

# SAN FRANCISCO BAY ENVIRONMENTAL SENSITIVITY INDEX METADATA

December 1998

*Prepared By:*

National Oceanic and Atmospheric Administration

National Ocean Service

Office of Response and Restoration

Hazardous Materials Response Division

7600 Sand Point Way N.E.

Seattle, Washington 98115-6349

*and*

State of California

Department of Fish and Game

Office of Spill Prevention and Response

Sacramento, California

**FILE DESCRIBES:** Digital data for 1998 San Francisco Bay Environmental Sensitivity Index.

**FILE CREATED BY:** NOAA Office of Response and Restoration  
7600 Sand Point Way N.E.  
Seattle, WA 98115-6349  
Phone: 206-526-6317  
Fax: 206-526-6329  
email: [library@hazmat.noaa.gov](mailto:library@hazmat.noaa.gov)

**FILE CREATED ON:** 19981212

**COMMENTS:** Information was developed using the U.S. Federal Geographic Data Committee's Content Standards for Digital Geospatial Metadata, June 8, 1994. The numbering scheme matches the Metadata Standard in order to facilitate referencing definitions of the elements. The items in **bold** are required elements and the others are optional elements. The Spatial Data Transfer Standard (SDTS), ver. 03/92, was referenced to properly identify the geographic entities.

Prevention and Response, Sacramento, California

**1.1.11. LARGER WORK CITATION:**

None

**1.2. DESCRIPTION**

**1.2.1. ABSTRACT:**

This data set comprises the Environmental Sensitivity Index (ESI) maps for the shoreline of San Francisco Bay. ESI data characterize estuarine environments and wildlife by their sensitivity to spilled oil. The ESI data include information for three main components: shoreline habitats; sensitive biological resources; and human-use resources.

**1.2.2. PURPOSE:**

The ESI data were collected, mapped, and digitized to provide environmental data for oil spill planning and response. The Clean Water Act with amendments by the Oil Pollution Act of 1990 requires response plans for immediate and effective protection of sensitive resources.

**1.3. TIME PERIOD OF CONTENT**

**1.3.1. TIME PERIOD INFORMATION**

**1.3.1.3. RANGE OF DATES/TIMES:**

The intertidal shoreline habitats of San Francisco Bay were originally mapped during overflights conducted in January 1986. They were updated onto 1:24,000 U.S. Geological Survey (USGS) topographic maps by an experienced coastal geologist in August 1996 using 1:24,000 natural-color vertical aerial photographs from NOAA. Maps for bayland habitats provided by the San Francisco Estuary Institute (SFEI) were also consulted during the shoreline classification. A series of overflights were conducted 4-6 March 1997 to verify the shoreline classification. In conjunction with the linear shoreline classification, the SFEI baylands data were used to delineate and classify polygonal habitats, including marsh types, tidal flats, and other features. The SFEI data were

originally compiled from unofficial 1985 National Wetlands Inventory (NWI) data, interjected with 1989 State Lands Commission tidal marsh polygons, updated and reviewed by experts using 1995/1996 National Aeronautic and Space Administration (NASA) aerial photography, and pre-released in November 1997. All biological resource data were obtained from a variety of data sources (detailed in this metadata report) and subsequently reviewed by local and regional experts in 1998.

#### **1.4. STATUS**

##### **1.4.1. PROGRESS:**

Complete

##### **1.4.2. MAINTENANCE AND UPDATE FREQUENCY:**

None planned

#### **1.5. SPATIAL DOMAIN**

###### **1.5.1.3. NORTH BOUNDING COORDINATE:**

38.25

###### **1.5.1.4. SOUTH BOUNDING COORDINATE:**

37.375

#### **1.6. KEYWORDS**

##### **1.6.1. THEME**

###### **1.6.1.1. THEME KEYWORD THESAURUS:**

None

###### **1.6.1.2. THEME KEYWORD:**

Sensitivity maps; ESI; coastal resources; oil spill planning; and coastal zone management

##### **1.6.2. PLACE**

###### **1.6.2.1. THESAURUS:**

None

**1.6.2.2. PLACE KEYWORD:**

San Francisco

**1.7. ACCESS CONSTRAINTS:**

None

**1.8. USE CONSTRAINTS:**

DO NOT USE ESI MAPS FOR NAVIGATIONAL PURPOSES.

Besides the above warning, there are no use constraints on these data.

Acknowledgment of the publishers and contributing sources listed in 1.11. would be appreciated in products derived from these data.

**1.11. DATA SET CREDIT:**

This project was supported by the National Oceanic and Atmospheric Administration (NOAA), National Ocean Service, Office of Response and Restoration, Hazardous Materials Response Division, Seattle, Washington and the State of California, Department of Fish and Game, Office of Spill Prevention and Response, Sacramento, California

**1.13. NATIVE DATA SET ENVIRONMENT:**

The software packages used to develop the atlas are Environmental Systems Research Institute's ARC/INFO® (version 7.0.3) and ORACLE® RDBMS (version 6.0.36.1.1). The hardware configuration is Hewlett Packard workstations (models 715/50 and 712/80i with 4 X-terminals) with UNIX operating system (HP-UX Release A.09.01). The following files are included in the data set:

birds.e00	biofile.e00	bio_lut.e00
biores.e00	breed.e00	breed_dt.e00
esi.e00	fish.e00	fishl.e00
habitats.e00	hydro.e00	index.e00
invert.e00	mgt.e00	m_mammal.e00
nests.e00	reptiles.e00	seasonal.e00
soc_dat.e00	soc_lut.e00	socecon.e00
sources.e00	species.e00	status.e00
t_mammal.e00		

The entire data set is approximately 56 megabytes.

## **2.0. DATA QUALITY INFORMATION**

### **2.1. ATTRIBUTE ACCURACY**

#### **2.1.1. ATTRIBUTE ACCURACY REPORT:**

The attribute accuracy is estimated to be “good” given the years of ESI experience, the data input methodology, the quality control review sessions, and the digital logical consistency checks.

### **2.2. LOGICAL CONSISTENCY REPORT:**

The digitization of shoreline types, biological resources, and human-use resources is a complex and highly quality-controlled process. Existing digital shoreline and wetlands data are integrated into a study-wide basemap. In order to facilitate digitizing, the entire study area is split into individual quadrangles using the INDEX data layer. The first layer of information digitized is the ESI shoreline classification. The ESI habitat ranking is compiled onto 1:24,000 USGS topographic quadrangles by a geomorphologist. The hardcopy maps are then digitized and then checked using both on-screen and hardcopy reviews. The edited maps are updated, checked once again for completeness and topological and logical consistency. Any errors in the shoreline classification are updated prior to digitization of the biological and human-use layers. All layers use the shoreline as the geographic reference so that there are no slivers in the geographic coordinates.

The hardcopy biological information is compiled onto 1:24,000 USGS topographic quadrangles by a biological expert using data from regional specialists in the form of maps, tables, charts, written descriptions of wildlife distributions, and personal interviews. Concurrently, digital data sources are imported, projected, checked for quality control, and integrated into the data structure. The hardcopy data are digitized, checked using both digital and on-screen procedures, integrated with existing data, plotted, and sent out for review by the regional specialists. The edited maps are updated, checked once again, and the final product plotted (at approximately 1:50,000 scale). A team of specialists reviews the entire series of maps, checks all data, and makes final edits. The data are then merged to form the study-wide layers. The data merging includes a final quality control check where labels, chains, and polygons are checked for attribute accuracy.

To finalize the data checking process, each coverage is checked using a standardized form by two GIS personnel (a technician and the GIS manager), and each attribute database is checked using several programs that test the files for missing or duplicate data, rules for proper coding, GIS topological consistencies (such as dangles, unnecessary nodes, etc.), and ORACLE® to ARC/INFO® consistencies. A final review is made by the GIS manager, where the data are written to tape and the metadata are written.

After the data are delivered to NOAA, they are again subjected to a number of quality and consistency checks. In the process of checking for topological and database consistencies, new IDs and RARNUMs are also generated. The new IDs are a combination of atlas number, element number and record number. In addition, the value used to represent the element is modified to reflect the type of feature being mapped. In the case of an element that is normally represented by a point or polygon, a value of 20 is added to the standard element value for mapping of linear features. In the case where an element usually mapped as a polygon is represented by a point, a value of 30 is added to the regular element value. The RARNUMs are also modified to include the atlas number, so multiple atlases can be combined and RARNUMs remain unique. RARNUMs are redefined on an element basis so resource at risk groupings will contain only a single element.

ESI data are also processed into multiple formats to make them useful to a wider community of GIS/mapping users. Distribution formats include ARC export, MOSS and Shape files, and MARPLOT map folders. An ArcView ESI project and a MARPLOT ESI product are also included on the CDs for ease of use of the ESI data. The database files are also distributed both in the NOAA standard relational database format (see NOAA Technical Memorandum NOS ORCA 115) and in a simplified desktop flat file format. This metadata document includes information on both of these database formats. Section 3.0, outlining Spatial Data Organization, refers to the source files in ARC export format only.

### 2.3. COMPLETENESS REPORT:

#### Shoreline Habitat Mapping:

The intertidal habitats of San Francisco Bay were originally mapped during overflights conducted in January of 1986. They were updated onto 1:24,000 USGS topographic maps by an experienced coastal geologist in August 1996 using natural-color vertical aerial photographs. Where appropriate, multiple habitats were delineated for each shoreline segment. Portions of the coast were flown in March 1997 to verify the photo-interpretation. The aerial surveys were carried out using a fixed-wing aircraft, flying at elevations of 500-1000 feet and slow air speed. Prediction of the behavior and persistence of oil on intertidal habitats is based on an understanding of the dynamics of the coastal environments, not just the substrate type and grain size. The vulnerability of a particular habitat is an integration of the following factors:

- 1) Shoreline type (substrate, grain size, tidal elevation, origin)
- 2) Exposure to wave and tidal energy
- 3) Biological productivity and sensitivity
- 4) Ease of cleanup

All of these factors are used to determine the relative sensitivity of intertidal habitats. Key to the sensitivity ranking is an understanding of the relationships between: physical processes, substrate, shoreline type, product type, fate and effect, and sediment transport patterns. The intensity of energy expended upon a shoreline by wave action, boat wake, tidal action, and river currents, directly affects the persistence of stranded oil. The need for shoreline cleanup activities is determined, in part, by the slowness of natural processes in removal of oil stranded on the shoreline.

These concepts have been used in the development of the ESI, which ranks shoreline environments as to their relative sensitivity to oil spills, potential biological injury, and ease of cleanup. Generally speaking, areas exposed to high levels of physical energy, such as wave action and tidal currents, and low biological activity rank low on the scale, whereas sheltered areas with associated high biological activity have the highest ranking.

### Sensitive Biological Resources:

Regional biologists contributed the biological data. These data denote the key biological resources that are most likely at risk in the event of an oil spill.

Seven major categories, or ELEMENTS, of biological resources were considered during data compilation: birds, fish, habitats/rare plants, invertebrates, marine mammals, reptiles/amphibians, and terrestrial mammals.

The ELEMENTs generally correspond to the coverage or geographic data layer names. There are also six attribute, or data tables, BIORES, BREED, SEASONAL, SOURCES, SPECIES, and STATUS, that are used to store the complex biological data (Fig. 1). Each biological coverage is linked to the Biological Resources table (BIORES) using the unique ID and the lookup table BIO\_LUT, or it can be linked directly using RARNUM. The ID is a unique combination of the atlas number (for San Francisco this is 30), an element specific number (birds are layer 1, fish are layer 2, etc.) and a unique record number. The items in BIORES include: RARNUM, SPECIES\_ID, CONC, SEASON\_ID, G\_SOURCE, S\_SOURCE, ELEMENT, EL\_SPE, and EL\_SPE\_SEA. SPECIES\_ID is the numeric identifier of each species and is unique within each ELEMENT. CONC is the concentration of the species and can be descriptive (LOW, MEDIUM, HIGH, etc.) or an actual count of the number of individuals or nests associated with a polygon or point. SEASON\_ID contains a numeric identifier for the unique monthly presence and life history characteristics of each species at a given location. There can be one seasonality record per species, or the same species can have different monthly presence or breeding activities at different sites. When this occurs, a new record with a different SEASON\_ID is referenced.

**FIGURE 1.** Relationship between biology data layers and attribute files.

G\_SOURCE contains the SOURCE\_ID for geographic information and S\_SOURCE contains the SOURCE\_ID for seasonality information. Both items link to the SOURCES data table. EL\_SPE is a concatenation of ELEMENT and SPECIES\_ID and links to other data tables (primarily the SPECIES table) and EL\_SPE-SEA is a concatenation of ELEMENT, SPECIES\_ID, and SEASON\_ID and links to the SEASONAL and BREED data tables.

The SPECIES data table contains the SPECIES\_ID (described above), common name (NAME), scientific name (GEN\_SPEC), date the list of Natural Heritage Program (NHP) ranks was published (DATE\_PUB), biological element (ELEMENT), biological subelement (SUBELEMENT), and the NHP global conservation status rank. The item SUBELEMENT refers to the grouping of the species:

ELEMENT	SUBELEMENT
BIRD	alcid
	diving
	gull_tern
	passerine
	raptor
	shorebird
	wading
FISH	waterfowl
	diadromous
	e_nursery
	e_resident
	freshwater
MARINE MAMMAL	m_benthic
	pinniped
HABITAT	algae
	plant
	submerged aquatic vegetation (sav)
	wetland
INVERTEBRATE	bivalve
	crab
	insect
	shrimp
REPTILE	amphibian
	turtle
TERRESTRIAL MAMMAL	sm_mammal

The STATUS data table contains records for each species that is threatened or endangered on state or federal lists. The items include: ELEMENT, SPECIES\_ID, STATE (two-letter state abbreviations), S\_F (state or federal status), T\_E (threatened or endangered status), DATE\_PUB, and EL\_SPE.

The SEASONAL data table stores the monthly presence of each species where each species is defined as three-character monthly abbreviations. The BIORES table is linked to the SEASONAL table using either the combination of SPECIES\_ID, ELEMENT, and SEASON\_ID items, or the item EL\_SPE\_SEA, which contains the concatenation of these items.

The BREED data table contains the life stage or life history data for each unique combination of ELEMENT, SPECIES\_ID, and SEASON\_ID (or EL\_SPE\_SEA), and up to 12 records (corresponding to each month of the year) can have different attributes and therefore separate records. The categories for each element of the items BREED1 through BREED5 are:

ELEMENT	BREED 1	BREED 2	BREED 3	BREED 4	BREED 5
BIRD	nesting	laying	hatching	fledging	
FISH	spawning	eggs	larvae	juveniles	adults
INVERT	spawning	eggs	larvae	juveniles	adults
M_MAMMAL	mating	calving	pupping	molting	
REPTILE	nesting	hatching	internesting	juveniles	adults

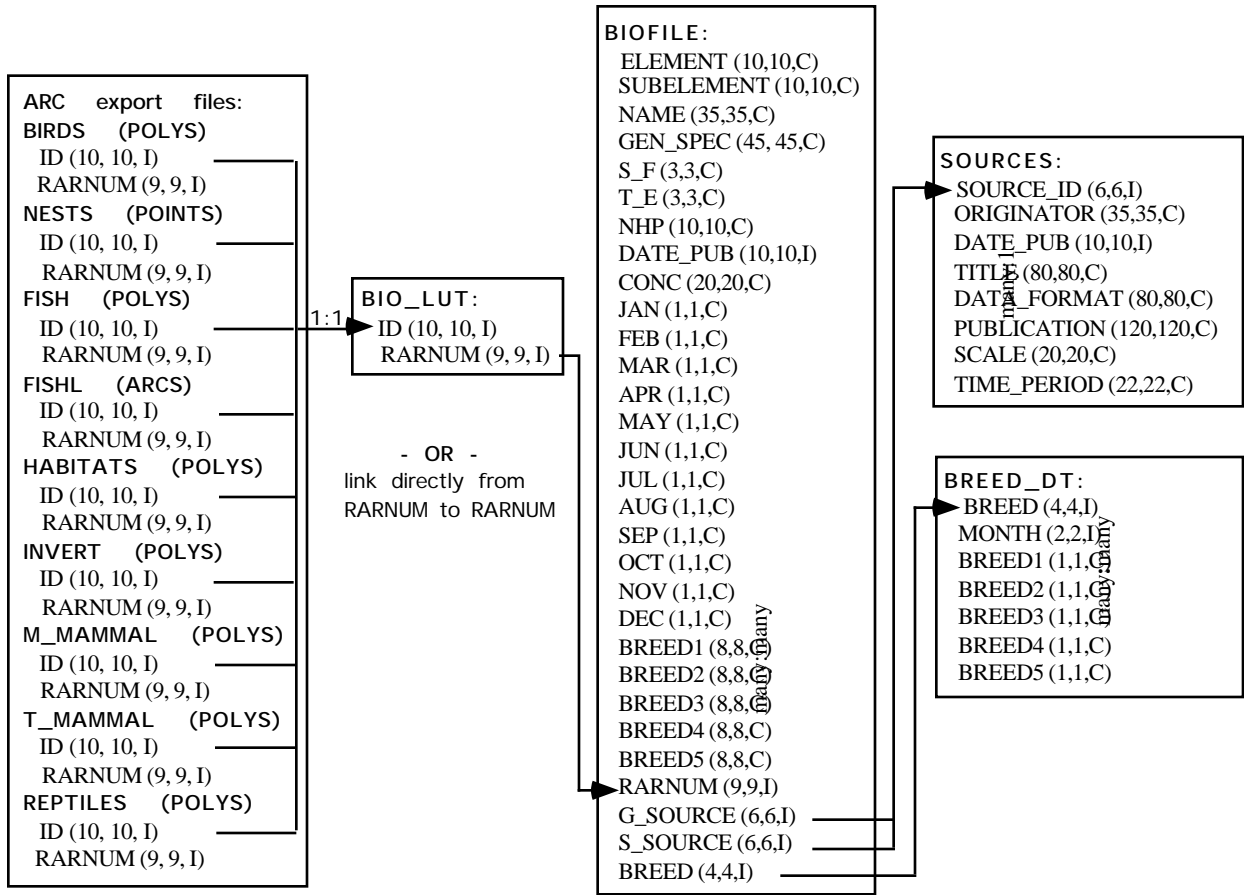

NOTE: There are no BREED variables for HABITAT and TERRESTRIAL MAMMALS.

The SOURCES data table contains metadata for each biological and human-use source listed in the ESI atlas. The items in SOURCES are: SOURCE\_ID, ORIGINATOR (author), DATE\_PUB (date of publication), TITLE (title of the data set), DATA\_FORMAT (digital type, hardcopy maps, etc.), PUBLICATION (additional citation), SCALE (source scale denominator), and TIME\_PERIOD (beginning and ending dates of original data collection). The SOURCES data table is linked to all biological and human-use data at the feature-level.

Due to the complexity of the relational database model, the biological data items are post processed into a flat file format. This file is entitled BIOFILE and it may be used in place of the relational files to ease simple data queries. The items in the flat file are ELEMENT, SUBELEMENT, NAME, GEN\_SPEC,

S\_F, T\_E, NHP, DATE\_PUB, CONC, JAN, FEB, MAR, APR, MAY, JUN, JUL, AUG, SEP, OCT, NOV, DEC, BREED1, BREED2, BREED3, BREED4, BREED5, RARNUM, G\_SOURCE, S\_SOURCE and BREED. All of these items are the same as their counterparts in the individual files described above, except the BREED1–BREED5 items. BREED is a newly generated variable used to link to the BREED\_DT file, a modified, more compact version of the aforementioned BREED file. Breed1–Breed5 give a text summary of when each life stage occurs within that polygon. The life stages referred to are the same as those listed in the previous table. The link to the BIOFILE may be made through BIO\_LUT using ID to link to RARNUM, or it may be linked directly to the RARNUM in each of the biology cover's attribute files. As mentioned, BREED\_DT is an auxiliary support file to the flat file structure, which allows the user to do searches based on month for seasonal breeding activities. The link from the flat file to BREED\_DT is the BREED item. A second supporting data file is SOURCE. This is the same as the source file described above and the link from the flat file is both G\_SOURCE and S\_SOURCE.

It should be noted that although the flat file eases data query, it is not a normalized database structure, and actual updates performed by the states and other responsible agencies should be done using the relational files.

**FIGURE 2.** Relationship of the BIOFILE to the biological covers and the supplementary BREED\_DT and SOURCES data tables.

### Human-Use Resources:

Several human-use, or socio-economic, features are included in ESI atlases. Entity points and complete chains (arcs) are digitized into the data layer. SOCECON and managed area polygonal data are stored in the MGT data layer. Both data sets are linked to the data table SOC\_DAT using the SOC\_LUT lookup table and the items HUNUM and ID. ID is a concatenation of atlas number (30), element number (SOCECON = 10 and MGT = 11), and unique record number.

All features are attributed using the item SOCECON and identify the type of feature:

Entity Points		Polygons	
Feature	TYPE	Feature	TYPE
Access	A2	National Park	NP
Airport	A	State Park	P
Beach	B	Wildlife Refuge	WR
Boat Ramp	BR		
Coast Guard	CG		
Commercial Fishing	CF		
Ferry	F		
Historical Site	HS		
Hoist	H		
Lock and Dam	LD		
Marina	M		
Recreational Fishing	RF		
Water Intake	WI		
Complete Chains			
Feature	TYPE		
Bridge	R		

The table SOC\_DAT contains the human-use number (HUNUM), feature type (TYPE), name of the facility (NAME), contact person (CONTACT), telephone number (PHONE), geographic source (G\_SOURCE), and attribute source (A\_SOURCE).

## 2.4. POSITIONAL ACCURACY

### 2.4.1. HORIZONTAL POSITIONAL ACCURACY

#### 2.4.1.1. HORIZONTAL POSITIONAL ACCURACY REPORT:

The ESI data use USGS 1:24,000 topographic quadrangles as the base map. It is estimated that the ESI has a minimum mapping unit of 50 feet. The biological data sets are developed primarily using regional experts who estimate concentration areas. Unlike shorelines, which maintain relative spatial stability through time, the biological data by nature migrate across the landscape. Therefore, the 1:24,000 USGS quadrangles are used as a base map in gathering the data but the data have “fuzzy” boundaries, which must be understood when utilizing this information.

## **2.5.2. PROCESS STEP**

### **2.5.2.1. PROCESS DESCRIPTION:**

The digitization of ESI, biological resources, and human-use resources is a complex and highly quality controlled process. In order to facilitate digitizing, the entire study area was split into individual quadrangles using the map index data layer. The first layer of information digitized was the shoreline with ESI classification. The digital shoreline was attributed with the ESI classification during fieldwork, checked for completeness, topological and logical consistency, and edited for any errors using the original overflight maps. Any errors in the shoreline classification were updated prior to digitization of the biological and human-use layers. All data use the shoreline as the geographic reference so that there are no slivers in the geographic layers. The biological information was compiled onto 1:24,000 USGS topographic quadrangles using the data from regional specialists in the form of verbal discussions, maps, tables, charts, and written

descriptions of wildlife distributions. Concurrently, all digital data were imported, merged into the spatial data structure, and checked for completeness. The hardcopy data were digitized, merged with existing digital data, checked using both digital and on-screen procedures, plotted, checked by the biological expert, edited to remove any errors, and plotted for review by the regional specialists. The reviewed maps were updated on the computer, checked once again, and plotted at final map scale. A team of specialists reviewed the entire series of maps, checked all data, and made final edits. The data were merged to form the study-wide layers that are described in this document. The data merging included a final quality control check where topological consistency, rules for geography, and database to geography were checked and validated for all relationships.

### 5.1. DETAILED DESCRIPTION: BIRDS

Birds in this atlas are divided into several species subgroups based on taxonomy, morphology, behavior, and oil spill vulnerability and sensitivity. The species table lists all the birds included on the maps, sorted by subgroup. These species are included either because of their likelihood of direct or indirect impact by an oil spill or similar incident, their general rarity or imperilment, or their special protection status as threatened or endangered. Migratory or wintering concentration areas, nesting sites and colonies, and protected species are especially emphasized.

For birds closely associated with wetland habitats, tidal flats, salt ponds, storage/treatment ponds, etc., expert and published sources were used in conjunction with the SFEI bayland habitat data and USGS topographic maps to identify and delineate specific locations for each species or assemblage of birds. California clapper rails, black rails, several passerine species, shorebirds, wading birds, waterfowl, certain raptors, etc. were mapped in this manner. Other species, many of them associated with certain open water habitats (e.g., diving ducks, grebes, common murre, etc.), linear shoreline segments, bridges (e.g., peregrine falcon), breakwaters, etc. were mapped by resource experts using USGS topographic maps and NOAA nautical charts as reference materials. Specific nesting colonies and nesting sites for seabirds (gulls, terns, diving birds, etc.) were mapped using published sources and USGS topographic maps. Wading bird colonies in many areas are depicted as polygons, although some sites in the northern section of the study area were mapped as points (see the NESTS data layer). CDFG's Natural Diversity Database (NDDDB) records were used in assisting resource experts during data development and review, however, nearly all NDDDB records were omitted from the final digital data set. The CDFG's Natural Heritage Division (telephone number 916/445-6383) should be contacted for the most complete and up-to-date digital NDDDB information.

At the request of local resource managers and experts, several species of shorebirds and waterfowl have been grouped into functional categories in the database based on their behavior and habitat utilization. The species listed in each category (Table 1) represent the most commonly occurring species in the San Francisco Bay region. It is not meant to be an inclusive list of all

shorebird and waterfowl species ever observed in the study area. It should also be noted that category names represent the general habitat or behavior of the group and exceptions do occur. For instance: “Salt Pond” shorebirds occur primarily in salt ponds, but will also be found in shallow water mudflat habitats in ponded, muted tidal or managed marshes throughout the bay area; dabbling ducks occur primarily in shallow ponds of all marsh habitats but can also be found occasionally in shallow nearshore open bay waters. Likewise, not all species within each group behave the same or utilize the exact same habitat; some may prefer different habitats or vegetation types, different water depths, sand versus mud bottoms, etc.

**TABLE 1.** Shorebird and waterfowl assemblages.

<b>Assemblage</b>	<b>Species</b>
Tidal Flat Shorebirds	Black-bellied plover, Black turnstone, Dunlin, Greater yellowlegs, Least sandpiper, Lesser yellowlegs, Long-billed curlew, Marbled godwit, Red knot, Ruddy turnstone, Sanderling, Semipalmated plover, Western sandpiper, Whimbrel, Willet
Salt Pond Shorebirds	American avocet, Black-necked stilt, Killdeer, Red-necked phalarope, Western snowy plover, Various other shorebirds depending on location
Dabbling Ducks	American wigeon, Blue-winged teal, Cinnamon teal, Gadwall, Green-winged teal, Mallard, Northern pintail, Northern shoveler
Diving Ducks	Barrow’s goldeneye, Bufflehead, Canvasback, Common goldeneye, Greater scaup, Lesser scaup, Red-breasted merganser, Redhead, Ruddy duck, Surf scoter, White-winged scoter

In addition to the use of shorebird and waterfowl assemblages, a limited number of species of special interest were also listed separately in the database, as requested by resource managers and expert sources. Species nesting in an area, threatened or endangered species, and unique species of special management or spill response concern were listed separately on the maps and data tables (Table 2).

**TABLE 2.** Supplemental shorebird and waterfowl species.

<b>Shorebirds</b>	<b>Waterfowl</b>
Western snowy plover (endangered, nesting)	Canvasback (declining species, unique habitat association)
Red-necked phalarope (unique habitat association)	Ruddy duck (unique habitat association and behavior)
Black oystercatcher (nesting, unique habitat association)	Northern pintail (declining species)
American avocet (nesting)	Greater white-fronted goose (unique to delta and Suisun marsh region)
Black-necked stilt (nesting)	Canada goose (unique to delta and Suisun marsh region)
Killdeer (nesting)	Snow goose (unique to delta and Suisun marsh region)
	Tundra swan (unique to delta and Suisun marsh region)

For birds, concentration was indicated as “present,” “potential,” “very high,” “high,” “medium,” or “low,” or as a numerical value representing the number of nests (for nesting records), or the number of individuals (for non-nesting records) occurring at a site. “Present” was used for endangered, rare, or special interest species that were known to occur at a site, where more detailed concentration information was not appropriate or not available. “Potential” was used for rare, endangered, or special interest species that were likely or suspected to occur at a site, or that were expected to re-occupy a site in the very near future, based on expert information (e.g., potential return of least tern nesting following predator control at a site). The “very high,” “high,” “medium,” and “low” categories or numerical values were used whenever possible. Descriptive concentration values represent the opinion of local resource managers or experts, based on relative concentrations in the study area. Numerical concentration values are based on the maximum number of birds recorded during recent surveys. Numerical concentrations at any particular site may fluctuate seasonally and annually based on local or regional conditions, or other factors. Nesting refers to the entire nesting period, while laying, hatching, and fledging are discrete subsets of the nesting time period. For many species there is a temporal shift in seasonality and

reproduction along with spatial changes in location. Temporal information included in the tables is specific to the one polygon or point that it references.

The following BIRDS species are found in the San Francisco Bay ESI atlas:

SPECIES ID	NAME
7	Western grebe
8	Double-crested cormorant
9	Brandt's cormorant
10	Pelagic cormorant
11	Tundra (whistling) swan
12	Canada goose
14	Greater white-fronted goose
15	Snow goose
17	Northern pintail
21	Canvasback
34	American coot
37	Western gull
39	California gull
46	Common murre
47	Pigeon guillemot
53	Red-necked (Northern) phalarope
54	Great blue heron
68	Black oystercatcher
70	Killdeer
85	California least tern
87	Little blue heron
88	Great egret
89	Snowy egret
90	Black-crowned night heron
93	Cattle egret
107	Peregrine falcon
131	White-tailed kite
133	Black skimmer
136	Caspian tern
138	Forster's tern
141	American avocet
142	Black-necked stilt
148	Ruddy duck
151	Saltmarsh common yellowthroat
173	American white pelican
174	Golden eagle
176	Short-eared owl

SPECIES ID	NAME
181	Northern harrier
187	Virginia rail
188	Sora
192	Common moorhen
194	Suisun song sparrow
204	California clapper rail
206	California black rail
233	San Pablo song sparrow
239	Clark's grebe
259	Alameda song sparrow
270	Western snowy plover
282	California brown pelican
349	Burrowing owl
1,001	Gulls
1,002	Shorebirds
1,003	Waterfowl
1,004	Wading birds
1,008	Terns
1,013	Dabbling ducks
1,014	Diving ducks
1,015	Egrets
1,016	Heron

**5.1. DETAILED DESCRIPTION: BREED\_DT**

The data table BREED\_DT is a supplement to the flat format BIOFILE that allows searches to be conducted for life stage activities by month. This is a condensed version of the BREED table where multiple species of the same element may link to the same BREED\_DT records. (There are no breeding activities for HABITAT or T\_MAMMAL elements.)

**5.1. DETAILED DESCRIPTION: ESI**

The data layer ESI contains arc (Complete Chains) and polygonal (GT-Polygons) features for the ESI shoreline classification and is based on *Environmental Sensitivity Index Guidelines, Version 2.0* (Halls, J., J. Michel, S. Zengel, J. Dahlin, and J. Petersen, 1997, Hazardous Materials Response and Assessment Division, NOAA). The ESI classification was performed in February 1997.

**5.1.1. ENTITY TYPES:**

<b>5.1.1.1. ENTITY TYPE LABEL:</b>	<b>5.1.1.2. ENTITY TYPE DEFINITION:</b>
<u>Complete Chains</u>	ESI character LINE character SOURCE_ID integer ENVIR character
<u>GT-Polygons</u>	ESI character WATER_CODE character

**5.1.2. ATTRIBUTES:****5.1.2.1. ATTRIBUTE LABEL:**

ESI

**5.1.2.2. ATTRIBUTE DEFINITION:**

The intertidal shoreline habitats of San Francisco Bay were originally mapped during overflights conducted in January 1986. In February 1997, the linear shoreline classification was updated onto 1:24,000 U.S. Geological Survey (USGS) topographic maps by an experienced coastal geologist using 1:24,000 natural color vertical aerial photography produced by the National Oceanic and Atmospheric Administration (NOAA), National Ocean Service, National Geodetic Survey, in August 1996. Maps for bayland habitats provided by the San Francisco Estuary Institute (SFEI) were also consulted during the shoreline classification. A series of overflights were conducted 4-6 March 1997 to verify the shoreline classification, using fixed-wing aircraft, flying at elevations of 500-1,000 feet and slow air speed. Air support was provided by the California Department of Fish and Game (CDFG). In

conjunction with the linear shoreline classification, digital baylands habitat data developed by SFEI were used to delineate and classify polygonal habitats including marsh types, tidal flats, and other features. The SFEI data were originally compiled from unofficial 1985 National Wetlands Inventory (NWI) data, interjected with 1989 State Lands Commission tidal marsh polygons, updated and reviewed by experts using 1995/1996 National Aeronautic and Space Administration (NASA) aerial photography, and pre-released in November 1997.

Prediction of the behavior and persistence of oil on intertidal habitats is based on an understanding of the dynamics of the coastal environments, not just the substrate type and grain size. The sensitivity of a particular intertidal habitat is an integration of the following factors:

- 1) Shoreline type (substrate, grain size, tidal elevation, origin)
- 2) Exposure to wave and tidal energy
- 3) Biological productivity and sensitivity
- 4) Ease of cleanup

All of these factors are used to determine the relative sensitivity of intertidal habitats. Key to the sensitivity ranking is an understanding of the relationships between: physical processes, substrate, shoreline type, product type, fate and effect, and sediment transport patterns. The intensity of energy expended upon a shoreline by wave action, tidal currents, and river currents directly affects the persistence of stranded oil. The need for shoreline cleanup activities is determined, in part, by the slowness of natural processes in removal of oil stranded on the shoreline.

These concepts have been used in the development of the ESI, which ranks shoreline environments as to their relative

sensitivity to oil spills, potential biological injury, and ease of cleanup. Generally speaking, areas exposed to high levels of physical energy, such as wave action and tidal currents, and low biological activity rank low on the scale, whereas sheltered areas with associated high biological activity have the highest ranking. A comprehensive shoreline habitat ranking system has been developed for the entire United States. The shoreline habitats delineated in San Francisco Bay are listed below in order of increasing sensitivity to spilled oil.

- 1A) Exposed Rocky Shores
- 1B) Exposed, Solid Man-made Structures
- 2A) Exposed Wave-cut Platforms in Bedrock
- 3A) Fine-to Medium-grained Sand Beaches
- 3B) Scarps and Steep Slopes in Sand
- 4) Coarse-grained Sand Beaches
- 5) Mixed Sand and Gravel Beaches
- 6A) Gravel Beaches
- 6B) Riprap
- 7) Exposed Tidal Flats
- 8A) Sheltered Rocky Shores
- 8B) Sheltered, Solid Man-made Structures
- 8C) Sheltered Riprap
- 9A) Sheltered Tidal Flats
- 9B) Vegetated Low Riverine Banks
- 10A) Salt- and Brackish-water Marshes

The item ESI contains values according to the ESI ranking of the shorelines and polygons. The ESI rankings progress from

low to high susceptibility to oil spills. In many cases, the shorelines are also ranked with multiple codes such as 10/7. The first number is the most landward shoreline type, salt marsh, with exposed tidal flats being the shoreline type closest to the water. ESI polygons for wetlands (ESI = 10) and tidal flats (ESI = 7, 9A) were derived from SFEI bayland habitat data. ESI = 10 polygons include tidal marshes and muted tidal marshes from SFEI.

### 5.1. DETAILED DESCRIPTION: FISH

The data layer FISH contains polygons for fish species.

Fish species depicted for San Francisco Bay include selected marine, estuarine, anadromous, and freshwater species. Species of commercial, recreational, ecological, and/or conservation interest are emphasized. Fish (and invertebrates such as bay shrimp and crabs) are mapped as multi-species assemblages to the greatest extent possible. For different regions of the Bay area, assemblages are broken into two major categories: shoals, shallow creeks, and sloughs (< or = 20 feet below MLLW) versus deeper channels (>20 foot depths). Polygons for “shallows” versus “channels” were developed from digital data provided by SFEI. Often, the same species, but different life stages, were associated with adjacent “shallows” and “channels.” Regional fish and invertebrate distributions were provided mainly by fisheries scientists with the CDFG Bay-Delta Division. Sacramento River-run chinook salmon distributions were depicted with the added assistance of USFWS biologists. Estuarine salinity zone distribution and seasonality data compiled by NOAA’s Biogeographic Characterization Branch and Estuarine Living Marine Resources program were also consulted. It should be noted that fish (and invertebrate) resource distributions depicted on the maps may be more widespread in some locations than would actually occur in any given year, due to inter-annual variation in river discharge and salinity. During dry years, distributions for several species may shift towards the upstream or upper estuary portions of the areas depicted on the maps, the opposite being true during wet years.

In addition to the multi-species assemblages depicted on the maps, specific concentration areas or other key habitats for a few individual species are mapped separately. For instance, Pacific herring spawning locations are mapped for Central San Francisco Bay based on: expert sources; rock, gravel, and man-made shoreline types (ESI = 1A, 1B, 5, 6A, 6B, 8A, 8B, 8C); eelgrass and *Gracilaria* (algae) distributions; and nearshore structures depicted on USGS topographic maps and NOAA nautical charts.

Polygons from California State Lands Commission (SLC) data sets were also used to depict locations for certain fish species. To avoid redundancy on the

final maps, resource locations generated from expert and published sources, SFEI data, and USGS topographic maps took precedence over the SLC data. CDFG's NDDDB records were used in assisting resource experts during data development and review, however, all NDDDB records were omitted from the final digital data set. The CDFG Natural Heritage Division (telephone number: 916/445-6383) should be consulted for the most complete and up-to-date digital NDDDB information.

Fish concentrations are listed as "high," "medium," "low," or "rare" in most cases, based on expert opinion. Some records for rare and endangered species may also contain "present" in the concentration field, where more detailed concentration descriptions were not appropriate or not available.

The following fish species (polygons) are found in the San Francisco Bay ESI atlas:

SPECIES ID	NAME
11	English sole
12	Starry flounder
38	Brown rockfish
43	White sturgeon
44	Green sturgeon
66	Pacific herring
68	Chinook salmon
74	Rainbow trout (steelhead)
87	American shad
104	Striped bass
172	Longfin smelt
177	Leopard shark
225	California halibut
473	Bat ray
474	Sacramento splittail
475	Delta smelt
476	Sacramento perch
490	Chinook salmon (fall)
491	Chinook salmon (late fall)
492	Chinook salmon (winter)
493	Chinook salmon (spring)
494	White croaker

### 5.1. DETAILED DESCRIPTION: FISHL

The data layer FISHL contains arcs for fish species.

Fish species depicted for San Francisco Bay include selected marine, estuarine, anadromous, and freshwater species. Species of commercial, recreational, ecological, and/or conservation interest are emphasized.

The lower sections (mouths) of known anadromous rainbow trout (steelhead) and chinook salmon (non-Sacramento R.) spawning streams were mapped based on published sources, information provided by local resource managers, and USGS topographic maps. National Marine Fisheries Service (NMFS) and U.S. Forest Service (USFS) personnel were consulted to confirm the locations of existing anadromous salmonid runs in the estuary. In a few cases, the names and/or locations of streams reported to have steelhead or chinook runs could not be identified using the USGS topographic maps, or were located just outside of the study area. Therefore, existing salmonid streams in the Bay area reported by Leidy (1997) or local resource managers are listed below (Table 3). Historic runs were not mapped as a part of this project, even though they might potentially hold salmonid runs in the future. It should also be recognized that steelhead and chinook juveniles and adults can be found migrating or feeding throughout the estuarine and riverine waters of the study area, not just in the spawning streams identified.

**TABLE 3.** Anadromous salmonid streams in the Bay area.

Stream Name	Species
Arroya Corte Madera Del Presidio Creek	steelhead
Corte Madera Creek	steelhead
Miller Creek	steelhead
Novato Creek	steelhead
Petaluma River (and some tribs.)	steelhead
Sonoma Creek (and tribs.)	steelhead, chinook
Napa River (and tribs.)	steelhead, chinook
Green Valley Creek	steelhead
Suisun Creek (and tribs.)	steelhead
Sacramento-San Joaquin Rivers and Tribs.	steelhead, chinook

<b>Stream Name</b>	<b>Species</b>
Walnut Creek	steelhead, chinook
Pinole River	steelhead
San Pablo Creek	steelhead
Tolay Creek	steelhead
Wildcat Creek	steelhead
San Leandro Creek	steelhead
San Lorenzo Creek	steelhead
Alameda Creek	steelhead
Coyote Creek	steelhead, chinook
Guadalupe River	steelhead, chinook
Saratoga Creek	steelhead
Redwood Creek	steelhead
Permanente Creek	steelhead
San Francisquito Creek	steelhead

Fish concentrations are listed as “high,” “medium,” “low,” or “rare” in most cases, based on expert opinion. Some records for rare and endangered species may also contain “present” in the concentration field, where more detailed concentration descriptions were not appropriate or not available. For the several anadromous species (sturgeon, shad, striped bass, longfin smelt, steelhead, chinook), spawning is only indicated for locations where actual spawning is known to occur. Where the beginning of spawning runs are indicated (e.g., steelhead trout), but actual spawning activity takes place upstream of the mapped distribution or study area (or specific spawning stretches of streams were not known), the adult time-period is used, but not the spawning category.

The following FISH species (arcs) are found in the San Francisco Bay ESI atlas:

<b>SPECIES ID</b>	<b>NAME</b>
68	Chinook salmon
74	Rainbow trout (steelhead)

### 5.1. DETAILED DESCRIPTION: HABITATS

Submersed habitats depicted in San Francisco Bay include eelgrass beds and *Gracilaria* (algae) beds. Eelgrass beds were mapped initially using digital data provided by SLC (after Echeverria and Rutten, 1989). Additional eelgrass beds were depicted using a wide variety of published sources, reports, and expert information. *Gracilaria* beds were mapped using expert opinion for limited portions of the Central Bay region, mainly areas associated with Pacific herring spawning activity. Additional *Gracilaria* beds may be present in other portions of the study area.

Individual plant species depicted on the maps include a wide variety of rare or endangered wetland and upland species. Certain wetland species are emphasized, although other species are included if they occur near estuarine shorelines or habitats, or if they are located near potential staging or access sites (where spill-related disturbance would be possible).

Mason's lilaeopsis is one species particularly emphasized. This species was mapped using digital point records provided by SFEI. Because the exact locations of individual Mason's lilaeopsis occurrences shift somewhat rapidly over time, SFEI records were used in conjunction with the ESI shoreline classification to develop polygons that represent areas where Mason's lilaeopsis is most likely to occur. Actual locations for this species will not cover the entire area indicated, but will occur at several discreet (though ephemeral) locations within the polygons. Additional records for Mason's lilaeopsis from other sources were also retained in some instances.

Other rare plant species emphasized in the atlas included: Suisun marsh aster, Alkali milk-vetch, Suisun thistle, Point Reyes bird's-beak, Soft bird's-beak, Delta tule pea, and California sea-blite. Rare plants were mainly mapped using expert and published sources in conjunction with SFEI baylands habitat data, and USGS topographic maps. USFWS and other experts were particularly helpful in locating certain key species. CDFG's NDDDB records were used in assisting resource experts during data development and review, however, all NDDDB records were omitted from the final digital data set. The CDFG Natural Heritage Division (telephone

number: 916/445-6383) should be consulted for the most complete and up-to-date digital NDDDB information.

Concentration was generally listed using a descriptive term, such as “high,” “medium,” or “low”. Records for rare and endangered species and submersed habitats may also contain “present” or “potential” in the concentration field, where more detailed concentration descriptions were not appropriate or not available.

The following HABITATS species are found in the San Francisco Bay ESI atlas:

SPECIES ID	NAME
1	Eelgrass
72	Soft bird's-beak
214	Rare plants
322	Mason's lilaeopsis
324	Suisun marsh aster
328	Suisun thistle
336	Contra Costa goldfields
356	California seablite
366	Delta tule pea
388	Point Reyes bird's-beak
396	Yellowray goldfields
397	Ambiguous indian paintbrush
398	Gracilaria
399	Nootka alkaligrass
400	Mojave seablite
1029	Vernal pool plants

### 5.1. DETAILED DESCRIPTION: INVERT

Invertebrate species depicted for San Francisco Bay mainly include bay shrimp (*Crangon* spp.) and crabs (*Cancer* spp.) of commercial, recreational, or ecological importance. Japanese littleneck clam harvest sites are also depicted in a few areas. Certain rare and endangered species, including tadpole shrimp and insects are also included in the atlas. Rare and endangered species are shown only when they occur near estuarine shorelines or habitats, or when they are located near potential staging or access sites (where spill-related disturbance would be possible). Estuarine bay shrimp and crabs (and fish species) are mapped as multi-species assemblages to the greatest extent possible. For different regions of the Bay area, assemblages are divided into two major categories: (1) shoals, shallow creeks, and sloughs (< or = 20 feet below MLLW) and (2) deeper channels (>20 foot depths). Polygons for “shallows” versus “channels” were developed from digital data provided by SFEI. Often, the same species, but different life stages, were associated with adjacent “shallows” and “channels.” Bay shrimp, crab, and fish distributions were provided mainly by fisheries scientists with the CDFG Bay-Delta Division. Estuarine salinity zone distribution and seasonality data compiled by NOAA’s Biogeographic Characterization Branch and Estuarine Living Marine Resources program were also consulted. It should be noted that bay shrimp, crab, and fish resource distributions depicted on the maps may be more widespread in some locations than would actually occur in any given year, due to inter-annual variation in river discharge and salinity. During dry years, distributions for several species may shift towards the upstream or upper estuary portions of the areas depicted on the maps, the opposite being true during wet years.

In addition to the multi-species assemblages depicted on the maps, special concentration areas or other key habitats for a few individual species are mapped separately. For instance, Pacific rock crab and Red rock crab concentration areas are mapped based on expert sources, ESI shoreline types, and nearshore structures depicted on USGS topographic maps and NOAA nautical charts. Rock crabs are shown in certain portions of the Bay where rock or riprap shorelines predominated (ESI = 1A, 6B, 8A, 8C).

Expert sources were used to depict locations for rare and endangered invertebrates. NDDDB records were used by resource experts during data development and review; however, all NDDDB records were omitted from the final digital data set. The CDFG Natural Heritage Division (telephone number: 916/445-6383) should be consulted for the most complete and up-to-date digital NDDDB information.

Concentration is listed as “high,” “medium,” or “low” in most cases, based on expert opinion. Some records for rare and endangered species may also contain “present” in the concentration field, where more detailed concentration descriptions were not appropriate or not available. For many species there may be temporal shifts in seasonality and life-history time periods, depending on location. Temporal information included in the tables is specific to the one polygon or site that it references.

The following INVERT species are found in the San Francisco Bay ESI atlas:

SPECIES ID	NAME
2	Vernal pool tadpole shrimp
3	California bay shrimp
9	Blacktail bay shrimp
14	Dungeness crab
26	Japanese littleneck clam
53	Red rock crab
57	Pacific rock crab
295	Mission blue butterfly

### 5.1. DETAILED DESCRIPTION: M\_MAMMAL

Marine mammals depicted in the San Francisco Bay atlas include harbor seals and California sea lions. Seal areas represent major haul-out sites and pupping areas. Certain harbor seal feeding concentrations are also represented. A few California sea lion haul-outs also occur in the Bay area, and these are depicted also (note that sea lions do not pup in the Bay). Seal and sea lion haul-outs and other locations were compiled from several recent surveys and reports, using USGS topographic maps and NOAA nautical charts for spatial referencing. Seal and sea lion locations were augmented and carefully refined based on the opinion of local resource managers and expert biologists. In addition to haul-outs and pupping areas shown on the maps, harbor seals and California sea lions are distributed throughout the estuarine waters of the bay, and may even venture up some of the rivers. Harbor seal feeding concentrations are often located in waters adjacent to the major haul-out sites, but occur in other areas as well. Feeding concentrations depicted on the maps are limited to a few sites that are not directly adjacent to haul-out locations. Though not considered threatened or endangered species, it should be noted that harbor seals and California sea lions are legally protected by the Marine Mammal Protection Act.

Concentration for harbor seals is usually represented as a number value indicating the highest number of seals documented at each haul-out or pupping site during recent surveys. Sea lion haul-outs are represented as descriptive concentrations, such as “high,” “medium,” or “low”. Descriptive concentrations are based on the opinion of local resource managers or experts concerning relative concentrations within the study area.

The final columns list the time periods for sensitive life-history activities, such as pupping and molting for harbor seals. Pupping refers to the time-period when pups are born. Molting refers to the time-period when seals haul-out to shed.

The following M\_MAMMAL species are found in the San Francisco Bay ESI atlas:

SPECIES ID	NAME
2	Harbor seal
22	California sea lion

## 5.1. DETAILED DESCRIPTION: NESTS

Most wading bird nesting colonies for the northern section of the study area (Yerba Buena Island northward) are mapped as points in the NESTS data layer using latitude and longitude coordinates provided by resource experts. Wading bird colonies in other areas are depicted as polygons in the BIRD data layer. Nesting sites or colonies for other species, including colonial nesting seabirds, are mapped as polygons, and are included in the BIRD data layer.

The following species are found in the NESTS coverage of the San Francisco Bay ESI atlas:

SPECIES ID	NAME
54	Great blue heron
88	Great egret
89	Snowy egret
90	Black-crowned night-heron

### 5.1. DETAILED DESCRIPTION: REPTILES

Reptiles and amphibians depicted in the San Francisco Bay atlas are limited to rare and endangered species including Western pond turtle and California tiger salamander. These species are only shown when they occur near estuarine shorelines or habitats, or when they are located near potential staging or access sites (where spill-related disturbance would be possible). In most cases, these species were mapped from published and expert sources, using USGS topographic maps and/or SFEI baylands habitat data for spatial referencing. CDFG's NDDDB records were used to assist data development and review, however, all NDDDB records were omitted from the final digital data set. The CDFG Natural Heritage Division (telephone number: 916/445-6383) should be consulted for the most complete and up-to-date digital NDDDB information.

Concentration is indicated as “present” where more detailed concentration information was not appropriate or not available. “High,” “medium,” or “low” concentrations were used whenever possible. For turtles and amphibians, the life-history columns indicate nesting, hatching, juvenile, and adult time-periods. For turtles, nesting refers to the time when adults construct nests and deposit eggs. Hatching refers to the time when young turtles are hatching and emerging from the nests. For amphibians, nesting refers to the general time when adults are breeding and laying eggs.

The following REPTILES species are found in the San Francisco Bay ESI atlas:

SPECIES ID	NAME
53	California tiger salamander
58	Western pond turtle

### 5.1. DETAILED DESCRIPTION: T\_MAMMAL

Terrestrial mammals depicted in this atlas emphasize rare and endangered small mammals that are closely associated with wetland habitats of the Bay, such as the salt-marsh harvest mouse, San Pablo vole, Suisun ornate shrew, and salt-marsh wandering shrew. In addition, areas with highly abundant populations of semi-aquatic fur-bearing mammals, such as the northern river otter, are also shown on the maps. For species closely associated with wetland habitats (such as tidal marshes), expert sources were used in conjunction with the SFEI bayland habitat maps and digital data to identify and delineate specific locations for each species. River otter distributions are based on expert opinion, and are depicted mainly in aquatic habitats such as in or along certain rivers and sloughs. CDFG's NDDDB records were used in assisting resource experts during data development and review, however, all NDDDB records were omitted from the final digital data set. The CDFG Natural Heritage Division (telephone number: 916/445-6383) should be consulted for the most complete and up-to-date digital NDDDB information.

Concentrations for terrestrial mammals are indicated using descriptive terms such as "present," "potential," "very high," "high," "medium," "low," etc. "Present" is used for endangered or rare species that were known to occur at a site, where more detailed concentration information was not appropriate or not available. "Potential" is used for rare or endangered species that are likely or suspected to occur at a site. The "high," "medium," and "low" categories are used whenever possible, and represent the opinion of local resource managers or experts on relative concentrations in the study area.

The following T\_MAMMAL species are found in the San Francisco Bay ESI atlas:

SPECIES ID	NAME
2	Saltmarsh wandering shrew
3	Suisun ornate shrew
7	San Pablo vole
8	Northern river otter
41	Salt-marsh harvest mouse

**5.1.1. ENTITY TYPES:****5.1.1.1. ENTITY TYPE LABEL:**GT-Polygons**5.1.1.2. ENTITY TYPE DEFINITION:**

ID integer

RARNUM integer

**5.1.2. ATTRIBUTES:****5.1.2.1. ATTRIBUTE LABEL:**

ID

**5.1.2.2. ATTRIBUTE DEFINITION:**

A unique identifier that links to the BIO\_LUT table. ID is a concatenation of atlas number (30), element number (4), and record number. ID values of 9999 are holes in polygons and do not contain information.
