## **Platinum-Group Metals Worksheet Notes**

#### **Data Sources**

The sources of data for the platinum-group metals (PGM) worksheet are the mineral statistics publications of the U.S. Bureau of Mines and the U.S. Geological Survey—Minerals Yearbook (MYB) and its predecessor, Mineral Resources of the United States (MR); Mineral Commodity Summaries (MCS); and Metal Prices in the United States through 1998 (MP98). The years of publication and corresponding years of data coverage are listed in the References section below. Blank cells in the worksheet indicate that data were either not available or were withheld because they are proprietary.

#### **Primary Production**

Primary production reports the palladium, platinum, and small amounts of the other PGM (iridium, osmium, rhodium, and ruthenium) recovered from placer production and byproduct production from gold and copper smelting for the years 1900–87 in the United States. In 1988, palladium and platinum production from the Stillwater Mine in Nye, MT, were added to the total reported primary production. For the years 1990–2000, primary production reports only the mine production of palladium and platinum at the Stillwater Mine. Data are withheld for 1985 and 1986. For the years 1900–83, data are recorded from the MR and MYB. For the years 1984–98, data are recorded from the MCS. For the years 1999 to the most recent, data are recorded from the MYB.

#### **Secondary Production**

Secondary production reports the PGM recovered from scrap metal, sweeps, and other waste products. Substantial quantities of catalysts, spinnerets, and laboratory-ware are returned for refining or reworking. These metals are not included in secondary production. Data are recorded from the MR and MYB for the years 1913–93. Data were not available for the years 1900–12 and 1994 to the most recent.

### **Secondary Production Toll-Refined**

The secondary production toll-refined category reports the depleted catalysts, worn-out extrusion dies, spinnerets, laboratory ware, and other used equipment that are sent to a refiner and/or fabricator for reworking. A toll is charged for this service. Data for the years 1960–65 and 1967–93 are reported in the MR and MYB. Data are not available for the years 1900–59, 1966, and 1994 to the most recent.

#### **Imports**

Imports report the PGM in metal content imported for consumption into the United States. Data are recorded from the MR and MYB. Data are not available for the years 1900–01 and 1904.

### **Exports**

Exports report the PGM in metal content exported from the United States. Data are recorded from the MR and MYB. Data are not available for the years 1900–10.

### **Apparent Consumption**

For the years 1900–01, apparent consumption was extrapolated. For the year 1904, apparent consumption was interpolated. For the years 1902, 1903, 1905–34, 1939–78, and 1994 to the most recent, apparent consumption for PGM was estimated with the formula:

 $\label{eq:apparent_consumption} APPARENT \ CONSUMPTION = PRIMARY \ PRODUCTION + SECONDARY \ PRODUCTION + IMPORTS \pm (CHANGES \ IN \ GOVERNMENT \ STOCKS) \pm (CHANGES \ IN \ INDUSTRY \ STOCKS) - EXPORTS.$ 

When using the equation, exports were assumed zero for the years 1900–12. For the years 1900–58, and 1997 to the most recent, secondary production, toll-refined data were not included. For the years 1900–12 and 1995 to the most recent, secondary production data were not included. Apparent consumption data for the years 1935–38 and 1979–93 are reported in the MYB.

## **Reported Consumption**

Reported consumption is recorded from the MR and MYB for the years 1918–93. Reported consumption is PGM "sold to industry." Data are not available after 1993.

## Unit Value (\$/t)

Unit value of PGM reports the value of 1 metric ton (t) of PGM apparent consumption. For the years 1918–94, unit value is estimated by weight averaging the amount of each metal sold to industry (from the MR and MYB) with price series for the metals from MP98. For the years 1902–03 and 1905–17, unit value was estimated with the average value of imports. For the year 1900–01 and 1904, production value was used to estimate unit value. A complete weight average of all six PGM is possible for the years 1957–94, because the reported consumption is given for all six metals during this period. For the years 1938–56, the reported consumption is published for palladium, platinum, and other PGM. For the years 1918–37, the reported consumption is published for iridium, palladium, platinum, and other PGM. However, a graphical comparison of \$/t for imports and \$/t for the weight-averaged values demonstrates a close overlap. This is because in the earlier years (prior to 1957) palladium and platinum were the primary metals consumed. For the years 1900–01 and 1904, using the production value to estimate unit value for years when import value was not

available is a good estimate for the same reason. A graphical comparison of \$/t for production and \$/t for imports demonstrates a close overlap. For the years 1994–97, unit value was estimated by weight averaging the amounts of refined metals (palladium, platinum, iridium, ruthenium, and rhodium) imported with prices from the MYB. For the years 1998 to the most recent, unit value was estimated using the value of imports.

## Unit Value (98\$/t)

The Consumer Price Index conversion factor, with 1998 as the base year, is used to adjust unit value in current U.S. dollars to the unit value in constant 1998 U.S. dollars.

#### World Production

World production of PGM is recorded from the MR and MYB for the years 1900 to the most recent.
