Non-CO₂ Climate Gases: An Overview

*David W. Fahey and
James W. Elkins*

ESRL Atmospheric Chemistry Review
January 29-31, 2008 ~ Boulder, Colorado

Non-CO₂ Climate Gases

	Climate	Ozone Depletion	Air Quality
Methane (CH ₄)	●	●	●
Nitrous oxide (N ₂ O)	●	●	
Hydrofluorocarbons (HFCs)	●		
Sulfur hexafluoride (SF ₆)	●		
Chlorofluorocarbons (CFCs)	●	●	
Halons	●	●	
Hydrochlorofluorocarbons (HCFCs)	●	●	
Halogenated solvents:			
Methyl chloroform (CH ₃ CCl ₃)	●	●	●
Carbon tetrachloride (CCl ₄)	●	●	●
Bromo-chloromethane (CH ₂ BrCl)	●	●	●
Carbon monoxide (CO)	●		●
Stratospheric & Tropospheric { Water vapor	●	●	
{ Ozone	●		●
Carbonyl sulfide (COS)	●	●	●

Relevant NOAA ESRL Research Activities

monitoring these gases at the surface and above

calculating emissions

using numerical models for radiative forcing calculations and gas-phase chemistry studies

conducting laboratory and field studies of atmospheric chemical processes

contributing to international and national assessments related to climate change and ozone depletion

NOAA OAR Strategic Plan: FY2005 - FY2010

Radiative forcing by non-CO₂ greenhouse gases

Climate information for policy makers

Climate model uncertainties

Climate sensitivity due to water vapor

Non-CO₂ Climate Gases

	Climate	Ozone Depletion	Air Quality
Methane (CH ₄)	●	●	●
Nitrous oxide (N ₂ O)	●	●	
Hydrofluorocarbons (HFCs)	●		
Sulfur hexafluoride (SF ₆)	●		
Chlorofluorocarbons (CFCs)	●	●	
Halons	●	●	
Hydrochlorofluorocarbons (HCFCs)	●	●	
Halogenated solvents:			
Methyl chloroform (CH ₃ CCl ₃)	●	●	●
Carbon tetrachloride (CCl ₄)	●	●	●
Bromo-chloromethane (CH ₂ BrCl)	●	●	●
Carbon monoxide (CO)	●		●
Stratospheric & Tropospheric {			
Water vapor	●	●	
Ozone	●		●
Carbonyl sulfide (COS)	●	●	●

Observations, Observations, Observations

Investment:

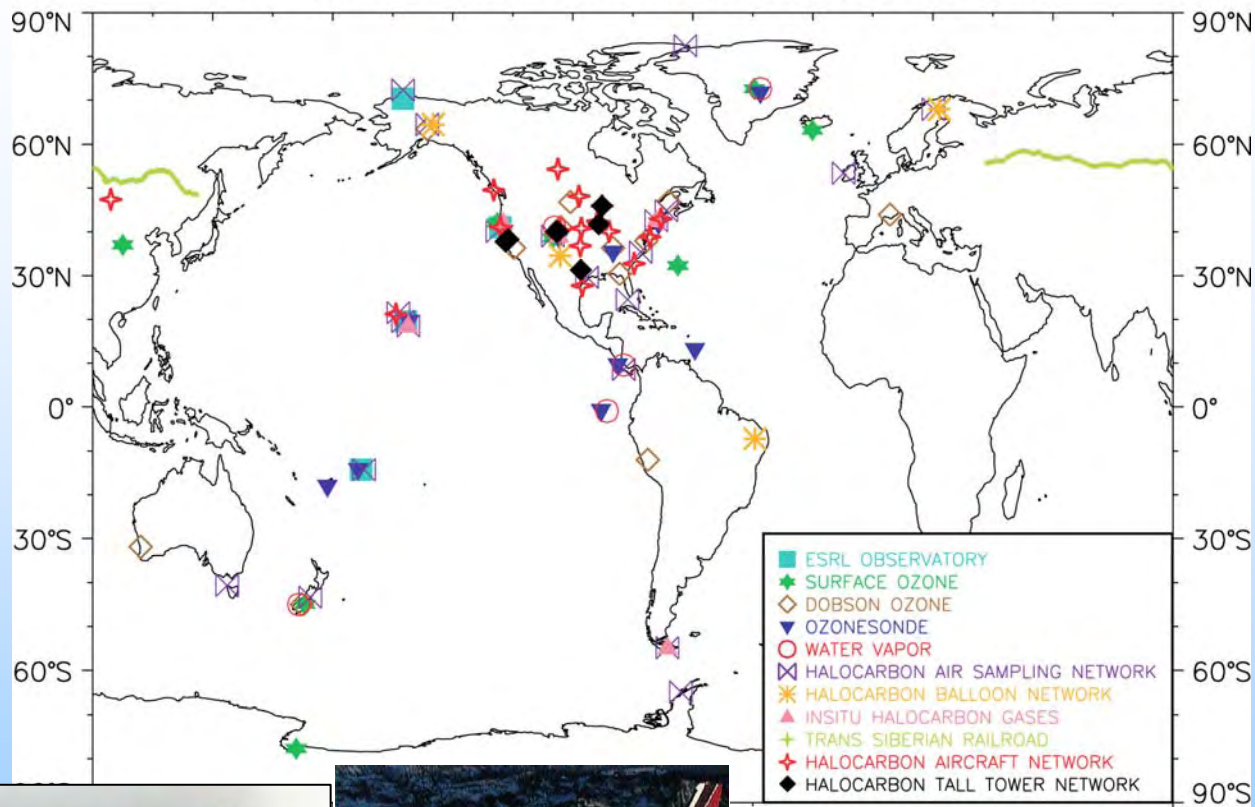

- > Diverse sampling, e.g., ground networks, airborne platforms
- > Calibration & standards

Scientific return

- > Concentrations and trends
- > Emissions
- > Chemical processes: sources and sinks
- > Climate feedback processes
- > Natural & anthropogenic attribution
- > Model projections and uncertainties

Observational Network and Platforms

ESRL Halocarbon Gases and Ozone Networks

Radiative Forcing Components in 2005

(since preindustrial times, ca. 1750)

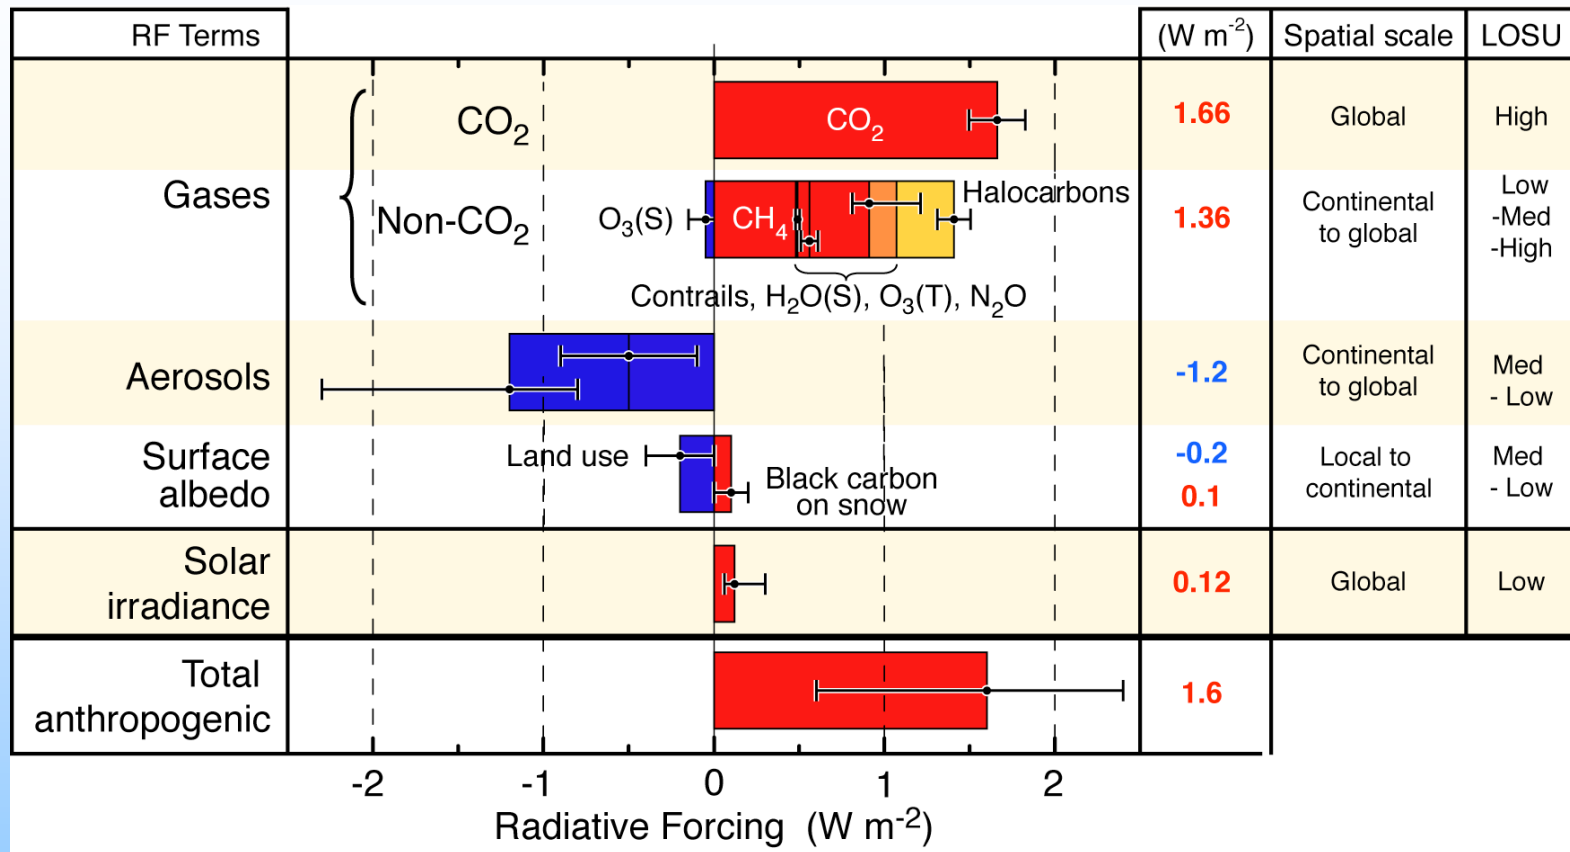

©IPCC 2007: WG1-AR4

- Long-lived non-CO₂ climate gases and ozone represent a significant fraction of anthropogenic RF in 2005
- Ozone forcings have large uncertainties

Radiative Forcing Components in 2005

(since preindustrial times, ca. 1750)

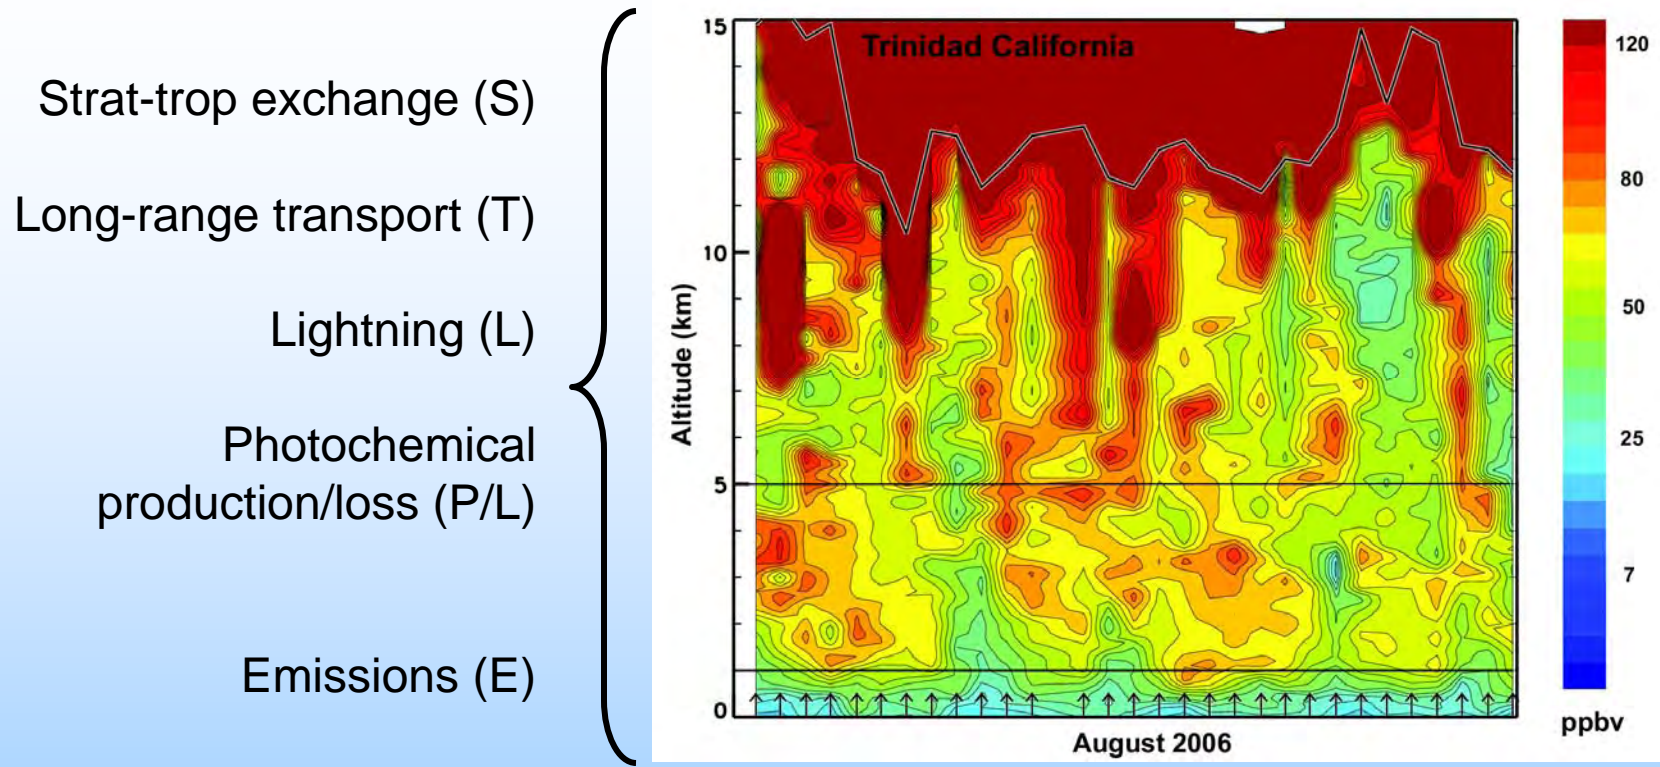

- Long-lived non-CO₂ climate gases and ozone represent a significant fraction of anthropogenic RF in 2005
- Ozone forcings have large uncertainties

Montreal Protocol Accelerated Phaseout of HCFC-22

- HCFC phaseout accelerated in September 2007.
- Policy decisions of this magnitude ultimately must rely on **scientific** results of high quality and relevance.
- ESRL has been and will continue to be a **leader** in measuring HCFC and CFC abundances.

Ozone profiles and surface ozone at Trinidad Head, California

- Tropospheric ozone displays significant variability as result of many controlling processes → **limiting** our understanding

“The picture of long-term tropospheric ozone changes is a varied one in terms of both the sign and magnitude of trends and in the possible causes of the changes.”

S. Oltmans, *Atmos. Environ.*, 2006.

- Trend measurements and analysis **guides and constrains** ozone process studies
Trends = fcn (S + T + L + P/L + E +)

Water vapor observations and analysis

Strat-trop exchange (S)
Long-range transport (T)
Convection (C)
Microphysics (M)
Dehydration (D)

- Atmospheric water vapor, as key **feedback**, strongly affects climate sensitivity to radiative forcing
- Modeling studies necessary to define **mechanisms** and their importance
- Trend measurements and analysis **guides and constrains** ozone process studies
Trends = fcn (S + T + C + M + D +)
- Water vapor **instrumentation** is currently a limiting factor, esp. < 10 ppm
