2,697 1,281 1,444 216 91 22

pares the resulting 1971 data with the 1969 data<sup>3</sup> and, in some cases, the 1967 data.<sup>2</sup>

Beds, services, and ownership.—The 22,004 nursing homes found in the 1971 MFI Survey represented an increase of 3,094 homes over the 1969 MFI figure. In addition to this rather large increase in homes (16 percent), there was an even larger increase in the number of nursing home beds (+257,722 beds, +28 percent), (table G). A substantial portion of this increase in nursing homes and their beds was in California. California increased by 1,466 homes (almost half of the total increase of 3,094 homes) and by 41,097 beds (16 percent of the total increase). Table 2 gives the 1971 figures, and Series 14, Number 6,3 gives the 1969 figures.

Table D indicates the changes in the number of nursing homes and beds that took place from 1967 to 1969 and the changes that took place from 1969 to 1971. In both instances the homes with 50 beds or more showed major increases, while the homes with less than 50 beds showed minor increases for 1971 and decreases for 1969. The nursing homes with 50 beds or more increased by 19 percent from 1967 to 1969 and by 31 percent from 1969 to 1971. The nursing homes with less than 50 beds decreased by 1,320 (10 percent) from 1967 to 1969, then increased by 980 homes (8 percent) from 1969 to 1971.

Figure 1 shows how nursing homes were distributed by type of service in 1971. The changes

that occurred since 1967 in the four types of nursing homes and their beds are given in table E. The NC homes have been steadily increasing, while the PCN homes showed a moderate decrease in 1969 with a very slight increase in 1971. The PC and DC homes, on the other hand, dropped sharply from 1967 to 1969 but then increased by 42 percent and 80 percent, respectively, between 1969 and 1971. As was mentioned earlier, most of this increase in personal care homes took place in California.

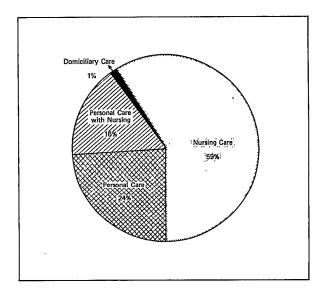

Figure 1. Distribution of nursing homes by primary type of service: United States, 1971

Table E. Number of nursing homes and nursing home beds and average bed capacity by primary type of service: United States, 1967, 1969, and 1971

	<del></del>		
Primary type of service	1971	1969	1967
Nursing care			
Homes Beds Average bed	12,871 917,707	11,484 704,217	10,636 584,052
capacity	71	61	55
Personal care with nursing			
HomesBeds	3,568 192,347	3,514 174,874	3,853 181,096
Average bed capacity	54	50	47
Personal care			
Homes Beds	5,369 88,317	3,792 63,532	4,396 66,787
Average bed capacity	16	17	15
Domiciliary care			
Homes Beds	196 3,227	120 1,253	256 4,619
Average bed capacity	16	10	18

In terms of ownership, government-owned homes decreased by 2 percent, while profit and nonprofit homes each increased by 18 percent from 1969 to 1971 (table F). Nursing care homes increased under all three types of ownership (up 60 percent for government, up 26 percent for nonprofit, and up 7 percent for profit, table G.) The number of profit PCN homes increased slightly (up 6 percent) as did nonprofit homes (up 2 percent), but there was a substantial decrease (down 29 percent) in the number of government-owned homes. PC homes had the same ownership trend as PCN homes but with much larger changes—profit and nonprofit PC homes increased by 60 percent and 21 percent, respectively, while government-owned PC homes decreased by 48 percent.

The most noticeable change of any kind was the increase which took place from 1969 to 1971 in profit PC homes. These homes increased from 2,879 to 4,611, an increase of 1,732 homes over that 2-year period. In all, profit homes of all types increased by 2,579 which represented 83 percent of the 3,094 overall increase.

Tables 3,4, and 5 present additional statistics on the characteristics of nursing homes in 1971.

Employees and residents.—Almost 568,000 full-time employees worked in nursing homes in 1971 (table 6), an increase of about 125,000 full-time employees over 1969. Increases took place in each of the four types of nursing homes, with the majority of the increase occurring in NC

Table F. Number of nursing homes for 1967, 1969, and 1971 and percent change between years, by type of ownership: United States

Type of ownership	1971	Percent change 1969 to 1971	1969	Percent change 1967 to 1969	1967
All homes	22,004	16	18,910	-1	19,141
Government Proprietary Nonprofit	1,368 17,049 3,587	-2 18 18	1,390 14,470 3,050	-5 -2 7	1,462 14,831 2,848

Table G. Number of nursing homes in 1969 and 1971, net change, and percent change, by type of ownership and primary type of service: United States

Type of ownership and primary type of service	1971	1969	Net change	Percent change
Government	1,368	1,390	-22	-2
Nursing care Personal care with nursing Personal care	872 223 265	546 316 506	326 -93 -241	60 <b>-</b> 29 -48
Proprietary	17,049	14,470	2,579	18

Nonprofit	3,587	3,050	537	18
Nursing care	2,036 1,028 493	1,617 1,011 407	419 17 86	26 2 21

homes, which increased by over 114,000 full-time employees. There was also a substantial increase (over 50,000) in the number of part-time employees from 1969 to 1971.

Table H indicates that the overall number of full-time employees per 1,000 residents continued to increase, but the increase took place only in NC homes with the PCN and PC homes experiencing declines in this rate. (Because of their small numbers, DC homes are sometimes not shown sepa-

rately and are omitted from the discussion.) This table also shows that this increase in the number of full-time employees per 1,000 residents did *not* occur for registered nurses (RN's) and licensed practical nurses (LPN's). They experienced a decline in their rates from 95.9 to 86.5 per 1,000 residents.

There were more LPN's than RN's employed in nursing homes in 1971 (73,569 LPN's to 66,434 RN's). This is opposed to the national picture,

Table H. Number of full-time employees and full-time registered nurses and licensed practical nurses per 1,000 residents in nursing homes, by primary type of service provided by home: United States, 1971, 1969, 1967

Primary type of service provided by home	Full-time employees			Full-time RN's and LPN's		
	1971	1969	1967	1971	1969	1967
	Rate per 1,000 residents					
All homes 1	527.8	522.3	507.1	86.5	95.9	90.9
Nursing care	581.8	575.1	563.8	101.1	109.6	107.6
Personal care with nursing	385.0	392.0	395.6	47.2	61.1	56.6
Personal care	281.6	289.8	288.8	21.0	38,8	30.5

<sup>&</sup>lt;sup>1</sup>Includes domiciliary care homes.

which showed about 723,000 RN's and 400,000 LPN's (also known as vocational nurses) employed in the United States in 1971.<sup>5</sup> Full-time and part-time RN's and LPN's employed in nursing homes are shown for each State in table 7.

Residents in nursing homes increased from about 850,000 in 1969 to over 1,075,000 in 1971. The residents in NC homes increased from 635,000 to 824,000 (an increase of 189,000), those in PCN homes increased from 158,000 to 172,000 (an increase of 14,000), and PC residents increased from 56,000 to 77,000 (an increase of 21,000) (table 8).

Occupancy rates for nursing homes remained constant from 1967 to 1971. In 1967, 1969, and 1971 the rate was 90 percent. This constant rate was due in a large degree to the long lengths of stay of many nursing home residents. The many residents who enter nursing homes to remain there for the rest of their lives contribute substantially to the high and also to the constant occupancy rates.

Tables 9 and 10 present other 1971 statistics for employees and residents.

Geographic distribution. — Table 11 shows the number of each type of nursing home by bed size group and by geographic region. Each of the four regional totals represent an increase in the number of homes over the 1969 figures. However, while the Northeast, North Central, and South increased by 6.2 percent, 8.6 percent, and 11.0 percent, respectively, the West Region increased by 44.8 percent. California was the biggest contributor to this increase (1,466 of the additional 1,810 homes in the West were in California). For the homes with less than 25 beds, there were decreases in the Northeast, North Central, and South Regions, while the West Region experienced an increase of 61 percent. In 1969 the West had fewer nursing homes than any of the other regions; however, by 1971 the West had passed both the South and the Northeast and was second only to the North Central Region in the number of nursing homes.

Figure 2 presents a pictorial view of the dis-

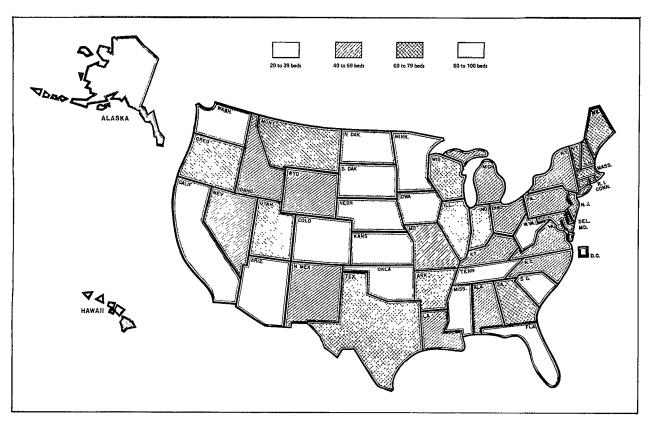

Figure 2. Nursing home beds per 1,000 population 65 years and over in each State: United States, 1971

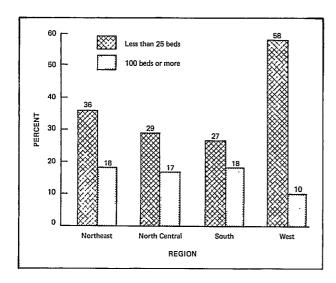

Figure 3. Percent of small and large nursing homes, by geographic region: United States, 1971

tribution of nursing home beds per 1,000 population aged 65 years and over in each State. Regional rates as well as those for the States are given in table 12. The West had the highest regional average (76.2 beds per 1,000 population 65 years and over), with the North Central second (69.3). The Northeast and South had the lowest average (50.7 and 50.5, respectively).

Figure 3 shows how the small and large nursing homes were distributed in each geographic region. It is clear from the figure that the West had a disproportionate number of small nursing homes (less than 25 beds) compared to its large homes (100 beds or more). When figure 3 is compared to a similar figure in the 1969 report, it can be seen that the percent of small homes in the Northeast, North Central, and South Regions decreased while the percent of small homes in the West increased.

### **HOSPITALS**

### How Many and What Size?

In 1971 there were 7,678 hospitals in the United States according to the joint survey conducted by NCHS and AHA. As shown in tables 13 and 14, the vast majority of the hospitals (6,607, 86 percent) were general medical and surgical or, simply, general hospitals. The remaining 1,071

were specialty hospitals, which included such hospitals as psychiatric (533), tuberculosis (99), chronic disease (90), rehabilitation (66), maternity (47), and narcotic addiction or alcoholism (2 and 41) plus various other kinds which are called "other" (193). (For an explanation of the "other" category, see appendix II).

More then 1½ million patient beds were available in the 7,678 hospitals, and 79 percent of them were occupied at the time of the survey. Although 86 percent of the hospitals were general hospitals, just 67 percent of the beds were in general hospitals. The result was an average of 152 beds per general hospital. The specialty hospitals had an average capacity of 470 beds per hospital. Psychiatric hospitals, averaging 785 beds, were responsible for this high average. In fact, specialty hospitals, excluding psychiatric, averaged 157 beds per hospitals, about the same average as the general hospitals. The average bed capacity of each type of hospital is given in table 15. (The high average bed capacity of psychiatric hospitals was not caused by a few atypical hospitals with enormous bed capacties. There were 157 psychiatric hospitals with 1,000 beds or more and 69 others with 500 to 999 beds. Together these two groups made up over 42 percent of all the psychiatric hospitals.)

The size of the hospital seemed to be related to the type of ownership of the hospital. Federally operated hospitals had the highest average bed capacities with 352, State and local government hospitals were next with an average of 266 beds per hospital, followed by nonprofit hospitals with 171 beds per hospital, and finally proprietary hospitals which averaged only 68 beds per hospital.

Psychiatric hospitals had perhaps the most significant effect on these averages. Of the 31 federally operated psychiatric hospitals, 16 had 1,000 beds or more and the rest had 300 beds or more (table 16). Of the 322 psychiatric hospitals operated by State and local governments, 141 had 1,000 beds or more while 115 others had 200 or more. Comparing these figures with the ones for nonprofit and profit psychiatric hospitals shows

<sup>&</sup>lt;sup>a</sup>The actual wording of the question asked to ascertain this was: "What was the census on the last day of your reporting period?"

that the government operated hospitals had much higher bed capacities than the nongovernment hospitals. Of the 86 nonprofit psychiatric hospitals, none had as many as 500 beds and only 9 had 200 to 499 beds. The proprietary psychiatric hospitals had even fewer hospitals of large bed size, with none having as many as 500 beds and just 3 having 200 to 499 beds.

### Utilization

The occupancy rates varied substantially among the different types of hospitals. They ranged from a low of 51 percent in the alcoholic or narcotic hospitals to a high of 86 percent in the chronic disease hospitals (table 17). The two most prevalent types of hospitals, general and psychiatric, had occupancy rates of 77 percent and 83 percent, respectively.

As table 15 indicates, the occupancy rates increase with the size of the hospital. The hospitals with fewer than 25 beds were barely half

full, whereas the hospitals with 1,000 beds or more were 84 percent occupied. This pattern is followed in both the general and psychiatric hospitals, but not with the remaining types of hospitals, which show no definite patterns. This could very well be due to the small number of hospitals that are found in each bed size group. One hospital, for example, with an unusually high or unusually low occupancy rate would be enough to significantly alter the total occupancy rate for that group.

Table 17 shows the occupancy rates of the various types of hospitals by ownership category. The proprietary hospitals, with 70 percent of their beds occupied, had about a 10 percent lower occupancy rate than the nonprofit hospitals (79 percent), the State and local government hospitals (79 percent), and the Federal government hospitals (82 percent). Figure 4 and table 18 show occupancy rates by State.

In addition to occupancy rates, another important measure of hospital utilization is turnover (the number of yearly admissions per bed).

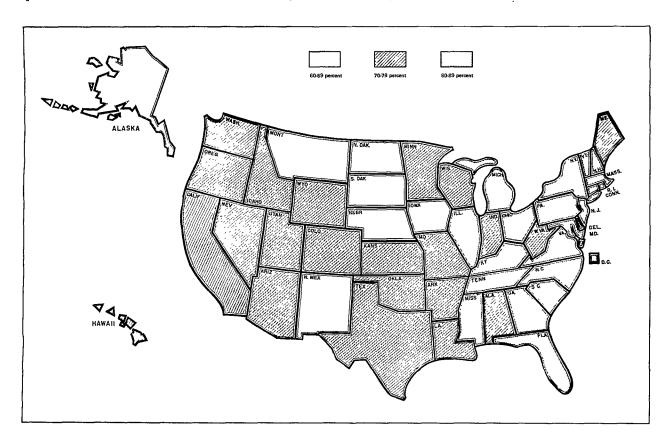

Figure 4. Hospital occupancy rates in each State: United States, 1971

Table J. Number of admissions per bed by type of hospital: United States, 1971

<del></del>	
Type of hospital	Turnover rate
General Psychiatric Tuberculosis Chronic disease Narcotic addiction or alcoholism Maternity Rehabilitation	32.3 1.6 2.0 1.4 14.6 38.4 5.1

This measure changes much more because of the type of hospital than because of bed size or ownership. General hospitals, for instance, had an average annual turnover rate of 32.3 admissions per bed, while psychiatric hospitals had an average turnover rate of 1.6. Table J shows the turnover rates for the various types of hospitals.

Not surprisingly, the table shows that the hospitals which are short-stay in nature (general, maternity) had a rather high turnover of patients whereas the hospitals that tend to be long-stay (psychiatric, tuberculosis, chronic disease, rehabilitation) had a rather low turnover of patients.

Looking at the actual lengths of stay (table 17), one finds that general and maternity hospitals had average lengths of stay of 9 and 6 days, respectively, whereas psychiatric and chronic disease hospitals had average lengths of stay of 312 and 212 days, respectively.

### Location With Respect to SMSA's

In general, a standard metropolitan statistical area (SMSA) is defined as an integrated economic and social unit with a large population nucleus. Each SMSA contains at least:

- One central city with 50,000 inhabitants or more, or
- 2. Two cities having contiguous boundaries and constituting, for general economic and social purposes, a single community with a combined population of at least 50,000, the smaller of which must have a population of at least 15,000.6

As of 1970, there were 243 SMSA's in existence. Based on the U.S. population in 1970 of 203.2 million, 68.5 percent of the people lived in an SMSA.

Though less than half (49.2 percent) of the hospitals in the United States were located in SMSA's, 68.8 percent of the hospital beds were in SMSA's (tables 19 and 20); thus the larger hospitals were in SMSA's. The number of beds per 1,000 population was the same whether the hospital was within an SMSA or not (7.4 per 1,000 population).

Table 19 shows the distribution of hospitals in and out of SMSA's by bed size groups. It is evident from this table that the preponderance of the smaller hospitals were not in SMSA's while the preponderance of the larger hospitals were in SMSA's. For example, the non-SMSA's had 68.5 percent of the hospitals with less than 100 beds while the SMSA's had 80 percent of the hospitals with 200 beds or more. The hospitals with 100-199 beds were more evenly spilt, with 44 percent in non-SMSA's.

Since the large metropolitan areas have such an immediate and great demand on them for health care, they would be expected to have the larger hospitals. Location in an SMSA had an even greater effect on the bed size of *general* hospitals, with non-SMSA's having 75 percent of the hospitals with under 100 beds and SMSA's having 84 percent of the hospitals with 200 beds or more.

Specialty hospitals were predominantly located in SMSA's (75 percent). However, a higher percent of the larger specialty hospitals than of the smaller ones were outside SMSA's. (Table 19.) Whereas 18 percent of the under 200 bed specialty hospitals were not in SMSA's, 35 percent of the specialty hospitals with 200 beds or more were not in SMSA's.

Although psychiatric hospitals were located predominantly in SMSA's, many large ones were not. Approximately 4I percent of the psychiatric hospitals with 200 beds or more were not in an SMSA. One reason for this centers on the fact that many of the large psychiatric hospitals in existence today were actually built in the late 1800's and early 1900's. People with psychiatric problems in those days were not usually accepted by society, so whenever an institution was built for them, it was usually built out in the country,

far from any city.

In general, the occupancy rates were slightly higher in the SMSA hospitals (80 percent) than in the non-SMSA hospitals (75 percent) (table 21). For example, the general hospitals in an SMSA had an occupancy rate of 79.4 percent, while those not in an SMSA had a rate of 71.1 percent. The psychiatric hospitals on the other hand showed virtually no difference in occupancy rates between SMSA's and non-SMSA's.

Occupancy rates both in SMSA's and outside SMSA's were higher for the larger hospitals (200 beds or more) (82 percent each) than for the smaller hospitals with less than 75 beds (62 percent for non-SMSA's and 64 percent for SMSA's).

### Geographic Distribution

There were 4.9 general hospital beds per 1,000 total U.S. population and 2.4 specialty hospital beds per 1,000 population in 1971. The Northeast Region had the highest number of beds per 1,000 population (8.6) in all hospitals, and the West had the lowest (5.8) (table 22). Table K lists the 12 highest States and the 12 lowest with respect to rates for hospital beds per 1,000 population.

The West Region had the lowest rate as a whole and also on a State by State basis; 10 of the 12 States with the lowest rates are located in the West Region. The Northeast Region had the highest overall rate, and, in addition, five of the first nine

Table K. 24 States with the 12 highest and the 12 lowest rates of hospital beds per 1,000 population: 1971

High		Low	• • •
State	Rate	State	Rate
District of Columbia South Dakota Massachusetts- West Virginia- North Dakota New York Pennsylvania Rhode Island Maine Wisconsin Delaware	16.7 9.8 9.4 9.2 9.2 8.7 8.6 5 8.4 8.4 8.3	Utah Idaho Washington- Nevada Alaska New Mexico- Oregon Arizona Arkansas California- Hawaii Kentucky	4.84 5.66 5.88 5.88 5.55 6.3

States with the highest rates are located in this region.

Rates for States and regions are shown in table 22 by type of hospital. The District of Columbia had the highest general hospital rate with 10.3 beds per 1,000 population. The next highest was North Dakota with 7.1. The lowest rate was recorded by Maryland, 3.6. The highest specialty hospital rate was in the District of Columbia with 6.4 beds per 1,000 population, followed by Massachusetts with 4.9. The lowest specialty hospital rate was 0.5 in Utah.

Table L. Number of hospitals in 1967, 1969, and 1971 and net change, by bed size:
United States

Bed size	1971 Hos- pitals	Net change 1969 to 1971	1969 Hos- pitals	Net change 1967 to 1969	1967 Hos- pitals

Less than 25 beds	636 1,648 1,052 772 1,545 739 708 578	-77 -85 -45 +39 - 2 +24 +37 +11	713 1,733 1,097 733 1,547 715 671 567	-199 -133 - 72 - 44 + 48 - 17 + 48 - 2	912 1,866 1,169 777 1,499 732 623 569

### **Hospital Trends**

This section compares hospital data for the years 1967, 1969, and 1971. If not shown in tables of this report, 1969 data can be found in Series 14, Number 6.3 and 1967 data in Series 14, Number 4.2

The decrease in the number of hospitals which occurred from 1967 to 1969 continued at a lessening degree through 1971, as seen in table L.

As in the previous 2-year span, the decrease from 1969 to 1971 occurred primarily in the number of smaller hospitals. In 1967 there were 3,947 hospitals with less than 75 beds in the United States. In 1971 this number was down to 3,336, a decrease of more than 15 percent. Over this same 4-year period, hospitals with 300 beds or more increased by 94, an 8 percent increase.

The total number of hospital beds also continued to decline but at a faster rate than the hospitals themselves. This resulted in a slight drop in the average bed capacity of hospitals.

Table M also shows that the patient census fell at a faster rate than the beds, resulting in a gradual drop in the occupancy rates.

The occupancy rates for the psychiatric hospitals decreased more than those for the general hospitals. From 94 percent in 1967, the former rate dropped to 87 percent in 1969 and to 83 percent in 1971. Occupancy rates for general hospitals actually increased from 1967 to 1969 (76 to 79 percent) before dropping in 1971 (77 percent).

In terms of ownership, the number of proprietary and nonprofit hospitals decreased steadily from 1967 to 1971, while the number of government operated hospitals increased (table N).

### Inpatient Utilization Trends

Despite a steady decrease in their average patient census from 1967 to 1971 (table M), hospitals have been substantially increasing their admissions. In 1967 the average yearly number of admissions per hospital was 3,774, in 1969 the average was 4,075, and by 1971 the average was up to 4,381. The actual total number of admissions rose from 30.7 million in 1967 to 31.7 million in 1969 to 33.6 million in 1971. (Table 15.)

The effect of this increase in admissions combined with the decrease in beds can be seen in the turnover rates (yearly admissions per bed) of hospitals from 1967 to 1971. From a rate of 18.8 in 1967, the turnover rate rose to 20.3 in 1969 and then to 22.3 in 1971. The turnover rate for general hospitals rose from 30.9 to 31.2 to 32.3, while the rates for psychiatric hospitals rose from 1.0 to 1.3 to 1.6 for the years 1967, 1969, and 1971, respectively. Increasing turnover rates imply a shorter length of stay with patients being released sooner and being sent to nursing homes and extended care facilities.

### **Outpatient Utilization Trends**

Another important measure of hospital utilization is outpatient visits. A tremendous number of people visit hospitals on an outpatient basis each year. In 1971, 214.8 million hospital outpatient visits were recorded in the United States (table

Table M. Number of hospitals and beds, average bed capacity, total patient census, average census, and average occupancy rate for 1967, 1969, and 1971: United States

Year	Hos- pitals	Beds	Aver- age bed capac- ity	Total patient census	Average number of patients per hos- pital	Average occu- pancy rate	
1971	7,678	1,507,988	196	1,185,528	154	.79	
1969	7,776	1,563,626	201	1,266,740	163	.81	
1967	8,147	1,631,101	200	1,340,929	165	.82	

Table N. Number of hospitals by type of ownership: United States, 1967, 1969, and 1971

Year	Propri- etary	Non- profit	Govern- ment		
1971	1,042	3,826 3,909	2,810 2,752		
1967	1,402	4,035	2,710		

23). (Due to multiple visits, an accurate count of the number of outpatients is not possible.) The 214.8 million was an increase of 32.7 million visits (18 percent) over 1969. There was a slight decrease in the number of hospitals providing outpatient services in 1971 compared with the number in 1969 (7,299 in 1971 and 7,306 in 1969).

The 7,299 hospitals that provided outpatient services in 1971 represented 95 percent of all the hospitals in the country. Virtually all (98 percent) general hospitals offered outpatient services, whereas less than half (46 percent) of the narcotic addiction or alcoholism hospitals offered them.

The three basic types of outpatient visits defined in the 1971 MFI Survey were (1) emergency visits, (2) outpatient clinic visits, and (3) other visits (referred patients).

Of the three types, most of the outpatient visits were clinic visits (45.8 percent), the remaining visits being split between emergency visits (27.6 percent) and referred patient visits (26.6 percent). The 98.3 million outpatient clinic visits shown in table 23 represent an increase of 39 percent over the 1969 figure and the 59.3 million emergency visits a 20-percent increase. However, the 57.2 million referred visits are a 4-percent decrease from the 1969 figure.

Almost all (406 of the 408) federally operated hospitals provided outpatient services. These hospitals had an average of 117,287 visits each in 1971. This compared to the nonprofit hospital average of 29,353 visits, the State and local government hospital average of 22,168 visits, and the proprietary hospital average of 8,424 visits. The extremely high average number of visits in Federal hospitals is in all probability due to the

fact that they were much larger than the other hospitals. As was mentioned earlier, the Federal hospitals had an average of 352 beds; State and local hospitals averaged 266 beds; nonprofit hospitals, 171 beds; and proprietary hospitals, 68 beds. The larger hospitals had more personnel and were able to both offer more services and handle more patients.

### **Employee Trends**

Table O shows how the number of full- and part-time employees in hospitals has been increasing.

Sizable increases took place in the number of nursing personnel in hospitals from 1969 to 1971. Full-time registered nurses increased by 36,548, 12 percent, and full-time licensed practical nurses increased by 27,332, or 17 percent. The ratio of full-time hospital employees to patients in 1971 was 2.06 to 1, or, stating it another way, 206 full-time employees for every 100 patients. Of these 206 full-time hospital employees, 45 were full-time RN's or LPN's. In 1969 the ratio of full-time hospital employees to patients was 1.79 to 1, or 179 full-time employees per 100 patients, of which 37 were full-time RN's or LPN's.

The number of part-time employees also continued to increase, from approximately 423,000 in 1967, to 496,000 in 1969, to 536,000 in 1971. Once again, it should be remembered that these increases took place despite a decrease in hospitals, beds, and patient census.

Table O. Number of full-time and parttime employees in hospitals and employees per hospital: United States, 1967, 1969, and 1971

Year	Full-time employees	Part- time em- ployees	Employ- ees per hos- pital		
1971	2,438,718	536,291	387.5		
1969	2,270,595	496,003	355.8		
1967	2,014,851	422,811	299.2		

There were increases from 1969 to 1971 in five of the six full-time medical employee groups shown in table 24. Physicians and dentists increased 8 percent; interns, 15 percent; RN's, 12 percent; LPN's, 17 percent; and other employees, 6 percent. The only decrease occurred with "other trainees," which showed a loss of 9 percent.

Most of the increase in full-time personnel occurred in general hospitals (up 168,549 from 1969). Although psychiatric hospitals increased their full-time personnel by 9,469, specialty hospitals overall decreased by 426 positions. Parttime employees also increased in general hospitals and decreased in specialty hospitals (table 25).

### OTHER HEALTH FACILITIES

Included in the 1971 MFI Survey were 4,769 health facilities other than hospitals and nursing homes. These facilities, henceforth called "other health facilities," included resident schools or homes for the deaf, blind, physically handicapped, mentally retarded and emotionally disturbed, unwed mothers, dependent children (and orphans), alcoholics or drug abusers; children's correctional facilities; and other miscellaneous facilities.

The largest number of these facilities were facilities for the mentally retarded (MR) with 1,236; homes for dependent children and orphans were the next largest group with 1,015. (Because of the similarity between homes for dependent children and orphanages, they have been combined for purposes of this report.) Table 26 shows the number of each type of facility by bed size group and ownership. This table indicates that homes for the mentally retarded were generally run by proprietary organizations, whereas facilities for the emotionally disturbed, dependent children, unwed mothers, and alcoholics or drug abusers were run by nonprofit organizations. Facilities for the deaf or blind and correctional facilities for children were usually run by government agencies.

Most of these other health facilities were small, with 45 percent having less than 25 beds and only 19 percent having 100 beds or more.

Table P. Average bed capacity and occupancy rate for other health facilities: United States, 1971

Type of facility	Aver- age bed capac- ity	Occu- pancy rate
Deaf or blind Unwed mothers Physically handicapped Mentally retarded Emotionally disturbed Orphans or dependent children Drug abusers or alcoholics Children's correctional facilities Miscellaneous other facilities	171 37 89 173 41 60 80 123	87.6 62.1 83.8 91.3 85.6 80.0 79.6 79.3
	<u> </u>	<u> </u>

Homes for the deaf or blind were the only type with more than half the homes having 100 beds or more (57 percent).

It can be seen in table 26, however, that there were 78 MR facilities with more than 1,000 beds and another 41 facilities with 500 to 999 beds. Due to these very large facilities the average bed capacity of the MR facilities was 173 beds, more than that of any of the other types of facilities. Homes for the deaf or blind with an average of 171 beds were the next largest type. The average bed capacity and occupancy rates for each of these other health facilities are shown in table P.

In addition to having the highest bed capacity averages, MR facilities and homes for the deaf or blind had the highest occupancy rates (91.3 percent and 87.6 percent, respectively). Homes for unwed mothers had the lowest occupancy rate, with 62.1 percent.

Tables 27 and 28 indicate for each type of facility the number of homes and number of beds in them by State.

Table Q shows how many residents and how many full- and part-time employees there were in these various types of facilities. It indicates there were 244,500 full-time and 26,035 part-time employees working to serve the 415,189 residents in the facilities. With the conversion of part-time

Table Q. Number of facilities, residents, full-time and part-time employees, part-time hours, and staff ratios in other health facilities, by type of facility: United States,

Type of facility	Facil- ities	Residents	Full-time employees	Part- time em- ployees	Part-time hours	Staff ratio <sup>1</sup>
All facilities	4,769	415,189	244,500	26,035	419,693	618

<sup>&</sup>lt;sup>1</sup>Full-time employees and equivalents per 1,000 residents.

personnel to full-time equivalents, b there were about 256,500 full-time employees and equivalents, or roughly 618 employees for every 1,000 residents in all facilities. Facilities for the physically handicapped had the highest staff ratio, with 837 employees per 1,000 residents.

Most facilities for the mentally retarded offer programs for training, educating, or rehabilitating their patients. The programs most frequently offered include classes for educable children, trainable children, and profoundly retarded children; classes for adults; and pro-

grams for vocational training and counseling, occupational therapy, and physical therapy. The programs that any MR facility offers depend mainly on the type of patient that the facility accepts (degree of retardation, age, and so forth). In this regard there are three basic degrees of retardation: (1) those retarded the most are called the profoundly retarded, (2) those that are less retarded are called trainable, and (3) those that are the least retarded are called educable.

Of the 1,236 MR facilities, 437 (35 percent) offered classes for profoundly retarded children, 304 (25 percent) offered classes for the trainable, and 353 (29 percent) offered classes for the educable (table 29). Two hundred thirty (19 percent) of the facilities offered no programs or classes for any of their residents.

b"Full-time equivalents" were computed by dividing the number of part-time hours by 35 (hours). For the purpose of this survey, if an employee worked 35 hours or more per week, he was considered a full-time employee.

#### APPENDIX I

#### **METHODOLOGY**

#### **Nursing Homes**

Survey procedures.—The nursing home mailing list for the 1971 Master Facility Inventory (MFI) was created by merging two lists—the final list of nursing homes for the 1969 MFI Survey, and the list of new nursing homes ("births") gathered by the Agency Reporting System (ARS).<sup>4</sup>

The 1969 MFI list consisted of 18,910 nursing homes, while the ARS contained approximately 4,600 births. Together these 23,500 (approximate) nursing homes made up the 1971 nursing home mailing list. Upon receiving the returned questionnaires, those homes that were out of business and those that did not meet the National Center for Health Statistics definition of a nursing home were eliminated. From the 1969 MFI list 412 nursing homes had gone out of business and were therefore eliminated, as were about 1,100 homes from the ARS list, which were either out of scope or had gone out of business. Thus the final tally of nursing homes for 1971 was 22,004.

Of these 22,004 homes, 21,376 sent back their completed questionnaires, which represented a response rate of 97.2 percent. Data for the 628 nonresponse homes, as well as data for missing items on the returned questionnaires, were obtained through various types of imputation procedures. Whenever possible, 1969 MFI data were used to replace missing data. (Since all 628 nonresponding homes had been surveyed in 1969 and had at that time returned completed questionnaires, their 1969 data were used again in 1971.)

For those responding homes that omitted data which were not available from 1969, an imputation method was used. In this method all nursing homes were stratified by predetermined variables such as bed size groups, ownership categories, and type of home. Missing data for a home were then supplied by using the data from a home whose characteristics were most like the missing data. It should be pointed out here that when a responding home failed to answer any of the major questions (bed size, ownership, type of facility, patients), a fail-edit questionnaire containing the questions they omitted was sent to them and they were asked to answer the question(s) they originally omitted.

The mailing dates for the nursing home portion of the MFI were as follows: Initial mailing - week of August 17, 1971 1st followup - September 15 2d followup - September 29 Field followup - October 13

Results of complement survey.—In an effort to check the completeness of coverage in the MFI, a complement survey was conducted. (The complement survey has been discussed in detail in Vital and Health Statistics, Series 1, No. 3.¹) Briefly, the complement survey matches the health facilities found independently in an area sample survey against the MFI list of facilities for that area. Any facility discovered in the sample survey but missed by the MFI constitutes undercoverage, and an appropriate weight is assigned to the missed facility.

The U.S. Bureau of the Census handled the matching and the weighting procedures for the 1971 Complement Survey. The results indicated that the MFI undercoverage for nursing homes was 6 percent for facilities and 1 percent for beds. Stating it in positive terms, the 1971 MFI list contained 94 percent of all the nursing homes and 99 percent of all the nursing home beds in the United States. This latter figure indicates that the nursing homes that were missed were small facilities, since the 5 percent missed (1,400) contained only 1 percent (12,100) of the total beds (an average of 9 beds per home).

#### Results of McGraw-Hill Match

In an effort to locate the nursing homes that were missed in the 1971 MFI Survey, an extensive match was performed between the 1971 MFI list and the 1973 McGraw-Hill nursing home directory entitled *Modern Nursing Home*. The first stage of the operation matched the 16,063 nursing homes in the McGraw-Hill directory with the 1971 MFI list of 22,004 nursing homes. The McGraw-Hill nursing homes that were not on the MFI list were marked as misses.

At this first stage of the match, there were 585 homes marked as misses. Table I shows how these homes were distributed by State, division, and region.

The second stage was designed to eliminate those nursing homes that came into existence after the 1971 MFI Survey list was created. This was accomplished by

Table I. Results of matching the nursing homes in the 1973 McGraw-Hill nursing home directory (Modern Nursing Home) with the 1971 MFI list of nursing homes: United States, each region and State

matching the missed homes from stage one with (1) a list of new homes gathered via the Agency Reporting System after the 1971 MFI Survey list was created and (2) the Modern Nursing Home Construction Reports, which list the various phases of construction of new nursing homes. Any missed homes found in these two sources were eliminated, since they were not in operation at the time of the 1971 MFI Survey. Only 45 homes were eliminated in this stage, leaving 540 homes for the third stage of the matching procedure.

The third and final stage of the match consisted of matching these 540 missed homes with a list of nursing homes originally on the 1971 MFI but taken off because they were found to be either out of business or out of scope. Any homes still left after this match were deemed true misses.

This last matching operation resulted in a final yield of 396 nursing homes not on the 1971 MFI list. These homes have been added to the MFI in preparation for the 1973 MFI Survey.

# Other Health Facilities

The procedure involved in creating the mailing list for the "other health facilities" was the same as that for the nursing homes. ("Other health facilities" include homes for the deaf, blind, physically handicapped, emotionally disturbed and mentally retarded, unwed mothers, dependent children, alcoholics or drug abusers, or juvenile delinquents.) The 1969 final listing of these facilities, which contained 4,225 such places, was merged with the ARS list of potential facilities, which contained approximately 1,400 places. With the elimination of the out-of-business and out-of-scope facilities, the final tally of other health facilities for 1971 was 4,769.

The response rate for these 4,769 facilities was 96.7 percent. The mailing dates were the same as those for the nursing homes.

#### Hospitals

Unlike nursing homes and "other health facilities," which are surveyed every 2 years, hospitals are surveyed annually. The mailing list for hospitals in 1971 was created, therefore, by merging the final list of hospitals from the 1970 survey with the list of new (or potentially new) hospitals found between the 1970 and 1971 surveys. This mailing list was composed of three parts—(1) those hospitals registered and surveyed by the American Hospital Association (AHA), (2) those hospitals belonging to and surveyed by the American Osteopathic Association, and (3) the remaining non-AHA, non-osteopathic hospitals which are surveyed by the National Center for Health Statistics.

The final 1970 list contained 7,613 hospitals. This consisted of 6,987 AHA hospitals, 195 osteopathic hospitals, and 431 non-AHA-osteopathic hospitals. To this list was added 227 potentially new hospitals (potential "births"). With the elimination of duplicate, out-of business, and out-of-scope hospitals, the final tally of hospitals for 1971 was 7,678.

The response rate for these 7,678 hospitals was approximately 93 percent. The imputation procedures used in obtaining missing hospital data were similar to those used in obtaining missing nursing home data.

The mailing dates for the non-AHA, non-osteopathic hospital portion of the MFI were as follows:

Initial mailing - the week of December 6, 1971 2d mailing - January 3, 1972 3d mailing (certified) - January 20 Telephone followup - February 1-11

The AHA and osteopathic surveys were conducted by these respective agencies approximately 1 month prior to the above dates.

#### APPENDIX II

# **CLASSIFICATION PROCEDURES**

## Criteria for Classifying Nursing Homes

The criteria for classifying institutions are based on several factors. (1) The number of persons receiving nursing care during the week prior to the day of the survey, (2) administration of medications and treatments in accordance with physician's orders, (3) supervision over medications which may be self-administered, (4) the routine provision of the following criterion personal services; rub and massage, help with tub bath or shower, help with dressing, correspondence, shopping, walking or getting about, and help with eating, and (5) the employment of registered professional or licensed practical nurses. On the basis of these factors, four types of establishments were distinguished and are defined as follows:

Nursing care home.—An establishment is a nursing care home if nursing care is the primary and predominant function of the facility. Those meeting the following criteria are classified as nursing care homes in this report: One or more registered nurses or licensed practical nurses were employed, and 50 percent or more of the residents received nursing care during the week prior to the survey. (Nursing care is defined as the provision of one or more of the following services: nasal feeding, catheterization, irrigation, oxygen therapy, full bed bath, enema, hypodermic injection, intravenous injection, temperature-pulse-respiration, blood pressure, application of dressings or bandages, and bowel and bladder retraining.)

Personal care home with nursing.—An establishment is a personal care home with nursing if personal care is the primary and predominant function of the facility but some nursing care is also provided. If an establishment met either of the following criteria it was classified as a personal care home with nursing:

- Some but less than 50 percent of the residents received nursing care during the week prior to the survey and there was one registered professional or licensed practical nurse or more on the staff.
- Some of the residents received nursing care during the week prior to the survey, no registered nurses or licensed practical nurses

were on the staff, but one or more of the following conditions were met:

- A. Medications and treatments were administered in accordance with physician's orders.
- B. Supervision over self-administered medications was provided.
- C. Three or more personal services were routinely provided.

Personal care home.—An establishment is a personal care home if the primary and predominant function of the facility is personal care and no residents received nursing care during the week prior to the survey. Places in which one or both of the following criteria were met are classified as personal care homes in this report whether or not they employed registered nurses or licensed practical nurses.

- Medications and treatments were administered in accordance with physician's orders, or supervision over medications which may be self-administered was provided.
- 2. Three or more of the criterion personal services were routinely provided.

Domiciliary care home.—A facility is a domiciliary care home if the primary and predominant function of the facility is domiciliary care but the facility has a responsibility for providing some personal care. If the criteria for a nursing care home or personal care home are not met but one or two of the criterion personal services are routinely provided, the establishment is classified as a domiciliary care home in this report.

In the classification process, a criterion was considered as not having been met if the necessary information for that criterion was unknown. For instance, if the type of nursing staff was unknown for a particular place, it was considered as not having met the criteria of having one or more registered nurses or licensed practical nurses on the staff. Establishments indicating that some nursing care was provided but not giving the number of persons to whom this care was provided were considered as institutions pro-

viding nursing care to some but less than 50 percent of their patients or residents. Table II shows in detail the classification of the establishments.

# Classification of Hospitals

General medical and surgical hospitals are establishments licensed as hospitals that provide diagnostic and treatment services for patients who have a variety of medical conditions both surgical and nonsurgical. For purposes of this report, a hospital unit of an institution (prison hospital, college infirmary, etc.) is considered a general hospital.

Specialty hospitals are establishments licensed as hospitals that usually limit their admissions to patients with specified illnesses or conditions only. The spe-

cialty hospitals discussed in this report are psychiatric, tuberculosis, chronic disease, rehabilitation, maternity, and alcoholic or narcotic. The remaining types of specialty hospitals are grouped together and called "other." This category includes Armed Forces dispensaries; eye, ear, nose, and throat hospitals; orthopedic hospitals; and any other type of hospital not already specified. As section B(2) on the hospital questionnaire indicates, there are two categories for the mentally retarded: a hospital unit within a school for the mentally retarded (code 12) and an institution for the mentally retarded (code 62). (See appendix III.) Any facility which was one of these two types was removed from the hospital list and placed on the MR portion of the "other health facilities" list.

## **GENERAL INSTRUCTIONS**

a. Include in this report information for the facility named in the mailing label or for its successor if the name or owner has changed. Include information for one facility only, but report for the entire facility including infirmaries and other subunits.

b. Due to name and address changes, duplicate listings, or other reasons, you may have been sent more than one questionnaire under different names or addresses. If you receive more than one form for the same facility, complete one only and return all others with the notation "Completed and returned under...(give name of facility on completed form and the identification number found in the upper left general of the lobel)"

- c. If this facility is a nursing unit for a retirement center, report only for the nursing unit.
- d. Answer all questions, please. Definitions and special instructions are given with the questions when needed. If your answer to a question is "none," put a zero in the appropriate space. Do not leave the space blank.
- e. Return the completed questionnaire in the preaddressed postage-paid envelope to:

Bureau of the Census Jeffersonville Census Operations Division 1201 East 10th Street Jeffersonville, Indiana 47130

#### PLEASE READ THESE INSTRUCTIONS BEFORE COMPLETING SECTIONS B-F

- a. HOSPITAL as used in this form refers to those facilities generally recognized as hospitals, in addition to institutions for the mentally retarded and other mental facilities, and medical units of nonhospital establishments (provided the units have six or more inpatient beds). If this facility is not a hospital, please use the "COMMENTS" section on page 4 to describe the facility and the services it offers and return the questionnaire
- b. Include in this report data for your entire hospital and all parts, units, component institutions, etc. However, do not include any component or unit which has its own separate discharge procedures. The latter are to be considered separate facilities and should be reported in the "COMMENTS." If you are in doubt about any unit, please include the unit and explain in the "COMMENTS" section.
- c. Answer all questions, please. Definitions and special instructions are given with the question when needed.
- d. Due to name and address changes, duplicate listings in our file, or other reasons, you may have been sent more than one questionnaire under different names and addresses. If you have received more than one form for the same hospital, complete one only and return all others with the notation "completed and returned under . . . (give name of hospital on completed form)."
- c. Report data for a 12-month period, preferably October 1, 1970 through September 30, 1971
- f. Return the completed questionnaire in the postage-paid envelope to.

# OUTLINE OF REPORT SERIES FOR VITAL AND HEALTH STATISTICS

Originally Public Health Service Publication No. 1000

- Series 1. Programs and collection procedures.—Reports which describe the general programs of the National Center for Health Statistics and its offices and divisions, data collection methods used, definitions, and other material necessary for understanding the data.
- Series 2. Data evaluation and methods research.—Studies of new statistical methodology including: experimental tests of new survey methods, studies of vital statistics collection methods, new analytical techniques, objective evaluations of reliability of collected data, contributions to statistical theory.
- Series 3. Analytical studies.—Reports presenting analytical or interpretive studies based on vital and health statistics, carrying the analysis further than the expository types of reports in the other series.
- Series 4. Documents and committee reports.—Final reports of major committees concerned with vital and health statistics, and documents such as recommended model vital registration laws and revised birth and death certificates.
- Series 10. Data from the Health Interview Survey.—Statistics on illness, accidental injuries, disability, use of hospital, medical, dental, and other services, and other health-related topics, based on data collected in a continuing national household interview survey.
- Series 11. Data from the Health Examination Survey.—Data from direct examination, testing, and measurement of national samples of the population provide the basis for two types of reports: (1) estimates of the medically defined prevalence of specific diseases in the United States and the distributions of the population with respect to physical, physiological, and psychological characteristics; and (2) analysis of relationships among the various measurements without reference to an explicit finite universe of persons.
- Series 12. Data from the Institutional Population Surveys.—Statistics relating to the health characteristics of persons in institutions, and on medical, nursing, and personal care received, based on national samples of establishments providing these services and samples of the residents or patients.
- Series 13. Data from the Hospital Discharge Survey.—Statistics relating to discharged patients in short-stay hospitals, based on a sample of patient records in a national sample of hospitals.
- Series 14. Data on health resources: manpower and facilities.—Statistics on the numbers, geographic distribution, and characteristics of health resources including physicians, dentists, nurses, other health manpower occupations, hospitals, nursing homes, and outpatient and other inpatient facilities.
- Series 20. Data on mortality.—Various statistics on mortality other than as included in annual or monthly reports—special analyses by cause of death, age, and other demographic variables, also geographic and time series analyses.
- Series 21. Data on natality, marriage, and divorce.—Various statistics on natality, marriage, and divorce other than as included in annual or monthly reports—special analyses by demographic variables, also geographic and time series analyses, studies of fertility.
- Series 22. Data from the National Natality and Mortality Surveys.—Statistics on characteristics of births and deaths not available from the vital records, based on sample surveys stemming from these records, including such topics as mortality by socioeconomic class, medical experience in the last year of life, characteristics of pregnancy, etc.
