

Bonaire 2008: Exploring Coral Reef Sustainability with New Technologies Expedition

Save a Reef!

FOCUS

Coral reef conservation

GRADE LEVEL

5-6 (Life Science)

FOCUS QUESTION

How do living and non-living structures affect coral reef habitats?

LEARNING OBJECTIVES

Students will be able to identify and explain five ways that coral reefs benefit human beings.

Students will be able to identify and explain three major threats to coral reefs.

Students will design a public information program to improve understanding of the coral reef crisis, and things individuals can do to reduce stresses on coral reef systems.

MATERIALS

None

AUDIO/VISUAL MATERIALS

(Optional) Equipment required for presentation of students' public information programs

TEACHING TIME

Two or three 45-minute class periods, plus time for group research

SEATING ARRANGEMENT

Groups of 4-6 students

MAXIMUM NUMBER OF STUDENTS

32

KEY WORDS

Coral reef
Bonaire
Conservation
Public information

BACKGROUND INFORMATION

Coral reefs provide habitats for some of the most diverse biological communities on Earth. Most people have seen photographs and video images of shallow-water coral reefs, and many have visited these reefs in person. Historically, scientists have believed that reef-building corals were confined to relatively shallow depths because many of these corals have microscopic algae called zooxanthellae (pronounced "zoh-zan-THEL-ee") living inside their soft tissues. These algae are often important for the corals' nutrition and growth, but require sunlight for photosynthesis. The maximum depth for reef-building corals was assumed to be about 150 m, since light levels below this depth are not adequate to support photosynthesis. Recently, though, ocean explorers have discovered extensive mounds of living coral in depths from 400 m to 700 m—depths at which there is virtually no light at all! These deep-water corals do not contain zooxanthellae, and do not build the same types of reef that are produced by shallow-water corals. But recent studies indicate that the diversity of species in deep-water coral ecosystems may be comparable to that of coral reefs in shallow waters, and that there are just as many species of

deep-water corals (slightly more, in fact) as there are species of shallow-water corals.

Coral reefs provide a variety of benefits including value for recreation and tourism industries, protecting shorelines from erosion and storm damage, supplying foods that are important to many coastal communities, and providing promising sources of powerful new antibiotic, anti-cancer and anti-inflammatory drugs (for more information about drugs from the sea, visit the Ocean Explorer Web site for the 2003 Deep Sea Medicines Expedition (<http://oceanexplorer.noaa.gov/explorations/03bio/welcome.html>)). Despite their importance, many of Earth's coral reefs appear to be in serious trouble due to causes that include over-harvesting, pollution, disease, and climate change (Bellwood et al., 2004). In the Caribbean, surveys of 302 sites between 1998 and 2000 show widespread recent mortality among shallow- (≤ 5 m depth) and deep-water (> 5 m depth) corals. Remote reefs showed as much degradation as reefs close to human coastal development, suggesting that the decline has probably resulted from multiple sources of long-term as well as short-term stress (Kramer, 2003; for additional information about threats to coral reefs, see "More About the Coral Reef Crisis" in the introduction to this Expedition Education Module).

Despite these kinds of data and growing concern among marine scientists, visitors continue to be thrilled by the "abundance and diversity of life on coral reefs." This paradox is an example of "shifting baselines," a term first used by fishery biologist Daniel Pauly. A baseline is a reference point that allows us to recognize and measure change. It's how certain things are at some point in time. Depending upon the reference point (baseline), a given change can be interpreted in radically different ways. For example, the number of salmon in the Columbia River in 2007 was about twice what it was in the 1930s, but only about 20% of what it was in the 1800s. Things look pretty good for the salmon if 1930 is the baseline; but

not nearly as good compared to the 1800's. The idea is that some changes happen very gradually, so that we come to regard a changed condition as "normal." When this happens, the baseline has shifted. Shifting baselines are a serious problem, because they can lead us to accept a degraded ecosystem as normal—or even as an improvement (Olson, 2002). So, people who have never seen a coral reef before may still find it to be spectacular, even though many species have disappeared and the corals are severely stressed.

One of the few coral systems that seems to have escaped the recent coral reef crisis is found in the coastal waters of Bonaire (part of the Netherlands Antilles in the southwestern Caribbean). A 2005 survey of the state of Bonaire's reefs (Steneck and McClanahan, 2005) found that they were among the healthiest reefs in the Caribbean, even though dramatic changes have occurred among corals and other reef species. This means that Bonaire's reefs have unique importance as baselines for comparison with other Caribbean coral reef ecosystems. Detailed mapping of Bonaire's shallow- and deep-water coral reefs is a top priority for protecting these ecosystems, as well as for defining a baseline for investigating and possibly restoring other coral reef systems. This mapping is the focus of the Bonaire 2008: Exploring Coral Reef Sustainability with New Technologies Expedition.

In this activity, students design and prepare educational programs to improve public awareness of the importance of coral reefs and what needs to be done to reduce or eliminate harmful impacts from human activities.

LEARNING PROCEDURE

1. To prepare for this lesson:

Review the introductory essays for the Bonaire 2008: Exploring Coral Reef Sustainability with New Technologies Expedition at <http://oceanexplorer.noaa.gov/explorations/08bonaire/welcome.html>. If you are not already familiar with coral reefs, you

may also want to review the coral reef tutorials at nos.noaa.gov/education/kits/corals/, as well as essays and trip logs from the 2007 Cayman Island Twilight Zone Expedition (<http://oceanexplorer.noaa.gov/explorations/07twilightzone/welcome.html>). Review – “Things You Can Do to Protect Coral Reefs” and “25 Things You Can Do To Save Coral Reefs,” <http://www.coralreef.noaa.gov/outreach/thingsyoucando.html> and <http://www.publicaffairs.noaa.gov/25list.html>, respectively.

2. Review the general biology of coral reefs and discuss how these reefs benefits humans. If time permits, you may want to have students work through the coral reef tutorials at nos.noaa.gov/education/kits/corals/. Be sure students understand that they may personally benefit from coral reefs, even if they live thousands of miles from the ocean and never see a reef in their lives (the potential of reefs as sources of anti-cancer drugs is a good example that is easily understood—but often unknown—by most people). Briefly describe the mission and activities of the Bonaire 2008: Exploring Coral Reef Sustainability with New Technologies Expedition. You may want to show students some images from the Ocean Explorer Web sites (oceanexplorer.noaa.gov/gallery/livingocean/livingocean_coral.html).
3. Lead a discussion of how data from monitoring programs help protect coral reefs. Student will probably realize that these data cannot directly improve the condition of reefs, since the root problem appears to be multiple stresses from many sources. Such data are very useful, however, in helping scientists understand why some reefs are in better condition than other reefs. This understanding is essential to developing programs to protect and restore coral reefs.

Ask students to discuss why coral reefs are at risk, and what they think can or should be done to reduce or eliminate the negative impacts of human activity on coral reefs. There is a strong

possibility that a significant part of the current risk to coral reef systems is the result of human activity, particularly as it relates to global warming. Meaningful actions to address this type of issue depend upon widespread understanding of the problem and commitment to workable solutions. Public education is an important step toward building this sort of understanding and commitment. Have students brainstorm what “key messages” might form part of a public education program about coral reefs, what audiences should be targeted to receive these messages, and how these messages might be most effectively delivered to these audiences.

4. Have student groups prepare one or more public education programs about coral reefs, based on the results of their brainstorming sessions in Step 3. Encourage students to consider various media, including publications, visual presentations, drama, and music. You may want to have an entire class work on a single program, or have smaller groups work on multiple programs using the medium (or media) of their choice. There are many possibilities, depending upon the target audiences. These presentations also offer cross-curricular opportunities, particularly with social studies, English/Language Arts, and fine arts. Whatever media students choose to work with, their final presentation should be accompanied by a list of sources for the information they present. A good starting point for this activity is the Roadmap to Resources: Corals (http://www.nos.noaa.gov/education/corals/supp_coral_roadmap.html), which provides links to many other sources of coral reef data and information.
5. If feasible, have students present their programs to appropriate audiences. Students should understand that this activity has the potential to make a meaningful contribution to protecting and restoring Earth’s coral reefs, and that the coral reef crisis is not the result of a single catastrophic action or event; it is the result of

countless individual decisions that have had unforeseen cumulative effects.

THE BRIDGE CONNECTION

<http://www.vims.edu/bridge/reef.html>

THE “ME” CONNECTION

Have students write a short essay on why coral reefs are personally important.

CONNECTIONS TO OTHER SUBJECTS

English/Language Arts, Fine Arts

ASSESSMENT

Discussions in Step 3 and public education programs prepared in Step 4 provide opportunities for assessment.

EXTENSIONS

1. Visit oceanexplorer.noaa.gov to keep up to date with the latest Bonaire 2008: Exploring Coral Reef Sustainability with New Technologies Expedition discoveries.
2. The National Ocean Service Coral Reef Discovery Kit (<http://oceanservice.noaa.gov/education/kits/corals/welcome.html>) contains a variety of other coral reef-related lessons, information, and activities.
3. Discuss the concept of “shifting baselines,” and why this is relevant to environmental and conservation issues. Brainstorm examples of shifting baselines from students’ own experience. You may also want to visit <http://www.shiftingbaselines.org/index.php> for more information about this concept and its relevance to ocean conservation.

MULTIMEDIA LEARNING OBJECTS

<http://www.learningdemo.com/noaa/> – Click on the links to Lessons 3, 12, and 13 for interactive multimedia presentations and Learning Activities on Deep-Sea Corals, Food, Water, and Medicine from the Sea, and Ocean Pollution.

OTHER RELEVANT LESSON PLANS FROM THE OCEAN EXPLORATION PROGRAM

A Piece of Cake

<http://oceanexplorer.noaa.gov/explorations/07twilightzone/background/edu/media/cake.pdf> (7 pages; 282kb PDF) (from the 2007 Cayman Island Twilight Zone Expedition)

Focus: Spatial heterogeneity in deep-water coral communities (Life Science)

In this activity, students will be able to explain what a habitat is, describe at least three functions or benefits that habitats provide, and describe some habitats that are typical of deep-water hard bottom communities. Students will also be able to explain how organisms, such as deep-water corals and sponges, add to the variety of habitats in areas such as the Charleston Bump.

Deep Gardens

<http://oceanexplorer.noaa.gov/explorations/07twilightzone/background/edu/media/deepgardens.pdf> (11 pages; 331kb PDF) (from the 2007 Cayman Island Twilight Zone Expedition)

Focus: Comparison of deep-sea and shallow-water tropical coral communities (Life Science)

In this activity, students will compare and contrast deep-sea coral communities with their shallow-water counterparts, describe three types of coral associated with deep-sea coral communities, and explain three benefits associated with deep-sea coral communities. Students will explain why many scientists are concerned about the future of deep-sea coral communities.

Friend, Foe, or...

http://oceanexplorer.noaa.gov/explorations/05stepstones/background/education/ss_2005_friendfoe.pdf (5 pages, 331k) (from the North Atlantic Stepping Stones 2005 Expedition)

Focus - Symbiotic relationships with corals (Life Science)

Students will be able to define and describe symbiotic, mutualistic, commensal, parasitic, facultative and obligatory relationships between organisms; describe at least three species that have symbiotic relationships with corals; and discuss whether these relationships are mutualistic, commensal, or parasitic.

Architects of the Deep Reef

http://oceanexplorer.noaa.gov/explorations/03mex/background/edu/media/mexdh_architects.pdf (5 pages, 388k) (from the Gulf of Mexico Deep Sea Habitats 2003 Expedition)

Focus: Reproduction in Cnidaria (Life Science)

Students will be able to identify and describe at least five characteristics of Cnidaria coral, compare and contrast the four classes of Cnidaria, and describe typical reproductive strategies used by Cnidaria. Students will also be able to infer which of these strategies are likely to be used by the deep-sea coral *Lophelia pertusa*, and will be able to describe the advantages of these strategies.

Chemists Without Backbones

http://oceanexplorer.noaa.gov/explorations/03bio/background/edu/media/Meds_ChemNoBackbones.pdf (4 pages, 356k) (from the 2003 Deep Sea Medicines Expedition)

Focus: Benthic invertebrates that produce pharmacologically-active substances (Life Science)

In this activity, students will be able to identify at least three groups of benthic invertebrates that are known to produce pharmacologically-active compounds and will describe why pharmacologically-active compounds derived from benthic invertebrates may be important in treating human diseases. Students will also be able to infer why sessile marine invertebrates appear to be promising sources of new drugs.

Keep Away

http://oceanexplorer.noaa.gov/explorations/03mex/background/edu/media/mexdh_keepaway.pdf (5 pages, 424k) (from the 2003 Gulf of Mexico Deep Sea Habitats Expedition)

Focus: Effects of pollution on diversity in benthic communities (Life Science)

Students will discuss the meaning of 'biological diversity' and compare and contrast the concepts of 'variety' and 'relative abundance' as they relate to biological diversity. Given information on the number of individuals, number of species, and biological diversity at a series of sites, students will make inferences about the possible effects of oil drilling operations on benthic communities.

NATIONAL SCIENCE EDUCATION STANDARDS

Content Standard A: Science As Inquiry

- Abilities necessary to do scientific inquiry
- Understanding about scientific inquiry

Content Standard C: Life Science

- Structure and function in living systems
- Populations and ecosystems
- Diversity and adaptations of organisms

Content Standard D: Earth and Space Science

- Structure of the Earth system

Content Standard E: Science and Technology

- Understandings about science & technology

Content Standard F: Science in Personal and Social**Perspectives**

- Personal health
- Populations, resources, and environments
- Risks and benefits
- Science and technology in society

OCEAN LITERACY ESSENTIAL PRINCIPLES AND FUNDAMENTAL CONCEPTS**Essential Principle 1.****The Earth has one big ocean with many features.**

Fundamental Concept h. Although the ocean is large, it is finite and resources are limited.

Essential Principle 5.**The ocean supports a great diversity of life and ecosystems.**

Fundamental Concept e. The ocean is three-dimensional, offering vast living space and diverse habitats from the surface through the water column to the seafloor. Most of the living space on Earth is in the ocean.

Essential Principle 6.**The ocean and humans are inextricably interconnected.**

Fundamental Concept b. From the ocean we get foods, medicines, and mineral and energy resources. In addition, it provides jobs, supports our nation's economy, serves as a highway for transportation of goods and people, and plays a role in national security.

Fundamental Concept e. Humans affect the ocean in a variety of ways. Laws, regulations and resource management affect what is taken out and put into the ocean. Human development and activity leads to pollution (such as point source, non-point source, and noise pollution) and physical modifications (such as changes to beaches, shores and rivers). In addition, humans have removed most of the large vertebrates from the ocean.

Fundamental Concept f. Coastal regions are susceptible to natural hazards (such as tsunamis,

hurricanes, cyclones, sea level change, and storm surges).

Fundamental Concept g. Everyone is responsible for caring for the ocean. The ocean sustains life on Earth and humans must live in ways that sustain the ocean. Individual and collective actions are needed to effectively manage ocean resources for all.

Essential Principle 7.**The ocean is largely unexplored.**

Fundamental Concept a. The ocean is the last and largest unexplored place on Earth—less than 5% of it has been explored. This is the great frontier for the next generation's explorers and researchers, where they will find great opportunities for inquiry and investigation.

Fundamental Concept b. Understanding the ocean is more than a matter of curiosity. Exploration, inquiry and study are required to better understand ocean systems and processes. *Fundamental Concept c.* Over the last 40 years, use of ocean resources has increased significantly, therefore the future sustainability of ocean resources depends on our understanding of those resources and their potential and limitations.

Fundamental Concept d. New technologies, sensors and tools are expanding our ability to explore the ocean. Ocean scientists are relying more and more on satellites, drifters, buoys, sub-sea observatories and unmanned submersibles. *Fundamental Concept f.* Ocean exploration is truly interdisciplinary. It requires close collaboration among biologists, chemists, climatologists, computer programmers, engineers, geologists, meteorologists, and physicists, and new ways of thinking.
