

SAND AND GRAVEL (CONSTRUCTION)¹(Data in million metric tons unless otherwise noted)²

Domestic Production and Use: Construction sand and gravel valued at \$7.6 billion was produced by an estimated 4,100 companies from about 6,700 operations in 50 States. Leading producing States, in order of decreasing tonnage, were California, Texas, Arizona, Michigan, Colorado, Wisconsin, Washington, New York, Ohio, and Utah, which together accounted for about 52% of the total output. It is estimated that about 44% of construction sand and gravel was used as concrete aggregates; 23% for road base and coverings and road stabilization; 14% as construction fill; 12% as asphaltic concrete aggregates and other bituminous mixtures; 3% for plaster and gunite sands; 1% for concrete products, such as blocks, bricks, and pipes; and the remaining 3% for filtration, golf courses, railroad ballast, roofing granules, snow and ice control, and other miscellaneous uses.

The estimated output of construction sand and gravel in the 48 conterminous States, shipped for consumption in the first 9 months of 2008, was about 769 million tons, a decrease of 19% compared with the revised total for the same period in 2007. Additional production information by quarter for each State, geographic region, and the United States is published by the U.S. Geological Survey (USGS) in its quarterly Mineral Industry Surveys for Crushed Stone and Sand and Gravel.

Salient Statistics—United States:	2004	2005	2006	2007	2008^e
Production	1,240	1,280	1,320	1,230	1,040
Imports for consumption	5	7	5	4	4
Exports	1	1	1	(³)	1
Consumption, apparent	1,240	1,290	1,320	1,240	1,050
Price, average value, dollars per ton	5.32	5.86	6.47	7.01	7.23
Employment, mines, mills, and shops, number	37,000	37,700	38,500	38,000	34,100
Net import reliance ⁴ as a percentage of apparent consumption	(³)	(³)	1	(³)	(³)

Recycling: Asphalt road surface layers, cement concrete surface layers, and concrete structures were recycled on an increasing basis.

Import Sources (2004-07): Canada, 73%; Mexico, 19%; The Bahamas, 5%; and other, 3%.

Tariff: Item	Number	Normal Trade Relations 12-31-08
Sand, silica and quartz, less than 95% silica	2505.10.5000	Free.
Sand, other	2505.90.0000	Free.
Pebbles and gravel	2517.10.0015	Free.

Depletion Allowance: Common varieties, 5% (Domestic and foreign).

Government Stockpile: None.

SAND AND GRAVEL (CONSTRUCTION)

Events, Trends, and Issues: As the U.S. economy continued to falter, construction sand and gravel output dropped for the second straight year, down by more than 15%, or nearly 200 million tons, compared with that of 2007. Demand for construction aggregate fell because total U.S. construction declined in 2008, led by a double-digit decline in housing construction. It is estimated that 2009 domestic production will decrease to about 1 billion tons as housing construction and home prices remain at historically low levels, and revenues to governments are affected by lower home values and associated revenues. Decreased revenues could curtail publicly funded construction projects, which in turn would lower demand for construction sand and gravel.

Crushed stone, the other major construction aggregate, continues to replace natural sand and gravel, especially in more densely populated areas of the Eastern United States. The construction sand and gravel industry continues to be concerned with environmental, health, permitting, safety, and zoning regulations. Movement of sand and gravel operations away from densely populated centers is expected to continue where environmental, land development, and local zoning regulations discourage them. Consequently, shortages of construction sand and gravel would support higher-than-average price increases in industrialized and urban areas.

World Mine Production, Reserves, and Reserve Base:

	Mine production		Reserves and reserve base⁵
	<u>2007</u>	<u>2008^e</u>	
United States	1,230	1,040	The reserves and reserve base are controlled largely by land use and/or environmental concerns.
Other countries ⁶	NA	NA	
World total	NA	NA	

World Resources: Sand and gravel resources of the world are large. However, because of environmental restrictions, geographic distribution, and quality requirements for some uses, sand and gravel extraction is uneconomic in some cases. The most important commercial sources of sand and gravel have been glacial deposits, river channels, and river flood plains. Use of offshore deposits in the United States is mostly restricted to beach erosion control and replenishment. Other countries routinely mine offshore deposits of aggregates for onshore construction projects.

Substitutes: Crushed stone remains the predominant choice for construction aggregate use. Increasingly, recycled asphalt and portland cement concretes are being substituted for virgin aggregate, although the percentage of total aggregate supplied by recycled materials remained very small in 2008.

^eEstimated. NA Not available.

²[See Appendix A for conversion to short tons.](#)

³Less than ½ unit.

⁴Defined as imports – exports + adjustments for Government and industry stock changes; changes in stocks are not available and assumed to be zero.

⁵[See Appendix C for definitions.](#)

⁶No reliable production information for most countries is available owing to the wide variety of ways in which countries report their sand and gravel production. Some countries do not report production for this mineral commodity. Production information for some countries is available in the country chapters of the USGS Minerals Yearbook.
