

# Housing Starts

MAY 1997

U.S. Department of Commerce  
 Economics and Statistics Administration  
 BUREAU OF THE CENSUS

C20/97-5  
 Issued June 1997

This issue contains a supplement showing annual statistics on new mobile homes placed by state and selected characteristics of new mobile homes placed by region.

Note: Total includes units started in structures with two to four units.

Source: U.S. Bureau of the Census, Housing Starts.

## HOUSING STARTS AND BUILDING PERMITS

Privately owned housing starts in May were at a seasonally adjusted annual rate of 1,397,000. This is 5 ( $\pm 5$ ) percent below the revised April rate of 1,468,000 and 5 ( $\pm 6$ ) percent below the May 1996 figure of 1,476,000.

Single-family housing starts in May 1997 were at a rate of 1,088,000; this is 3 ( $\pm 5$ ) percent below the April figure of 1,116,000. The May rate for units in buildings with five units or more was 271,000. The May rate for units in buildings with two to four units was 38,000.

During the first 5 months of this year, 573,500 housing units were started compared with 593,000 units for the same period in 1996. This is a decrease of 3 ( $\pm 2$ ) percent.

New privately owned housing construction was authorized in May in the 19,000 permit-issuing places at a seasonally adjusted annual rate of 1,443,000 units; this is virtually unchanged ( $\pm 1$  percent) from the revised April rate of 1,442,000, but 1 ( $\pm 1$ ) percent below the May 1996 rate of 1,457,000.

Single-family authorizations in May 1997 were at a rate of 1,056,000; this is virtually unchanged ( $\pm 1$  percent) from the April figure of 1,060,000. Authorizations of units in buildings with five units or more were at a rate of 320,000. The May rate of permit-authorized units in buildings with two to four units was 67,000.

During the first 5 months of this year, 573,700 housing units were authorized by permits in the 19,000 places compared with 585,300 units for the same period in 1996. This is a decrease of 2 ( $\pm 1$ ) percent.

In interpreting changes in housing starts and building permits, note that month-to-month changes in seasonally adjusted statistics often show movements which may be irregular. It may take 4 months to establish an underlying trend for total starts and 3 months for building permit authorizations.

The statistics in this report are estimated from sample surveys and are subject to sampling variability as well as nonsampling error including bias and variance from response, nonreporting, and undercoverage. Estimated average relative standard errors of preliminary data are shown in the tables. Whenever a statement such as "2 ( $\pm 3$ ) percent above" appears in the text, this indicates the range (-1 to +5 percent) in which the actual percent change is likely to have occurred. All ranges given are 90-percent confidence intervals and account for only sampling variability. If a range contains zero, it is uncertain whether there was an increase or decrease; that is, the change is not statistically significant. For any comparison cited without a confidence interval, the change is statistically significant. The April 1997 Current Construction Reports, C20/97-4, includes explanations of confidence intervals and sampling variability. On average, the preliminary seasonally adjusted estimates of total housing starts and building permits are revised about  $\pm 1$  percent.

Housing starts and building permits data do not include mobile home units. Mobile home statistics are shown in Table 5, and in the Supplement.

## HISTORICAL DATA

Historical data on housing starts and residential permit authorizations are available from Residential Construction Branch, Manufacturing and Construction Division, Bureau of the Census, Washington, DC 20233-6900. Telephone 301-457-4703.

A list of tables and special supplements is shown below:

NA Not available. <sup>p</sup>Preliminary (does not apply to shipments). X Not applicable.

<sup>1</sup>Data for placements and shipments of mobile homes are seasonally adjusted at an annual rate.

<sup>2</sup>Average Relative Standard Errors (Avg. RSE): Annual—Avg. RSE for the last 2 years; Monthly—Avg. RSE for the latest 6-month period (January through June or July through December).

Source: Except for manufacturers' shipments, these data are produced by the Commerce Department's Bureau of the Census from a survey sponsored by the Department of Housing and Urban Development. Statistics on shipments are compiled from manufacturers' reports to the National Conference of States on Building Codes and Standards (NCSBCS).

**Table 6. Seasonal Indexes Used to Adjust Housing Units Started**

<sup>a</sup>Preliminary. <sup>b</sup>Revised.

<sup>1</sup>The implicit seasonal index is the ratio of the unadjusted number of housing units started in the United States to the seasonally adjusted national total of housing units started. It provides an indication of the overall seasonality for the particular month.

Note: These seasonal indexes include trading-day adjustment factors.

**Table 7. Seasonal Indexes Used to Adjust Housing Units Authorized in Permit-Issuing Places**

NA Not available. <sup>b</sup>Preliminary (does not apply to shipments).

<sup>1</sup>The implicit seasonal index is the ratio of the unadjusted United States estimate to the seasonally adjusted United States estimate. It provides an indication of the overall seasonality for the particular month.

Note: These seasonal indexes include trading-day adjustment factors.

# Supplement.

## New Mobile Homes Placed in 1996

---

In 1996, an estimated 319,700 new mobile homes were placed for residential use. This is 3 percent above the 1995 total of 310,700. Of the 319,700 homes placed in 1996, 154,100, or 48 percent, were single-wide homes and 160,300, or 50 percent, were double-wide homes. The Midwest and West were the only regions where more double-wide than single-wide homes were placed in 1996; 52 percent of placements in the Midwest and 69 percent of placements in the West were double-wide homes.

The average floor area of all new mobile homes placed in the United States in 1996 was 1,380 square feet. The average sales price of a new mobile home placed in 1996 was \$38,400 compared with the 1995 average of \$36,300. In 1996, sales prices of single-wide homes averaged \$28,200 compared with \$47,300 for double-wide homes. Average sales prices by state appear in Table S-3.

The states where the most new mobile homes were placed in 1996 were North Carolina with 33,200 placements and Texas with 32,200. Table S-2 and Figure 1 show the distribution of new mobile home placements by State; Figure 2 shows the distribution by State of new mobile home placements per 1,000 population.

Table S-1 provides data on selected characteristics of homes placed in the United States and the four census regions. The data for this supplement are from a survey conducted by the Bureau of the Census and sponsored by the Department of Housing and Urban Development.

The methodology for collecting information on new mobile homes for 1974 through 1979 involved contacting a sample of mobile home dealers each month within 137 geographic areas or primary sampling units. The dealers were requested to provide data on the number of mobile homes received from manufacturers, the number placed on a site for residential use, and the number held in inventory.

The methodology used after 1979 involves a monthly sample of new mobile homes shipped by manufacturers. The dealer to whom the sampled unit was shipped is contacted by telephone and asked about the status of the unit. This is done each month until that unit is reported as placed.

### DEFINITIONS

A mobile home is defined as a movable dwelling, 8 feet or more wide and 40 feet or more long, designed to be towed on its own chassis, with transportation gear integral to the unit when it leaves the factory, and without need of a permanent foundation. These mobile homes include multiwides, which are counted as single units, and expandable mobile homes. Excluded are travel trailers, motor homes, and modular housing.

Beginning in 1980, the average sales prices are computed from data for mobile homes sold at or before the time they are placed on a site. Prices (values) of mobile homes leased or sold after placement are not collected. The average sales price

computation for mobile homes placed prior to 1980 included not only the sales price of those sold, but also the intended sales price of those for sale and the value of leased mobile homes.

### RELATED STATISTICS

The series of shipments of mobile homes shown in Table 5 of this report are estimates of new mobile homes shipped by manufacturers each month. These estimates differ from mobile home placements (shown in this supplement and in Table 5) in that shipments to dealers may or may not be placed in the same month as they are shipped.

### RELIABILITY OF ESTIMATES

The estimates in this supplement are based on a sample survey and may differ from the results that would have been obtained from a complete census using the same schedules and procedures. An estimate based on a sample survey is subject to both sampling error and nonsampling error. The accuracy of a survey result is determined by the joint effects of these errors. Sampling error reflects the fact that only a particular sample was surveyed rather than the entire population. Nonsampling errors can be attributed to many sources: inability to obtain information about all cases in the sample, definitional difficulties, differences in interpretation of questions, inability or unwillingness of respondents to provide correct information, and errors made in processing the data. These nonsampling errors also occur in complete censuses. Although no direct measurements of the biases have been obtained, it is believed that most of the important response and operational errors were detected in the course of reviewing the data for reasonableness and consistency. As derived for this report, the estimated relative standard errors include part of the effect of nonsampling errors, but do not measure any systematic biases in the data.

Each sample selected for the Survey of New Mobile Home Placements is one of a large number of similar probability samples that, by chance, might have been selected under the same specifications. Estimates derived from the different samples would differ from each other. The standard error, or sampling error, of a survey estimate is a measure of the precision with which an estimate from a particular sample approximates the average from all possible samples. Estimates of the standard errors for mobile home placements, average sales prices, and selected characteristics have been computed from the sample data. They are presented in the tables in the form of relative standard errors. The relative standard error equals the standard error divided by the estimated value to which it refers. For a more detailed description of sampling variability, see the appendix to Current Construction Reports, C20/97-4.
