HOUSING STARTS AND BUILDING PERMITS

Privately owned housing starts in February 2000 were at a seasonally adjusted annual rate of 1,781,000; this is 1 (± 6) percent above the revised January rate of 1,758,000 and 2 (± 7) percent above the February 1999 figure of 1,738,000.

Single-family housing starts in February 2000 were at a rate of 1,310,000; this is 4 (± 6) percent below the January figure of 1,363,000. The February rate for units in buildings with five units or more was 435,000. The February rate for units in buildings with two to four units was 36,000.

During the first 2 months of this year, 225,800 housing units were started compared with the 220,200 units for the same period in 1999. This is an increase of 3 (± 6) percent.

New privately owned housing construction was authorized in February in the 19,000 permit-issuing places at a seasonally adjusted annual rate of 1,631,000 units; this is 8 (± 1) percent below the revised January rate of 1,772,000, and 6 (± 1) percent below the February 1999 figure of 1,738,000.

Single-family authorizations in February 2000 were at a rate of 1,217,000; this is 8 (± 1) percent below the January figure of 1,318,000. Authorizations of units in buildings with five units or more were at a rate of 345,000 in February; this is 11 percent below the January figure of 389,000. The February rate of permit-authorized units in buildings with two to four units was 69,000.

During the first 2 months of this year, 218,200 housing units were authorized compared with the 219,800 units for the same period in 1999. This is a decrease of 1 (± 1) percent.

In interpreting changes in housing starts and building permits, note that month-to-month changes in seasonally adjusted statistics often show movements which may be irregular. It may take 5 months to establish an underlying trend for total starts and 3 months for building permit authorizations.

The statistics in this report are estimated from sample surveys and are subject to sampling variability, as well as nonsampling error including bias and variance from response, nonreporting, and undercoverage. Estimated average relative standard errors of preliminary data are shown in the tables. Whenever a statement such as "2 (± 3) percent above" appears in the text, this indicates the range (-1 to +5 percent) in which the actual percent change is likely to have occurred. All ranges given are 90-percent confidence intervals and account for only sampling variability. If a range contains zero, it is uncertain whether there was an increase or decrease; that is, the change is not statistically significant. For any comparison cited without a confidence interval, the change is statistically significant. The appendix to this report includes explanations of confidence intervals and sampling variability. On average, the preliminary seasonally adjusted estimates of total housing starts and building permits are revised about ± 1 percent.

HISTORICAL DATA

Historical data on housing starts and residential permit authorizations are available from Residential Construction Branch, Manufacturing and Construction Division, U.S. Census Bureau, Washington, DC 20233-6900. Telephone: 301-457-1321.

A list of tables and special supplements is shown below:

^pPreliminary. ^rRevised.

¹Average Relative Standard Errors: Average for the latest 6-month period (January through June or July through December).

Note: These backlog data represent the number of housing units authorized in all months up to and including the last day of the reporting period and not started as of that date without regard to the months of original permit issuance. Cancelled, abandoned, expired, and revoked permits are excluded from the backlog.

Table 4. New Privately Owned Housing Units Started, by Location and Type of Structure

[Thousands of units. Detail may not add to total because of rounding]

¹The implicit seasonal index is the ratio of the unadjusted number of housing units started in the United States to the seasonally adjusted national total of housing units started. It provides an indication of the overall seasonality for the particular month.

Note: These seasonal indexes include trading-day adjustment factors.

¹The implicit seasonal index is the ratio of the unadjusted number of housing units authorized by building permits in the United States to the seasonally adjusted national total of housing units authorized. It provides an indication of the overall seasonality for the particular month.

Note: These seasonal indexes include trading-day adjustment factors.

Supplement.

New Privately Owned Housing Units by Intended Use and Design at Time of Start: 1999

SUMMARY

Approximately 60 percent of all privately owned housing units started in 1999 were built for sale and, of these, about 12 percent were intended for condominium ownership. As shown in Table S-1, condominium ownership can refer to either single-family houses or units in multifamily buildings. Under condominium ownership, the owners of the individual housing units are joint owners of the common areas of the building or community.

Approximately 80 percent of the units in structures with two units or more were intended for rent, while only about 3 percent of one-unit structures were intended for rent. A small number of units in buildings with two units or more were for sale or sold under cooperative ownership. Under this type of ownership, the occupants of the housing units own stock in a project as a whole, but do not actually own the units in which they live.

Table S-2 shows that about 9 percent of the one-unit structures started in 1999 were attached units. About 5 percent of units in structures with five units or more were townhouse apartments. Design information for structures with two to four units is not available.

For purposes of this report, in addition to single-family detached houses, the Census Bureau defines as "one-unit structures" attached units with no other units above or below which are separated from adjoining units by a ground-to-roof wall (no common attic or basement) and have their own separate utilities which are not shared with any of the other units. Builders of structures containing five units or more and three floors or less were asked to differentiate between townhouse apartments and conventional apartments. Townhouse apartments, though attached with no other units above or below, are not separated by a ground-to-roof wall and/or share the heating system and/or some interstructural facility, such as water supply, sewage disposal, etc. Units in a conventional-type multifamily building may share a common basement, heating plant, stairs, entrance halls, water supply, or sewage disposal facilities.

RELIABILITY OF ESTIMATES

The estimates in this supplement are based on a sample survey and may differ from the results that would have been obtained from a complete census using the

same schedules and procedures. An estimate based on a sample survey is subject to both sampling error and non-sampling error. The accuracy of a survey result is determined by the joint effects of these errors. Sampling error reflects the fact that only a particular sample was surveyed rather than the entire population. Nonsampling errors can be attributed to many sources: inability to obtain information about all cases in the sample, definitional difficulties, differences in interpretation of questions, inability or unwillingness of respondents to provide correct information, and errors made in processing the data. These nonsampling errors also occur in complete censuses. Although no direct measurements of the biases have been obtained, it is believed that most of the important response and operational errors were detected in the course of reviewing the data for reasonableness and consistency. Since "design" and "ownership" characteristics may present more of a conceptual problem to respondents than other statistics in this supplement, the estimates of these characteristics may be subject to higher nonsampling errors. No explicit measures are available for such errors. As derived for this supplement, the estimated relative standard errors include part of the effect of nonsampling errors, but do not measure any systematic biases in the data.

Each sample selected for the Survey of Construction is one of a large number of similar probability samples that, by chance, might have been selected under the same specifications. Estimates derived from the different samples would differ from each other. The standard error, or sampling error, of a survey estimate is a measure of the precision with which an estimate from a particular sample approximates the average from all possible samples. Estimates of the standard errors have been computed from the sample data. They are presented in the tables in the form of relative standard errors. The relative standard error equals the standard error divided by the estimated value to which it refers. For a more detailed description of sampling variability, see the appendix to Current Construction Reports, C20/00-2.
