

Nursing and Related Care Homes as Reported from the 1980 NMFI Survey

Statistics on nursing and related care homes are presented based on data collected for the 1980 National Master Facility Inventory Survey. The statistics include the number of homes, beds, residents, and employees, as well as types of ownership and geographic distribution.

Nursing and Related Care Homes

by Al Sirrocco, Division of Health Care Statistics

Introduction

The data presented in this report reflect findings from the 1980 National Master Facility Inventory Survey of nursing and related care homes. The tables include statistics on numbers of homes, beds, residents, employees, admissions, and discharges. These variables are shown with such characteristics as type of ownership, bed size group, geographic region, and State.

The National Center for Health Statistics first conducted the National Master Facility Inventory (NMFI) Survey in 1963, followed by Surveys in 1967, 1969, 1971, 1973, 1976, and 1978. Prior to the 1978¹ survey, the inventory included hospitals, nursing and related care homes, and other types of inpatient health facilities (for example, homes for the blind, deaf, mentally retarded, and emotionally disturbed). The 1978 and 1980 inventories have data only on nursing and related care homes. Data for hospitals are now obtained directly from the American Hospital Association (AHA). For convenience, this report will use the terms "nursing and related care homes" and "nursing homes" interchangeably.

Due to changes in collection coverage beginning in 1976 (see appendix I), certain types of facilities have been added and others deleted. The most notable change in coverage for 1980 involved the additions of more than 2,500

adult foster care homes in Michigan and of 1,000 residential community care facilities in California. These homes may have existed in prior years, but were only recently identified as meeting the minimum definitional requirements of the National Center for Health Statistics for inclusion in the National Master Facility Inventory.

Another notable change in the 1980 inventory is the exclusion of all identifiable hospital-based nursing homes and extended care facilities. Previous NMFI Surveys included many of these homes; however, the inability to obtain data on all such facilities from all States resulted in the decision to drop them from the survey and to use the AHA figures for these facilities. In 1980, according to AHA, there were 1,056 such facilities, with 76,024 beds.²

From the discussion above, it is apparent that any comparisons between the 1980 and earlier NMFI Surveys must be made with extreme caution. If comparisons are attempted, it is recommended they be made among only the larger homes (25 beds or more), since most of the additions, deletions, and definitional changes to the surveys applied to the smaller homes. In addition, the counts of hospital-based nursing homes should be eliminated when comparing those pre-1980 surveys with the 1980 survey.

Highlights

The following statistics represent highlights from the tables presented in this report (see detailed tables). Additional tables and an overview of the 1980 National Master Facility Inventory (NMFI) Survey data have been published elsewhere.³

- Table 1 The U.S. average for number of nursing home beds per 1,000 persons 65 years and over was 60.2. The States with the three highest averages were South Dakota (95.0), Nebraska (92.2), and Washington (90.8). At the other extreme, Florida (21.4), New Mexico (26.5), and West Virginia (27.0) had the three lowest averages.
- Table 2 Of the 23,065 nursing homes, half had fewer than 50 beds and 95 percent had fewer than 200 beds. California, with its residential community care facilities (RCCF's) and Michigan, with its adult foster care homes (AFCH's), together accounted for 72 percent of the homes that had fewer than 10 beds and for 40 percent of those with 10–24 beds.
- Table 3 Forty percent of all nursing home beds were in homes with 100–199 beds. In addition, of the States with more than 20,000 beds, five had more than half of their total beds in homes with 100–199 beds. All five of these States were located in the South Region (Louisiana, 56.7 percent; Texas, 55.9 percent; Georgia, 54.2 percent; Alabama, 52.5 percent; and Florida, 51.1 percent).
- Table 4 Nationwide, about 80 percent of nursing homes were under proprietary ownership. However, in six States (Alaska, Minnesota, Nebraska, North Dakota, South Dakota, and Wisconsin), no more than half of the homes were under proprietary ownership. (Note that five of these six States were in the North Central Region.)
- Table 5 Approximately 70 percent of all nursing home beds were in homes under proprietary ownership. Seven States (the six States mentioned above plus Pennsylvania) and the District of Columbia had fewer than half of their nursing home beds in such homes.
- Table 6 The large numbers of small proprietary homes in the North Central (3,141) and West (2,975) Regions are very apparent in this table. Michigan's AFCH's made up 2,504 (30 percent) of the North Central Region's total, and California's RCCF's made up 2,576 (45 percent) of the West Region's total.
- Table 7 The high number and percent of homes with 3-9 beds was not unexpected considering the addition of Michigan's AFCH's and California's RCCF's. The high number and percent of homes with 100-199 beds

- (for every ownership category) indicates a tendency toward this size of nursing home.
- Table 8 The number and percent of beds in nursing homes with 100–199 beds is nearly three times higher than the next largest group. More than 40 percent of all nursing home beds and nearly 44 percent of proprietary nursing home beds were in homes of this size.
- Table 9 Nursing homes in most of the States employed more licensed practical nurses (LPN's) than registered nurses (RN's). In 10 States (Alabama, Arkansas, Georgia, Louisiana, Mississippi, New Mexico, Oklahoma, Tennessee, Texas, and Utah), all from the South Region, nursing homes employed more than twice as many. Among the States with more RN's than LPN's, the most notable were Arizona, Connecticut, Delaware, New Hampshire, New Jersey, Oregon, South Dakota, and Washington.
- Tables 10-13 Nursing homes in the Northeast Region employed the most full-time RN's, having almost as many as the South and West Regions combined (table 10). This was not a result of the Northeast having more nursing homes and nursing home beds; in fact, there were far fewer homes in this region than in the other three regions and far fewer beds than in both the North Central and South Regions.

A possible explanation for the high number of RN's in the Northeast Region could lie in the types and sizes of the nursing homes within the four regions. The certification data collected in the survey were incomplete (see appendix I), but according to the information that was available, the Northeast Region had many more large skilled nursing facilities (SNF's) than did the South and West Regions. Of SNF's with 200 or more beds, the Northeast Region had 295, compared with 113 and 64 for the South and West Regions, respectively. Of SNF's with 500 beds or more, the Northeast Region had 37, the South Region had 4, and the West Region had none.

Because SNF's are required to (1) provide skilled nursing care and (2) maintain 24-hour coverage by RN's, they would be expected to have more RN's than would the noncertified homes. Results from the 1977 National Nursing Home Survey tended to substantiate this

^aThe NMFI Surveys included only nursing home employees on the staff payroll, not those employed under contract. Since RN's and LPN's are occasionally employed under contract, they are undercounted in these surveys.

hypothesis. Of the 66,900 estimated full-time equivalent (FTE)^b RN's employed in nursing homes at that time, 53,000 (79 percent) were in homes classified as SNF's.⁴ The Northeast Region, with many more large SNF's, therefore could be expected to have many more RN's also.

Nursing homes in the Northeast Region employed^a the most part-time RN's, followed by the North Central Region. Each of these regions had more part-time RN's than did the South and West combined (table 11). Nursing homes in the South Region employed^a the most full-time LPN's. The West had by far the fewest, employing only 14 percent of the full-time LPN's (table 12).

Although nursing homes in the North Central and Northeast Regions employed many more part-time LPN's than did the South (table 13), when these figures are combined with the full-time LPN's (table 12) to form

full-time equivalents^b (FTE's), the South Region had many more FTE LPN's (25,685) than did the North Central (21,633) or Northeast (18,510) Regions. The West homes employed not only the fewest FTE LPN's (10,920), but also the fewest FTE RN's (tables 10 and 11). Combining these results shows the West had only half as many nurses (FTE RN's plus LPN's) employed in their nursing homes as did each of the other three regions.

Table 14 — Turnover rates (admissions per bed) were higher for the medium-sized nursing homes (50 to 299 beds) than for either the small or the large homes. These rates were also higher for proprietary homes and for homes in the West.

^bFull-time equivalents = (number of full-time employees) + (number of part-time employees \div 2).

Appendix I Technical notes

All of the National Master Facility Inventory (NMFI) Surveys (of non-hospitals) through 1973 were conducted by NCHS with the assistance of the Bureau of the Census. From 1976 through 1980, the Cooperative Health Statistics System (CHSS) decentralized the responsibility for collecting data from the Federal to the State level. In 1976, 16 States within CHSS collected some or all of the NMFI data; in 1978, 26 States collected data; and in 1980, there were 38 States collecting NMFI data. In each of these years, the non-CHSS States were surveyed by NCHS. The following States collected data for and furnished data to the National Center for Health Statistics as part of the 1980 National Master Inventory Survey: Alabama, Arizona, Arkansas, California, Colorado, District of Columbia, Florida, Georgia, Hawaii, Idaho, Illinois, Indiana, Kansas, Kentucky, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Nebraska, New Hampshire, New Jersey, New York, North Carolina, Ohio, Oregon, Pennsylvania, Rhode Island, South Carolina, Tennessee, Texas, Vermont, Virginia, Washington, West Virginia, Wisconsin, and Wyoming.

The licensing agencies within the CHSS States usually collected the NMFI data for NCHS. Since State survey coverage was structured according to licensing laws, there were differences in definitions, scope, and timing of the surveys among the CHSS States. Whereas NCHS surveys included such facilities as personal care homes, homes for the aged, and rest homes, some States did not license these types of homes and therefore did not survey them.

For the States surveyed by NCHS, a mailing list was compiled by merging the following two files: the final inventory of facilities from the 1978 NMFI Survey, and a list of new facilities gathered through the Agency Reporting System⁵ (ARS). The ARS is a compilation of the most recent State and national directories and listings, which is then matched against the latest (1978) NMFI listing to locate new facilities.

Although the 1980 NMFI Survey was a universe rather than a sample survey, and hence not subject to sampling error, it is subject to other types of errors, such as nonresponse

to questionnaire items. To minimize item nonresponse as well as overall nonresponse, NCHS used a two-part procedure in the States surveyed. The first part used a series of followups to reduce overall nonresponse. This procedure included (as needed) a postcard reminder, two questionnaire followups, and a final effort telephone or personal interview by Bureau of the Census personnel. The second part involved sending an abbreviated questionnaire (see appendix II) to responding facilities that failed to answer certain critical items on the initial questionnaire. Facilities were asked to complete only those critical items originally left blank. These procedures produced a response rate of 98.3 percent.

Data on nursing and related care homes may have biases due to the following factors:

- Data from nursing homes surveyed in the 1978 NMFI
 were substituted in 1980 for Alaska and South Dakota.
 Alaska had three hospital-based nursing homes in 1978
 which were excluded from the 1980 statistics.
- Data for 1978 were substituted in the case of 48 nursing homes in Indiana and 96 homes in Connecticut.
- Since neither 1980 nor 1978 data were available for approximately 200 residential care homes in New York, these homes were excluded from the figures in this report.
- The 3,013 residential community care facilities in California reported only number of beds and type of ownership. Residents were imputed by multiplying beds by 0.90 (the average occupancy rate in nursing and related care homes). Admissions, discharges, inpatient days of care, and employees were not imputed; therefore, these homes were not included in tables showing these variables.
- The only information available for the 2,524 adult foster care homes (AFCH's) in Michigan was number of beds. Residents were imputed by multiplying beds by 0.90. Based on existing knowledge, these homes were assigned an ownership category of proprietary. Since no other data were imputed, these homes were excluded from tables showing any variables other than beds, residents, and ownership.

Office of Health Research, Statistics, and Technology
National Center for Health Statistics

1980 MASTER FACILITY INVENTORY SURVEY

RETURN COMPLETED QUESTIONNAIRE TO:

Operation of Health, Education, and Welfare Public Health Service
National Center for Health Statistics—Rm. 1-60
Center Building—Prince George Center 3700 East-West Highway
Hyattsville, Maryland 20782

Dear Administrator:

As part of its responsibility to provide information on the Nation's health resources, the National Center for Health Statistics (NCHS) collects information on all hospitals and nursing and related care facilities in the United States; in addition, information is also collected from those facilities which provide some kind of personal or domiciliary care. The survey is conducted under the authority of Section 306 (42 USC 242k) of the Public Health Service Act.

The purpose of this survey is TO OBTAIN CURRENT INFORMATION FROM EACH FACILITY on its ownership, staff size, number of beds and other related facility characteristics. The information will be used to provide statistics on the number and kinds of such facilities in the United States and the CHANGES THAT HAVE OCCURRED since the last Master Facility Inventory Survey. In addition, the data will be used to determine trends, identify shortage areas, publish directories, and assist in the planning of health services. While your participation is voluntary, your individual contribution to this national survey is greatly needed by the health industry.

The information obtained in Sections A and B of the questionnaire will be made available by the NCHS upon request. However, the data from Sections C and D will be held in strict confidence, and will not be released to anyone under any circumstances or used in any way other than in statistical summaries. These summaries will only be presented in a manner which will ensure that no individual facility can be identified.

If you should have any questions about this survey, please feel free to contact Mrs. Evelyn Mathis on (301) 436-8830. Please return your completed form in the postage-free envelope enclosed for your convenience. Your cooperation is this study is greatly appreciated.

Sincerely yours,

Dorothy P. Rice

Director

National Center for Health Statistics

INSTRUCTIONS FOR COMPLETING THIS FORM

- Include in this report information only for the facility named in the mailing label or for its SUCCESSOR if the name or owner has changed.
- 2. Due to name and address changes, duplicate listings, or other reasons, you may receive more than one question-naire under different names or addresses. If you receive more than one form for the same facility, complete one only and return all others with the notation "Completed and returned under...(give name of facility on completed form and the IDENTIFICATION NUMBER found in the upper left corner of the mailing label)."
- If this facility is a nursing unit of a retirement center, report only for the nursing unit.
- If this facility is an SNF unit of a hospital, report only for the SNF unit.
- Please answer all applicable questions. Definitions and special instructions are given with the questions when needed. If your answer to a question is "None," put a zero in the appropriate space. DO NOT LEAVE THE SPACE BLANK.
- For questions 9 and 14, data should be reported for a 12-month period, preferably the calendar year from

January 1, 1979 through December 31, 1979. If data is for a different 12-month period than this, indicate the time period used:

Ending date: month day vi

cc18,19 cc20,21 cc22,23

The months, da, s, and years are to be 2-digit numbers.)

7. Is this nursing home part of a larger group of homes?

Yes No [

If the answer to the above is YES and information for this home is available only at your home office, please forward this questionnaire to your home office with the instruction to fill it out for your specific facility.

- If you are the home office and receive a forwarded questionnaire from one or more of your homes, please fill out each questionnaire you receive. (We need separate information for each home).
- If you are the home office and receive a questionnaire addressed specifically to you, do not fill it out. However, please provide us with the name and address of all homes for which you are the home office.

COM	COMMENTS					

Appendix III Definitions of certain terms used in this report

Admissions—Total number of inpatients admitted during the year.

Bed—For this report, a bed that is set up and staffed for use.

Discharges—Total number of inpatients discharged during the year.

Employee—Any person who was on the staff of the facility, including any paid worker, proprietor, or member of a religious order who contributed services. (Persons who worked under contract were excluded.) Employees working 35 hours per week or more were considered full-time; those working less than 35 hours were considered part-time.

Geographic Regions—The U.S. Bureau of the Census groups the 50 States plus the District of Columbia into the following four regions:

Northeast Region—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania.

North Central Region—Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, Kansas.

South Region-Delaware, Maryland, District of

Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, Texas.

West Region—Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, California, Alaska, Hawaii.

Nursing Home—An establishment that provides nursing or personal care to the aged, infirm, or chronically ill. It must have a minimum of three beds.

Ownership—Type of organization that controls and operates the nursing home. Proprietary homes are operated under private commercial ownership; nonprofit homes are operated under voluntary or nonprofit auspices, which may or may not be church related; government ownership refers to homes operated under Federal, State, or local government auspices.

Resident—A person who has been formally admitted but not discharged from a nursing home. All such persons were included in the survey whether or not they were physically present at the time of the survey.

Vital and Health Statistics series descriptions

SERIES 1.	Programs and Collection Procedures—Reports describing the				
	general programs of the National Center for Health Statistics				
	and its offices and divisions and the data collection methods				
	used. They also include definitions and other material necessary				
	for understanding the data.				

- SERIES? Data Evaluation and Methods Research—Studies of new statistical methodology including experimental tests of new survey methods, studies of vital statistics collection methods, new analytical techniques, objective evaluations of reliability of collected data, and contributions to statistical theory.
- SERIES 3 Analytical and Epidemiological Studies—Reports presenting analytical or interpretive studies based on vital and health statistics, carrying the analysis further than the expository types of reports in the other series.
- SERIES 4 Documents and Committee Reports—Final reports of major committees concerned with vital and health statistics and documents such as recommended model vital registration laws and revised birth and death certificates.
- SERIES 10. Data From the National Health Interview Survey—Statistics on illness, accidental injuries, disability, use of hospital, medical, dental, and other services, and other health-related topics, all based on data collected in the continuing national household interview survey.
- SERIES 11. Data From the National Health Examination Survey and the National Health and Nutrition Examination Survey—Data from direct examination, testing, and measurement of national samples of the civilian noninstitutionalized population provide the basis for (1) estimates of the medically defined prevalence of specific diseases in the United States and the distributions of the population with respect to physical, physiological, and psychological characteristics and (2) analysis of relationships among the various measurements without reference to an explicit finite universe of persons.
- SERIES 12 Data From the Institutionalized Population Surveys—Discontinued in 1975. Reports from these surveys are included in Series 13
- SERIES 13. Data on Health Resources Utilization—Statistics on the utilization of health manpower and facilities providing long-term care, embulatory care, hospital care, and family planning services.

- SERIES 14. Data on Health Resources: Manpower and Facilities—Statistics on the numbers, geographic distribution, and characteristics of health resources including physicians, dentists, nurses, other health occupations, hospitals, nursing homes, and outpatient facilities
- SERIES 15. Data From Special Surveys—Statistics on health and health-related topics collected in special surveys that are not a part of the continuing data systems of the National Center for Health Statistics.
- SERIES 20 Data on Mortality—Various statistics on mortality other than as included in regular annual or monthly reports. Special analyses by cause of death, age, and other demographic variables; geographic and time series analyses; and statistics on characteristics of deaths not available from the vital records based on sample surveys of those records
- SERIES 21 Data on Natality, Marriage, and Divorce—Various statistics on natality, marriage, and divorce other than as included in regular annual or monthly reports. Special analyses by demographic variables; geographic and time series analyses; studies of fertility; and statistics on characteristics of births not available from the vital records based on sample surveys of those records
- SERIES 22. Data From the National Monthly and Natality Surveys—Discontinued in 1975. Reports from these sample surveys based on vital records are included in Series 20 and 21, respectively.
- SERIES 23. Data From the National Survey of Family Growth—Statistics on fertility, family formation and dissolution, family planning, and related maternal and infant health topics derived from a periodic survey of a nationwide probability sample of ever-married woman 15-44 years of age.
