CURRENT CONSTRUCTION REPORTS

C25/95-A

U.S. Department of Housing and  
Urban Development

U.S. Department of Commerce  
Economics and Statistics Administration  
BUREAU OF THE CENSUS

## Acknowledgments

This report was developed in the Bureau of the Census' Manufacturing and Construction Statistics Division. It was prepared under the general direction of **Linda P. Hoyle**, Acting Chief, Construction Starts Branch. **Steven Berman, A. Nishea Quash, Dale R. Jacobson, Brenda C. Newman, Anne M. Wojcik, Dennis Duke, and Dolores Harris** performed specific activities relating to the presentation, review, and correction of the data and to computation of sampling variances. **Diane Roebuck, James M. Fare,** and **Linh Diep** handled the computer processing. The supplement on the Survey of Market Absorption was prepared in conjunction with **Anne Smoler** of the Housing and Household Economic Statistics Division.

**Lillie M. Skinner** coordinated the various phases of the publication process.

The staff of Administrative and Customer Services Division, **Walter C. Odom**, Chief, performed publication planning, design, composition, editorial review, and printing planning and procurement. **Margaret A. Smith** and **Barbara Adams** provided publication coordination and editing.

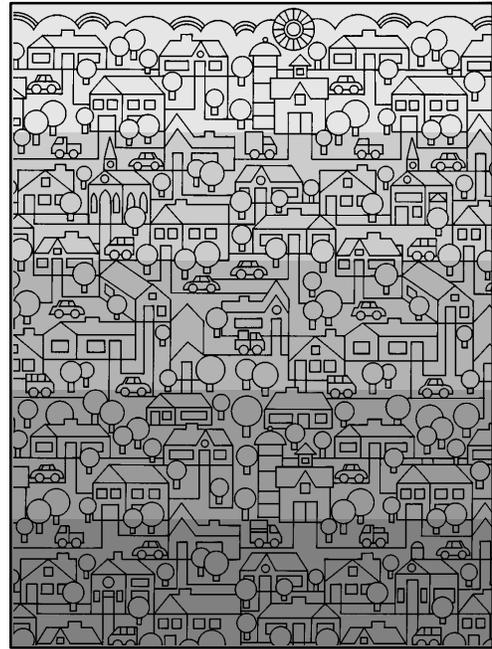

**Ronald J. Sepanik** was responsible for overseeing this report on behalf of the Department of Housing and Urban Development.

The Bureau of the Census is indebted to thousands of respondents included in the samples. Without their cooperation in providing information, this report would not have been possible. The Bureau also extends its appreciation to the field interviewers responsible for collecting the basic data.

## Preface

This report on the characteristics of new housing in 1995 is derived from the Bureau of the Census' Survey of Construction, Survey of New Mobile Home Placements, and Survey of Market Absorption, which are sponsored, all or in part, by the U.S. Department of Housing and Urban Development. The report includes sections on the characteristics of single and multifamily housing completed, one-family houses sold, contractor-built houses started, new mobile home placements, and a supplement on the types and characteristics of apartment units completed in buildings having five units or more.

# Contents

Introduction .....	1
<b>New Privately Owned Housing Units Completed</b>	
Table	
1. Purpose of Construction of New Privately Owned Housing Units Completed by Location: 1991 to 1995 .....	3
<b>Privately Owned One-Family Houses Completed</b>	
2. Central Air-Conditioning by Category of House and Location: 1991 to 1995 .....	4
3. Number of Bathrooms by Category of House and Location: 1991 to 1995 .....	6
4. Number of Bedrooms by Category of House and Location: 1991 to 1995 .....	8
5. Type of Construction Method by Category of House and Location: 1991 to 1995 ....	10
6. Principal Type of Exterior Wall Material by Category of House and Location: 1991 to 1995 .....	12
7. Type of Financing by Category of House and Location: 1991 to 1995 .....	15
8. Number of Fireplaces by Category of House and Location: 1991 to 1995 .....	18
9. Type of Foundation by Category of House and Location: 1991 to 1995 .....	20
10. Type of Heating Fuel by Category of House and Location: 1991 to 1995 .....	22
11. Type of Heating System by Category of House and Location: 1991 to 1995 .....	24
12. Presence of Outdoor Features by Category of House and Location: 1991 to 1995 ..	26
13. Type of Parking Facility by Category of House and Location: 1991 to 1995 .....	30
14. Number of Stories by Category of House and Location: 1991 to 1995 .....	32
15. Square Feet of Floor Area by Category of House and Location: 1991 to 1995 .....	34
16. Average and Median Square Feet of Floor Area by Category of House, Location, and Type of Financing: 1991 to 1995 .....	37
Figure	
1. New Houses With Air-Conditioning .....	5
2. New Houses Using Wood as Exterior Wall Material .....	14
3. New Houses With One Fireplace or More .....	17
4. New Houses With 1,600 or More Square Feet of Floor Area, New Houses With a Full or Partial Basement .....	38
5. New Houses Using Electric Heat, New Houses With a Garage .....	39
<b>Privately Owned Multifamily Housing Completed</b>	
Table	
17. Characteristics of New Multifamily Buildings by Region: 1991 to 1995 .....	40
18. Characteristics of Units in Multifamily Buildings by Region: 1991 to 1995 .....	42

## Figure

6. Comparison of Completed Units With Selected Characteristics: 1991 to 1995 ..... 45

**New One-Family Houses Sold**

## Table

19. Sales Price of Houses by Location and Type of Financing: 1991 to 1995 ..... 46
20. Closing Costs Included in Sales Price of Houses by Location and Type of Financing: 1991 to 1995 ..... 48
21. Price Per Square Foot of Floor Area by Location: 1991 to 1995 ..... 49
22. Square Feet of Floor Area by Location: 1991 to 1995 ..... 51
23. Selected Characteristics by Sales Price: 1995 ..... 52
24. Selected Characteristics by Design of House: 1995 ..... 55
25. Price Index of Houses Sold in the United States: 1977 to 1995 ..... 56

**Contractor-Built Houses Started**

26. Contract Price of Houses by Location: 1991 to 1995 ..... 57
27. Price Per Square Foot of Floor Area by Location: 1991 to 1995 ..... 58

**Mobile Home Placements**

28. Selected Characteristics by Type of Mobile Home and Region: 1991 to 1995 ..... 60
29. Average and Median Square Feet of Floor Area by Type of Mobile Home and Region: 1991 to 1995 ..... 63
30. Average and Median Sales Price by Type of Mobile Home and Region: 1991 to 1995 ..... 63

## Figure

7. Comparison of Mobile Homes With Selected Characteristics: 1991 to 1995 ..... 64

- S-2. Selected Characteristics of New Rental Apartments Completed by Asking Rent: 1995 ..... S-4
- S-3. New Condominiums Completed by Location, Number of Bedrooms, and Asking Price: 1995 ..... S-6
- S-4. Standard Errors of Estimates of Apartments in Buildings With Five Units or More ... S-7
- S-5. Standard Errors of Estimated Percentages for All Types of Apartments, Except for Condominiums ..... S-7
- S-6. Standard Errors of Estimated Percentages for Condominium Apartments ..... S-7

## Figure

8. Survey of Market Absorption of New Apartment Buildings Questionnaire ..... S-8

---

## Introduction

---

This 1995 annual report on the characteristics of new housing is published jointly by the U.S. Department of Commerce, Bureau of the Census, and the U.S. Department of Housing and Urban Development (HUD). Data are obtained from the Bureau's Survey of Construction, Survey of New Mobile Home Placements, and the Survey of Market Absorption. HUD sponsors all or part of these surveys.

This report provides annual estimates on selected physical and financial characteristics of new housing. The first 18 tables provide data on new housing units completed, with tables 1 through 16 showing data by purpose of construction. Data are shown for the United States, inside or outside of metropolitan areas, and within each Census region. Table 1 presents summary data for all housing units completed. Tables 2 through 16 provide specific physical or financial characteristic data for one-family houses completed. Tables 17 and 18 provide data on specific physical characteristics of multifamily buildings (more than one unit in the building) and their units.

See the Contents pages for the characteristics for which data are provided for one-family houses completed. Most, but not all, of these characteristics are shown for either the buildings or units in multifamily buildings.

Two new tables have been added to display even more one-family unit characteristics. The new characteristics shown are method of construction and outdoor amenities. The methods of construction shown are: (1) stick-built; (2) modular; and (3) other. Outdoor amenities shown are: (1) patio; (2) porch; and (3) deck. See appendix B for definitions of these new characteristics.

Tables 19 through 25 provide financial and physical characteristics data on new one-family houses sold. This includes one-family houses sold under condominium arrangements.

Tables 26 and 27 provide financial characteristics data for contractor-built houses started. This category covers custom-built one-family houses; that is, houses built by a general contractor on the owner's land for the owner's use.

Tables 28 through 30 provide data on mobile homes placed for residential use. Data are provided for median and average sales prices as well as certain physical characteristics. In addition to total placements, the tables display separate data for single-wide and double-wide placements

Finally, there is a supplement on the characteristics of apartment units completed in buildings with five units or more. The Bureau's Housing and Household Economics Statistics Division (HHES) produces these data from the Survey of Market Absorption (SOMA). This supplement shows data on the types of units completed, characteristics data about unfurnished rental apartments, and characteristics data about units sold through condominium arrangements.

Being that the estimates in this report are produced from sample surveys, they are subject to sampling variability as well as to errors of response and nonreporting. They may differ from estimates of similar data published by other sources because of differences in definitions, methodologies, scope of the surveys, survey design and controls, and sampling variability.

Other principal sources of data are:

- a. Data on operations of the Federal Housing Administration (FHA) and Rural Housing Service (formerly Farmers Home Administration). Their publications provide more detailed information on the activities of these agencies and the characteristics of houses built under their respective programs.
- b. The Federal Housing Finance Board (FHFB) series on interest rates and other characteristics of conventional first mortgage loans. Its series on conventional first mortgage loans includes information on prices of new houses financed with conventional mortgages.

B Withheld because estimate did not meet publication standards on the basis of sample size.

<sup>1</sup>Includes houses built for rent (not shown separately).

<sup>2</sup>Data prior to 1993 exclude small number of gas heat pumps.

<sup>3</sup>Includes electric baseboard, panel, radiant heat, space heater, floor or wall furnace, solar, other types, or none.

S Withheld because estimate did not meet publication standards on the basis of response rate, associated standard error, or a consistency review. X Not applicable. Z Fewer than 500 units or less than 0.5 percent.

<sup>1</sup>Data prior to 1992 exclude small number of gas heat pumps.

<sup>2</sup>All units in building are included in one size category based on average number of square feet per housing unit. The average was calculated using total square feet of all floors based on exterior dimensions divided by number of housing units in the building. Hallways, lobbies, and elevator shafts were included in the total floor area; unfinished basements, common laundry rooms, etc., were excluded.

Figure 6.  
**Comparison of Completed Units With Selected Characteristics: 1991 to 1995**

— One-family units  
 — Units in multifamily buildings

## BRIEF EXPLANATION OF THE PRICE INDEX

The price index is derived from five separate price models. There are four models for detached houses, one for each of the Census regions and one model for attached houses in the United States. Each of these models is designed to measure changes over time in the sales price of new one-family houses which are the same with respect to important physical characteristics and their location.

Although the price index is designed to measure price changes, keeping quality constant with regard to the characteristics, houses may vary from one time period to the next due to workmanship, materials, and mechanical equipment. Hence, the price index only accounts for such quality characteristics insofar as they may be correlated with the characteristics actually used. These characteristics account for from 60 to 80 percent of the variation in the logarithm of the sales price of new one-family houses.

The price indexes have been structured so that each index equals 100.0 in 1992. The price index for the United States is a weighted average of the indexes computed from the four regional detached models and the attached model. The weight for each index is the proportion of all housing units sold in 1992 of that type. Each regional index is a weighted average of the detached regional index and an attached regional index derived from the attached model. The weight for each of these indexes is the proportion of housing units sold in that region of that type in 1992.

Each index is calculated by making a regression estimate of the logarithm of the sales price of the 1992 house based on the characteristics used for each index. After the regression coefficients have been computed from the current data, the current period index number for each of the five indexes is calculated from the Laspeyres, fixed weight formula by dividing an estimate (shown in column six) of the average price of the kinds of houses sold in 1992 in terms of what they would have sold for in another period by their 1992 average sales price of houses sold in 1992.

Since the price index applies to the total sales price, it covers not only cost of labor and materials, but also land cost, direct and indirect selling expenses, and seller's profits. The index is thus conceptually broader in coverage than a cost index. Reflecting the sales price, the price index is affected by all factors which influence movements of house prices—both supply factors such as wage rates, material costs and productivity, and demand factors such as demographic changes, income, and availability of mortgage money.

The price index is computed from actual transaction prices, including value of the developed lot, of houses built for sale and actually sold by merchant or speculative builders. Excluded from the index are houses built for the exclusive use of the land owner who either hires a single general contractor to build the house or acts as his own general contractor. A house is defined as sold when a sales contract is signed or deposit accepted regardless of the stage of construction and the month of sale refers to the contract or deposit date.

Because the price index is based on fixed proportions of certain characteristics of new houses sold in 1992, movements of the price index may differ greatly from changes in the average sales price of new houses actually sold. Unlike the price index, the average sales price of new houses actually sold may change from one period to the next not only because of price changes which are independent of quality, but also because of shifts in quality; that is, the proportions of new houses with different characteristics.

For example, the price index indicates that new houses sold in 1992, which had an average sales price of \$144,100, would have sold for \$161,900 in 1995. However, the actual average sales price of new houses sold in 1995 was \$158,700. The difference of \$3,200 may be attributed to the shift towards smaller houses and houses with fewer amenities.

## Appendix A.

# Description of Surveys

---

The statistics in this report are estimates based on sample surveys conducted by the Bureau of the Census, U.S. Department of Commerce, under contract with the U.S. Department of Housing and Urban Development (HUD).

### **SURVEY OF CONSTRUCTION**

This survey is used to produce estimates of new housing units started, completed, or sold. Every month interviewers obtain data from the builders or owners of a sample of new housing units for which permits have been issued or, in nonpermit areas, on which construction has started. This national sample covers 169 areas consisting of counties and independent cities. Within these areas interviewers sample building permits issued monthly in approximately 820 areas requiring them. They select permits for 1-to-4-unit buildings with probability proportional to the number of units on the permit so that overall 1 in 40 units is selected. All permits for 5-or-more-unit buildings are selected. Within the 169 areas there are land areas not requiring the issuance of building permits, called nonpermit areas. These areas were grouped into 2 strata according to their 1980 populations. Overall, 1 of every 120 land areas from the strata with larger land areas was selected; 1 out of every 600 was selected from the strata of smaller land areas. This selection produced a sample of approximately 130 land areas which interviewers canvass for all new housing units started. Each sampled building is followed through until completion and, if applicable, sale. The statistics from this survey are based upon data received by the end of March 1996. We estimate that about 1 percent of all activity occurring in 1995 still had not been reported by this time. Imputations are made to cover this small amount.

### **MOBILE HOME PLACEMENTS**

Each month the National Conference of States on Building Codes and Standards (NCSBCS) provides the Census Bureau with lists of new mobile home shipments. NCSBCS works as an agent for HUD ensuring that newly constructed mobile homes meet HUD standards. The lists identify the mobile homes produced and the dealers to whom the units are shipped. From these lists, a random sample is selected at an overall rate of 1 of every 40 units shipped. The dealers receiving the selected units are then contacted by telephone and asked about the status of each selected unit. We continue this procedure for each selected unit until it is placed.

### **ADJUSTMENT FOR NONREPORTING**

Most statistics have been adjusted to eliminate nonreporting. Cases for which a characteristic was not reported have been distributed proportionally to those for which the characteristic was reported. For example, assume that 80 percent of the units represented by cases reporting on the characteristic "air-conditioning" indicate it is installed. Then, 80 percent of the units covered by cases for which the air-conditioning characteristic was not reported will be counted as having it installed. This is done only when the percentage of cases reporting a given characteristic is at a statistically acceptable level. For this report that level is 75 percent reporting. In most instances, if this level is not attained the statistics are suppressed. For all other cases, the tables have been marked to warn of the potential weaknesses of the estimates.

### **RELIABILITY OF DATA**

Since the statistics are estimates based on sample surveys, they may differ from statistics obtained from a complete census using the same forms and procedures. Estimates based on sample surveys are subject to both sampling and nonsampling error. The accuracy of an estimate is determined by the joint effects of these errors.

### **Measures of Sampling Errors**

Sampling errors reflect the fact that only a particular sample was surveyed rather than the entire population. The sample selected for this survey is one of a large number of similar probability samples that, by chance, might have been selected using the same specifications. Estimates derived from the different samples would differ from one another. The standard error, or sampling error, of a survey estimate is a measure of the variation among the estimates from all possible samples and, thus, is a measure of the precision with which an estimate from a particular sample approximates the average from all possible samples.

Estimates of the standard errors covering the period 1991 through 1995 have been computed from the 1993 through 1995 sample data for selected statistics in this report. They are presented in tables A-1 through A-5. The estimates in tables A-4 and A-5 are expressed in the form of relative standard errors. Table A-6 shows relative standard errors for characteristics of mobile home placements in 1995. The relative standard error equals the standard error divided by the estimated value to which it refers.

The sample estimate and an estimate of its standard error allow us to construct interval estimates with prescribed confidence that the interval includes the average result of all possible samples with the same size and design. A 90-percent confidence interval is defined as being from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate. If all possible samples were selected and surveyed under essentially the same conditions and all the respective 90-percent confidence intervals were generated, then approximately nine-tenths of the intervals would include the average value of all sample estimates and approximately one-tenth would not. For example, table 1 of this report shows that an estimated 682,000 one-family houses built for sale were completed in 1995. The standard error of this estimate interpolated from table A-1 is 13,180. To obtain a 90-percent confidence interval, multiply 13,180 by 1.6 and add or subtract the result from 682,000. This yields limits of 660,912 and 703,088. The average estimate of one-family houses completed and built for sale may or may not be contained in this computed interval, but one can say that the average is included in the constructed interval with a specified confidence of 90 percent.

To economically derive estimates of applicable standard errors for a wide variety of items found in this report we made certain approximations. As a result, the relative standard errors shown in tables A-4 through A-6 provide orders of magnitude rather than precise values. Tables A-1 through A-3 show a generalized formula for computing the standard errors as well as providing these errors based on orders of magnitude.

### Nonsampling Errors

As calculated for this report the standard error measures certain nonsampling errors, but does not measure any systematic biases in the data. Bias is the difference, averaged over all possible samples with the same size and design, between the estimates and the true value being estimated. Nonsampling errors can be attributed to many sources:

1. inability to obtain information about all cases in the sample,
2. definitional problems,
3. differences in interpretations of questions,
4. inability or unwillingness of respondents to provide correct answers, and
5. errors made in processing data.

These nonsampling errors also occur in complete censuses. Although no direct measurements of the biases have been obtained, it is believed that most of the important response and operational errors were detected while reviewing the data for reasonableness and consistency.

The overall nonresponse rate for questions asked for this survey is very low. Practically everyone asked responded to the questionnaires shown in appendix C. However, nonresponse to individual items varied. For the physical characteristics, such as the number of bathrooms or bedrooms, the nonresponse rate is between 1 and 10 percent. Items with higher nonresponse rates are those related to the sales price of new houses sold or to the contract price of contractor-built houses.

### ILLUSTRATED USES OF STANDARD ERRORS TABLES

Table 19 shows that the estimate of the number of new houses sold in the South region with a sales price between \$70,000 and \$79,999 is 22,000. Using the generalized formula ( $SE = 16 \sqrt{\text{est.}}$ ) given in table A-1, one can compute the value of the standard error for 22,000 by replacing "est." with the estimate, to obtain a standard error of 2,374. To obtain a 90-percent confidence interval multiply 2,374 by 1.6, which produces a result of 3,799. Add or subtract that result from 22,000 yielding limits of 18,201 and 25,799 houses.

The estimate of the proportion of houses sold in the South region (300,000 total) with a sales price between \$70,000 and \$79,999 is 7 percent. Using the generalized formula ( $SE = 16 \sqrt{(p \times q)/y}$ ) shown in table A-2, one can compute the standard error. The value of "p" is 7 percent. The value of "q" is defined as 100 - p, or 93 percent. The value of "y" is the base, 300,000. Thus, the standard error of 7 percent with a base of 300,000 houses is 0.7 percentage points. This means that a 90-percent confidence interval for 7 percent would be between 5.8 and 8.2 percent (7 percent plus or minus 1.2, which is  $0.7 \times 1.6$ ).

Table 19 also shows that the median sales price of new houses sold during 1995 in the South region was \$124,500. Table A-4 shows that the relative standard error of the estimate is 3 percent. Multiplying \$124,500 by 0.03, we obtain \$3,735 as the standard error. A 90-percent confidence interval for \$124,500 would be between \$118,524 and \$130,476.

Table 17 shows that 10,000 of the buildings with two units or more completed in the United States in 1995 had electricity for heating fuel. Table A-5 shows that the relative standard error of the estimate is 6 percent. Multiplying 10,000 by 0.06, we obtain 600 as the standard error. A 90-percent confidence interval for 9,000 would be between 9,040 and 10,960.

Table 30 shows that the average sales price for all mobile home placements in the West region was \$46,800. Table A-6 shows that the relative standard error of the estimate is 2 percent. Multiplying \$46,800 by 0.02 yields a standard error of \$936. Producing a 90-percent confidence interval would give limits of \$45,302 and \$48,298.

## Appendix B. Definitions

---

**Bathroom.** For the purposes of this survey, a full bathroom is one that has a wash basin, a toilet, and either a bathtub or shower, or a combination of bathtub and shower. A half bathroom is one that has either a toilet, bathtub, or shower, but not all the facilities to be classified as a full bathroom. If the respondent reported a full bathroom and two half bathrooms, the house is classified as a two-bathroom house.

**Bedroom.** A bedroom is a finished room specifically designed to be used for sleeping. A den, a space in the attic, or a basement which could be converted to a bedroom are not counted as bedrooms.

**Closing costs.** The closing costs are the total estimated costs customarily chargeable to the buyer for items which are incidental to the transaction. These costs include the initial service charge of the mortgage, cost of title search, charges for the preparation of deed and mortgage documents, mortgage tax, recording fees, and similar items. For houses sold with FHA-insured mortgages, they include an examination or application fee. Items not included in closing costs are deposits for unaccrued taxes, insurance premiums, and similar items that are treated as prepayable expenses.

**Contractor-built houses.** This category includes all houses built for owner occupancy on owner's land with construction under the supervision of a single general contractor.

### Construction Method

*Modular.* Finished 3-dimensional sections of the complete dwelling, built in a factory, are transported to the site to be joined together on a permanent foundation.

*Panelized.* Shipped from the factory as a package of wall panels, roof trusses, and other components to be assembled on site. May include all materials required to finish the house as a complete package. For purposes of this report panelized houses are included in the "Other" category.

*Precut.* A package of lumber or timber (logs), precut to exact size, length, and quantity, to be assembled on site. Package may also include plumbing, wiring, and/or heating system elements. For purposes of this report precut houses are included in the "Other" category.

*Stick-built.* Built on site. Can include SOME factory components such as roof and floor trusses, wall panels, door frames, etc.

**Contractor price.** The contract price used in this survey for contractor-built houses is the price on the original contract awarded to the general contractor. The contract price does not reflect any subsequent changes in the price resulting from change orders or from any other factors affecting the price of the house. It does not include the cost of any contracts awarded to a different contractor for work on the grounds around the house, nor does it include any proposed expenditures on the house after construction is completed by the general contractor. Finally, because the house is being built for the owner's occupancy on his own land, the contract price does not include the cost of the land.

The median contract price is equal to the middle point of all contract prices reported. The point is chosen so that half the contract prices of houses started are below the median and half are above the median. The average, or arithmetic mean, contract price is obtained by dividing the sum of all contract prices by the number of houses reporting contract prices.

**Deck.** A floored area without a roof, not sitting directly on the ground, typically made of wood.

**Efficiencies.** One room apartment units or studio apartment units which have no room designated specifically for sleeping.

**Exterior wall material.** The statistics on exterior wall material relate only to the principal type used; that is, the material covering more than half the exterior wall.

**Financing, type of.** The type of financing tabulated in this survey is the type reported at the time the original sales agreement was signed or deposit accepted. However, changes in the type of financing do occur between the original contract signing and final settlement. These changes are not reflected in the tables.

The FHA and VA type-of-financing data presented in this report tend to differ from those published directly by those agencies. For the actual number of FHA-insured and VA-guaranteed loans made for new houses at the time of final settlement, refer to the publications of the respective agencies. The data differ because of the difference in time

periods between the signing of the original sales contract, the start of construction, and the insurance or guarantee of the mortgage, as well as the sampling variability in this survey.

Early in 1995 the Farmers Home Administration was reorganized. As part of this reorganization the Rural Housing Service now handles the mortgage functions formerly done by the Farmers Home Administration.

**Fireplace (indoor).** An indoor fireplace is defined as an open recess in a chimney in which a fire may be built. Included are those made of masonry, tile, metal, or other permanently installed materials that are a fixed and integral part of the building.

**Floor area.** For this survey, floor area is defined as all completely finished floor space, including space in basements and attics with finished walls, floors, and ceilings.

In concept, measurement is based on exterior dimensions. Measurements are taken to the outside of exterior walls for detached houses. Half stories are measured to the outside of enclosing partitions. Row houses are measured from the centerline of party walls to the outside surface of the exterior walls. For purposes of this survey, where the floor area for a new house was reported based on interior dimensions, the figure was converted to exterior dimensions by multiplying by a standard conversion factor of 1.08. A standard conversion factor of 1.04 was used to convert figures to exterior dimensions where it was not known whether the reported area was based on exterior or interior dimensions.

**Heat pump.** "Heat pump" refers to a heating/cooling system which utilizes indoor and outdoor coils, a compressor, and refrigerant to pump hot air in during the winter and out during the summer. Only heat pumps that are centrally installed with ducts to the rooms are included in this category.

**Housing unit.** A housing unit is defined as a single room or group of rooms intended as separate living quarters by a family, by a group of unrelated persons living together, or by a person living alone. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which have direct access from the outside of the building or through a common hall which is used or intended to be used by the occupants of another unit or the general public.

In addition to single-family detached houses, the definition of single-family houses also includes those townhouses attached together in groups of two or more which are partitioned from each other by a ground-to-roof wall. Also, these units must not share heating/air-conditioning systems or interstructural public utilities, such as water supply, power supply, or sewage disposal lines.

**Metropolitan Statistical Areas (MSA's).** The general concept, as originally defined in June 1983, underlying the specific MSA or older SMSA definitions is a geographic

area consisting of a large population nucleus together with adjacent communities having a high degree of economic and social integration with that nucleus. For the MSA definitions this meant an area qualified for MSA status by: (1) including a city of at least 50,000 population; or (2) including an urbanized land area of at least 50,000 population with a total metropolitan population of at least 100,000 (75,000 in New England).

Besides the county containing the main city or urbanized area, an MSA may include additional counties having strong economic and social ties to the central county. These ties are determined chiefly by the extent of the urbanized area and by census data on commuting to work. Thus, an MSA can contain more than one city of 50,000 population and may cross State lines.

**Mobile home.** A movable dwelling, 8 feet or more wide and 40 feet or more long, designed to be towed on its own chassis. The transportation gear is integral to the dwelling when it leaves the factory. There is no need for a permanent foundation. There are two general types of units.

*Single-wide.* Is any unit so designated by a dealer. There is only one section and only one HUD label number.

*Double-wide.* Is any unit so designated by a dealer consisting of more than one section and more than one HUD label number.

**New houses (built for sale) completed.** This category includes new houses occupied, or available for occupancy, by the end of the year, which have been sold or are still for sale.

**New houses sold.** The category, "houses sold," includes all houses for which a sales contract has been signed or a deposit accepted. This includes houses for which a sales contract is signed or deposit accepted before construction is actually started; for instance, houses sold from a model or from plans before any work is started on the footings or foundations. It also includes houses sold while under construction or after completion; that is, houses built on speculation.

**Owner-built houses.** This category includes houses built for owner occupancy, on owner's land, under the supervision of the owner acting as his own general contractor: (1) in most cases built partly by owner and partly with paid help; (2) sometimes built entirely with the employment of subcontractors; and (3) in a smaller number of cases, on a "do-it-yourself" basis.

**Patio.** A floored area, with or without a roof, sitting directly on the ground. This does not include small concrete pads at entryways.

**Porch.** A floored area with a roof, enclosed or open, not sitting directly on the ground. This does not include small covered entryways.

**Regions.** The standard census geographic regions are used in the tables of this report. States included in each region are:

*Northeast.* Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania;

*Midwest.* (formerly North Central)—Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas;

*South.* Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, and Texas;

*West.* Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, California, Alaska, and Hawaii.

**Rental houses.** A house or housing unit used by a person or persons who do not own nor are purchasing the property.

**Response rate.** The percentage of respondents answering a survey question. The overall response rate for all new houses covered by this survey is very high. Practically everyone asked responded to the questionnaires shown in appendix C. However, response to individual items varied. For the physical characteristics, such as number of bedrooms or bathrooms, the response rate is within the range of 90 to 99 percent. Items with response rates somewhat lower are those related to the sales price of new houses sold or the contract price of contractor-built houses started.

**Sale.** The sale of the new house occurs with the signing of a sales contract or the acceptance of a deposit. This survey does not follow through to the final stage of the sales transaction. Land must be included in the transaction.

**Sales price.** The sales price used in this survey is the price agreed upon between purchaser and seller (and reported by the latter) at the time the first sales contract is signed or deposit is made for the house. The sales price does not reflect any subsequent price changes resulting from change orders or from any other factors affecting the price of the house. Furthermore, the sales price does not include the cost of any extras or options paid for in cash by the purchaser or otherwise not included in the original sales price reported by the seller.

The median sales price is the middle point of all sales prices reported; the point is chosen so that half the houses were sold with a sales price below the median and half with a sales price above the median. The average, or arithmetic mean, sales price is obtained by dividing the sum of all the sales prices reported by the number of houses reporting a sales price.

**Stages of construction.** The stages of construction are defined as follows:

*Start.* A house is defined as started at the time of excavation for the footings or foundation. For a house or building being totally rebuilt on an existing foundation, a start occurs when work on the superstructure of the new building begins.

*Completion.* A house is defined as completed when all finished flooring has been installed (or carpeting if used in place of finished flooring). If the building is occupied before all construction is finished, it is classified as completed at the time of occupancy. In privately owned buildings with two or more housing units, all the units in the buildings are counted as completed when 50 percent or more of the units are occupied or available for occupancy. In most of these buildings all units within the building actually become available for occupancy at the same time. In some larger apartment buildings, some floors or some units are completed and occupied before other parts of the building are completed. In these cases, housing units counted as completed prior to completion of the entire building tend to be offset by those housing units in other buildings actually completed during that month but which had been counted as completed previously.

**Story.** That portion of a building between the floor and the ceiling or roof, or the next floor above in the case of a multistory house. A basement is not counted as a story even if it is finished as a den or recreation room. Houses referred to as “bi-levels” or “split foyers” are classified as two-story houses.

*Half story.* A story finished as living accommodations located wholly or partly within the roof frame is considered a half story; it is tabulated in this survey as a whole story; for example, one and one-half stories is counted as two.

*Split level.* Identifies a structure having floors on more than one level when the difference in some floor levels is less than one story. This definition is interpreted on the basis of local custom and may vary from area to area.

## Supplement.

# Survey of Market Absorption

## Selected Characteristics of Apartment Units

This supplement presents preliminary statistics on selected characteristics of apartment units in the Survey of Market Absorption (SOMA). This survey provides data on the rate at which newly completed, privately financed, nonsubsidized, unfurnished apartment units in buildings containing five or more units are rented or sold (absorbed).

The buildings selected for SOMA are those included in the Survey of Construction (SOC), which is described in Appendix A. Description of Surveys of this report. Each quarter a sample of buildings with five or more housing units in the SOC sample reported as completed during that quarter come into sample for SOMA. Buildings completed in locations not requiring building permits are excluded.

Table S-1 provides preliminary data on the types of apartment units completed during the year 1995. Table S-2 provides preliminary data about unfurnished units for rent. Table S-3 provides preliminary data for unfurnished units being sold under a condominium arrangement. This table excludes units sold under a cooperative ownership arrangement.

These data are preliminary and are subject to revision when published in future issues of Current Housing Reports, series H130, *Market Absorption of Apartments*.

### ESTIMATION PROCEDURE

Annual estimates are obtained within each region by summing the four quarterly estimates. Unbiased quarterly estimates are formed by multiplying the counts for each building by its base weight (the inverse of its probability of selection) and then summing over all buildings. The final estimate is then obtained by multiplying the unbiased estimate by the following regional ratio estimate factor:

$$\frac{\text{SOC}}{\text{SOMA}}$$

where SOC is the total estimated units in 5+ unit buildings completed in permit-issuing areas for that quarter and where SOMA is the estimated total number of units in 5+ buildings for that quarter. The United States total is the sum of the regions.

This procedure produces estimates of the units completed in a given quarter which are consistent with the published figures from the Current Construction Reports, Series C22, *Housing Completions*, and also reduces, to some extent, the sampling variability of the estimates totals.

Therefore, the estimates shown in this supplement are not the same as those shown in the other tables of this report because they do not include:

- a. Units in buildings containing two to four units.
- b. Units completed in areas not requiring the issuance of building permits.

### RELIABILITY OF ESTIMATES

The SOMA statistics are subject to the same sampling errors and nonsampling errors as described in Reliability of Data in appendix A because SOMA uses subsamples of the SOC samples. Additional errors are also introduced due to subsampling of buildings with five units or more.

It is assumed that the characteristics of units not included in the interviewed group or not accounted for are identical to ones for units where data were obtained. The noninterviewed and not accounted for cases constitute less than 2 percent of the sample housing units in the SOMA survey.

### ILLUSTRATED USES OF STANDARD ERRORS TABLES

Table S-2 shows that the estimate of the number of unfurnished apartments completed in the Midwest region with an asking rent between \$450 and \$549 was 11,000. Using the generalized standard errors from table S-4, one can calculate the standard error for the estimate of this size to be approximately 1,678. One can also construct a 90-percent confidence interval by multiplying 1,678 by 1.6 to obtain limits of 8,315 and 13,685.

Table S-2 also shows that of the estimated 27,000 unfurnished apartments completed with an asking rent between \$450 and \$549, 42 percent were in the Midwest region. Using table S-5 one can compute a standard error for 39 percent with a base of 27,000 units to be about 4.7 percentage points. Multiplying 4.7 x 1.6 yields 7.6. Adding or subtracting 7.6 from 39 percent produces a 90-percent confidence interval of between 31.4 and 46.6 percent.

Similarly, using tables S-4 and S-6 one can compute the standard errors and 90-percent confidence intervals for the characteristics of condominiums shown in table S-3.

## DEFINITIONS

**Condominium.** A building in which each unit is owned individually, although not necessarily by the person(s) occupying the unit. The owner of each unit also holds a common or joint ownership in all common areas and facilities that serve the building: land, roofs, hallways, entrances, elevators, lobbies, etc.

**Cooperative.** A building that is owned by its shareholders and is organized as a corporation. Ownership of shares in the corporation entitles each shareholder to perpetual use of one or more units in the building until the owners sell their shares.

**Federally subsidized.** Units in buildings built under programs of HUD, such as the Low Income Housing Assistance (Section 8), Senior Citizens Housing Direct Loans (Section 202), and all units in buildings in the FHA rent supplement program.

**Rental apartments.** Units in buildings built for rent wherein the building is owned by an individual, partnership, private corporation, or organization other than a public agency.

**Unfurnished.** Management provides only such items as a range, refrigerator, carpeting, and drapes.

**Furnished.** Management provides all the major articles of furniture, such as bed, chest of drawers, sofa, chairs, and tables.

## ADDITIONAL INFORMATION

See current Housing Reports, series H130, *Market Absorption of Apartments*, for further information about SOMA and its estimation procedure. Otherwise, call 301-763-8552 regarding questions about the data found in this supplement.

Table S-1. **Type of Apartment Units Completed in Buildings With Five Units or More by Location: 1995**

[Preliminary data. Components may not add to totals because of rounding. Percents computed from unrounded figures]

Type of apartment unit	United States	Inside MSA's	Outside MSA's	Northeast	Midwest	South	West
<b>Number of apartment units (thousands)</b>							
Total .....	212	191	21	16	44	99	54
Rental apartments:							
Unfurnished .....	156	141	15	7	32	79	38
Furnished .....	2	2	(Z)	(Z)	1	1	(Z)
Condominiums <sup>1</sup> .....	36	31	5	5	7	12	12

25 or 75 .....	21.6	9.0	6.8	1.8	3.0	2.5	2.2	1.8	1.2	0.9
40 or 60 .....	24.4	10.9	7.7	5.5	3.5	2.8	2.4	2.0	1.3	1.0
50 or 50 .....	24.9	11.1	7.9	5.6	3.5	2.9	2.5	2.0	1.3	1.0

p=Percent distribution. q=100-p. SE=Standard error. y=Base for a given characteristic.

Table S-6. Standard Errors of Estimated Percentages for Condominium Apartments

$$\left( SE = 20 \sqrt{\frac{p \times q}{y}} \right)$$

Estimated percentages (p or q)	Number of houses in base of percentage <sup>(y)</sup>									
	1,000	3,000	5,000	10,000	15,000	25,000	50,000	75,000	100,000	150,000
2 or 98 .....	8.9	5.1	4.0	2.8	2.3	1.8	1.3	1.0	0.9	0.7
5 or 95 .....	13.8	8.0	6.2	4.4	3.6	2.8	1.9	1.6	1.4	1.1
10 or 90 .....	19.0	11.0	8.5	6.0	4.9	3.8	2.7	2.2	1.9	1.5
20 or 80 .....	25.3	14.6	11.3	8.0	6.5	5.1	3.6	2.9	2.5	2.1
25 or 75 .....	27.4	15.8	12.2	8.7	7.1	5.5	3.9	3.2	2.7	2.2
40 or 60 .....	31.0	17.9	13.9	9.8	8.0	6.2	4.4	3.6	3.1	2.5
50 or 50 .....	31.6	18.3	14.1	10.0	8.2	6.3	4.5	3.7	3.2	2.6

p=Percent distribution. q=100-p. SE=Standard error. y=Base for a given characteristic.
