## NOAA Technical Memorandum NMFS

#### Abstract

The National Marine Fisheries Service's Alaska Fisheries Science Center uses the NOAA Technical Memorandum series to issue informal scientific and technical publications when complete formal review and editorial processing are not appropriate or feasible. Documents within this series reflect sound professional work and may be referenced in the formal scientific and technical literature.

The NMFS-AFSC Technical Memorandum series of the Alaska Fisheries Science Center continues the NMFS-F/NWC series established in 1970 by the Northwest Fisheries Center. The new NMFS-NWFSC series will be used by the Northwest Fisheries Science Center.

This document should be cited as follows:

#### Abstract

This report presents a compilation by species, year, area, and gear type (trawl, longline, pot, and jig) of observer data on incidental take by the domestic (1989-2001) and joint venture (1989-1990) groundfish fisheries in the U.S. Exclusive Economic Zone of Alaska and the U.S. West Coast. Nineteen species of marine mammals (276 individuals) were observed killed or injured. Four of these 19 marine mammal species are classified as endangered under the Endangered Species Act: the western population only of the Steller sea lion (Eumetopias jubatus), the humpback whale (Megaptera novaeangliae), the fin whale (Balaenoptera physalus), and the sperm whale (Physeter macrocephalus). Sperm whales were not killed in groundfish gear, but two sperm whales were considered seriously injured after becoming entangled in and released with trailing longline gear. The only take recorded for the jig fishery was one Dall's porpoise (Phocoenoides dalli) entangled in the lines and released with trailing gear; no marine mammals were directly killed by jig gear. Thirteen individual marine mammals sustained minor injuries before being returned to the sea, and 26 other individuals returned to the sea unharmed after either being caught by the gear or boarding the vessel of their own volition. Sea otters (Enhydra lutris) were reported killed in the groundfish fisheries only by pot gear, and only in 1992. Stratified random sampling ratio estimates were used to calculate total bycatch. The at-sea Pacific whiting trawl fishery off the coasts of Washington, Oregon, and California was estimated to have incidentally caught and killed a total of 44 marine mammals between 1990 and 2001. In Alaska, the domestic trawl fishery was estimated to have incidentally killed a total of 445 marine mammals during the years from 1989 to 2001. The estimated average annual bycatch of Steller sea lions by the domestic trawl fisheries in Alaska during 1990-2001 was about $10 \%$ of the level of the average annual estimated take ( 127 sea lions) by the joint venture fisheries in Alaska during 1985-1989.

## INTRODUCTION

Assessing the status of marine mammal stocks includes determining various sources of natural and human-induced mortality. One source of human-induced mortality that has impacted marine mammal populations is incidental take (bycatch) in commercial fisheries. For example, Steller sea lions (Eumetopias jubatus) were incidentally caught by foreign and joint venture groundfish trawl fisheries in Alaska during 1973-1988, and bycatch of adult female sea lions in these fisheries was considered an important source of mortality during the 1970s in the early phases of the decline of the Steller sea lion populations in Alaska (Loughlin and York 2000; Perez and Loughlin 1991).

Section 3(13) of the Marine Mammal Protection Act of 1972 (MMPA) states that the term "take" means to harass, hunt, capture, or kill, or attempt to harass, hunt, capture, or kill any marine mammal. Section 3(18) of the Endangered Species Act of 1973 defines the term "take" as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct. Incidental take is unintentional or accidental take which might occur during an otherwise lawful activity. Amendments to the MMPA in 1994 required that fisheries be managed based on incidental serious injuries and mortalities, and these amendments also allowed the Secretary of Commerce to prohibit, as necessary, the use by fisheries of deterrence of marine mammals.

The National Marine Mammal Laboratory (NMML) and the North Pacific Groundfish Observer Program (NPGOP) at the Alaska Fisheries Science Center (AFSC), National Marine Fisheries Service (NMFS), have been compiling and analyzing data collected by observers on the interactions of marine mammals with fisheries in the North Pacific Ocean and Bering Sea since the early 1970s. Data collected since 1989 by observers aboard vessels of the U.S. domestic groundfish fisheries have been analyzed annually to assess: 1) the levels of incidental take, and 2) the number of animals subjected to deterrence to prevent interactions with fishing gear (including predation on groundfish catches). The NPGOP published several reports during
the early 1990s that summarized the history, sampling methods, and groundfish catch statistics of the joint venture (1989-1990) and domestic groundfish fisheries (1990-1991) in Alaska and the North Pacific Ocean (Berger et al. 1990; Guttormsen et al. 1990, 1992a, 1992b, 1992c; Narita et al. 1994). No comparable reports have been published for the years 1992 to 2001. The sampling methods used by observers at sea are detailed in the NPGOP training manual for observers (AFSC 2001). This manual undergoes annual revision to include changes in fishery regulations, improved sampling design, and recent additions to data collection requirements.

The domestic fishery is harvested by a variety of gear types, but most observer trips occur on vessels using one of three types: trawl, longline, or pot (AFSC 2001). Trawl vessels fish with a net towed behind the boat. The net is shaped like a large funnel. At the end of this funnel is a bag called the codend, which collects fish caught by the net. A non-pelagic trawl is the use of any trawl net towed by one vessel which does not meet the configuration (e.g., mesh size, fishing line, ropes, floats, weights, etc.) specified for a pelagic trawl net in the fishing regulations. Trawlers make up the largest component of vessels which carry observers and include both catcher vessels and catcher/processor vessels (C/Ps). Catcher vessels are generally small boats that do not process their catch. Catcher/processors have factories and freezers aboard. It is the ability to freeze fish that differentiates C/Ps from catcher boats, and a vessel which freezes whole fish is still considered a C/P. Longline vessels fish with fixed hooks strung along a ground line. The longline can be several miles long and can have thousands of baited hooks attached. The longline fleet is made up of both catcher boats and C/Ps. Pot vessels fish with fixed steel traps, or "pots". The fish enter the pot in search of bait and become trapped inside. Most pot vessels are catcher boats, but there are a few C/Ps. A few observers have also been placed on jig (hook and line) fishing vessels which fish using a single, non-buoyed, weighted line with hooks attached and a moving retrieval device (longline vessels use a stationary, buoyed, and anchored line with hooks and a fixed roller device for retrieval). Observers are not placed on U.S. fishing vessels less than 60 feet in length. The joint venture groundfish fisheries during 1989 and 1990 consisted of U.S. catcher boats using trawl gear that
delivered their fish to foreign processor vessels of the following countries: the People's Republic of China, Iceland, Japan, the Republic of Korea, Poland, and the former Soviet Union (Russia).

The purpose of this report is to present a compilation by year and gear type (trawl, longline, pot, and jig) of the incidental take of marine mammals by the domestic groundfish fisheries (1989-2001) and the joint venture trawl fisheries (1989-1990) in the U.S. Exclusive Economic Zone (EEZ) off Alaska and the U.S. West Coast. The marine mammal bycatch data from all years (1989-2001) have been reanalyzed in this study based on updated information on species identification from canine tooth specimens and DNA analyses, as well as the current requirement to manage fisheries based on data from both serious injuries and mortalities. Average annual trends or interannual differences in catch rates, biological data collected by observers from incidentally caught marine mammals, and the predominant groundfish catch species when marine mammals were incidentally caught by the domestic groundfish fisheries during 1989-2001 is discussed by Perez (in prep. ${ }^{\text {a }}$ ).

## METHODS

In this report, rates of incidental take are presented by gear type (trawl, longline, pot, and jig), year (1989-2001), and statistical reporting area. The statistical reporting areas for the groundfish fisheries in the U.S. EEZ off Alaska and the U.S. West Coast were redefined and modified between 1989 and 1993 from the original system developed for the International North Pacific Fisheries Commission (INPFC, 1952-1992) to the current management area definitions (Appendix 1). The results from each statistical area were also summarized by the three geographical regions of the U.S. EEZ: 1) the Bering Sea and Aleutian Islands (Fig. 1); 2) the Gulf of Alaska (Fig. 2); and 3) the North Pacific Ocean off the coasts of Washington, Oregon, and California (Fig. 3).

Observer data were combined with fishery data to produce estimates of incidental take as described in the following paragraphs. Ratio estimates (for each subgroup of species, gear type,
statistical area, and year) of total marine mammal incidental take by the groundfish fisheries were derived using two data components: 1) the number of observed marine mammals caught per metric ton ( t ) of fishing effort monitored by observers onboard at-sea vessels (but not from observers stationed at shoreside processing plants), and 2) the estimated total commercial fishing effort (metric tons).

## Total Fishing Effort (Fishery Catch Data)

The only effort data available for the entire fishery (all years, gears, and areas) was estimated total weights ( t ) of catches. The total fishery catch weights for the joint venture trawl fisheries during 1989-1990 were compiled by Berger et al. (1990) and Guttormsen et al. (1992b). The estimated total weight of fish (retained plus discarded amounts) caught by all vessels in the domestic fishery, including those vessels without observers, and for each calendar week by statistical area were derived from the "Blend" database of the NMFS Alaska Regional Office. The Blend database combines industry and observer data from the following sources: 1) shoreside processor weekly production reports, 2) catcher/processor weekly production reports, and 3) observer reports of total estimated catch. The Blend database summarizes catch by week except for 1989 which was summarized by month. The total weights of groundfish catches in the at-sea trawl fisheries off the coasts of Washington, Oregon, and California were based only on observer reports since 1992.

The total numbers of vessels that fished, days of fishing, hauls or sets deployed, and gear devices (nets, hooks, pots, or jigs) used by all vessels (observed and unobserved vessels) in any particular area during a given week were not available. Table 1 lists vessel observer coverage and effort by fishing days and gear type for observed cruises during 1989-2001 by year and region. Based on data (not presented here) in the NORPAC (observer database maintained by the NPGOP) and Blend databases, approximately $80 \%$ of the total groundfish catch by the entire trawl and longline fisheries was taken by observed vessels ( $28 \%$ for pot and $1 \%$ for jig vessels). Applying these percentages to the data presented in Table 1 may provide estimates for the total
numbers of days fished or sets deployed in the entire fishery. This assumes constant average proportions of tonnage caught in sets deployed per day by gear type among all vessels; assumptions that are untested.

The locations where trawl sets occurred on observed cruises in the Bering Sea, Aleutian Islands, and Gulf of Alaska are shown for pelagic trawls in Figure 4, non-pelagic trawls in Figure 5, and joint venture trawls in Figure 6. The locations where trawl sets occurred on observed cruises off Washington, Oregon, and California are shown for pelagic trawls in Figure 7, non-pelagic trawls in Figure 8, and joint venture trawls in Figure 9. The locations where longline sets occurred on observed cruises in the Bering Sea, Aleutian Islands, and Gulf of Alaska are shown in Figure 10. The locations where pot sets occurred on observed cruises in the Bering Sea, Aleutian Islands, and Gulf of Alaska are shown in Figure 11.

Two known biases must be considered when using catch tonnage as a measure of fishing effort. First, part of the groundfish catch on longline gear is lost to predation by marine mammals or sharks prior to retrieval, and there is no way to account for the weight of the lost catch from the empty hooks or remaining fish fragments (heads, lips, etc.). Second, the weight of some prohibited species bycatch or miscellaneous catch may be included in NORPAC, but not in the Blend database. The first bias (loss to predation) affects both NORPAC and the Blend databases equally, and thus may be considered negligible. The second bias is also mainly an issue for longline fisheries, for which prohibited fish species bycatch or miscellaneous catch items can sometimes represent up to $18 \%$ of the total weight of the longline set. Inclusion of such data in the NORPAC database will produce conservative (lower) estimates of total take compared to the Blend data since the species composition matrix will be different between the two databases for the same vessels. However, exclusion of these prohibited species weights from NORPAC likely would inflate catch rates and estimates. The species composition matrices of the two databases were not modified because there is no reliable method of estimating the weight of excluded prohibited fish bycatch or miscellaneous catch items in the unobserved fishery.

The regional totals of catch weights for the entire fishery presented in the tables in this report vary slightly from totals presented elsewhere because the catch weights were summed by strata to obtain regional totals. The Blend database is a hybrid of industry and observer data, and there is sometimes a discrepancy in catch data reported by statistical area, vessel class, and week between the two databases. It was necessary to account for differences in catch weights between the two data sets when the total groundfish catch weight on observed cruises exceeded that of the reported fishery tonnage in the same stratum. In all cases the NORPAC data were considered the minimum levels for catch (i.e., less than or equal to the expected "Blend" value; the "Blend" values were adjusted to equal the observer data when the former was lower).

## Observer Data

AFSC (2001) provides a complete and detailed discussion of all observer duties, record-keeping forms and data codes, and procedures used to record and sample marine mammal bycatch and sightings, in addition to the procedures used by observers to monitor fishing effort and the composition of the groundfish catch. The observer's duties and priorities consist of collecting catch information, estimating total tonnage of groundfish caught, sampling for species composition of fish in the catch and the incidence of prohibited crab and fish species in the catch, collecting biological data on various species, and watching for incidental take of marine mammals and seabirds. The NPGOP Observer Manual (AFSC 2001) states that the first priority of an observer is to record incidental takes and collect specimens of short-tailed albatross (Phoebastria albatrus), to record takes of marine mammals, and to collect canine teeth from pinnipeds (except walrus, Odobenus rosmarus) and tissue samples from cetaceans. Bycatch of short-tailed albatross and marine mammals take precedence over recording fishing effort and catch. This is a shift in priorities from those assigned to observers on foreign and joint venture vessels in the 1970s and 1980s when marine mammal incidental catch data were secondary and not to interfere with the collection of fishery catch data (Perez and Loughlin 1991). In addition to the collection of pinniped teeth (for identification of species and age estimation) and cetacean
tissue samples (for identification of species and stock structure), observers are also asked to determine sex and length of any marine mammal found dead in the catch and to take photographs of any marine mammal involved in an interaction.

The "unidentified" categories used in this study do not imply the take of mammals from species not listed in Table 2. Rather, in most cases, the unidentified animals can be presumed to belong to one of the identified species of pinnipeds or cetaceans, but positive identification was not possible. This was generally because they were either not seen or examined closely by the observer, or they were in advanced stages of decomposition.

Observers recorded marine mammal interactions with fishing gear and vessels on standardized forms (or, since 1997, electronically through the ATLAS At-Sea Program on vessels equipped for satellite transmission of computer data). Marine mammal data forms for the domestic groundfish fisheries were still in development in 1989, and most observers on domestic vessels used the joint venture fishery marine mammal forms that year. Some improvements to the data collection forms and marine mammal duties of observers have been made since 1990 . For example, estimating the proportion of each gear set monitored began in 1992, and groundfish catch predation has been routinely recorded since 1997.

Observers were instructed to randomly pre-select hauls (sets) which they would monitor for incidental take of marine mammals. These randomly selected hauls or sets were used to calculate unbiased bycatch rates and estimates of total takes by the observed and unobserved fraction of the entire fleet of the groundfish fisheries. Observers also recorded interactions with marine mammals in unmonitored hauls on the same vessel whether the observer actually saw the animal involved with the interaction or was subsequently informed of the incident by the crew. However, in most cases the observer did see (and measure) the incidentally caught marine mammal from an unsampled haul, after being informed by the crew of the animal's capture.

## Estimated Incidental Take

All observed marine mammals (actually seen and examined by the observer) which were seriously injured, killed by the gear or the vessel propeller, or lethally taken by the crew (none were reported during 1989-2001) during monitored hauls (sets) were included in bycatch rate estimations. The following data were not included in the bycatch estimation procedures used in this study (but their recorded occurrences are listed in Appendices 2 and 3): 1) animals which boarded the vessel or climbed on gear of their own volition, or were caught by the gear and subsequently returned to the sea unharmed or with only minor injuries; 2) carcasses in varying states of decomposition which were caught by the gear but were presumed to have died at some time prior to fishing operations, including dead animals for which the time and cause of death was unknown; 3) reported occurrences of isolated marine mammal parts (e.g., walrus tusks, pieces of baleen, skulls, or bones), miscellaneous unidentifiable fragments (tissue, blubber, or skin), or solitary aborted fetuses.

The seriousness of the injuries or trailing gear was not determined by the observers, nor was it recorded in NORPAC. Angliss and DeMaster (1998) provide guidelines for classifying injuries and/or trailing gear as either a "serious injury" or a "minor injury". A marine mammal observed incidentally taken in a monitored set and also considered a "serious injury" was included in bycatch rate estimations. Comments (edited) recorded by observers on the condition of each of the animals which were injured or had trailing gear are listed in Appendix 4.

Total incidental takes of marine mammals were calculated as ratio estimates on the basis of the number of observed marine mammals incidentally caught per metric ton of groundfish in monitored hauls (sets). Ratio estimates (with tonnage as the effort parameter) were previously applied to the foreign and joint venture trawl fisheries (Perez and Loughlin 1991). They were applied in this study to analyses of marine mammal data from all gear types in the domestic groundfish fisheries for which tonnage was the only available effort statistic.

All observed hauls within each stratum were used to calculate the mean and variance of marine mammal bycatch. A ratio estimate allowed for unequal size hauls, but assumed the observed portion of each haul was an independent sample unit. In fact, each haul was not independent because hauls occurred in groups (cluster samples) for a vessel with a NMFS-certified observer onboard for a series of fishing days (a cruise). For simplicity, the vessel-cruise cluster sampling and the different observer sampling rates for various vessel size classes were ignored in this analysis. Although approximately $70 \%$ of the total number of trawl, longline, or pot sets and $54 \%$ of jig sets (Table 1) on a given cruise were monitored by an observer for marine mammal interactions, the actual proportion of the groundfish catch within a particular set monitored by an observer varied by gear type and circumstance (e.g., time and priority constraints). By definition, observed trawl hauls were considered monitored for marine mammal interactions in their entirety (100\%). However, the percentage of the groundfish catch of longline, pot, and jig sets monitored for marine mammal interactions varied from 0 to $100 \%$. Thus, a smaller percentage of the groundfish catch (tonnage basis) in these fisheries was observed for marine mammal bycatch than for the trawl fishery. The NORPAC database contained estimated weights of the entire groundfish catch (all species combined) in whole sets (official total catch); these weights were adjusted by the percentage of the set monitored for marine mammals to obtain the weight of the observed portion of groundfish catch in the set.

Catch rates and estimates of incidental take for each species (and combined species) of marine mammals were calculated for each 4-week period (minimum stratum level) by year, statistical area, gear type, and vessel class (catcher/processor, mothership/processor, or catcher-only vessel). Each of the 13, 4-week periods per year were defined as four calendar weeks (ending on the same day of the week as the "Blend" database stratum) with partial weeks (at the start or end of the year) included in the first or last period. Bycatch rates and estimated takes were calculated independently for each stratum, and estimates of total bycatch and variance for each stratum were summed (stratified) to calculate rates and estimates for annual and regional totals. The statistical formulae used in this process are listed in the Appendix 5. The
total number of hauls (sets) in the entire fishery was estimated using the proportion of hauls (sets) for observed tonnage (NORPAC) to the total fishery catch tonnage ("Blend") to derive data necessary to estimate parameters in the calculation of standard errors of catch rates.

Rates and variance of incidental take for each stratum were calculated by the simple random sampling ratio estimate $(\hat{R})$ method, using the sum of the marine mammals observed killed or seriously injured by fishing operations divided by the sum of the observed tonnage of fish catch in monitored hauls. Total estimated bycatch $\left(\hat{Y}_{R_{s}}\right)$ was calculated by the separate ratio estimate method in stratified random sampling (Cochran 1977, Levy and Lemeshow 1999). The fraction of hauls observed in the total fishery is unknown; instead, the percentage of total tonnage sampled was used as an estimate of the fraction of total effort observed. The resulting values are reported as multiples of $10,000 \mathrm{t}$ of fish catch.

Total estimated incidental take of marine mammals was first calculated by multiplying the observed rate of incidental take (per metric ton of fish catch) in each stratum by the total tonnage caught by the entire fishery in the same stratum. Second, the estimated takes of all strata were summed (stratified) to obtain the total bycatch (stratified random sampling ratio estimator, $\hat{Y}_{R_{s}}$ ) by year and area. Third, the calculated stratified random sampling ratio estimator was adjusted $\left(\hat{Y}_{A}\right)$ to include the number of additional marine mammal mortality takes reported by observers which were both 1) unobserved and/or unmonitored, and 2) occurred only in strata which had zero or unknown bycatch (i.e., bycatch reported by observers in strata where marine mammal bycatch was not observed in monitored hauls). This adjustment was necessary to prevent underestimation of annual and regional bycatch when incidental take was known to occur but was missed by the sampling design. Unobserved and/or unmonitored takes from strata which had observed monitored takes were ignored because they comprised a fraction of the estimated bycatch for a stratum. These adjustments were only made on the estimates of the total number of marine mammals taken by the entire fishery; the bycatch rates and confidence intervals presented in this report were calculated using data only from observed marine mammals taken in randomly sampled, monitored sets.

Estimated values of bycatch were rounded to the nearest integer. Upper confidence limits were rounded up to the nearest integer larger than or equal to the calculated value; the lower confidence interval limit values were rounded down to the nearest integer smaller than or equal to the calculated value. Thus, some minor rounding errors occur when adding the tabular integer totals across statistical areas (or combining species). If it is important to know the value of $\hat{Y}_{R_{s}}$ rather than $\hat{Y}_{A}$, it is easy to determine the value of $\hat{Y}_{R_{s}}$ (before the adjustment of additional takes was made) directly from the tables by the following procedure: multiply the catch rate ( $\hat{R}$, after dividing by 10,000 ) times the total groundfish catch ( t ) to obtain the result $\left(\hat{Y}_{R_{s}}\right)$ which should then be rounded up to the smallest integer larger than or equal to the calculated value.

The ratio estimates and catch rates presented in this report were calculated by summing the ratio estimate results (stratification) from individual subgroups of the data based on gear type, year, statistical area, vessel class, and month (4-week period). Thus, although similar, the values of the ratio estimates and catch rates in this report will be slightly different from those previously presented annually during the last decade in stock assessment reports (e.g., Angliss and Lodge 2002, Carretta et al. 2002), unpublished reports or memoranda where the data were merely aggregated (pooled) and then recalculated by non-stratified ratio estimates in any combination of the data by time, area, or vessel class. In addition, because this report included recently updated information on species identification from teeth specimens and DNA analyses, as well as the inclusion of data from serious injuries, the numbers of observed and estimated incidental takes will also slightly vary from the previously published stock assessment reports. Differences in observer coverage (by tonnage) listed in the tables of this report from Appendix 6 in Angliss and Lodge (2002) are merely the result of the stratification process in summing the updated groundfish catch data in the Blend and NORPAC databases.

## RESULTS AND DISCUSSION

Incidental Take
Nineteen species of marine mammals have been observed killed or injured by fishing operations during 1989-2001 (Table 2). Four of these 19 marine mammal species are classified as endangered under the Endangered Species Act: the western population only of the Steller sea lion, the humpback whale (Megaptera novaeangliae), the fin whale (Balaenoptera physalus), and the sperm whale (Physeter macrocephalus).

Steller sea lions often congregate around a vessel to feed from a discard chute, a trawl codend, or a longline as it being retrieved. Vessel crews have deterred sea lions from damaging the groundfish catch (e.g., Pacific cod, Gadus macrocephalus; walleye pollock, Theragra chalcogramma) and/or gear, or from being caught by the gear using several methods, including noise devices, pole gaffs, or firecrackers ("seal bombs") to frighten the animals. Acoustical deterrence devices have also been used to prevent other marine mammal species such as killer whales (Orcinus orca) and sperm whales, which may feed on groundfish (e.g., Greenland halibut, Reinhardtius hippoglossoides; Pacific halibut, Hippoglossus stenolepsis; sablefish, Anoplopoma fimbria) directly from longline gear. Whales feeding directly on hooked groundfish are the most common type of interactions between marine mammals and longline vessels. Six other species of marine mammals have also been infrequently observed involved in these predation or deterrence interactions (Table 2). However, interactions involving predation of the groundfish catch by marine mammals and deterrence of the mammals from the gear by crew members are not considered incidental take, and they will not be discussed in this report. They are referenced here because they are one of the factors involved in the chances that a marine mammal will be incidentally taken by the fishery. Most marine mammal predation and deterrence interactions do not result in incidental takes. The frequency of observed predation interactions by marine mammals on the groundfish catch during 1997-2001 and observed deterrence interactions by the crew is discussed separately by Perez (in prep. ${ }^{\text {b }}$ ).

During 1989-2001, a total of 276 marine mammals of the 19 identified species were observed (in monitored sets) killed or seriously injured incidental to commercial fishing operations (trawl, longline, pot, or jig gear) in the U.S. EEZ off Alaska and the U.S. West Coast (Tables 3-7). The locations in Alaska and off the coasts of Washington, Oregon, and California where these species were taken by the domestic and joint venture groundfish fisheries during 1989-2001 are shown in Figures 12-17 as follows: northern fur seals, Callorhinus ursinus (Fig. 12); California sea lions Zalophus californianus (Fig. 13); Steller sea lions (Figs. 13 and 14); walruses (Fig. 12); bearded seals, Erignathus barbatus (Fig. 15); harbor seals, Phoca vitulina (Figs. 13 and 15); spotted seals, Phoca largha (Fig. 15); ringed seals, Pusa hispida (Fig. 15); ribbon seals, Histriophoca fasciata (Fig. 15); northern elephant seals, Mirounga angustirostris (Figs. 13 and 15); humpback whales (Fig. 16); minke whales, Balaenoptera acutorostrata (Fig. 16); fin whales (Fig. 16); sperm whales (Fig. 16); Pacific white-sided dolphins, Lagenorhynchus obliquidens (Figs. 13 and 17); killer whales (Fig. 17); harbor porpoises, Phocoena phocoena (Fig. 17); Dall's porpoises, Phocoenoides dalli (Figs. 13 and 17); and sea otters, Enhydra lutris (Fig. 12).

The domestic trawl fisheries in the Bering Sea, the Aleutian Islands region, and the Gulf of Alaska was estimated to have incidentally killed a total of 445 marine mammals during the years from 1989 to 2001: 25 northern fur seals, 176 Steller sea lions, 27 walruses, 18 bearded seals, 27 harbor seals, 6 spotted seals, 20 ringed seals, 4 ribbon seals, 3 northern elephant seals, 3 humpback whales, 2 minke whales, 3 fin whales, 2 Pacific white-sided dolphins, 13 killer whales, 8 harbor porpoises, 82 Dall's porpoises, 15 unidentified pinnipeds, 9 unidentified cetaceans, and 2 unidentified marine mammals (Table 3). The at-sea Pacific whiting trawl fishery off the coasts of Washington, Oregon, and California was estimated to have incidentally caught and killed a total of 44 marine mammals between 1990 and 2001: 5 California sea lions, 5 Steller sea lions, 4 harbor seals, 6 northern elephant seals, 4 Pacific white-sided dolphins, 18 Dall's porpoises, and 2 unidentified pinnipeds (Table 3). During 1989 and 1990, the joint venture trawl fisheries caught and killed an estimated 17 marine mammals in Alaska ( 2 northern
fur seals; 8 Steller sea lions; 2 walruses; 3 harbor seals; and 2 minke whales) and 14 individuals in the North Pacific Ocean off the coasts of Washington, Oregon, and California (8 Pacific white-sided dolphins, 4 Dall's porpoises, and 2 unidentified cetaceans) (Table 4).

Catch rates and bycatch estimates for pelagic and non-pelagic trawl gears were combined in Table 3 because the blend database does not distinguish between these two gear types prior to 1996. Northern fur seals, Steller sea lions, bearded seals, harbor seals, killer whales, and Dall's porpoises have been observed killed by both types of trawl gear. However, except for the Steller sea lion in the Bering Sea, the numbers of observed mortalities were insufficient in most years to justify illustrating bycatch estimates by type of trawl gear. Catch rates and estimates of Steller sea lion mortalities were greater for non-pelagic trawl gear hauls than for pelagic trawl gear hauls (observer coverage was similar for both trawl gears), although fishing effort (groundfish tonnage caught) using pelagic trawl gear was approximately twice the amount caught with non-pelagic trawl gear (Fig. 18).

Longline gear may have directly killed an estimated total of 154 marine mammals between 1990 and 2001 in Alaska (but this estimate may be high as discussed in the next section below): 66 Steller sea lions, 39 harbor seals, 3 ribbon seals, 15 northern elephant seals, 4 Pacific white-sided dolphins, 4 killer whales, 9 Dall's porpoises, and 14 unidentified pinnipeds (Table 5). Although no sperm whales were reported killed by the groundfish gear, two sperm whales were entangled and considered seriously injured by trailing longline gear (Table 5). An observer saw one unidentified baleen whale that was released with trailing gear after being seriously injured by entanglement in the buoy line of an unmonitored pot set (Table 6); this was the only cetacean reported taken by the pot fishery in Alaska during 1989-2001. The only take by the jig fishery was one Dall's porpoise which was considered to have suffered a serious injury when entangled with trailing gear (Table 7); no marine mammals have been reported directly killed by groundfish jig gear.

Thirteen marine mammals ( 2 northern fur seals, 7 Steller sea lions, 2 unidentified otariids, 1 walrus, and 1 Dall's porpoise) suffered minor injuries or were entangled in
non-threatening amounts of trailing gear before being released alive to the sea (Appendix 2). Sixteen pinnipeds (4 northern fur seals, 9 Steller sea lions, and 3 unidentified pinnipeds) boarded the vessel of their own volition and 10 other marine mammals (1 northern fur seal, 4 Steller sea lions, 2 walruses, 1 unidentified pinniped, and 2 unidentified dolphin/porpoises) were caught or entangled by the gear but subsequently freed by the crew and returned to the sea; all 26 of these animals apparently were unharmed by the interaction (Appendix 2). A detailed list of all marine mammal bycatch reported by observers onboard groundfish vessels in the U.S. EEZ off Alaska and the U.S. West Coast during 1989-2001 is presented in Appendices 2 and 3.

Only in 1992 were sea otters reported killed by any type of groundfish gear. That year observers saw eight sea otters caught in monitored pot sets that occurred during May to August in locations near the fishing closure zones around Steller sea lion rookeries on Attu Island (observed pot fishing did not occur at the same nearshore locations in subsequent years during the same months). An additional 10 sea otters were estimated killed by the pot fishery that year (Table 6). Seven harbor seals were estimated killed by the pot fishery between 1990 and 2001 (Table 6).

## Ratio Estimates

One problem with ratio estimates as applied here, regardless of stratification, is that the level of observer coverage directly influences the catch rate calculations. In strata with low observer coverage, and where marine mammal takes also occurred, the calculated bycatch rates and estimates will tend to be high. Stratification preserves this slight upward bias. This can be seen in Table 5 where the stratified estimated incidental takes of Steller sea lions (Areas 630 and 650) and harbor seals (Area 650) by longline gear are probably overestimates. However, as can be seen in Tables 3-7, there were few such instances. The calculated values were retained in this report because there was no basis to change any value only because it seemed high.

Distribution and abundance of marine mammals vary geographically and temporally in the regions discussed in this study, and the susceptibility of mammals to interactions with fishing
gear vary accordingly. The stratified ratio estimate method was used to partially account for seasonal and spatial variability in the absence of other data related to marine mammal biology. This approach seemed more reasonable than assuming that the bycatch rates for strata representing different areas and seasons in the monitored fishery would also apply to any unmonitored area of Alaska at any time of the year, which has sometimes been done in the past when using a simple ratio estimate approach with aggregated (pooled) data for an entire region or year comprising a single stratum.

The stratified estimates of total bycatch in this study should be conservative because any possible bycatch in strata (by time, area, and vessel class) without any observer coverage was not included. However, should there have been any bycatch in these unobserved strata, it was presumably minimal (unless unusual types of takes occurred in such strata due to different fishing conditions or marine mammal biology, but there is no basis to expect such a scenario). The percentage of the vessel fleet which fished in strata that was unobserved by the NPGOP (all sets in such strata were unmonitored) was generally small, or the amount of fishing that occurred on these unobserved vessels is low. For the combined years (1989-2001), the percentages of the total fishery catch by gear type in these unobserved strata were: $2.0 \%$ (domestic trawl), $0.02 \%$ (joint venture trawl), $7.8 \%$ (longline), $15.0 \%$ (pot) and $97.1 \%$ (jig). Although the pot and jig gear fisheries were largely unobserved because the vessels generally are too small to accommodate an observer and the fishery is considered to present a low probability of interaction, the fishing effort using these gear types was very low compared to trawl catches. The percentage of the total groundfish catch taken by gear for all years (1989-2001) combined was $88.8 \%$ by domestic trawl gear, $3.5 \%$ by joint venture trawl gear, $6.5 \%$ by longline gear, $1.1 \%$ by pot gear, and $0.02 \%$ by jig gear. Thus, it seems reasonable to assume that the estimations of marine mammal bycatch using the stratified separate ratio estimate method accounted for the vast majority of expected incidental take by the groundfish fisheries in the U.S. EEZ. off Alaska and the U.S. West Coast.

## Marine Mammal Bycatch and Stock Assessment

Stock assessment reports for marine mammals (e.g., Angliss and Lodge 2002, Carretta et al. 2002) base their assessments on the most recent 5 years of information on marine mammal serious injury and mortality. However, the data in Tables 3-7 provide the bycatch rates and estimates on an annual basis. Appendix 6 lists data on the average annual rates and estimates for 1997-2001 which have been based on Tables 3-7 and taken from Perez (in prep ${ }^{\text {b }}$ ) and modified by the author to be consistent with marine mammal stock definitions (Angliss and Lodge 2002, Carretta et al. 2002) and the format of Tables 3-7 of the present report. Thus, the data in Appendix 6 lend themselves to being used in stock assessment reports consistent with current practice.

Three endangered marine mammal species were observed killed or seriously injured by gear used in the domestic groundfish fisheries in the 1990s that were not observed killed or injured by the foreign or joint venture fisheries in the 1970s or 1980s: the humpback whale, the fin whale, and the sperm whale. It is possible that any one of these three species may also have been involved in critical bycatch interactions under similar circumstances involving trawl or longline gear in the foreign or joint venture groundfish fisheries prior to the 1990s when monitoring of marine mammal bycatch by observers was less prevalent than in the domestic fishery.

The annual incidental mortality catch rates of Steller sea lions caught by domestic trawl gear in Alaska during 1990-2001 ranged from 0.014 to $0.180(0.051 \pm 0.008$, average annual stratified rate) sea lions per 10,000 t of groundfish catch (Table 3, and Perez in prep. ${ }^{\text {a }}$ ). The average annual incidental mortality rate of Steller sea lions in the domestic groundfish fishery in Alaska during 1990-2001 was only $1 \%$ of the pooled years' bycatch rate (1.212 $\pm 0.146$ ) for the joint-venture groundfish fisheries during 1985-1989 (based on data in Table 4, and Perez and Loughlin 1991). The estimated average annual bycatch of Steller sea lions by domestic trawl fisheries in Alaska during 1990-2001 was about $10 \%$ of the level of the average annual estimated take (127 sea lions) by the joint venture fisheries in Alaska during 1985-1989 (based on data in

Table 4, and Perez and Loughlin 1991). Closure of fishing areas near sea lion rookeries in the Aleutian Islands and Bering Sea since 1990 is one of the reasons for the decline in incidental mortality rates of Steller sea lions between 1985 and 2001; also, fewer Steller sea lions would be expected to encounter fishing vessels each year due to the continuing decline ( $5 \%$ annual rate, Loughlin and York 2000) of the western stock of the Steller sea lion.

Under the implementation of regulations in Section 118 of the MMPA (50 CFR 229.2), NMFS must publish, at least annually, a List of Fisheries (LOF) that places all U.S. commercial fisheries into one of three categories based on the level of incidental serious injury and mortality of marine mammals that occurs in each fishery (16 U.S.C. 1387 (c)(1)). The categorization of a fishery in the LOF determines whether participants in that fishery may be required to comply with certain provisions of the MMPA, such as registration, observer coverage, and take reduction plan requirements. Owners of vessels or gear engaging in a Category I or II fishery are required to register with NMFS and obtain a marine mammal authorization from NMFS in order to lawfully incidentally take a marine mammal in a commercial fishery. Owners of vessels or gear engaged in a Category III fishery are not required to register with NMFS or obtain a marine mammal authorization. All of the commercial groundfish fisheries discussed in this report were classified as "Category III" fisheries in the LOFs from 1996 to 2002 (60 FR 67063, 28 December 1995; 62 FR 33, 2 January 1997; 63 FR 5748, 4 February 1998; 64 FR 9067, 24 February 1999; 65 FR 24448, 26 April 2000; 66 FR 42780, 15 August 2001; 67 FR 2410, 17 January 2002) because they did not have a sufficiently high level of direct serious injury or mortality to necessitate any management actions via Section 118 of the MMPA. However, the Interim North Pacific Groundfish Observer Program which monitors the groundfish fisheries in Alaska and off the coasts of Washington, Oregon, and California has been extended through 31 December 2007 (67 FR 72595, 6 December 2002).

NMFS has proposed elevating the Bering Sea and Aleutian Islands groundfish trawl fishery to Category II in 2003 based on their Tier 2 analysis (68 FR 1414, 10 January 2003). The total annual incidental mortality and serious injury across all fisheries is greater than or
equal to $10 \%$ of the PBR levels for the following stocks: western North Pacific humpback whales, eastern North Pacific resident killer whales, eastern North Pacific transient killer whales, central North Pacific humpback whales, and western U.S. Steller sea lions (68 FR 1414, 10 January 2003). NMFS noted that the Bering Sea and Aleutian Islands trawl fishery could also qualify for elevation to Category I because the total annual mortality and serious injury of the western North Pacific stock of humpback whales in this fishery is 0.4 animals per year, or $57.1 \%$ of the PBR level ( 0.7 animals per year); however, there is insufficient data at present to determine if this level of mortality and serious injury impacts only the western North Pacific stock of humpback whales or also the central North Pacific stock of humpback whales, in which case reclassification to Category I may not be justified (68 FR 1414, 10 January 2003).

## ACKNOWLEDGMENTS

This report would not have been possible without the enthusiasm and accomplishments of the 2,630 observers who completed their arduous assignments to monitor the groundfish catch and incidental take of marine mammals onboard 808 vessels of the domestic and joint venture groundfish fisheries during 1989-2001. The staff of the North Pacific Groundfish Observer Program (NPGOP) at the Alaska Fisheries Science Center (AFSC) trained and debriefed the observers, and edited and processed the data for inclusion in the NORPAC database. NPGOP staff including Steve Barbeaux, Jerry Berger, Bob Carlson (deceased), Sheryl Corey, Dan Decker, Steve Hochberg, Kitty MacCauley, Ren Narita, and Karen Teig assisted the author with the retrieval of data which were only found in logbooks or erroneously recorded in NORPAC. Mike Brown, Glen Campbell, Angie Greig, Mike Guttormsen, Terry Hiatt, Dan Holland, and Brad Stenberg (all AFSC), and Mary Furuness of the Alaska Regional Office, NMFS, assisted the author in obtaining the "Blend" data for the domestic fisheries. Jerry Berger provided the "Blend" data for the joint venture fisheries. Species identification of marine mammals was verified by the staff of the National Marine Mammal Laboratory (NMML), AFSC, from
photographs, canine teeth from pinnipeds, and tissue specimens from cetaceans that were occasionally taken by observers. Identification and ageing of canine teeth was coordinated by John Sease and Jim Thomason. Marilyn Dahlheim and Christy Sims coordinated the processing the tissue samples for transmittal to the Southwest Fisheries Science Center which conducted the DNA analysis. AFSC Graphics Unit staff assisted with the preparation of figures. Reviews by Robyn Angliss, Jeff Breiwick, and John Sease were helpful in improving the quality of this paper.

Washington, Oregon and California (no vessels in the at-sea processing Pacific whiting fishery used jig gear during 1989-2001)

Joint venture trawl gear vessels

${ }^{\text {a }}$ Vessels with multiple observer cruises or observers during the calendar year were counted only once.
${ }^{\mathrm{b}}$ Fishing days are the number of calendar days per vessel that set gear to catch groundfish on each day.
c The marine mammal interactions referred to in this table include any type of interaction (e.g., marine mammals killed or injured by fishing operations; animals boarding vessels of their own volition or entangled in the gear and subsequently released unharmed; catch of decomposed carcasses or body parts; marine mammal predation on the groundfish catch; deterrence of animals from the catch by the crew).
${ }^{\text {d }}$ Observers were placed on $100 \%$ of the fishing vessels in the at-sea processing Pacific whiting fishery.

Table 2.-List of marine mammal species that interacted with any type of fishing gear or vessel operations in the domestic and joint venture groundfish fisheries in the U.S. Exclusive Economic Zone off Alaska and the U.S. West Coast during 1989-2001. The common types of interactions reported by observers are summarized for each species.

Marine mammal interactions with groundfish fisheries

| Marine mammal species | Killed by fishing operations or serious injuries ${ }^{\text {a }}$ | Released from gear unharmed or minor injuries ${ }^{\text {b }}$ | Decomposed carcasses <br> or body parts in gear ${ }^{\text {c }}$ | Predation on groundfish catch ${ }^{\text {d }}$ | Deterrence from groundfish catch by crew ${ }^{\text {e,f }}$ |

Table 2.--Continued.
${ }^{\text {a }}$ Includes any type of incidental take that resulted in mortality including gear entanglement, propeller strikes, and serious injuries resulting from wounds or trailing gear (including broken longline hooks stuck in the mouth).
b Includes any type of incidental take that did not impair the survivability of the animal in which the marine mammal was either caught by the gear or boarded the vessel and was subsequently released alive by the crew.
c Includes any type of incidental take of carcasses or miscellaneous body parts from animals that were known to have died previous to gear deployment or were not confirmed to have been killed by the gear or fishing operations.
${ }^{\text {d }}$ Includes any type of predation interaction of the marine mammal on the groundfish catch (not discards); these interactions (which are not classified as incidental takes) are not discussed in this paper. Observers did not routinely record these types of interactions before 1996.
e Includes any method of deterrence, with or without devices, actively used by the crew to prevent the animal from interacting with the gear; these interactions (which are not classified as incidental takes) are not discussed in this paper.
f Although amendments in 1994 to the MMPA allowed for prohibition of the use by fisheries of deterrence of marine mammals, the same types of deterrence methods were used every year during 1989-2001 in the domestic groundfish fisheries in Alaska, especially in the longline fishery directed at killer whales, sperm whales, and Steller sea lions.
g Includes animals from any of the identified marine mammal species.
${ }^{h}$ There was one interaction where a minke whale was observed near the trawl net as it was retrieved, but the observer could not confirm that the groundfish were eaten from the catch.
${ }^{i}$ There was one interaction where an unidentified large whale, possibly a baleen whale, was observed feeding on the groundfish catch from the trawl net as it was retrieved..
j No sperm whales were reported killed directly by the gear or during fishing operations; however, two sperm whales with trailing longline gear were considered serious injuries.
${ }^{k}$ Beaked whale skulls were caught on two occasion in the trawl gear, and these skulls may have been from Bering Sea beaked whales.
${ }^{1}$ Unidentifiable carcasses in very advanced stages of decomposition or miscellaneous cetacean bones without flesh found isolated in the groundfish catch may have come from any cetacean species that occurs in the area, including species not listed in this table. For example, one decomposed Risso's dolphin (Grampus griseus) was caught by trawl gear in the foreign and joint venture groundfish fisheries in the Bering Sea and Aleutian Islands during 1973-1988 (Perez and Loughlin 1991).

Table 3.--Number of marine mammals, by species, incidentally caught by trawl vessels of the domestic groundfish fishery in the U.S. Exclusive Economic Zone in the Bering Sea, Gulf of Alaska and off Washington, Oregon, and California, 1989-2001, reported by U.S. fishery observers, including an estimation of the total incidental mortality by area and year. Catch rates are the ratio $(\hat{R})$ and standard error $(s(\hat{R}))$ of the observed incidental take of marine mammals killed (or seriously injured) monitored during fishing operations to the observed groundfish catch (per 10,000 metric tons [ $t$ ] basis). The coefficient of variation (CV) of the catch rate is also listed. Estimated mortality of marine mammals as bycatch is the adjusted ratio estimate ( $Y_{A}$ ) and its $95 \%$ confidence interval ( $L_{95 \%}$ ).

| Species <br> Area <br> Year | Groundfish |  |  | Marine mammals |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

$\mathrm{NF}=$ No trawl fishing.
a The estimated lower $95 \%$ confidence level was less than the number of animals reported by U.S. observers; the number of marine mammals monitored in hauls was used as a substitute.
b The estimated lower $95 \%$ confidence level was less than zero; the number of marine mammals monitored in hauls was used as a substitute.
c Reported bycatch occurred only in the nonsampled hauls of observed cruises.
d The estimated upper $95 \%$ confidence level was less than the adjusted estimated bycatch; the latter was used as a substitute.
e The number of animals reported killed (or with serious injuries or trailing gear) during fishing operations by observers from both sampled and unmonitored hauls exceeded the estimated bycatch in some component strata; the number reported dead was used as a substitute in those particular strata.
${ }^{f}$ Includes pinnipeds that may belong to one of the identified species.
g Includes cetaceans that may belong to one of the identified species.
${ }^{h}$ Includes animals that may belong to any one of the identified marine mammal species.

Table 4.--Number of marine mammals, by species, incidentally caught by trawl vessels of the joint venture (JV) groundfish fisheries (countries combined ${ }^{\text {a }}$ ) in the U.S. Exclusive Economic Zone in the Bering Sea, Gulf of Alaska, and off Washington, Oregon, and California, 1989-1990, reported by U.S. fishery observers, including an estimation of the total incidental mortality by area and year. Catch rates are the ratio $(\hat{R})$ and standard error $(s(\hat{R}))$ of the observed incidental take of marine mammals killed (or seriously injured) monitored during fishing operations to the observed groundfish catch (per 10,000 metric tons [ t$]$ basis). The coefficient of variation (CV) of the catch rate is also listed. Estimated mortality of marine mammals as bycatch is the adjusted ratio estimate $\left(Y_{A}\right)$ and its $95 \%$ confidence interval $\left(L_{95 \%}\right)$.

$\mathrm{NF}=$ No joint venture trawl fishing.
${ }^{\text {a }}$ The U.S. joint venture groundfish fisheries in Alaska and the North Pacific during 1989 and 1990 were with the following countries: the People's Republic of China, Iceland, Japan, the Republic of Korea, Poland, and the former Soviet Union (Russia).
b The estimated lower $95 \%$ confidence level was less than zero; the number of marine mammals monitored in hauls was used as a substitute.
c The estimated lower $95 \%$ confidence level was less than the number of animals reported by U.S. observers; the number of marine mammals monitored in hauls was used as a substitute.
${ }^{\text {d }}$ Reported bycatch occurred only in the nonsampled hauls of observed cruises.
e The estimated upper $95 \%$ confidence level was less than the adjusted estimated bycatch; the latter was used as a substitute.
${ }^{f}$ Includes cetaceans that may belong to one of the identified species.

Table 5.--Number of marine mammals, by species, incidentally caught by longline vessels of the domestic groundfish fishery in the U.S. Exclusive Economic Zone in the Bering Sea and Gulf of Alaska, 1989-2001, reported by U.S. fishery observers, including an estimation of the total incidental mortality by area and year. Catch rates are the ratio $(\hat{R})$ and standard error $(s(\hat{R}))$ of the observed incidental take of marine mammals killed (or seriously injured) monitored during fishing operations to the observed groundfish catch (per 10,000 metric tons [t] basis). The coefficient of variation (CV) of the catch rate is also listed. Estimated mortality of marine mammals as bycatch is the adjusted ratio estimate ( $\hat{Y}_{A}$ ) and its $95 \%$ confidence interval ( $L_{95 \%}$ ).

$\mathrm{NF}=\mathrm{No}$ longline fishing.
a The estimated lower $95 \%$ confidence level was less than zero; the number of marine mammals monitored in hauls was used as a substitute.
b The estimated lower $95 \%$ confidence level was less than the number of animals reported by U.S. observers; the number of marine mammals monitored in hauls was used as a substitute.
c Reported bycatch occurred only in the nonsampled hauls of observed cruises.
${ }^{d}$ Includes pinnipeds that may belong to one of the identified species.
e No sperm whales have been observed killed by any type of groundfish fishery gear in Alaska. These estimates were based solely on one animal in each of two years which was observed caught and released with trailing longline gear; these takes were classified as serious injuries.

Table 6.--Number of marine mammals, by species, incidentally caught by pot fishery vessels of the domestic groundfish fishery in the U.S. Exclusive Economic Zone in the Bering Sea and Gulf of Alaska, 1989-2001, reported by U.S. fishery observers, including an estimation of the total incidental mortality by area and year. Catch rates are the ratio $(\hat{R})$ and standard error $(s(\hat{R}))$ of the observed incidental take of marine mammals killed (or seriously injured) monitored during fishing operations to the observed groundfish catch (per 10,000 metric tons [t] basis). The coefficient of variation (CV) of the catch rate is also listed. Estimated mortality of marine mammals as bycatch is the adjusted ratio estimate ( $\hat{Y}_{A}$ ) and its $95 \%$ confidence interval ( $L_{95 \%}$ ).

Table 6.--Continued.
$\mathrm{NF}=$ No fishing with pots.
a The estimated lower $95 \%$ confidence level was less than zero; the number of marine mammals monitored in hauls was used as a substitute.
${ }^{b}$ Reported bycatch occurred only in the nonsampled hauls of observed cruises.
c The observed, unidentified phocid may have been a harbor seal, but the canine tooth specimen did not appear to be a typical harbor seal tooth. If it was not a harbor seal, then it would be the first known occurrence of another phocid species caught by pot fishing gear in the groundfish fisheries in Alaska.
d An unidentified baleen whale with trailing gear is the only cetacean known to have been impacted by pot gear in Alaska during 1989-2001.
e The estimated lower $95 \%$ confidence level was less than the number of animals reported by U.S. observers; the number of marine mammals monitored in hauls was used as a substitute.

Table 7.--Number of marine mammals, by species, incidentally caught by jig fishery vessels of the domestic groundfish fishery in the U.S. Exclusive Economic Zone in the Bering Sea and Gulf of Alaska, 1989-2001, reported by U.S. fishery observers, including an estimation of the total incidental mortality by area and year. Catch rates are the ratio $(\hat{R})$ and standard error $(s(\hat{R}))$ of the observed incidental take of marine mammals killed (or seriously injured) monitored during fishing operations to the observed groundfish catch (per 10,000 metric tons [t] basis). The coefficient of variation (CV) of the catch rate is also listed. Estimated mortality of marine mammals as bycatch is the adjusted ratio estimate ( $\hat{Y}_{A}$ ) and its $95 \%$ confidence interval ( $L_{95 \%}$ ).

$\mathrm{NF}=\mathrm{No}$ fishing with jigs.

Figure 1. Statistical fishing areas in the Bering Sea and Aleutian Islands region used to summarize catch and effort data. See Appendix Table 1 for a list of fishery area changes that occurred during 1989-2000 by merging and splitting some of these areas.

Figure 2. Statistical fishing areas in the Gulf of Alaska region used to summarize catch and effort data. See Appendix Table 1 for a list of fishery area changes that occurred during 1989-2000 by merging and splitting some of these areas.

Figure 3. Statistical fishing areas in the North Pacific Ocean off the coasts of Washington, Oregon, and California used to summarize catch and effort data.

Figure 4. Locations in the Bering Sea, Aleutian Islands, and Gulf of Alaska where pelagic trawl gear was used during fishing operations in the domestic groundfish fishery, 1989-2001. Only trawl sets on vessels with observers were included.

Figure 5. Locations in the Bering Sea, Aleutian Islands, and Gulf of Alaska where non-pelagic trawl gear was used during fishing operations in the domestic groundfish fishery, 1989-2001. Only trawl sets on vessels with observers were included.

Figure 6. Locations in the Bering Sea, Aleutian Islands, and Gulf of Alaska where trawl gear was used during fishing operations in the joint venture groundfish fisheries, 1989-1990. Only trawl sets on vessels with observers were included.

Figure 7. Locations in the North Pacific Ocean off Washington, Oregon, and California where pelagic trawl gear was used during fishing operations in the domestic groundfish fishery, 1990-2001. Only trawl sets on vessels with observers were included.

Figure 8. Locations in the North Pacific Ocean off Washington, Oregon, and California where non-pelagic trawl gear was used during fishing operations in the domestic groundfish fishery, 1990-1992 and 2001. Only trawl sets on vessels with observers were included.

Figure 9. Locations in the North Pacific Ocean off Washington, Oregon, and California where trawl gear was used during fishing operations in the joint venture groundfish fisheries, 1989-1990. Only trawl sets on vessels with observers were included.

Figure 10. Locations in the Bering Sea, Aleutian Islands, and Gulf of Alaska where longline gear was used during fishing operations in the domestic groundfish fishery, 1989-2001. Only longline sets on vessels with observers were included.

Figure 11. Locations in the Bering Sea, Aleutian Islands, and Gulf of Alaska where pot gear was used during fishing operations in the domestic groundfish fishery, 1990-2001. Only pot sets on vessels with observers were included.

Figure 12. Locations in Alaska where northern fur seals, walruses, and sea otters were incidentally taken by domestic and joint venture groundfish fisheries, 1989-2001. Only animals which were either killed or seriously injured during fishing operations were included. The 200 m depth contour is also indicated.

Figure 13. Locations in the North Pacific Qean off Washington, Oregon, and California where California sea lions, Steller sea lions, harbor seals, northern elephant seals, Pacific white-sided dolphins, and Dall's porpoises were incidentally taken by domestic and joint venture groundfish fisheries, 1989-2001. Only animals which were either killed or seriously injured during fishing operations were included. The 200 m depth contour is also indicated.

Figure 14. Locations in the Bering Sea, Aleutian Islands, and Gulf of Alaska where Steller sea lions were incidentally taken by domestic and joint venture groundfish fisheries, 1989-2001. Only animals which were either killed or seriously injured during fishing operations were included. The 200 m depth contour is also indicated.

Figure 15. Locations in the Bering Sea, Aleutian Islands, and Gulf of Alaska where bearded seals, harbor seals, spotted seals, ringed seals, ribbon seals, and northern elephant seals were incidentally taken by domestic and joint venture groundfish fisheries, 1989-2001. Only animals which were either killed or seriously injured during fishing operations were included. The 200 m depth contour is also indicated.

Figure 16. Locations in the Bering Sea and Gulf of Alaska where humpback whales, minke whales, fin whales, and sperm whales were incidentally taken by domestic groundfish fisheries, 1989-2001. Only animals which were either killed or seriously injured during fishing operations were included. The unidentified baleen whales (due to limited observation) belonged to one of the three identified species. The 200 m depth contour is also indicated.

Figure 17. Locations in the Bering Sea and Gulfof Alaska where Pacific white-sided dolphins, killer whales, harbor porpoises, and Dall's porpoises were incidentally taken by domestic groundfish fisheries, 1989-2001. Only animals which were either killed or seriously injured during fishing operations were included. The 200 m depth contour is also indicated.

Figure 18. Incidental take (bycatch) of Steller sea lions by type of trawl gear used in the domestic trawl fishery in the Bering Sea, 1996-2001: (A) the bycatch rate (and standard error) per 10,000 metric tons of the groundfish catch; (B) the estimated total number (and standard error) of Steller sea lions killed or seriously injured; (C) the total groundfish catch (metric tons); and (D) the percent of the total groundfish catch observed.

Appendix 1.--List of statistical fishing areas in the U.S. Exclusive Economic Zone (EEZ) of the Bering Sea and North Pacific Ocean by year of analysis, 1989-2001. See
Figures 1-3 for boundary locations of these areas.

## Gulf of Alaska

| Area 610 |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 17 January 1990 | Eumetopias jubatus | 1 | Killed by gear | Yes | Yes | $54^{\circ} 05^{\prime} \mathrm{N} 164^{\circ} 30^{\prime} \mathrm{W}$ |
| 30 September 1991 | Eumetopias jubatus | 1 | Minor injury | Yes | Yes | $53^{\circ} 44^{\prime} \mathrm{N} 164^{\circ} 09^{\prime} \mathrm{W}$ |
| 18 October 2001 | Eumetopias jubatus | 1 | Killed by gear | Yes | Yes | $53^{\circ} 59^{\prime} \mathrm{N} 164^{\circ} 19^{\prime} \mathrm{W}$ |
| 9 March 1991 | Phoca vitulina | 1 | Killed by gear | Yes | Yes | $54^{\circ} 26^{\prime} \mathrm{N} 162^{\circ} 25^{\prime} \mathrm{W}$ |
| 26 October 1990 | Mirounga angustirostris | 1 | Killed by gear | Yes | Yes | $53^{\circ} 56{ }^{\prime} \mathrm{N} 163^{\circ} 19^{\prime} \mathrm{W}$ |
| 14 February 1997 | Unidentified dolphin/porpoise | 1 | Aborted fetus | Yes | Yes | $55^{\circ} 16^{\prime} \mathrm{N} 159^{\circ} 25^{\prime} \mathrm{W}$ |
| 26 April 1990 | Unidentified whale | 1 | Bones only | Yes | Yes | $54^{\circ} 24^{\prime} \mathrm{N} 162^{\circ} 12^{\prime} \mathrm{W}$ |
| 27 April 1990 | Unidentified whale | 1 | Bones only | Yes | Yes | $54^{\circ} 25^{\prime} \mathrm{N} 162^{\circ} 17^{\prime} \mathrm{W}$ |
| 21 March 1991 | Unidentified whale | 1 | Decomposed | Yes | Yes | $55^{\circ} 30^{\prime} \mathrm{N} 159^{\circ} 31^{\prime} \mathrm{W}$ |
| 10 May 2000 | Unidentified whale | 1 | Bones only | Yes | Yes | $53^{\circ} 44^{\prime} \mathrm{N} 164^{\circ} 36^{\prime} \mathrm{W}$ |
| 11 May 2000 | Unidentified whale | 1 | Bones only | Yes | Yes | $53^{\circ} 45^{\prime} \mathrm{N} 164^{\circ} 16^{\prime} \mathrm{W}$ |
| 9 March 1991 | Unidentified small whale | 1 | Decomposed | Yes | Yes | $54^{\circ} 24^{\prime} \mathrm{N} 162^{\circ} 07^{\prime} \mathrm{W}$ |
| 6 May 2000 | Unidentified small whale | 1 | Skull only | No | Yes | $53^{\circ} 44^{\prime} \mathrm{N} 164^{\circ} 51^{\prime} \mathrm{W}$ |
| 18 July 1994 | Unidentified large whale | 1 | Bones only | Yes | No | $54^{\circ} 27^{\prime} \mathrm{N} 159^{\circ} 12^{\prime} \mathrm{W}$ |
| Area 620 |  |  |  |  |  |  |
| 14 August 1990 | Eumetopias jubatus | 1 | Killed by gear | Yes | Yes | $55^{\circ} 46^{\prime} \mathrm{N} 157^{\circ} 29^{\prime} \mathrm{W}$ |
| 18 March 1992 | Phoca vitulina | 1 | Killed by gear | Yes | Yes | $56^{\circ} 27^{\prime} \mathrm{N} 156^{\circ} 53^{\prime} \mathrm{W}$ |
| 11 May 1990 | Unidentified baleen whale | 1 | Decomposed | Yes | Yes | $55^{\circ} 30{ }^{\prime} \mathrm{N} 156^{\circ} 05^{\prime} \mathrm{W}$ |
| 1 July 1994 | Unidentified baleen whale ${ }^{3}$ | 1 | Decomposed | Yes | Yes | $55^{\circ} 35^{\prime} \mathrm{N} 155^{\circ} 49^{\prime} \mathrm{W}$ |
| 25 April 1996 | Unidentified baleen whale ${ }^{3}$ | 1 | Decomposed | Yes | Yes | $57^{\circ} 58^{\prime} \mathrm{N} 154^{\circ} 42^{\prime} \mathrm{W}$ |
| 1 May 1997 | Unidentified whale | 1 | Bones only | Yes | Yes | $56^{\circ} 52^{\prime} \mathrm{N} 157^{\circ} 01^{\prime} \mathrm{W}$ |
| Area 630 |  |  |  |  |  |  |
| 26 July 1993 | Eumetopias jubatus | 1 | Killed by gear | Yes | Yes | $58^{\circ} 40^{\prime} \mathrm{N} 148^{\circ} 29^{\prime} \mathrm{W}$ |
| 19 October 1996 | Eumetopias jubatus | 1 | Minor injury | Yes | Yes | $57^{\circ} 21^{\prime} \mathrm{N} 152^{\circ} 29^{\prime} \mathrm{W}$ |
| 18 July 1999 | Phoca vitulina | 1 | Decomposed | Yes | Yes | $56^{\circ} 28^{\prime} \mathrm{N} 152^{\circ} 39^{\prime} \mathrm{W}$ |
| 26 July 1993 | Mirounga angustirostris | 1 | Killed by gear | No | Yes | $58^{\circ} 32{ }^{\prime} \mathrm{N} 148^{\circ} 29^{\prime} \mathrm{W}$ |
| 6 April 2000 | Eschrichtius robustus | 1 | Decomposed | Yes | Yes | $57^{\circ} 00^{\prime} \mathrm{N} 152^{\circ} 25^{\prime} \mathrm{W}$ |
| 23 July 2000 | Megaptera novaeangliae | 1 | Decomposed | No | No | Not recorded ${ }^{2}$ |
| 9 July 1995 | Orcinus orca | 1 | Decomposed | No | Yes | $58^{\circ} 34^{\prime} \mathrm{N} 148^{\circ} 38^{\prime} \mathrm{W}$ |
| 21 March 1996 | Phocoenoides dalli | 1 | Decomposed | Yes | Yes | $57^{\circ} 14^{\prime} \mathrm{N} 152^{\circ} 24^{\prime} \mathrm{W}$ |
| 4 March 1993 | Unidentified dolphin/porpoise | 1 | Skull only | Yes | Yes | $56^{\circ} 38^{\prime} \mathrm{N} 152^{\circ} 30^{\prime} \mathrm{W}$ |
| 10 December 1993 | Unidentified whale | 1 | Bones only | Yes | Yes | $56^{\circ} 27^{\prime} \mathrm{N} 153^{\circ} 34^{\prime} \mathrm{W}$ |
| 5 March 1996 | Unidentified whale | 1 | Bones only | Yes | Yes | $59^{\circ} 24^{\prime} \mathrm{N} 149^{\circ} 43^{\prime} \mathrm{W}$ |
| 5 May 1996 | Unidentified small whale | 1 | Decomposed | Yes | Yes | $57^{\circ} 39^{\prime} \mathrm{N} 151^{\circ} 46^{\prime} \mathrm{W}$ |
| 14 March 1993 | Unidentified large whale | 1 | Bones only | Yes | Yes | $57^{\circ} 01^{\prime} \mathrm{N} 149^{\circ} 53^{\prime} \mathrm{W}$ |
| 18 April 1998 | Unidentified large whale | 1 | Skull only | Yes | Yes | $57^{\circ} 49^{\prime} \mathrm{N} 149^{\circ} 36^{\prime} \mathrm{W}$ |
| 9 July 1999 | Unidentified large whale | 1 | Bones only | Yes | Yes | $59^{\circ} 13^{\prime} \mathrm{N} 147^{\circ} 15^{\prime} \mathrm{W}$ |
| 25 July 2001 | Unidentified cetacean | 1 | Bones only | Yes | Yes | $57^{\circ} 35^{\prime} \mathrm{N} 151^{\circ} 35^{\prime} \mathrm{W}$ |
| Area 640 |  |  |  |  |  |  |
| 14 July 1996 | Unidentified whale | 1 | Skull only | Yes | Yes | $59^{\circ} 59^{\prime} \mathrm{N} 144^{\circ} 31^{\prime} \mathrm{W}$ |
| 7 July 2000 | Unidentified whale | 1 | Skull only | Yes | Yes | $59^{\circ} 09^{\prime} \mathrm{N} 141^{\circ} 40^{\prime} \mathrm{W}$ |
| Area 650 |  |  |  |  |  |  |
| 25 April 1990 | Unidentified pinniped | 1 | Decomposed | Yes | Yes | $57^{\circ} 14^{\prime} \mathrm{N} 136^{\circ} 19^{\prime} \mathrm{W}$ |

Appendix 2.--Continued.

## Bering Sea

Area 517
29 June $1995 \quad 1 \quad$ Trailing gear $\quad$ Phocoenoides dalli $\quad$ Yes $\quad$ Yes $\quad 5^{\circ} 05^{\prime} \mathrm{N} 166^{\circ} 34^{\prime} \mathrm{W}$
${ }^{1}$ The following codes were used to indicate the various types of incidental take: 1) "Killed by gear" refers to a marine mammal which died as a direct result of being caught or entangled in the gear during fishing operations or retrieval; 2) "Hit propeller" indicates a marine mammal that was killed during fishing operations by collision with the ship's propeller and/or hull; 3) "Carcass" refers to a dead marine mammal caught or entangled in the gear, but the time or mode of death could not be determined; 4) "Decomposed" indicates a marine mammal which had died previously and was in the process of decomposition prior to being caught or entangled in the gear; 5) "Trailing gear" indicates that a marine mammal, which was caught or entangled in the gear, was subsequently returned to the sea with attached pieces of fishing gear (e.g., hook and line, net fragments, or buoy that will seriously restrict the animal's survivability) after the gear was broken either accidentally or intentionally by the crew; 6) "Serious injury" refers to a marine mammal which sustained either injuries to vital body parts, noticeable trauma, or gear impalement (e.g., hook still in the mouth after returning to sea) that will presumably restrict the ability of the animal to survive at sea; 7) "Minor injury" refers to a marine mammal that was wounded on the body or appendages by the gear, but will subsequently heal and survive at sea without serious impact from the incident; 8) "Unharmed" refers to a marine mammal which was caught or entangled in the gear and subsequently returned to the sea, without injury or trauma, either on its own volition or after being freed from the gear by the crew; 9) "Boarded ship" indicates a marine mammal that climbed onto the vessel (e.g., via the stern ramp or trawl alley) and subsequently returned to the sea, without injury or trauma, either on its own volition or after being deterred from the ship by the crew; 10) "Aborted fetus" indicates that only an isolated fetus (which was aborted at sea by its mother sometime prior to the interaction) was caught or entangled in the gear; 11) "Misc. flesh" indicates that miscellaneous mammalian remnants (e.g., isolated fragments of blubber, skin or tissue) were either found in the catch or caught/entangled in the gear; 12) "Baleen only" indicates that only an isolated piece of baleen was caught or entangled in the gear; 13) "Bones only" indicates a miscellaneous isolated bone specimen (not from a skull, and usually vertebrae) without flesh from a marine mammal which had died and decomposed long before the part was caught or entangled in gear; 14) "Skull only" indicates a miscellaneous complete skull (which may have attached bones or tusks) without flesh from a marine mammal which had died and decomposed long before the part was caught or entangled in the gear; 15) "Skull/bones" indicates a combination of a miscellaneous skull without flesh and unattached skeletal bones from a marine mammal which had died and decomposed long before the part was caught or entangled in the gear; 16) "Tusks only" indicates isolated walrus tusks were found caught or entangled in the gear; and 17) "Unknown" indicates that the status of the animal could not be determined as to whether it was dead or alive (or injured).

Appendix 2.--Continued.
${ }^{2}$ This take occurred in the unmonitored portion of the fishery which has no observers at sea; the take was reported to an observer at the shoreside processing plant where the catcher vessel delivers its groundfish catch.
${ }^{3}$ This whale may have been a humpback whale.
${ }^{4}$ Only a 3-inch round plug of mammalian skin and blubber was found in the catch.
${ }^{5}$ The animal was pulled from the front of the net well before the codend; the deck hand said it was alive and returned it to the sea before the observer could examine it.
${ }^{6}$ This harbor seal was caught in the fish pump.
${ }^{7}$ Large pieces of grooved throat were found in the net which were not decomposed, and the observer classified this take as an animal killed by the fishing operations during the haul; however, there were some circular bite marks noticed on the side.
${ }^{8}$ The marine mammal boarded the ship by climbing up the stern ramp, but was subsequently injured with a minor back wound as the crew deterred the animal back to the sea.
${ }^{9}$ This marine mammal may have been a Steller sea lion.
${ }^{10}$ Many chunks of flesh were found in the catch along with many mud sharks; the observer assumed that these pinniped remnants were from the stomach contents of one or more of the mud sharks.
${ }^{11}$ Only an intestine of a minke whale was found in the catch.
${ }^{12}$ This whale may have been a minke whale.
${ }^{13}$ This same whale was caught again in the next haul on the same date by the same vessel at $56^{\circ} 57^{\prime} \mathrm{N} 172^{\circ} 26^{\prime} \mathrm{W}$.
${ }^{14}$ This animal was presumably a baleen whale.
${ }^{15}$ This take was considered a serious injury because the whale was presumably injured by impact with the ship's propeller.
${ }^{16}$ This female northern fur seal was pregnant.
${ }^{17}$ This unidentified phocid was either a harbor seal or spotted seal.
${ }^{18}$ Based on the condition of the specimen, this take was originally coded by the observer as "Killed by gear".
${ }^{19}$ This whale may have been a killer whale.
${ }^{20}$ The observer did not record the position of this killer whale take in the logbook.
${ }^{21}$ This partially decomposed head of a baleen whale was dragged up off the sea bottom by the ground line.
${ }^{22}$ The rollerman said the pinniped was hooked on its flipper with no wounds, and swam away vigorously upon hitting the water after its release.
${ }^{23}$ The sea lion was hit by line weights (chains thrown by the crew) while it was being deterred from interacting with the catch and/or gear; it is unknown if this sea lion sustained any injuries from the incident.
${ }^{24}$ The sea lion may have been struck by a pole gaff as the crew attempted to gaff a fish in the dark; shortly thereafter, when three sea lions appeared, one of the animals had an injury on its left cheek.
${ }^{25}$ The observer did not know if the ribbon seal was dead or alive before the interaction because only a piece of fur (with a 5 cm wide band) was found hooked on the line; this take could have been a serious injury or mortality since the piece of fur was apparently ripped off the animal.
${ }^{26}$ The sea lion was accidentally hooked by a pole gaff as the crew tried to deter the animal from the catch; a 6- to 8 -inch cut was noticeable after the gaff hook fell out of the sea lion's back, but no blood was visible.
${ }^{27}$ One of several sea lions taking fish off the groundline apparently became hooked or entangled briefly because the groundline was pulled in the wrong direction and put under a great deal of stress before it snapped free.
${ }^{28}$ This unidentified baleen whale was not a humpback whale, but it may have been a fin whale or minke whale.

13 June $1990 \quad 1 \quad$ Khocoenoides dalli $\quad 1$|  | Killed by gear |
| :--- | :--- |

a The following codes were used to indicate the various types of incidental take: 1) "Killed by gear" refers to a marine mammal which died as a direct result of being caught or entangled in the gear during fishing operations or retrieval; 2) "Decomposed" indicates a marine mammal which had died previously and was in the process of decomposition prior to being caught or entangled in the gear; 3) "Baleen only" indicates that only an isolated piece of baleen was caught or entangled in the gear; 4) "Bones only" indicates a miscellaneous isolated bone specimen (not from a skull, and usually vertebrae) without flesh from a marine mammal which had died and decomposed long before the part was caught or entangled in gear; and 5) "Skull only" indicates a miscellaneous complete skull (which may have attached bones or tusks) without flesh from a marine mammal which had died and decomposed long before the part was caught or entangled in the gear.
b This minke whale may have started to decompose as indicated by evidence of peeling of some of the black skin areas, but the observer was uncertain. The observer also noted that this skin peeling could have been due to entanglement in the net.
c This whale may have been a killer whale.

Appendix 4.--Summary of comments (edited) recorded by observers on the condition of marine mammals with injuries and/or trailing gear caused by entrapment or entanglement in gear during fishing operations of the domestic groundfish fisheries in the U.S. EEZ of the Bering Sea and North Pacific Ocean, 1989-2001. ${ }^{\text {a }}$

| Species/Comments | Status | Fishing Gear | Area | Date |
| :--- | :--- | :--- | :--- | :--- |
| Callorhinus ursinus | Minor injury | Pelagic trawl | Area 517 | 4 June 1990 |

A northern fur seal which was caught in the net jumped into the live catch tank. After several attempts to lasso the animal, it finally entered the processing area where a net was thrown over it and hauled up. The seal hit its mouth falling off the conveyor belt and it started to bleed from the mouth. That was the only sign of injury and it swam away with no apparent problem.

## Callorhinus ursinus Minor injury Longline Area 54128 February 2000

A northern fur seal became hooked by the gear as it fed off the catch. The roller man stopped the gear with the seal suspended in the air and went to cut the gangion (a line that serves to attach a hook, suspended at a specific target depth, to the mainline of a longline) to release it. However, the seal tore free before the gangion could be cut. The seal was hooked on its front left flipper and bled quite severely once it tore free. The same seal was observed during a subsequent haul feeding on the catch.

## Eumetopias jubatus Serious injury Pelagic trawl Area $521 \quad 13$ September 1990

A Steller sea lion was brought on board entrapped in the codend. It was unusually sluggish and appeared to be suffering from trauma. Liquid was seen from the mouth and nose (foaming), and weak eye movement was observed The deck crew released it by lifting the hydraulic live tank hatch which sent the sea lion down the stern ramp.

## Eumetopias jubatus Minor injury Pelagic trawl Area 52128 August 1991

A Steller sea lion boarded the vessel and was deterred by a pressure hose. The observer noticed that the sea lion had several open wounds (which looked more like scrapes than punctures) which were still bleeding on its dorsal surface. The crew said that the animal attempted to get on top of the codend while it was still in the water, but the observer did not see that activity.

## Eumetopias jubatus

 Minor injury Non-pelagic trawl Area 61030 September 1991A Steller sea lion was found in the intermediate just above the fish in the codend of the net. It was active and aggressive when first let out of the net, but it subsequently laid down on top of another net and rested for an hour. The animal had an abrasion on its snout. Eventually the crew was able to coax it to get up and go back to the water over the stern railing.

## Appendix 4.--Continued.

| Species/Comments | Status | Fishing Gear Area |
| :--- | :--- | :--- | :--- | :--- |

## Eumetopias jubatus

## Minor injury Non-pelagic trawl Area 63019 October 1996

A Steller sea lion was caught in the codend of the net during the last moments before the net was brought aboard. The animal was inside the bag which was hoisted in the air and opened from the bottom allowing the contents to spill into the trawl alley; it jumped over the side rail after two minutes on deck. The sea lion seemed traumatized but strong and responsive. Visible injuries included bleeding from the nose which looked superficial and bleeding from its right eye which looked badly scraped.

Eumetopias jubatus Minor injury Longline Area $521 \quad 19$ March 1994
Three Steller sea lions were deterred from taking fish off the groundline by the crew smacking a pole gaff on the rail of the vessel in full reverse (causing turbulence) under heavy seas. One sea lion was accidentally hooked by the pole gaff and dragged through the water by the vessel. The hook fell out of the sea lion's back within 5 minutes. The observer could see a 6 - to 8 -inch long cut, but no blood was visible.

## Eumetopias jubatus Minor injury Longline Area 52124 March 1995

The crew speculated that one Steller sea lion was struck by a pole gaff as the crew attempted to gaff a fish. The pole was thrown and hit something big in the dark, and the object swam to the stern with the pole gaff. Two deckhands pulled the pole gaff while one of the lines straightened and it came free. Shortly thereafter, three sea lions showed up, approaching from the stern, and one of the animals had an injury on its left cheek. The observer did not see the incident.

Eumetopias jubatus Minor injury Longline Area $540 \quad 17$ April 1992
Seven Steller sea lions were taking fish off the groundline. The crew deterred these sea lions from the catch by throwing several line weights (chains). One male was hit by the chains, and may have been slightly injured. [Area 542]

Eumetopias jubatus Minor injury Longline Area 542 6 April 1997
A juvenile Steller sea lion freed itself from the hook. Some blood was apparent in the water. The animal looked a little dazed, but it swam away after a couple of seconds.

## Unidentified otariid Minor injury Pelagic trawl Area $521 \quad 11$ May 1990

A young otariid (presumably a Steller sea lion) came up in the catch while the haul was being dumped into the fish holding tanks below deck. The animal was injured but still showed signs of life and was returned to the sea. The observer did not see the incident.

## Appendix 4.--Continued.

| Species/Comments | Status | Fishing Gear | Area | Date |
| :--- | :--- | :--- | :--- | :--- |
| Unidentified otariid | Minor injury | Longline | Area 524 | 27 May 2001 |

An unidentified otariid was hooked on the cheek and brought up alive on the groundline. It fell off the line before it reached the roller, then it twisted around and disappeared.

## Odobenus rosmarus Minor injury Non-pelagic trawl Area $514 \quad 9$ May 1996

A juvenile male walrus came up in the wings of the trawl net. It was very tired and didn't move around the deck much. It stayed on the deck for about 7 hours, and after it regained strength, it seemed to enjoy resting on the deck until it left the vessel. The walrus had a few minor skin lacerations, but looked in good (tired) condition.

## Unidentified pinniped Serious injury Longline Area 50928 March 1995

This animal was probably a Steller sea lion which was hooked through the mouth, but still alive and agitated. The crew freed the animal by cutting the gangion. Thus the hook was still stuck in the mouth (some trailing gear). The observer did not see the incident.

Unidentified pinniped Serious injury Longline Area 540 8 July 1992
This animal was presumably a phocid which was hooked in the mouth and still alive. The crew tried to disengage the hook from the seal's mouth, but ended up cutting the gangion leaving some trailing gear. The observer was unable to examine the damage to the mouth, but it was suggested that the seal probably wouldn't survive. [Area 542]

## Unidentified baleen whale Trailing gear Pot Area $513 \quad 14$ July 1998

The observer saw a baleen whale as it was hanging by the block with the buoy line wrapped around the base of its tail. The crew dropped the line with the whale back in the water and cut the line. The whale was breathing hard and slowly swam away on the surface with the diver buoy still wrapped around its tail. The animal was probably a fin or minke whale (it was not a humpback whale).

## Physeter macrocephalus Trailing gear Longline Area $640 \quad 21$ June 1997

A sperm whale became entangled in the longline gear. The gear was cut to prevent injury to a crewman. At that time the whale had to support at least 350 fathoms of gear. The crew then started from the other end of the gear which was still attached to the animal to try to disentangle it. However, the whale struggled and broke the gear. The sperm whale got away with probably 60 or more fathoms of gear still attached.

## Appendix 4.--Continued.

Species/Comments Status Fishing Gear Area Date

Physeter macrocephalus Trailing gear Longline Area $640 \quad 25$ April 2000
While the crew was retrieving the longline gear, the line acted as though it was hung up on the bottom. A sperm whale was entangled in the line which did not appear to be wrapped around the animal, but near the head as if caught like a fish. The crew tried to free the animal from the line, but ended up cutting the line and possibly leaving gear with the animal. The observer recorded that the whale was injured. The observer saw the animal later, but it was not feeding on the catch or diving on the gear at that time.

## Orcinus orca $\quad$ Serious injury Non-pelagic trawl Area 51026 October 1989

During the haul there was a loud thud in the engine, and the crew was unsure what happened. Presumably a killer whale hit the vessel or propeller, and it was assumed to have been wounded. This assumption was made because a similar accident involving a killer whale occurred a day earlier on the same vessel; and that whale was assumed to have hit the ship's propeller because pieces of flesh were seen floating behind the stern then. The observer did not see either incident. [Area 519]

## Phocoenoides dalli Minor injury Non-pelagic trawl Area 5217 August 1992

A Dall's porpoise was caught in the net in front of the excluder device before the codend. A small amount of blood was coming from its snout area, probably from thrashing about in the net trying to get free. As soon as the crew got the animal back in the water, the porpoise quickly swam away apparently uninjured. However, the event occurred too quickly for the observer to inspect the animal thoroughly or take photographs.

## Phocoenoides dalli $\quad$ Trailing gear Jig $\quad$ Area $517 \quad 29$ June 1995

A Dall's porpoise was caught in the line and injured (bleeding). The crew tried to maneuver close enough to the porpoise to disentangle it, but the line snapped.

## Unidentified cetacean Trailing gear Pelagic trawl Area $521 \quad 25$ July 2001

This animal was presumably a baleen whale that was entangled in the net. The vessel stopped hauling back and was going to cut the animal free, but the net rope snapped and the whale swam off. The crew only saw the tail of the animal, but a deckhand said it looked like the tail on the baleen whale that was killed in another haul by the same vessel. The observer did not see the incident.

[^0]Appendix 5 -- Statistical formulae used to calculate bycatch rates and estimates.
Estimates of catch rates of incidental mortality of marine mammals were obtained by ratio estimates of pooled data within a single stratum. The data were compartmentalized into subgroups (subgroup = stratum, indexed by the letter $h$ ) by year, gear (and nation for JV vessels), statistical area, 4-week period, and vessel class. Sampling units (indexed by the letter $i$ ) were defined as individual hauls (sets). Catch rates and variance were based only on bycatch data from observed marine mammals in monitored hauls. Since the catch rates (incidental take ratios) calculated with the equations below were all decimals less than one, they were multiplied by 10,000 to facilitate readability. The phrase "marine mammals" below refers only to the marine mammal species for which catch rates were calculated in each analysis, unless specifically stated otherwise in the text or tables. Equations for ratio estimates were based on Cochran (1977) and Levy and Lemeshow (1999). The stratified random sampling ratio estimator for total incidental take was adjusted by the addition of the number of reported mortality takes from strata which had zero or unknown bycatch rates (i.e., from strata where no marine mammals were observed in monitored hauls). Confidence intervals were calculated using the adjusted ratio estimates with the standard errors based only on monitored hauls.

## Given:

| $J$ | $=$ number of strata analyzed (total for year, gear or area), |
| :--- | :--- |
| $L_{l}$ | $=$ lower $95 \%$ confidence limit, |
| $L_{2}$ | $=$ upper $95 \%$ confidence limit, |
| $L_{95 \%}$ | $=$ both $95 \%$ confidence interval limits expressed as a range, |
| $n_{h}$ | $=$ number of observed sampling units in stratum $h$, |
| $N_{h}$ | $=$ total number of sampling units in the fishery in stratum $h$ (including those not |
|  | observed), |
| $x_{i}$ | $=$ metric tons of groundfish observed in sampling unit $i$, |
| $\bar{x}_{h}$ | $=$ mean number of metric tons of groundfish observed in stratum $h$, |
| $X_{h}$ | $=$ total metric tons of groundfish caught in the fishery in stratum $h$, |
| $y_{i}$ | $=$ number of marine mammals observed in sampling unit $i$, |
| $\bar{y}_{h}$ | $=$ mean number of marine mammals observed in stratum $h$, |
| $f_{h} \quad=$ | the sampling fraction $\left(n_{h} / N_{h}\right)$ (since $N_{h}$ is unknown, $f$ was approximated by the |

## Appendix 5 -- Continued.

$\hat{R} \quad=\quad$ observed incidental take ratio (catch rate) for stratum $h$,
$s(\hat{R}) \quad=\quad$ standard error of observed incidental take ratio (catch rate) for stratum $h$,
$\hat{Y}_{R}=\quad=$ ratio estimate of total incidental take for stratum $h$,
$\hat{Y}_{R_{s}} \quad=$ stratified random sampling ratio estimator for total incidental take obtained by summing the separate ratio estimates from $J$ strata,
$V\left(\hat{Y}_{R}\right) \quad=$ variance of ratio estimate for stratum $h$, and
$V\left(\hat{Y}_{R_{s}}\right)=$ variance of stratified random sampling ratio estimator from $J$ strata.
$A_{s} \quad=$ number of marine mammals reported by observers which were unobserved (seen only by crew) and/or occurred in unmonitored hauls from $J$ strata which had zero or unknown bycatch rates.
$\hat{Y}_{A} \quad=$ adjusted stratified random sampling ratio estimator for total incidental take.

Catch rates and ratio estimates were obtained from:

$$
\begin{gather*}
f_{h}=\frac{\sum_{l}^{n_{h}} x_{i}}{X_{h}}  \tag{1}\\
\hat{R}=\hat{R}_{h}=\frac{\sum_{l}^{n_{h}} y_{i}}{\sum_{l}^{n_{h}} x_{i}}=\frac{\bar{y}_{h}}{\bar{x}_{h}}  \tag{2}\\
s(\hat{R})=s\left(\hat{R}_{h}\right)=\frac{\sqrt{1-f_{h}}}{\bar{x}_{h} \sqrt{n_{h}}} \bullet \sqrt{\frac{\sum y_{i}^{2}-2 \hat{R}_{h} \sum y_{i} x_{i}+\hat{R}_{h}^{2} \sum x_{i}^{2}}{n_{h}-1}}  \tag{3}\\
\hat{Y}_{R}=\hat{Y}_{R_{h}}=X_{h} \hat{R}_{h}  \tag{4}\\
V\left(\hat{Y}_{R}\right)=V\left(\hat{Y}_{R_{h}}\right)=X_{h}^{2}\left[s\left(\hat{R}_{h}\right)\right]^{2} \tag{5}
\end{gather*}
$$

## Appendix 5 -- Continued.

$$
\begin{gather*}
\hat{Y}_{R_{s}}=\sum_{l}^{J} \hat{Y}_{R_{h}}  \tag{6}\\
V\left(\hat{Y}_{R_{s}}\right) \approx \frac{1}{\left(\sum x_{h}\right)^{2}} \sum_{l}^{J} V\left(\hat{Y}_{R_{h}}\right)  \tag{7}\\
\hat{Y}_{A}=\hat{Y}_{R_{s}}+A_{s} \tag{8}
\end{gather*}
$$

Lower $\left(L_{l}\right)$ and upper $\left(L_{2}\right) 95 \%$ confidence interval (Cl) limits were estimated using the following formulas and the appropriate values of Student's $t_{.05[n]}$ (where $n=$ degrees of freedom):

$$
\begin{gather*}
95 \% C I=\hat{R} \pm t_{.05[n]}(s(\hat{R}))  \tag{9}\\
95 \% C I=\hat{Y}_{R} \pm t_{.05[n]}\left(\sqrt{V\left(\hat{Y}_{R}\right)}\right)  \tag{10}\\
95 \% C I=\hat{Y}_{R_{s}} \pm t_{.05[n]}\left(\sqrt{V\left(\hat{Y}_{R_{s}}\right)}\right) \tag{11}
\end{gather*}
$$

When the calculated $95 \%$ lower confidence limit is less than the total number of observed marine mammals in the combined strata, then the calculated lower confidence limit is replaced by the observed number of marine mammals because:

$$
\begin{equation*}
L_{l}\left(\hat{Y}_{R_{s}}\right) \text { must be } \geq \sum_{l}^{J}\left(\sum_{l}^{n_{h}} y_{i}\right) \tag{12}
\end{equation*}
$$

When the calculated $95 \%$ upper confidence limit is less than the adjusted stratified random sampling ratio estimator for total incidental take, then the calculated upper confidence limit is replaced by the adjusted stratified random sampling ratio estimator because:

$$
\begin{equation*}
L_{2}\left(\hat{Y}_{R_{s}}\right) \text { must be } \geq \hat{Y}_{A} \tag{13}
\end{equation*}
$$

Appendix 6.--Average annual (1997-2001) number of marine mammals, by species and stock ${ }^{\text {a }}$, incidentally caught by the domestic groundfish fisheries in the U.S. Exclusive Economic Zone in the Bering Sea, Gulf of Alaska and off Washington, Oregon, and California ${ }^{\mathrm{b}}$. Catch rates are the ratio ( $\hat{R}$ ) and standard error $(s(\hat{R})$ ) of the average annual observed incidental take of marine mammals killed (or seriously injured) monitored during fishing operations to the average annual observed groundfish catch (per 10,000 metric tons [ $t$ ] basis). The coefficient of variation (CV) of the catch rate is also listed. Estimated mortality of marine mammals as bycatch is the average annual adjusted ratio estimate ( $\hat{Y}_{A}$ ) and its $95 \%$ confidence interval ( $L_{95 \%}$ ).

${ }^{\text {a }}$ The stock categories were taken from Angliss and Lodge (2002) and Carretta et al. (2002).
${ }^{\text {b }}$ The data presented in this table was adapted from Perez (in prep ${ }^{\text {a }}$ ) to be consistent with the format of Tables 3-7 in the current report.
c Estimated average annual bycatch of marine mammals during 1997-2001 is listed for each identified species that was incidentally killed (or seriously injured) by any gear in the groundfish fisheries in each region during 1973-2001 based on the data in Tables 3-7, Appendices 2-3, and in Perez and Loughlin (1991).
${ }^{\text {d }}$ Although not listed in this appendix, the pot fishery in the Bering Sea did have a minimum average annual bycatch of 0.2 cetaceans during 1997-2001 because there was one observed and unidentified baleen whale entangled in the fishing gear lines in 1998; the whale was released with trailing gear (see Table 5 and Appendix 2).
e Although northern fur seals migrate annually from Alaska to waters where the at-sea Pacific whiting fishery occurs, trawl sets of this fishery occurred only in the months from May to November (1997-2001); this is a seasonal period when most northern fur seals of the Eastern Pacific stock are typically in Alaska (Angliss and Lodge 2002).
${ }^{f}$ The estimated lower $95 \%$ confidence level was less than zero; the number of marine mammals monitored in hauls was used as a substitute.
g Reported bycatch occurred in the nonsampled hauls of observed cruises.
${ }^{h}$ The estimated lower $95 \%$ confidence level was less than the number of animals reported by U.S. observers; the number of marine mammals monitored in hauls was used as a substitute.
${ }^{\text {i }}$ The number of animals reported killed (or with serious injuries or trailing gear) during fishing operations by observers from both sampled and unmonitored hauls exceeded the estimated bycatch in some component strata of some years; the number reported dead was used as a substitute in those particular strata.
${ }^{j}$ The estimated upper $95 \%$ confidence level was less than the adjusted estimated bycatch; the latter was used as a substitute.
${ }^{\text {k }}$ Includes only statistical areas 610, 620, 630, 640 and 649 (Fig. 2).
${ }^{1}$ Includes only statistical areas 650 and 659 (Fig. 2). Although animals of this stock can be found at locations east of Cape Suckling $\left(144^{\circ} \mathrm{N}\right)$ in statistical area 640 (Fig. 2), that area was excluded because the blend data for individual statistical areas could not be subdivided.
${ }^{m}$ Excludes the Aleutian Islands area (statistical areas 541, 542 and 543 in Fig. 1) of the Bering Sea region.
${ }^{n}$ Includes only statistical areas 541, 542 and 543 (Fig. 1).
${ }^{\circ}$ Includes only statistical areas 670, 710 and 720 (Fig. 3).
${ }^{\mathrm{p}}$ The two stocks overlap in the same geographical areas (Angliss and Lodge 2002); it was not possible to determine how each stock was impacted by the different components of the groundfish fisheries.
${ }^{q}$ Includes only statistical areas 670 and 710 (Fig. 3).
r Includes only statistical area 720 (Fig. 3).

## RECENT TECHNICAL MEMORANDUMS

Copies of this and other NOAA Technical Memorandums are available from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22167 (web site: www.ntis.gov). Paper and microfiche copies vary in price.
