# National Park Visitor Spending and Payroll Impacts, 2007

Daniel J. Stynes  
September 2008

## Executive Summary

*The National Park System received 275.6 million recreation visits in 2007. Park visitors spent \$11.79 billion in local gateway regions (within roughly 50 miles of the park). Visitors staying outside the park in motels, hotels, cabins and B&B's accounted for 55% of the total spending. Over half of the spending was for lodging and meals, 16% for gas and local transportation, and 14% for souvenirs. Local economic impacts were estimated after excluding spending by visitors from the local area (9.5% of the total). Combining local impacts across all parks yielded a total impact, including direct and secondary effects, of 209,000 jobs, \$4.5 billion in labor income, and \$7.0 billion value added. The four economic sectors most directly affected by visitor spending were lodging, restaurants, retail trade, and amusements. Visitor spending supported roughly 56,000 jobs in each of the hotel and restaurant sectors, and over 22,000 jobs each in the retail trade and the amusements sectors.*

*Parks also impact the local region through the NPS payroll. In FY 2007, the NPS employed 23,853 people, with a total payroll of \$1,142 million in wages and salaries and \$300 million in payroll benefits. The local economic impact of the NPS payroll was \$1.8 billion in labor income, \$2.0 billion in value added, and 35,000 total jobs (including NPS jobs). The combined impact of visitor spending and park payrolls was \$6.29 billion in labor income, \$9.02 billion in value added, and 244,000 local jobs. Visitor spending accounted for 86% of the total jobs and 78% of the total value added*

## Introduction

This report provides updated estimates of NPS visitor spending for 2007 and estimates the economic impacts of visitor spending and the NPS payroll on local economies. Visitor spending and impacts were estimated using the MGM2 model (Stynes et al., 2000) based on calendar year 2007 park visits, spending averages from park visitor surveys, and local area economic multipliers. Impacts of the NPS payroll were estimated based on fiscal year 2007 payroll data for each park.

Visitor spending impacts were estimated for all park units with visitation data. Payroll impacts were estimated for all parks, including administrative units and parks without visit count data. Impacts measure the direct and secondary effects of visitor spending and park payrolls on local economies in terms of jobs, income, and value added<sup>1</sup>. Impacts of

---

<sup>1</sup> Jobs include full-time and part-time jobs. Seasonal positions are adjusted to an annual basis. Personal income covers wages and salaries, including income of sole proprietors and payroll benefits. Value added is the sum of personal income, profits and rents, and indirect business taxes. It can also be defined as total sales net of the costs of all non-labor inputs. Value added is the preferred economic measure of the contribution of an industry or activity to the economy.

construction activity and park purchases of goods and services from local firms are not included. Local regions are defined as a 50-mile radius<sup>2</sup> around each park.

Direct effects cover businesses selling goods and services directly to park visitors. Secondary effects include indirect and induced effects resulting from sales to backward-linked industries within the local region and household spending of income earned directly or indirectly from visitor spending. Sales in retail and wholesale trade sectors represent the margins accruing to local firms on goods sold to park visitors.

Systemwide totals are estimated by summing the spending and impact estimates for all park units. Results for individual park units are reported in the appendix.

### **Visitor Spending**

The National Park System received 275.6 million recreation visits in 2007. Visitor spending was estimated by dividing visitors to each park into segments with distinct spending patterns and applying spending averages based on surveys of park visitors at selected parks. As spending averages are measured on a party-day basis (party nights for overnight trips), the NPS counts of recreation visits are converted from person entries to a park to party days in the area by applying average party size, length of stay, and park re-entry factors. This adjusts for some double counting of visits. To the extent possible, spending not directly related to a park visit is excluded<sup>3</sup>.

In 2007, there were 14 million recreation overnight stays in the parks representing 3.2% of all visits. Twenty-eight percent of park visits were day trips by local residents, 42% were day trips from 50 miles or more<sup>4</sup>, and 30% involved an overnight stay near the park. Visitor spending depends on the number of days spent in the local area and also the type of lodging on overnight trips. Non-local day trips accounted for 35% of the party days spent in the local area, local day trips 27%, and overnight stays 38%. Two-thirds of all overnight stays by park visitors were in motels, lodges, or B&B's outside the park, another 19% are in campgrounds outside the park, and 12% are inside the park in NPS campgrounds, lodges, or backcountry sites.

NPS Systemwide spending averages for 2007 are given in Table 1 for seven distinct visitor segments. A typical park visitor party on a day trip spends \$40 if a local resident and \$71 if non-local (Table 1). Spending averages do not include park entry fees.

---

<sup>2</sup> The 50-mile radius is a general average representing the primary impact region around most parks. The radius is closer to 30 miles for parks in urban settings and as large as 100 miles for some western parks. Economic multipliers are based on regions defined as groupings of counties to approximate a 50-mile radius of the park.

<sup>3</sup> For example, spending during extended stays in an area visiting relatives, on business, or when the park visit was not the primary trip purpose. For most historical sites and parks in urban areas, spending for one day or night is counted for each park entry. Where several park units are within a 50-mile radius, adjustments are made for those visiting more than one park on the same day.

<sup>4</sup> Day trips include pass-through visitors not spending a night within 50 miles of the park, as well as stays with friends and relatives and in owned seasonal homes.

**Table 1. National Park Visitor Spending in the Local Area by Segment, 2007  
(\$ per party per day/night).**

Spending Category	Visitor Segment						
	Local Day Trip	Non-local Day Trip	NPS Lodge	NPS Campgd	Back-country	Motel-Outside Park	Camp-Outside Park
Motel, hotel, B&B	0.00	0.00	180.47	0.00	8.14	115.36	0.00
Camping fees	0.00	0.00	0.00	19.49	3.62	0.00	25.43
Restaurants & bars	12.73	20.32	65.60	12.37	10.40	55.66	14.09
Amusements/Entert.	4.16	8.71	20.79	7.27	5.64	17.22	14.95
Groceries	6.19	7.41	11.26	15.64	7.24	14.24	10.27
Gas & oil	8.02	19.21	26.27	20.59	18.14	19.94	19.54
Local transportation	0.52	1.25	3.81	1.22	0.76	2.89	1.16
<u>Souvenirs</u>	<u>8.41</u>	<u>14.13</u>	<u>28.16</u>	<u>11.05</u>	<u>15.28</u>	<u>25.00</u>	<u>20.04</u>
<b>Total</b>	<b>40.02</b>	<b>71.02</b>	<b>336.36</b>	<b>87.63</b>	<b>69.23</b>	<b>250.31</b>	<b>105.48</b>

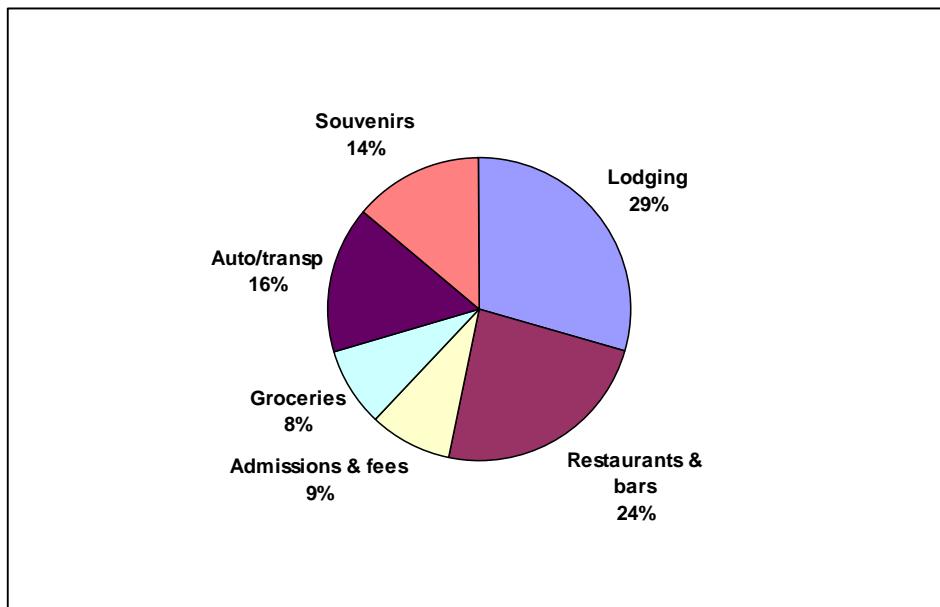

On a party-night basis, spending by visitors on overnight trips varied from \$69 for backcountry campers to \$336 for visitors staying in park lodges. Campers spent \$105 per night if staying outside the park and \$88 if staying inside the park. Spending averages at individual parks varied from these Systemwide averages due to differences in local prices and spending opportunities. For example, while non-local visitors on day trips spent \$26 per party at John Day Fossil Beds National Monument, their counterparts at Grand Canyon spent \$138. Visitors staying in park lodges spent over \$500 per party per night at Grand Teton National Park.

In total, park visitors spent \$11.79 billion in the local region surrounding the parks in 2007<sup>5</sup>. Local residents accounted for 9.5% of this spending (Table 2). Visitors staying in motels and lodges outside the park accounted for over half of the total spending, while non-local visitors on day trips contributed 22% of all spending. Over half of the visitor spending was for lodging and restaurant meals (Figure 1).

<sup>5</sup> Spending figures exclude airfares and other trip spending beyond 50 miles of the park. Purchases of durable goods (boats, RV's) and major equipment are also excluded. Special expenses for commercial rafting trips, air overflights, and other special activities are not fully captured for all parks.

**Table 2. National Park Visitor Spending by Segment, 2007.**

Segment	Total Spending \$Millions	Pct of Spending
Local day trip	1,124	9.5%
Non-local day trip	2,600	22.1%
Lodge–In park	408	3.5%
Camp–In park	254	2.2%
Backcountry campers	42	0.4%
Motel–Outside park	6,470	54.9%
Camp–Outside park	798	6.8%
<u>Other overnight visitors</u>	<u>90</u>	<u>0.8%</u>
<b>Total</b>	<b>11,786</b>	<b>100.0%</b>

**Figure 1. Distribution of National Park Visitor Spending.**

### Impacts of Visitor Spending

Economic impacts of visitor spending were estimated in the MGM2 model using multipliers for local areas around each park<sup>6</sup>. Multipliers capture both the direct and secondary economic effects in gateway communities around the parks in terms of jobs,

<sup>6</sup> Sets of sector-specific multipliers in the MGM2 model were estimated with the IMPLAN system for four types of regions varying in population size and levels of economic development. A region type is assigned to each park based on surrounding populations. MGM2 multipliers are based on IMPLAN's Type II multipliers estimated with 2001 IMPLAN data for over 500 distinct regions. Job-to-sales ratios were adjusted to 2007 using the consumer price index.

personal income, and value added. National totals were the sum of the local impacts for 355 park units that have counts of visitors.

Both economic significance and economic impacts were estimated. The economic *significance* estimates in Table 3 measure the impacts of all visitor spending (\$11.8 billion), including that of local visitors. Economic *impacts* in Table 4 exclude spending by local residents, estimating the impacts of the \$10.7 billion spent by visitors who do not reside within the local region.

Economic impact measures attempt to estimate the likely losses in economic activity to the region in the absence of the park. Should the park opportunities not be available, it is assumed that local residents would spend the money on other local activities, while visitors from outside the region would not have made a trip to the region<sup>7</sup>. Spending by local residents on visits to the park do not represent “new money” to the region and are generally excluded when estimating impacts. Local resident spending is included in the economic significance measures, as these capture all economic activity associated with park visits, including local and non-local visitors.

#### Economic Significance

The \$11.8 billion spent by all park visitors within 50 miles of the park (Table 2) had a total economic effect (significance) of \$14.4 billion in sales, \$5.0 billion in labor income, and \$7.8 billion in value added. Visitor spending supported about 232,000 jobs in gateway regions. Total effects may be divided between the direct effects that occur in businesses selling goods and services directly to park visitors and secondary effects that result from the circulation of this money within the local economy<sup>8</sup>.

Direct effects were \$9.6 billion in sales, \$3.7 billion in labor income, \$5.4 billion in value added, and 188,000 jobs. The local region captured 77% of all visitor spending as direct sales. Note that direct sales of \$9.6 billion was less than the \$11.8 billion in visitor spending, as the manufacturing share of retail purchases (groceries, gas, sporting goods, souvenirs) was not included. It is assumed that most of the producer price of retail purchases immediately leaks out of the region to cover the cost of goods sold. Sales figures for retail and wholesale trade are the margins on these purchases.

The average sales multiplier across all local park regions was 1.50, which means for every dollar of direct sales another \$ .50 in sales was generated in the region through secondary effects.

---

<sup>7</sup> To the extent possible, spending not directly associated with a park visit is also excluded. For example, only one night’s expenses are counted for visitors in the area primarily on business, visiting relatives, or visiting other attractions. For parks with visitor surveys, spending attributed to a park visit was estimated based on the percentage of visitors identifying the park visit as the primary purpose of the trip.

<sup>8</sup> Secondary effects include indirect effects of businesses buying goods and services from backward-linked local firms and induced effects of household spending of their earnings.

**Table 3. Economic Significance of National Park Visitor Spending to Local Economies, 2007.**

Sector/Spending Category	Sales \$Millions	Jobs	Labor Income \$Millions	Value Added \$Millions
<b>Direct Effects</b>				
Motel, hotel cabin, or B&B	\$ 3,389	57,190	\$ 1,420	\$ 2,337
Camping fees	265	2,982	32	76
Restaurants & bars	2,946	64,884	1,107	1,267
Amusements & entertainment	1,111	25,656	390	663
Other vehicle expenses	126	1,632	23	54
Local transportation	37	894	17	19
Grocery stores	260	5,006	101	137
Gas stations	404	5,282	150	198
Other retail	826	16,460	370	524
<u>Wholesale trade</u>	<u>212</u>	<u>8,034</u>	<u>99</u>	<u>112</u>
Total Direct Effects	9,577	188,018	3,709	5,388
<u>Secondary Effects</u>	<u>4,806</u>	<u>44,224</u>	<u>1,323</u>	<u>2,420</u>
<b>Total Effects</b>	<b>14,383</b>	<b>232,242</b>	<b>5,031</b>	<b>7,808</b>

Notes: Economic significance covers all \$11.8 billion in spending of park visitors in the local region, including that of local visitors. Jobs include full-time and part-time jobs, with seasonal positions adjusted to an annual basis. Personal income covers wages and salaries, including income of sole proprietors and payroll benefits. Value added is the sum of personal income, profits and rents, and indirect business taxes.

### Economic Impacts

Excluding \$1.1 billion dollars spent by local residents on park visits reduces the total spending to \$10.6 billion (Table 2) for the impact analysis. Local visitors represented about 28% of all visits, but less than 10% of all visitor spending. The total effects of visitor spending, excluding locals, is \$12.9 billion in sales, \$4.5 billion in labor income, \$7.0 billion in value added, and over 209,000 jobs. The four economic sectors most directly affected are lodging, restaurants, retail trade, and amusements. Visitor spending supports roughly 56,000 jobs in each of the hotel and restaurant sectors and over 22,000 jobs each in the retail trade and the amusements sectors.

**Table 4. Economic Impacts of National Park Visitor Spending on Local Economies, 2007.**

Sector/Spending Category	Sales \$Millions	Jobs	Labor Income \$Millions	Value Added \$Millions
<b>Direct Effects</b>				
Motel, hotel cabin, or B&B	\$3,318	56,536	\$1,388	\$2,265
Camping fees	260	2,948	31	74
Restaurants & bars	2,515	55,916	943	1,071
Amusements & entertainment	967	22,547	339	572
Other vehicle expenses	109	1,414	20	46
Local transportation	36	883	17	19
Grocery stores	209	4,064	81	109
Gas stations	344	4,536	127	166
Other retail	692	13,914	309	435
<u>Wholesale trade</u>	<u>177</u>	<u>6,783</u>	<u>83</u>	<u>93</u>
Total Direct Effects	8,626	169,541	3,337	4,851
<u>Secondary Effects</u>	<u>4,298</u>	<u>39,730</u>	<u>1,185</u>	<u>2,168</u>
<b>Total Effects</b>	<b>12,924</b>	<b>209,271</b>	<b>4,522</b>	<b>7,018</b>

Note: Economic impacts cover the \$10.6 billion spent by non-local visitors.

### Impacts of NPS Payrolls

National Park System units also impact local economies through their own spending, especially NPS payrolls. Payroll impacts were estimated for fiscal year (FY) 2007. In FY 2007 the National Park Service employed 23,853 people<sup>9</sup>, with a total payroll of \$1,142 million in wages and salaries and \$300 million in payroll benefits (Table 5). The local economic impacts of park payrolls were \$1.77 billion in labor income, \$2.0 billion in value added, and 35,143 jobs.

Impacts of park payrolls for each park unit were estimated by applying economic multipliers to wage and salary data to capture the induced effects of NPS employee spending on local economies. As with the MGM2 model, distinct multipliers were used for parks in rural areas, parks in or near small cities, and parks in larger metropolitan regions<sup>10</sup>. The overall employment multiplier for NPS jobs is 1.5. For every two NPS jobs, another job is supported through the induced effects of employee spending in the local region. There are additional local economic effects from NPS purchases of goods and services from local suppliers and from construction activity. These impacts were not estimated.

<sup>9</sup> The number of employees is estimated as an annual average for each park, so that seasonal positions are converted to annual equivalents. However, the job estimates include both full-time and part-time positions.

<sup>10</sup> Multipliers for household spending were estimated in IMPLAN using the spending patterns of households with incomes of \$50,000 - \$75,000.

**Table 5. NPS Payroll Impacts on Local Economies, 2007.**

Payroll	Salary	Payroll	Jobs
	\$Millions	Benefits \$Millions	
Park units with visit data	797	213	17,866
<u>Other units</u>	<u>345</u>	<u>87</u>	<u>5,987</u>
<b>Total</b>	<b>1,142</b>	<b>300</b>	<b>23,853</b>

Local Impacts	Labor Income	Value Added	Jobs
	\$Millions	\$Millions	
Park units with visit data	1,229	1,390	25,490
<u>Other units</u>	<u>542</u>	<u>616</u>	<u>9,653</u>
<b>Total</b>	<b>1,771</b>	<b>2,006</b>	<b>35,143</b>

The visitor spending and payroll impacts may be combined, as park admission fees and most other visitor spending accruing to the National Park Service were omitted from the visitor spending figures to avoid double counting<sup>11</sup>. Using the visitor spending impact estimates from Table 4, which exclude spending of local visitors, the combined impacts are \$6.25 billion in labor income, \$9.02 billion in value added, and 244,414 local jobs. Visitor spending accounts for 86% of the total jobs and 78% of the total value added (Table 6).

**Table 6. Combined Impacts - Visitor Spending and Payroll, 2007.**

Impact Measure	Visitor Spending Impacts <sup>a</sup>	NPS Payroll Impacts	Combined Impacts	Visitor Spending Share
<b>Direct Effects</b>				
Labor income (\$Millions)	\$3,337	\$1,443	\$4,780	70%
Value added (\$Millions)	\$4,851	\$1,443	\$6,294	77%
Jobs	169,540	23,853	193,393	88%
<b>Total Effects</b>				
Labor income (\$Millions)	\$4,522	\$1,771	\$6,293	72%
Value added (\$Millions)	\$7,018	\$2,006	\$9,024	78%
Jobs	209,271	35,143	244,414	86%

a. Excludes spending by local visitors.

### State-by-State Impact Estimates

Economic impacts of individual parks can be aggregated to the state level with a few complications. While most parks are located within a single state, there are 20 park units with facilities in more than one state. For these parks, shares of visits were assigned to each state based on percentages provided by the NPS Public Use Statistics Office. It was assumed that spending and economic impacts were proportional to where recreation visits are assigned.

<sup>11</sup> There will be some double counting of camping fees as payments to concessionaires could not be fully sorted out from payments to the NPS.

Estimates of recreation visits, spending, and local economic impacts for each state and U.S. territory are given in Table A-5 in the appendix. Jurisdictions receiving the greatest economic effects were California, the District of Columbia, Arizona, and North Carolina. National Park Service region totals are given in Table A-6 of the appendix.

State totals reported here represent an accumulation of local impacts within roughly 50 miles of each park. The total economic effects on each state would be much larger if all spending of NPS visitors that takes place within each state were estimated and statewide multipliers, instead of local ones, were used to capture secondary effects. As noted earlier, impacts reported here do not include long-distance travel, airfares, or purchases made at home for items that may be used on trips to National Park System units.

### **Trends from 2003–2007**

Recent trends in National Park System visits, spending, and impacts are summarized in Table 7. Spending and economic impacts follow the trends in recreation visits. Recreation visits increased by one percent in 2007, while average spending increased by 8.7%, to yield an increase in overall visitor spending of 10%. For consistency with prior years, spending and impact figures in this table include local visitors. Impacts excluding local visitors are about 10% lower than when local visitors are included.

### **Methods**

Spending and impacts were estimated using the Money Generation Model version 2 (MGM2). NPS public use statistics for calendar year 2007 provided estimates of the number of recreation visits and overnight stays at each park. For each park, recreation visits were allocated to the seven MGM2 segments<sup>12</sup>, converted to party days/nights in the local area, and then multiplied by per-day spending averages for each segment. Spending and impact estimates for 2007 were made individually for each park and then summed to obtain Systemwide totals. The system totals are therefore a sum of local impacts at each park, not an overall estimate of the impacts on the national economy<sup>13</sup>.

Spending averages for seven distinct visitor segments were based on visitor surveys at selected parks over the past six years and were price-adjusted to 2007 using Bureau of Labor Statistics (BLS) price indices. Spending averages covered all trip expenses within roughly 50 miles of the park. Therefore, they exclude most en route expenses on longer

---

<sup>12</sup> Visits are classified as local day trips, non-local day trips, and overnight trips staying in campgrounds or hotels, lodges, cabins, and B&B's. For parks with lodging facilities within the park, visitors staying in park lodges, campgrounds, or backcountry sites are distinguished from those staying outside the park in motels or non-NPS campgrounds. Visitors staying with friends or relatives, in owned seasonal homes, or passing through without a local overnight stay are generally treated as day trips.

<sup>13</sup> Applying park visitor spending to a national model/set of multipliers would capture 98% of visitor spending as direct sales (instead of the 80% that accrues to firms in the local regions around each park) and would also yield significantly larger secondary effects. National sales multipliers for tourism spending are about 2.5, while the average sales multiplier for local regions around parks is only 1.5.

trips, as well as airfares and purchases made at home in preparation for the trip, including costs of durable goods and equipment.

**Table 7. NPS System Recreation Visits, Spending and Impacts 2003-2007<sup>a</sup>.**

	2003	2004	2005	2006	2007
Recreation visits (Millions)	266.1	276.9	272.6 <sup>e</sup>	272.3 <sup>e</sup>	275.2 <sup>e</sup>

Total value added (\$ Millions)	\$6,336	\$6,884	\$6,943	\$7,006	\$7,808

Note: All dollar figures are actual dollars, not adjusted for inflation.

a. Spending and impact figures include visitors from the local area.

b. Adjusts visits for park re-entries, party sizes, and length of stay in the region. Measured in days for day trips and nights for overnight trips. To the extent possible, only days/nights in the local area directly related to the park visit are counted. Average party sizes range from 2.0 - 3.0 across parks and visitor segments. Systemwide, the average party size is 2.6.

c. Direct effects accrue to tourism-related businesses selling goods and services directly to park visitors. Jobs include full-time and part-time jobs. Seasonal jobs are adjusted to an annual basis. Income is personal income, including wages and salaries, income of sole proprietors, and payroll benefits. Value added includes all personal income, rents and profits, and indirect business taxes.

d. Total local effects include direct, indirect, and induced effects in the local regions around NPS units.

e. Beginning in 2005, visits to Kings Canyon and Sequoia national parks were combined for the economic analysis, and the combined visits for the two units were reduced to account for some double counting. Visit figures for these years are therefore slightly lower than those in the NPS *Statistical Abstract*.

Spending averages vary from park to park based on the type of park and the regional setting (low, medium, or high spending area). For parks with recent visitor surveys, spending averages were estimated directly from the survey data with, some adjustments for off-season use<sup>14</sup>. Parks without recent visitor spending studies were assigned the MGM2 high, medium, or low spending profiles based on manager or researcher judgments.

The segment mix is very important in estimating visitor spending, as spending varies considerably across the MGM2 segments. Segment shares were estimated based on park overnight stay data and, where available, park visitor surveys. For park units that lack recent visitor surveys, estimates are made by generalizing from studies at similar parks or based on manager or researcher judgment.

<sup>14</sup> Most park surveys are conducted during the peak season, so estimates of segment shares and spending must be adjusted for seasonal differences.

For parks with Visitor Services Project (VSP) studies over the past seven years, spending averages were estimated from the survey data at each park<sup>15</sup>. Averages estimated in the surveys were price-adjusted to 2007 using BLS price indices for each spending category. Sampling errors for the spending averages in VSP studies are generally 5-10% overall, but can be as high as 20% for individual visitor segments.

The observed spending patterns in park visitor studies were then used to estimate spending averages for other parks that lack visitor-spending surveys. This procedure does not capture some spending variations attributable to unique characteristics of a given park or gateway region. Examples include the greater use of public transportation at Alaska parks or extra expenses for special commercial attractions in or around some parks, such as rafting trips, flightseeing, and other tours. When visitor studies are conducted at individual parks, these unique situations are taken into account. For example, river runners were treated as a distinct segment at Grand Canyon National Park (Stynes and Sun 2005).

Multipliers for local regions around national parks<sup>16</sup> were applied to the spending totals to translate spending into jobs, income, and value added, and also to estimate secondary effects. All MGM2 multipliers were re-estimated in 2006 using 2001 IMPLAN data and based on the North American Industrial Classification System.

For most parks, generic multipliers built into the MGM2 model were applied (Stynes and Sun 2000)<sup>17</sup>. The appropriate generic multipliers for each park were selected based on the population of the surrounding region. Generic multipliers were estimated as averages across over 100 distinct IMPLAN models for each type of region. The maximum observed absolute deviations between the IMPLAN multipliers for individual regions and the corresponding generic multiplier for that region were generally 10% or less; on average, the differences were less than five percent (Chang 2001). The larger deviations, typically in job-to-sales ratios, could be due to errors in the underlying IMPLAN data. In this respect, the generic multipliers may average out some errors in IMPLAN data for individual regions.

The generic approach to multipliers works well for tourism-related applications because the vast majority of visitor spending accrues to service industries. These sectors are quite labor intensive, and the other inputs to production are primarily utilities and services that tend to exist in an area in direct proportion to population size. Hence, secondary effects are predicted fairly well based on the local population size.

---

<sup>15</sup> Detailed impact reports for parks that have included economic questions in their VSP studies are available at the MGM2 (<http://web4.canr.msu.edu/mgm2/>) or the NPS Social Science Program website, (<http://www.nature.nps.gov/socialscience/products.cfm#MGM2Reports>).

<sup>16</sup> Multipliers are developed using the IMPLAN input-output modeling system (MIG, Inc.).

<sup>17</sup> For some parks, custom IMPLAN models estimated for the county or counties around the park were used to derive the multipliers. In all of these cases, the impact results with the custom multipliers were not significantly different than with the appropriate generics.

Note that the IMPLAN estimates of the ratios of income and value added to sales for each sector are essentially constant across regions because IMPLAN uses a national average production function for each sector. Only the IMPLAN estimates of job-to-sales ratios and secondary effects vary significantly between regions, and these variations are captured quite well for service and retail sectors by the population of the region.

With the exception of parks with new visitor surveys in 2006<sup>18</sup>, no changes were made in party sizes, lengths of stay, or re-entry factors between 2006 and 2007. Local economic ratios and multipliers were also assumed to be constant, except for job-to-sales ratios, which were adjusted to 2007 based on the consumer price index. MGM2 model parameters for individual parks are adjusted over time as new park visitor studies are conducted or other relevant information becomes available.

Impacts of park payrolls were estimated for each park by applying local area multipliers to NPS wage and salary figures for FY 2007. Multipliers capture the induced effects of park employee spending by re-circulating their income as household spending within the local economy. Payroll benefits were not re-circulated in estimating secondary effects of park employee spending, but the direct payroll benefits were included in total value added. Four sets of household spending multipliers were estimated to capture variations in impacts across regions based on population size<sup>19</sup>. Local impacts of park purchases of supplies and services or construction activities were not included in the analysis.

The number of employees for each park was estimated by totaling the number of distinct social security numbers in each pay period and dividing by the number of pay periods. The figure is therefore an annual average. Four seasonal jobs for three months counts as one job. Hence, no distinction is made between part-time and full-time employees.

Jobs, salary, and payroll benefits were assigned to the park where the employees' time was charged, which may differ from their duty stations. Where possible, the NPS's unit "org codes" were used to separate out payroll data for parks that are administered under a another park unit.

Spending and impact totals for states were developed from the 2007 estimates by simply summing the results for all units in a given state, using the mailing address for the park to identify the state. For 2007, 20 parks were identified with facilities in more than one state. For these parks, visitors and spending were allocated to individual states based on shares used by the NPS Public Use Statistics Office for allocating visits to states (*see Table A-7 in the appendix*). For example, visits to Great Smoky Mountains National Park were split 44% to North Carolina and 56% to Tennessee. It should be noted that these

---

<sup>18</sup> New VSP surveys were conducted in 2006 at Golden Spike National Historic Site, Katmai National Park, Kings Mountain National Military Park, Monocacy National Battlefield, Yellowstone National Park, and Zion National Park. Adjustments also were made to estimates at Eleanor Roosevelt, Home of Franklin D. Roosevelt, and Vanderbilt Mansion national historic sites based on inputs from park staff. Estimates for all Alaska parks were updated based, in part, on the Katmai survey. Alaska state multipliers were used for all Alaska parks.

<sup>19</sup> IMPLAN's spending patterns for households averaging \$50,000- \$75,000 were used to estimate the multipliers.

allocations may not fully account for where the spending and impacts occur. In addition, there are many other parks with facilities in a single state, but located within 50 miles of a state border. A portion of the spending and impacts for these parks may accrue to nearby states. For example, the local region for Saint-Gaudens National Historic Site includes counties in both Vermont and New Hampshire (Stynes 2007a); however, all impacts in this report were assigned to New Hampshire, because the visitor surveys do not identify exactly where spending may have occurred within the local region.

## **Errors and Limitations**

The accuracy of the spending and impact estimates rests largely on the input data, including: 1) public use recreation visit and overnight stay data; 2) party size, length-of-stay, and park re-entry conversion factors; 3) visitor segment shares; 4) spending averages; and 5) local area multipliers.

Public use data provide reasonably accurate estimates of visitor entries for most parks. Some visitors may be missed by the counting procedures, while others may be counted multiple times when they re-enter a park more than once on a single trip. Accurate estimates of park re-entries, party sizes, and lengths of stay in the area are needed to convert park entries to the number of visitor or party days in the region. Visitors staying overnight outside the park pose significant problems, as they tend to be the greatest spenders and may enter the park several times during their stay. Similarly, visitors staying inside the park may enter and leave several times during their stay and be counted each time as a distinct visit. Re-entry factors adjust for these problems to the extent possible.

For multi-purpose trips, it is difficult to determine what portion of the spending should be attributed to the park visit. This is especially a problem for historic sites and parks in urban areas or parks in multiple-attraction destinations. For parks with visitor surveys, the proportion of days and spending counted was decided based on stated trip purposes and the importance of the park in generating the trip to the region.

Parkways and urban parks pose special difficulties for economic impact analyses. These units have some of the highest number of visits, while posing the most difficult problems for estimating visits, spending, and economic impacts. The majority of visits to these types of units were assumed to be local or non-local day trips, and only one night of spending was counted for overnight trips. Due to the high numbers of visits at these units, small changes in assumed spending averages or segment mixes can swing the spending estimates by substantial amounts.

Clusters of parks within a single 50-mile area pose additional difficulties. For example, the many monuments and parks in the Washington, D.C. area each count visitors separately. To avoid double counting of spending across many National Capital Region parks, how many times a visitor has been counted at park units during a trip to the Washington, D.C. area must be known. For parks in the National Capital Region, it's currently assumed that an average of 1.7 park visits are counted for local day trips, 3.4

visits for non-local day trips, and 5.1 park visits on overnight trips. Similar difficulties exist for clusters of parks in Boston, New York, and San Francisco.

NPS units in Alaska pose special problems for economic analysis. Spending opportunities near Alaska parks are limited, and for many visitors the park visit is part of a cruise or guided tour, frequently purchased as a package. Most visitors are on extended trips to Alaska, making it difficult to allocate expenses to a particular park visit. Lodging, vehicle rentals, and air expenses frequently occur in Anchorage, many miles from the park. Many Alaska parks are only accessible by air or boat, so spending profiles estimated from visitor surveys at parks in the lower 48 states do not apply well. Due to the prominence of cruise lines and package tours, special studies would be required to estimate the proportion of visitor spending that stays in the local regions around National Park System units in Alaska.

Estimates for Alaska parks were updated this year based on a visitor survey at Katmai, but there remain problems with visit counts, handling of package tours, and isolating the share of spending to allocate to park visits in Alaska. A visit to one or more national park units is an important part of the trip for most Alaska visitors. One could therefore argue to count most tourism spending in Alaska as related to national park visits. The Travel Industry Association estimated tourist spending in Alaska at \$1.6 billion in 2005 (TIA 2008). This is more than ten times what this analysis has included as spending in the local regions around Alaska's national parks.

### **Suggestions for Further Research**

Refinements to the impact estimates should focus first on the visitation data, as the number of visits drives changes in spending and impact estimates over time. Analysts using NPS recreation visit data frequently interpret estimates of recreation visits as if these represent distinct trips, rather than simply entries to the park. This confusion has resulted in many inflated estimates of visitor spending when trip spending averages are applied to recreation visits without adjustments for re-entries. The extent of potential double counting of visitors (due to re-entries to parks and parks in close proximity to one another) is not well-known for many parks. It would be useful to more fully sort out the double-counting problem at each park and to report both park entries and the number of distinct person-trips.

In estimating spending, it is quite important to be able to divide visitors into distinct segments with different spending patterns. Day visitors and locals spend much less than visitors on overnight trips. Spending of overnight visitors varies across lodging types. For parks lacking recent visitor surveys, the visitor segment mix is not well-known. The mix of visitors may also change over time due to changes in populations surrounding the park and park use patterns. While overnight stay data provide good estimates of overnight visitors who stay in the park, all other visitors are generally treated as day visitors (to the park), even though many are staying overnight in gateway communities.

Visitors staying overnight outside the park usually have the greatest economic impacts on the local economy. Therefore, it is important to distinguish between local residents, day trips from beyond 50 miles, and overnight stays in area motels, campgrounds, or private homes. These segment shares can be estimated in visitor surveys. Parks, perhaps in cooperation with regional tourist organizations, could track lodging capacities and occupancy rates in gateway communities in order to better understand the mix of visitor accommodations inside and outside the park.

Deciding what proportion of trips and spending to attribute to a park visit is a difficult issue, particularly for smaller parks and historic sites that may not be the primary reason for many trips, but instead are something for tourists to do while in an area. Attributing spending to the park visit requires more complete information about visitors, including their trip purposes and other activities in the area. This information has been gathered in recent VSP studies, but it is not available for most parks. For visitors on multi-purpose trips, the share of trip expenses to be attributed to the park visit is somewhat arbitrary. Theoretically, it should be known which trips would not have been made in the absence of the park and/or what additional spending resulted from the park visit. These are sometimes difficult questions for visitors to answer.

The VSP program of conducting visitor surveys at a dozen or more parks each year should be continued. In addition to providing basic information about visitor characteristics, attitudes, and park use patterns, VSP data supports the analysis of economic impacts of park visitors on local regions. Visitor spending averages used in the MGM2 model are refined each year as new visitor surveys are completed. The great diversity in NPS units, visitors, and spending opportunities poses difficulties in generalizing from one park to another. While price indices can be used to update spending averages over time, they may not fully account for possible structural changes in trip characteristics and spending patterns.

VSP studies could be supplemented with other studies of particular visitor segments with high or unique spending patterns. These segments might be tackled by sampling at several parks during a single year. Examples include campers and visitors in lodges, backcountry visitors, river runners, visitors on bus tours, and school groups, particularly at historic sites and nature centers. These types of visitors are often missed in VSP studies, or the samples are too small to yield reliable spending averages.

The MGM2 generic multipliers were updated in 2006 using 2001 IMPLAN data sets. The general practice is to develop custom IMPLAN models when estimating impacts in conjunction with a VSP survey and to employ MGM2 generic multipliers for other parks. Unique multipliers for each park could be developed using the IMPLAN system. This requires the identification of counties to be included in the local region for each park.

The problems associated with sorting out impacts for parks that involve more than one state are likely best addressed on a case-by-case basis. Perhaps the best candidates for such studies would be parks in the Washington, D.C. area and the Blue Ridge and Natchez Trace parkways. A regional analysis makes more sense than estimating impacts

park-by-park in the D.C. area. For parkways and other parks involving multiple states, the specific locations of park entrances and commercial development dictate where the economic impacts will occur. Sorting out exactly where the impacts occur requires more detailed spatial analysis of visitor use and spending patterns at these parks. Such studies are best conducted for individual parks, where the additional data collection costs can be justified.

It is useful to ground spending and impact estimates in hard data and to try to triangulate across multiple sources. For parks with significant concession operations, concessioner data could be more fully utilized to validate estimates of spending inside the park. Some parks support significant commercial operations around the park, such as whitewater rafting, flightseeing, horseback operations, and guided tours. These are not fully covered in MGM2 spending estimates, except for selected parks with recent visitor surveys.

Estimates of sales, income, and jobs associated with park visitors can also be compared with overall economic figures for a given area or with tourism impact estimates. However, local tourism estimates are sometimes exaggerated, and one must be careful in comparing studies that may involve distinct methods and coverage. Tourism figures may include airfares and other items not covered in the MGM2 impact figures. Impacts may also be reported in different units (e.g., jobs vs. full-time equivalents) or may cover larger or smaller geographic areas.

Economic impact analyses rest considerably on the definition of the impact region. Cooperative studies with local tourism and regional development interests are recommended to better understand the role of each park in the area economy, especially the park's role in attracting and serving visitors to an area. Visitor studies should cover information sources and patterns of use both within and outside the park, especially the extent and use of lodging facilities near the park.

Additional studies also are recommended to assess the role of National Park System units in Alaska's tourism economy, to better understand the contribution of international visitors to U.S. national parks, and to capture spending and impacts outside of gateway regions that are associated with national park visitors.

Notes: Non-local visitors are those living beyond a roughly 50-mile radius of the park. Jobs include part-time and full-time jobs, with seasonal jobs adjusted to an annual basis. Impacts include direct and secondary effects of visitor spending on the local economy. Labor income covers wages and salaries, payroll benefits, and incomes of sole proprietors in the local region. Value added includes labor income, profits and rents, and indirect business taxes.

\* For these parks, results are based on a visitor survey at the designated park that included spending data. The MGM2 model is used along with custom multipliers for the local region estimated with the IMPLAN system. For other parks, a variation of the MGM2 short-form model is employed, along with MGM2 generic multipliers.  
a. Sequoia and Kings Canyon national parks are combined for the economic analysis. Recreation visits for the two parks are reduced to reflect double counting between the two parks

**Table A-2. Payroll Impacts of National Park Units on Local Economies, FY 2007.**

Notes: Jobs include part-time and full-time jobs, with seasonal positions adjusted to an annual basis. NPS jobs, salary, and benefits are assigned to the unit where the employees' time was charged, which may differ from their duty station. Economic impacts include NPS payroll and jobs, plus the induced effects of NPS employees spending their wages and salaries in the local region, which supports additional non-NPS jobs.

Notes: Non-local visitors are those living beyond a roughly 50-mile radius of the park. Total spending is the sum of non-local visitor spending and payroll spending. Jobs include part-time and full-time jobs, with seasonal jobs adjusted to an annual basis. Total job impacts include NPS jobs, induced effects of NPS salaries, and the direct and secondary effects of non-local visitor spending in the local region.

**Table A-5. Impacts of National Park Visitor Spending and Payroll on Local Economies by State, 2007.**

State	Recreation Visits (000's)	Non-local Visitor Spending (\$000's)	Jobs from Non-local Visitor Spending	Payroll-related Jobs	Total Jobs Supported
Rhode Island	49	3,506	66	10	76
South Carolina	1,439	42,207	824	124	948
South Dakota	3,622	143,304	2,909	344	3,253
Tennessee	7,889	479,867	9,121	495	9,615
Texas	5,593	229,650	4,525	678	5,203
Utah	8,164	484,616	10,234	913	11,147
Vermont	32	1,759	35	34	69
Virgin Islands	719	76,405	1,797	135	1,932
Virginia	22,815	461,557	9,119	1,413	10,532
Washington	6,892	246,405	5,051	1,036	6,087
West Virginia	1,763	59,129	1,136	629	1,765
Wisconsin	442	22,278	471	104	575
Wyoming	5,785	451,404	7,322	900	8,221
NA (Jobs Corps)				66	66
<b>Total</b>	<b>275,221</b>	<b>10,617,476</b>	<b>209,271</b>	<b>35,143</b>	<b>244,413</b>

Notes: Payroll-related jobs include NPS jobs and the induced effects of the NPS payroll on the local economy, covering parks with visit counts (Table A-2), as well as administrative units and parks without visit counts (Table A-3). Total job impacts include those supported by non-local visitor spending and the NPS payroll. For 20 parks with property in more than one state, activity is allocated using the proportions shown in Table A-7.

**Table A-6. Impacts of National Park Visitor Spending and Payroll on Local Economies by NPS Region, 2007.**

Region	Visits (000's)	Non-local Spending (\$ Millions)	Jobs from Non-local Visitor Spending	Payroll-related Jobs	Total Jobs Supported
Alaska	2,637	134	2,254	1,185	3,439
Harpers Ferry	0	0	0	305	305
