DHHS (NIOSH) PUBLICATION No. 2001-129

Foreword

The Occupational Safety and Health Act of 1970 was enacted “to assure so far as possible every working man and woman in the Nation safe and healthful working conditions.” However, deaths from injuries at work continue to be a major public health problem. On average, 16 workers die each day in this country. These workers die simply trying to earn a living. Through the National Traumatic Occupational Fatalities surveillance system, NIOSH continues to help fill the gap in the knowledge of traumatic work-related injury deaths.

This document provides an update to data published in the 1993 publication, *Fatal Injuries to Workers in the United States, 1980-1989: A Decade of Surveillance*. The current document includes 16 years of data from the National Traumatic Occupational Fatalities surveillance system for the years 1980 through 1995. Occupational injury mortality statistics on over 93,000 deaths are provided by demographic and injury characteristics. These data illuminate the nature and magnitude of work-related injury death for the United States and comprise the most comprehensive summary available in one document.

Although fatal occupational injuries have decreased over the years, the burden remains high. The data presented in this report provide the basis for developing strategies to prevent traumatic work-related injury deaths by profiling high-risk industries, occupations, and causes of fatal injuries. It is our hope that the information contained in this document will serve as a comprehensive resource for federal, state and local agencies, safety and health professionals, researchers, and others who can affect the prevention of occupational fatalities.

Acknowledgments

The authors are indebted to Joyce R. Spiker of the Division of Safety Research for all of her efforts in preparing and formatting this document for publication.

The authors would also like to thank Susan P. Baker, M.P.H., Johns Hopkins Center for Injury Research and Policy; Lois A. Fingerhut, National Center for Health Statistics; James C. Helmkamp, Ph.D., West Virginia University Center for Rural Emergency Medicine; Edward L. Husting, Ph.D., National Center for Injury Prevention and Control; and John W. Ruser, Ph.D., Bureau of Labor Statistics for their helpful comments on this document.

The authors are also grateful to the State vital registrars and their staffs for providing these valuable data. The success of the National Traumatic Occupational Fatalities surveillance system is due to the help and cooperation of these State vital records offices.

Public Health Summary

What are the hazards?

Over 93,000 workers were fatally injured while working in the United States from 1980 through 1995. Each day an average of 16 people died—simply by doing their jobs. These deaths result from exposure to many different hazards on the job. Leading causes of traumatic occupational fatalities include motor vehicles, homicides, machines, falls, electrocutions, and falling objects.

How can a worker be exposed or put at risk?

Workers are at risk of fatal injury in many different ways. Workers who operate motor vehicles or machines risk injury due to overturns or collisions. Taxicab drivers risk being killed during robbery attempts while construction workers risk fatal falls while working from heights. Electrical linemen risk electrocution while repairing power lines and loggers risk being struck by a falling tree during tree harvesting operations. These scenarios highlight some of the risks that are a daily presence in many of the industries and occupations in the United States. These jobs are frequently noted as being the jobs with the highest fatal injury rates. However, the potential for work-related injury exists in any job where injury risks are present and not controlled.

What recommendations has the federal government made to protect workers' safety and health?

Several federal agencies promulgate standards and regulations for worker safety. Agencies with specific regulatory authority for worker protection include the Occupational Safety and Health Administration, Federal Railroad Administration, Mine Safety and Health Administration, Federal Highway Administration, and the Employment Standards Administration. NIOSH, however, is the only federal agency responsible for conducting research and making recommendations for the prevention of work-related illnesses and injuries. NIOSH conducts research programs that improve understanding of injury and disease risks, identify populations at risk, and evaluate prevention strategies. For example, prevention recommendations are developed for specific risks through the Fatality Assessment and Control Evaluation program and the Health Hazard Evaluation program. Additional recommendations are developed through the funding of individual research projects, both within NIOSH and with extramural partners. As a result of these efforts NIOSH creates and disseminates scientifically valid recommendations for preventing work-related disease, injury, and disability.

Where can more information be found?

The references and additional readings contained in this document identify sources that provide additional information on fatal occupational injuries. Additional information on worker safety and health may be obtained from NIOSH through

1-800-35-NIOSH (800-356-4674) or at www.cdc.gov/niosh

Executive Summary

The National Institute for Occupational Safety and Health collects and automates death certificates from the 52 vital statistics reporting units in the 50 States, New York City, and the District of Columbia for workers 16 years of age or older who die as a result of a work-related injury. Analysis of occupational injury deaths, such as those gathered through the National Traumatic Occupational Fatalities (NTOF) surveillance system, facilitates identification of high risk worker groups and potential injury risk factors by demographic, employment, and injury characteristics. This promotes the effective use of resources aimed at preventing injuries in the workplace. In reviewing these data, it is important to note the distinction between the number of deaths and fatality rates. The number of deaths indicates the magnitude of a problem and fatality rates depict the risk faced by workers. Fatal occupational injury data for 1980 through 1995 are provided for the U.S. and for each State.

Major findings from this study:

- There were 93,338 civilian workers who died from injuries sustained while working in the U.S., 1980 through 1995 (Table US-1).
- The average annual occupational fatality rate for the U.S. civilian workforce was 5.2 per 100,000 workers for 1980 through 1995 (Table US-1).
- Civilian fatal occupational injuries decreased 28%, from 7,343 fatalities in 1980 to 5,314 in 1995 (Table US-1).
- The average annual fatality rate per 100,000 civilian workers decreased, from 7.4 in 1980 to 4.3 in 1995 – a 42% decrease (Table US-1).
- The greatest number of fatal occupational injuries occurred in California (9,670), Texas (9,423), Florida (5,596), Illinois (4,169), and Pennsylvania (3,926) (Table US-2).
- The States with the highest occupational injury fatality rates per 100,000 workers were Alaska (24.3), Wyoming (16.7), Montana (12.4), Idaho (10.7), West Virginia (10.4), and Mississippi (10.1) (Table US-2).
- The fatality rate for males (8.8 per 100,000 workers) was 11 times higher than the rate for females (0.8 per 100,000 workers) (Table US-3).
- Eighty-five percent of civilian workers who died were white and 11% were black (Table US-3).
- Black workers had the highest fatality rate per 100,000 workers (5.8), followed by whites (5.1) (Table US-3).
- The age group with the largest number of occupational injury fatalities was the 25-34 year old age group (26%) followed closely by the 35-44 year old age group (22%) (Table US-3).

- Workers 65 years and older had the highest fatality rate of all age groups (13.6 deaths per 100,000 workers) in every industry and occupation division (Tables US-3, US-17, US-27).
- The leading causes of occupational injury death in the U.S. were motor vehicle crashes (23%), homicides (14%), machine-related incidents (13%), falls (10%), electrocutions (7%), and being struck by falling objects (6%) (Table US-7).
- The highest rates by cause of death varied by gender: the highest rate for females was homicide (0.3 per 100,000 workers), while motor vehicle crashes (2.0 per 100,000 workers) were the cause of death with the highest rate among males (Table US-7).
- While the rate of motor vehicle-related fatalities decreased 36% between 1980 and 1995 (from 1.7 per 100,000 workers to 1.1), motor vehicles continued to have the highest rate through 1995. Machines had the second highest rate per 100,000 workers until 1990, when they were surpassed by homicides (Table US-9).
- The highest rates by cause of death varied by race: the highest rate for whites was motor vehicle crashes (1.2 per 100,000 workers), while the highest rate by cause of death for blacks was homicide (1.4 per 100,000 workers) (Table US-10).
- The industry divisions with the greatest proportion of fatalities were construction (18%), transportation/communication/public utilities (17%), manufacturing (15%), and agriculture/forestry/fishing (12%) (Table US-13).
- The mining industry had the highest average annual fatality rate per 100,000 workers (30.4), followed by agriculture/forestry/fishing (19.6), construction (15.3), and transportation/communication/public utilities (12.6) (Table US-13).
- The highest rates by cause of death varied by industry: the highest rate in the agriculture/forestry/fishing industry was for machinery-related incidents (6.6 per 100,000 workers), while the highest rate by cause of death in the retail trade industry was for homicides (1.7) (Table US-16).
- The occupation divisions with the greatest proportion of fatalities were precision production/craft/repairers (21%), transportation/material movers (17%), farmers/foresters/fishers (13%), and laborers (11%) (Table US-23).
- The occupation division of farmers/foresters/fishers had the highest average annual fatality rate per 100,000 workers (21.9), followed by transportation/material movers (21.6), laborers (13.7), and precision production/craft/repairers (9.2) (Table US-23).
- The highest rates by cause of death varied by occupation: the highest rate among executives/administrators/managers was for homicides (0.8 per 100,000 workers), while machinery-related incident rates were highest among farmers/foresters/fishers (7.0) (Table US-26).

Fatal Injuries to Civilian Workers in the United States, 1980-1995 (National Profile)

Introduction

The National Institute for Occupational Safety and Health (NIOSH) began collecting death certificates from all 50 States and the District of Columbia in answer to the need for a comprehensive enumeration of workers who sustain a fatal work-related injury. The National Traumatic Occupational Fatalities (NTOF) surveillance system was developed to fill gaps in the knowledge of work-related injury deaths in the United States (U.S.) by providing a census of occupational injury deaths for all U.S. workers.

Surveillance data such as those gathered through NTOF allow analysis of demographic, employment, and injury characteristics and also enable the examination of trends over time. These data allow the description of the nature and magnitude of the occupational injury problem in the U.S., the identification of potential risk factors, the generation of hypotheses for further research, and the setting of research and prevention priorities.

In 1993, a comprehensive summary of fatal occupational injuries in the U.S. was published based on data collected through NTOF for the years 1980 through 1989 (Jenkins et al., 1993). The present document extends the period of analysis to 16 years, providing the most comprehensive summary of fatal occupational injuries in one document for the U.S. as a whole, and for every State. This current document however, is considerably different than the earlier publication with the primary goal of providing detailed data in tabular format. The data are being presented in this format to provide the occupational safety and health community with direct access to data from the NTOF surveillance system. This document will serve as a comprehensive resource to describe the magnitude and circumstances of occupational injury deaths in the U.S. from 1980 through 1995.

Methods

Selection Criteria

The NTOF surveillance system is composed of information obtained from death certificates from the U.S. vital statistics reporting units in the 50 States, New York City, and the District of Columbia. For a case to be included in NTOF, it must meet three criteria:

1. the decedent is 16 years of age or older;
2. the external cause of death is classified as E800-E999 (International Classification of Diseases, Ninth Revision (World Health Organization, 1977)); and
3. the "Injury at Work?" item is marked positive by the certifier.

Why Death Certificates?

While studies have shown that multiple source surveillance systems are the best approach in counting occupational fatalities, death certificates were chosen for NTOF because they are the single source that identifies the largest number of cases, and are fairly comparable between all vital statistics reporting units. Studies show that death certificates alone identify between 67% and 90% of all fatal work injuries among the various States (Baker et al., 1982; Karlson and Baker, 1978; Stout and Bell, 1991).

Data Utility

The NTOF system contains 30 variables useful for describing characteristics of victims as well as injury circumstances. Data elements include coded worker characteristics and injury circumstances such as sex, race, occupation, and cause of death. In addition, narrative text for industry, occupation, causes of death, and injury description is entered and maintained. Narrative data have been utilized in a number of focused analyses listed in the Additional Readings section of this document (Appendix VI).

Data Coding: Industry/Occupation/Cause of Death

Codes for 'usual' industry and occupation were assigned based on the narrative information contained on the death certificates. Two methods of coding were used for the periods 1980 through 1989, and 1990 through 1995. Prior to the availability of an automated coding system, narrative information from the occupation and industry items was manually hand-coded by an expert coder, starting with data year 1990. Earlier years of data had been coded using a crude software program with known problems. The Standardized Occupation and Industry Coding (SOIC) software,¹ a more sophisticated and accurate application released in 1998, was used to recode the data from 1980 through 1989. Cases that could not be assigned a code by the SOIC software were manually hand-coded if the death certificate contained adequate information. The industry and occupation narratives were coded according to the 1980 and 1990 Bureau of the Census classification schemes (Bureau of Census, 1982; Bureau of Census, 1992). Death certificates for which no occupation or industry entry was present or for which the entry was too vague were coded into the "not classified" category. Certificates which had entries such as "housewife" or "student" were also coded into the "not classified" category. Appendix I provides explanations of the abbreviations used in the tables for occupation and industry divisions. Appendices II and III provide codes for detailed industry and occupation groupings included in the tables.

Cause of death codes are based on the International Classification of Diseases, Ninth Revision (ICD-9) supplementary chapter for the classification of external causes of injury and poisoning (World Health Organization, 1977) as assigned by trained nosologists and compiled by the National Center for Health Statistics (NCHS) for the Vital Statistics Mortality data (National Center for Health Statistics, 1980-1995). Codes from this chapter, denoted with a preceding "E," cover the spectrum of unintentional and intentional causes of death, with the actual E-code rubrics of the aggregated categories shown in Appendix IV. E-codes in this report were aggregated in a manner

¹The Standardized Occupation and Industry Coding (SOIC) System is a software application developed collaboratively by NIOSH and other agencies and organizations. The software system takes real-world literal descriptions of occupations and industries from death certificates and other documents, and translates them into the 1990 Bureau of the Census occupation and industry codes. Based on a comparison of cases that were coded both by the SOIC software and by hand, it was determined that 87% of the cases matched for both industry and occupation.

believed to be most beneficial for demonstrating exposures specific to traumatic occupational death. Alternative methods for grouping E-codes have been proposed, including the use of a matrix to present mechanism of injury within the major intent categories of unintentional, intentional, and self-inflicted (Centers for Disease Control and Prevention, 1997). While our rubric does not directly match the intent categories laid out in the suggested matrix framework, the authors believe the categories presented in this report are more beneficial for occupational death analysis and provide for continuity of earlier research. A footnote on Table US-8 provides information that may be used to calculate totals based on major intent categories.

Calculation of Rates

For this analysis, death certificates identified for inclusion in the NTOF data represent a complete count of traumatic occupational fatalities. These data therefore are not subject to sampling error, though they are subject to measurement error such as misclassification or failure to identify positive cases. The tables in this document include cells with counts of three or more deaths. Additionally, data for “Unknown” or “Not Classified” categories are only included for univariate tabulations.

Employment estimates for rate calculations were obtained from the Bureau of Labor Statistics’ (BLS) Current Population Survey (CPS), a population-based household sample survey of the civilian noninstitutionalized population. These data were extracted from the BLS *Employment and Earnings* and the CPS monthly micro data files (Bureau of Labor Statistics, 1981-1996; Bureau of Labor Statistics, 1992). Because the employment data are based on a sample survey, standard errors are associated with the workforce estimates. However, confidence intervals for fatality rates were not calculated for this publication but are addressed elsewhere.¹

Fatality rates were calculated as deaths per 100,000 workers. Rates were not calculated for categories with less than three fatalities or less than 20,000 employees, due to the instability of rates based on small numbers. In addition to this safeguard, considerable caution should be exercised in the interpretation of rates based on less than 20 deaths due to the possibility of rate instability (National Center for Health Statistics, 1999). It should be noted that in some instances rates were calculated for 1983 through 1995 only (e.g., industry division by occupation division), due to the lack of comparably coded denominator data for the earlier period.

The employment data used for rate calculations were based on the number of workers, rather than hours of work (or full-time equivalents). Using the number of workers does not account for the difference in exposure for groups that commonly work less than a full-time schedule of 40 hours per week (e.g., youth and older workers). For most workers however, the injury rates are similar regardless of which type of employment measure is used (Ruser, 1998). In addition, crude rates are presented in this report rather than age-adjusted rates. Age adjustments made when calculating occupational injury death rates, in nearly all cases, have only a negligible effect as age is not the primary risk factor (Bailer et al., 1998). Lastly, there is a dissimilarity between death and employment data when State-specific rates are calculated. The death data indicate the State where the death occurred while the employment data indicate the State of residence. This should be kept in mind when reviewing State fatality rates as net commuter in- and outflows may artificially increase or decrease State-specific rates.

¹Standard errors associated with the CPS are explained in BLS’ “Employment and Earnings” and “Geographic Profiles of Employment and Unemployment” (Bureau of Labor Statistics, 1981-1996; Bureau of Labor Statistics, 1982-1997).

Limitations of Death Certificate Data

Limitations of death certificates used to ascertain work-related fatality information have previously been described (Bell et al., 1990; Jenkins et al., 1993; Russell and Conroy, 1991; Stout and Bell, 1991). Incomplete or unclear information on the death certificate and the lack of a national standard for the completion of the “Injury at Work?” item on the death certificate during this period are particular problems. Motor vehicle crashes and homicides accentuate the difficulty of attempting to identify occupational injuries (Colorado Dept. of Health, 1988; Russell and Conroy, 1991). Furthermore, because death certificates ask if the injury occurred at work, the death certificate may not be a true measure of work-relatedness for certain causes of death. For instance, a suicide that takes place at work may or may not be associated with work per se.

Standardized guidelines for coding the “Injury at Work?” item on the death certificates were not introduced until 1992.¹ Certifier interpretation without the aid of standardized guidelines probably accentuated the problem of false positives being included in the data and false negatives not being identified. The improvements in the quality of the data, such as the sensitivity and positive predictive value, that resulted from these guidelines are unknown.

There are potential discrepancies in the collection of race and ethnicity in death data.² NCHS made the first official recommendation to the States to include separate questions for race and ethnicity on their respective death certificates in January 1987 (Tolson et al., 1991). Variation in the collection methods employed by States is possible prior to the implementation of this recommendation. Additionally, studies have shown that race and ethnicity can be confused, and the manner in which the information is gathered affects the subsequent estimates (Tucker and Kojetin, 1996; Bureau of Census, 1996; Bureau of Census, 1997). As a result of the different approaches to collecting “race” and “ethnicity” information, rates should be interpreted with caution (Hahn, 1992).

Death certificates query for the “usual” occupation and industry of the decedent. Studies comparing the reliability of “usual” occupation and industry reported on death certificates to information derived from personal interviews prior to death reported agreement for “usual” occupation to be 48% to 76%, and 57% to 76% for “usual” industry (Gute and Fulton, 1985; Schade and Swanson, 1988; Schumacher, 1986; Swanson et al., 1984; Turner et al., 1987). Studies comparing death certificate entries for usual occupation and industry to employment information at the time of death reported agreement for occupation to be 64% to 74%, and 60% to 76% for industry (Davis, 1988; Illis et al., 1987; Schade and Swanson, 1988). Additionally, “most recent” occupation and industry were incorrectly entered in the “usual” occupation and industry fields on death certificates in about 6% to 11% of the cases (Davis, 1988; Schade and Swanson, 1988). For these reasons, there exists the possibility that for any surveillance system based on death certificates, cases may be misclassified with respect to industry and occupation.

¹In 1992, national guidelines for completing the “Injury at Work?” item were developed and disseminated by the Association for Vital Records and Health Statistics (now the National Association for Public Health Statistics and Information Systems), NIOSH, NCHS, and the National Center for Environmental Health (Appendix V).

²During the period from 1980 through 1995, categories for race and ethnicity were defined by the Office of Management and Budget’s Statistical Policy Directive 15. Racial and ethnic categories are not to be interpreted as biological or genetic, but are simply a social-political construct designed for collecting data. Race categories include: White, Black, Native American, and Asian/Pacific Islander. Ethnicity categories are: “Hispanic or Latino” and “Not Hispanic or Latino” (Office of Management and Budget, 1977).

Finally, this report only includes information on deaths of civilians who died at work in the U.S. Civilians who died at work while abroad, and military personnel, regardless of their duty station, are excluded. The number of U.S. civilian workers killed while abroad is not known. And while NTOF does contain military cases for those who died at work in the U.S., they were excluded from this report primarily because of difficulties in establishing a definition of work-relatedness comparable to that of civilians. Unlike civilians, whose death is generally considered work-related if the incident occurred (1) on an employer's premise, or (2) off the worksite premises but while the worker was conducting legitimate work duties, active duty military personnel are considered to be on-duty 24 hours per day (Helmkamp and Kennedy, 1996).

Comparison of Data to Previously Published Fatal Occupational Injury Data

The data contained in the current publication are comparable to those from the 1993 document with a few exceptions. In the current report, the industry and occupation narrative data from 1980 through 1989 were recoded, thus frequency counts and rates for these two variables may differ from what was published in the earlier document. Additionally, rates by industry, overall rates by state, and industry rates by state were calculated based on a different source of employment data. The fatality rates by industry, overall rates by state, and industry rates by state included in the earlier publication were calculated using County Business Patterns (CBP), an establishment-based census of employers, supplemented with data from the 1982 Agricultural Census and data for the public administration industry from the CPS. The CBP excludes agricultural production workers, domestic-service workers, railroad workers subject to the Railroad Retirement Act, most government workers, and the self-employed. These exclusions introduce a bias in the calculation of industry-specific incidence rates, resulting in artificially high rates. Because the CPS, which is a population-based survey, includes wage and salaried, self-employed, and all agricultural workers, it best matches the worker population included in NTOF. These differences are discussed in more detail elsewhere (Biddle and Kisner, 1998).

To address some of the limitations of death certificates and other existing data sources in the surveillance of fatal occupational injuries, in 1992 the BLS began collecting national work-related death data through the Census of Fatal Occupational Injuries (CFOI) system. The CFOI requirement that work-relatedness be substantiated by at least two sources has led to improvements in both the number of cases identified and the overall data accuracy. While CFOI and NTOF identified similar patterns from 1992 through 1995, NTOF captured 21,038 cases for this period compared to the 25,455 cases captured by CFOI (Toscano and Windau, 1998). Another difference between the two surveillance systems is that the coding systems used to specify cause of death differ. NTOF uses E-codes from the ICD-9 (World Health Organization, 1977) and CFOI uses the BLS-designed Occupational Injury and Illness Classification System (Toscano et al., 1996). Direct comparisons of the two systems are complicated, but broad results for cause of death are similar.

Additional Readings

The last section in this document (Appendix VI) includes a list of articles and other publications that can be referred to for additional information. While not exhaustive, this list includes journal articles, NIOSH publications, and other articles that involved NTOF analyses.

Detailed Bureau of the Census (BOC) Industry Groupings*

BOC Industry Codes[†]	Industry Description
010-011	Ag Production
012-030 (020-021)	Ag Services
031-032 (030-031)	Forestry & Fisheries
042	Oil and Gas Extraction
040-041, 050	Metal/Coal/Nonmetal Mining
060	Construction
100-122	Food & Kindred Prod MFG
132-150	Textile Mill Prod MFG
151-152	Apparel & Other Textile Pr MFG
160-162	Paper & Allied Products MFG
171-172	Printing/Publishing/Allied MFG
180-192, 200-201, 210-212	Chemical/Petroleum/Rubber MFG
230-241	Lumber & Wood MFG
242	Furniture MFG
250-262	Stone/Clay/Concrete MFG
270-280	Primary Metals MFG
281-300	Fabricated Metals MFG
301	NS Metal Ind
310-332	Mach, Ex Elect MFG
340-350	Elect Mach, Equip Supplies MFG
351	Motor Vehicles Equip
352	Aircraft & Parts MFG
360-370	Other Transport Equip MFG
371-381	Prof & Photo Equip/Watches MFG
390	Toys/Amusement/Sporting Goods
130, 220-222, 391-392	Misc & NEC MFG Industries
410-411	Trucking/Warehousing/Storage
400-402, 412-432	Other Transportation
441	Telephone Communications
440, 442	Other Communications
450 (460)	Electric Light and Power
451-472 (461-472)	Other Utility/Sanitary Service
500-571	Wholesale Trade
601-611	Food Stores
612-622	Motor Veh/Auto Supply Dealer
623-630 (630-631)	Apparel & Accessory Stores
641	Eating & Drinking Places

Detailed Bureau of the Census (BOC) Industry Groupings (cont'd)*

BOC Industry Codes[†]	Industry Description
580-600, 631-640, 642-691 (580-600, 632-640, 642-691)	Other Retail Trade
700-710	Banking and Other Finance
711-712	Insurance and Real Estate
761	Private Household Services
721-741 (721-742)	Business Services
742-760 (750-760)	Automobile and Repair Services
762-791	Pers Serv Exc Priv Household
800-810 (800-802)	Entertainment & Rec Services
831	Hospitals
812-830, 832-840	Health Services, Exc Hosp
842-860	Educational Services
841, 861-893 (861-892)	Other Professional Services
910	Justice, Pub Order, & Safety
922	Admin of Hum Res Programs
932	National Sec/Internal Affairs
900-901, 921, 930-931	Other Pub Admin

*1980 and 1990 Bureau of the Census Alphabetical Index.

[†]Code groupings were, for the most part, identical for the 1980 and 1990 BOC industry codes. Where differences do occur, the 1980 code groupings are provided in parentheses.

Appendix III

Detailed Bureau of the Census (BOC) Occupation Groupings*

BOC Occupation Codes [†]	Occupation Description
003-006	Officials & Administrators, Public Admin
007-022 (007-019)	Other Executive, Admin & Managerial
023-037	Management Related Occupations
043-063	Engineers
064-068	Mathematical and Computer Scientists
069-083	Natural Scientists
084-089	Health Diagnosing Occupations
095-106	Health Assessment and Treatment Occupations
113-154	Teachers, College and University
155-159	Teachers, Except College and University
178-179	Lawyers and Judges
163-177, 183-199	Other Professional Specialty Occupations
203-208	Health Technologists and Technicians
213-225	Engineering and Science Technicians
226-235	Technicians, Exc Health/Engineering/Science
243	Supervisors and Proprietors, Sales Occ
253-257	Sales Reps, Finance and Business Services
258-259	Sales Reps, Commodities, Except Retail
263-278	Sales Workers, Retail & Personal Services
283-285	Sales Related Occupations
303-307	Supervisors, Administrative Support
308-309	Computer Equipment Operators
313-315	Secretaries, Stenographers, and Typists
337-344	Financial Records Processing
354-357	Mail and Message Distribution
316-336, 345-353, 359-389	Other Admin. Support, Including Clerical
403-407	Private Household Service Occupations
413-427	Protective Service
433-444	Food Service
445-447	Health Service
448-455	Cleaning and Building Service
456-469	Personal Service
473-476	Farm Operators and Managers
477-489	Farm Workers and Related Occupations
494-499	Forestry and Fishing Occupations
503-549	Mechanics and Repairers
553-599	Construction Trades
613-699	Other Precision Production, Craft, and Repair

Detailed Bureau of the Census (BOC) Occupation Groupings (cont'd)*

BOC Occupation Codes[†]	Occupation Description
703-779	Machine Operators/Tenders, Except Precision
783-799	Fabricators, Assemblers, Inspectors, Samplers
803-814	Motor Vehicle Operators
823-859	Other Transport and Material Moving Occ
869	Construction Laborers
875-883	Freight, Stock, & Materials Handlers
864-868, 874, 885-889 (863-867, 873, 885-889)	Other Handlers, Equip. Cleaner, Helper, Laborer

*1980 and 1990 Bureau of the Census Alphabetical Index.

[†]Code groupings were, for the most part, identical for the 1980 and 1990 BOC occupation codes. Where differences do occur, the 1980 code groupings are provided in parentheses.

Appendix IV

ICD-9* E-code Rubrics for Cause of Death Categories

Category	ICD-9 Rubric
Rail Transport	E800-E807
Motor Vehicle	E810-E829, E846-E849
Water Transport	E830-E838
Air Transport	E840-E845
Poisoning	E850-E858, E860-E869
Falls	E880-E888
Fires	E890-E899
Nature/Environment	E900-E909, E928
Drowning	E910
Suffocation	E911-E913
Struck By Falling Object	E916
Flying Object/Caught In Machine	E917, E918 E919
Explosion	E921, E923
Electrocution	E925
Suicide	E950-E959
Homicide	E960-E969
Other	E870-E879, E914, E915, E920, E922, E924, E926, E927, E929, E930-E949, E970-E978, E990-E999
Unknown/Undetermined	E980-E989, Blank

*International Classification of Diseases, Ninth Revision.

Appendix V

Operational Guidelines for Determination of Injury at Work

Operational Guidelines For Determination Of Injury At Work

1. Complete the injury at work item if any other than natural cause of death is mentioned in Part I or Part II of the medical certification, including homicides, suicides, and accidents, including motor vehicle deaths.
2. The injury at work item must be completed for decedents ages 14 or over and may be completed for those less than 14 years of age if warranted. Consider possibility of work injury regardless of whether injury occurred in the course of work in “usual” or other occupation and/or industry. If decedent’s “usual” occupation is housewife, student, or retired consider possible injury during other employment. If occupation is transportation-related, suspect injury at work and evaluate per criteria.
3. Consider available information with regard to location and activity at time of injury. If location is farm, suspect work-related and evaluate per criteria.

CRITERIA	INJURY AT WORK	
<i>On Employer Premises</i>	Yes	No
• Engaged in work activity, apprentice, vocational training	✓	
• On break, in hallways, rest room, cafeteria, storage area	✓	
• In employer parking lots while working, arriving, or leaving	✓	
• Engaged in recreational activities on employer controlled facilities (games, etc.) for personal enjoyment		✓
• As a visitor for non-work purposes, not on official business		✓
<i>Off Employer Premises</i>		
• Working for pay or compensation, including at home	✓	
• Working as a volunteer EMS, firefighter, or law enforcement officer	✓	
• Working in a family business, including family farm. Activity should be clearly related to a profit-oriented business.	✓	
• Traveling on business, including to and from customer/business contacts	✓	
• Engaged in work activity where vehicle is considered the work environment (e.g., taxi driver, truck driver, etc.)	✓	
• Homemaker working at homemaking activities		✓
• Working for self—non profit, i.e., mowing lawn, repairing own roof, hobby, or recreation activities		✓
• Student engaged in school activities		✓
• Operating vehicle (personal or commercial) for non-work purposes		✓
• Commuting to or from work site		✓

These guidelines were developed jointly by: The Association for Vital Records and Health Statistics (AVRHS), the National Institute for Occupational Safety and Health (NIOSH), the National Center for Health Statistics, (NCHS), and the National Center for Environmental Health and Injury Control (NCEHIC).
